The snails without shells, which we have mentioned as being mostly found in Africa, are remarkably useful for dysentery, five of them being burnt with half a denarius of gum acacia, and taken, in doses of two spoonfuls, in myrtle wine or any other kind of astringent wine, with an equal quantity of warm water. Some persons employ all kinds of African snails indiscriminately in this manner; while others, again, make use of a similar number of African snails or broad-shelled snails, as an injection, in preference: in cases, too, where the flux is considerable, they add a piece of gum acacia, about the size of a bean. For dysentery and tenesmus, the cast-off slough of a snake is boiled in a pewter vessel with oil of roses: if prepared in any other kind of vessel, it is applied with an instrument made of pewter. Chicken-broth is also used as a remedy for these affections; but the broth of an old cock, strongly salted, acts more powerfully as a purgative upon the bowels. A pullet's craw, grilled and administered with salt and oil, has a soothing effect upon cœliac affections; but it is absolutely necessary that neither fowl nor patient should have eaten corn for some time before. Pigeons' dung, also, is grilled and taken in drink. The flesh of a ring-dove, boiled in vinegar, is curative of dysentery and cœliac affections: and for the cure of the former, a thrush is recommended, roasted with myrtleberries; a blackbird, also; or honey, boiled, in which the bees have died.

Detailed table of contents

CHAP. 20.

REMEDES FOR THE ILIAC PASSION, AND FOR OTHER MALADIES OF THE BOWELS.

One of the most dangerous of maladies is that known by the name of “ileos:” it may be combatted, they say, by tearing a bat asunder, and taking the blood, or by rubbing the abdo. men with it. Diarrhœa is arrested more particularly by taking snails, prepared in manner already mentioned for cases of asthma; the ashes, also, of snails burnt alive, administered in astringent wine; the liver of poultry grilled; the dried craw of poultry, a part that is usually thrown away, mixed with poppy-juice — in some cases it is used fresh, grilled, and taken in wine — partridge broth; the craw of partridges beaten up by itself in red wine; a wild ringdove boiled in oxycrate; a sheep’s milt, grilled and beaten up in wine; or else pigeons’ dung, applied with honey. The crop of an ossifrage, dried and taken in drink, is remarkably useful for patients whose digestion is impaired—indeed, its good effects may be felt if they only hold it in the hand while eating. Hence it is that some persons wear it attached to the body as an amulet; a practice which must not be too long continued, it being apt to cause a wasting of the flesh. The blood, too, of a drake has an astringent effect.

Flatulency is dispelled by eating snails; and griping pains in the bowels, by taking a sheep’s milt grilled, with wine; a wild ringdove boiled in oxycrate; the fat of an otis in wine; or the ashes of an ibis, burnt without the feathers, administered in drink. Another prescription mentioned for griping pains in the bowels is of a very marvellous nature: if a duck, they say, is applied to the abdomen, the malady will pass into the bird, and it will die. Gripings of the bowels are treated also with boiled honey in which the bees have died.

Colic is most effectually cured by taking a roasted lark with the food. Some recommend, however, that it should be burnt to ashes in a new vessel, feathers and all, and then pounded and taken for four consecutive days, in doses of three spoonfuls, in water. Some say that the heart of this bird should be attached to the thigh, and, according to others, the heart should be swallowed fresh, quite warm, in fact. There is a family of consular dignity, known as the Asprenates, two brothers, members of which, were cured of colic; the one by eating a lark and wearing its heart in a golden bracelet; the other, by performing a certain sacrifice in a chapel built of raw bricks, in form of a furnace, and then blocking up the edifice the moment the sacrifice was concluded. The ossifrage has a single intestine only, which has the marvellous property of digesting all that the bird has swallowed: the extremity of this intestine, it is well known, worn as an amulet, is an excellent remedy for colic.

There are certain concealed maladies incident to the intestines, in relation to which there are some marvellous statements made. If to the stomach and chest, more particularly, blind puppies are applied, and suckled with milk from the patient’s mouth, the virulence of the malady, it is said, will be

transferred to them, and in the end they will die: on opening them, too, the causes of the malady will be sure to be discovered. In all such cases, however, the puppies must be allowed to die, and must be buried in the earth. According to what the magicians say, if the abdomen is touched with a bat's blood, the person will be proof against colic for a whole year: when a patient, too, is attacked with the pains of colic, if he can bring himself to drink the water in which he has washed his feet, he will experience a cure.

CHAP. 21. (8.)

REMEDIES FOR URINARY CALCULI AND AFFECTIONS OF THE BLADDER.

For the cure of urinary calculi, it is a good plan to rub the abdomen with mouse-dung. The flesh of a hedge-hog is agreeable eating, they say, if killed with a single blow upon the head, before it has had time to discharge its urine upon its body: [persons who eat this flesh, it is said, will never by any possibility suffer from strangury.] The flesh of a hedgehog thus killed, is a cure for urinary obstructions of the bladder; and the same, too, with fumigations made therewith. If, on the other hand, the animal has discharged its urine upon its body, those who eat the flesh will be sure to be attacked by strangury, it is said. As a lithontriptic, earth-worms are recommended, taken in ordinary wine or raisin wine; or else boiled snails, prepared the same way as for the cure of asthma. For the cure of urinary obstructions, snails are taken from the shells, pounded, and administered in one cyathus of wine, three the first day, two the second, and one the third. For the expulsion of calculi, the empty shells are reduced to ashes and taken in drink: the liver also of a water-snake, and the ashes of burnt scorpions are similarly employed, or are taken with bread or eaten with a locust. For the same purpose, the small grits that are found in the gizzard of poultry or in the craw of the ringdove, are beaten up and sprinkled in the patient's drink; the craw, too, of poultry is taken, dried, or if fresh, grilled.

For urinary calculi and other obstructions of the bladder, dung of ring-doves is taken, with beans; ashes also of wild ring-doves' feathers, mixed with vinegar and honey; the intestines of those birds, reduced to ashes, and administered in doses of three spoonfuls; a small clod from a swallow's nest, dissolved in warm water; the dried crop of an ossifrage; the dung of a turtle-dove, boiled in honied wine; or the broth of a boiled turtle-dove.

It is very beneficial also for urinary affections to eat thrushes with myrtle-berries, or grasshoppers grilled on a shallow-pan; or else to take the millepedes, known as "onisci," in drink. For pains in the bladder, a decoction of lambs' feet is used. Chicken-broth relaxes the bowels and mollifies acridities; swallows' dung, too, with honey, employed as a suppository, acts as a purgative.

Detailed table of contents

CHAP. 22.

REMEDIES FOR DISEASES OF THE FUNDAMENT AND OF THE GENERATIVE ORGANS.

The most efficacious remedies for diseases of the rectum are wool-grease — to which some add pompholix and oil of roses — a dog's head, reduced to ashes; or a serpent's slough, with vinegar. In cases where there are chaps and fissures of those parts, the ashes of the white portion of dogs' dung are used, mixed with oil of roses; a prescription due, they say, to Æsculapius, and remarkably efficacious also for the removal of warts. Ashes of burnt mouse-dung, swan's fat, and cow suet, are also used. Procidence of the rectum is reduced by an application of the juices discharged by snails when punctured. For the cure of excoriation of those parts, ashes of burnt woodmice are used, with honey; the gall of a hedge-hog, with a bat's brains and bitches' milk; goose-grease, with the brains of the bird, alum, and wool-grease; or else pigeons' dung, mixed with honey. A spider, the head and legs being first removed, is remarkably good as a friction for condylomata. To prevent the acridity of the humours from fretting the flesh, goosegrease is applied, with Punic wax, white lead, and oil of roses; swan's grease also, which is said to be a cure for piles.

A very good thing, they say, for sciatica, is, to pound raw snails in Aminean wine, and to take them with pepper; to eat a green lizard, the feet, head, and intestines being first removed; or to eat a spotted lizard, with the addition of three oboli of black poppy. Ruptures and convulsions are treated with sheep's gall, diluted with woman's milk. The gravy which escapes from a ram's lights roasted, is used for the cure of itching pimples and warts upon the generative organs: for other affections of those parts, the ashes of a ram's wool, unwashed even, are used, applied with water; the suet of a sheep's caul, and of the kidneys more particularly, mixed with ashes of pumice-stone and salt; greasy wool, applied with cold water; sheep's flesh, burnt to ashes, and applied with water; a mule's hoofs, burnt to ashes; or the powder of pounded horse teeth, sprinkled upon the parts. In cases of decidence of either of the testes, an application of the slime discharged by snails is remedial, they say. For the treatment of sordid or running ulcers of those parts, the fresh ashes of a burnt dog's head are found highly useful; the small, broad kind of snail, beaten up in vinegar; a snake's slough, or the ashes of it, applied in vinegar; honey in which the bees have died, mixed with resin; or the kind of snail without a shell, that is found in Africa, as already mentioned, beaten up with powdered frankincense and white of eggs, the application being renewed at the end of thirty days; some persons, however, substitute a bulb for the frankincense.

For the cure of hydrocele, a spotted lizard, they say, is marvellously good, the head, feet, and intestines being first removed, and the rest of the body

roasted and taken frequently with the food. For incontinence of urine dogs' fat is used, mixed with a piece of split alum the size of a bean; ashes, also, of African snails burnt with the shells, taken in drink; or else the tongues of three geese roasted and eaten with the food, a remedy which we owe to Anaxilaiis. Mutton-suet, mixed with parched salt, has an aperient effect upon inflammatory tumours, and mouse-dung, mixed with powdered frankincense and sandarach, acts upon them as a dispellent: the ashes, also, of a burnt lizard, or the lizard itself, split asunder and applied; or else bruised millepedes, mixed with one third part of turpentine. Some make use of earth of Sinope for this purpose, mixed with a bruised snail. Ashes of empty snail-shells burnt alone, mixed with wax, possess certain repercussive properties; the same, too, with pigeons' dung, employed by itself, or applied with oat-meal or barley-meal. Cantharides, mixed with lime, remove inflammatory tumours quite as effectually as the lancet; and small snails, applied topically with honey, have a soothing effect upon tumours in the groin.

Detailed table of contents

CHAP. 23. (9.)

REMEDIES FOR GOUT AND FOR DISEASES OF THE FEET.

To prevent varicose veins, the legs of children are rubbed with a lizard's blood: but both the party who operates and the patient must be fasting at the time. Wool-grease, mixed with woman's milk and white lead, has a soothing effect upon gout; the liquid dung also voided by sheep; a sheep's lights; a ram's gall, mixed with suet; mice, split asunder and applied; a weasel's blood, used as a liniment with plantago; the ashes of a weasel burnt alive, mixed with vinegar and oil of roses, and applied with a feather, or used in combination with wax and oil of roses; a dog's gall, due care being taken not to touch it with the hand, and to apply it with a feather; poultry dung; or else ashes of burnt earth-worms, applied with honey, and removed at the end of a couple of days. Some, however, prefer using this last with water, while others, again, apply the worms themselves, in the proportion of one acetabulum to three cyathi of honey, the feet of the patient being first anointed with oil of roses. The broad, flat, kind of snail, taken in drink, is used for the removal of pains in the feet and joints; two of them being pounded for the purpose and taken in wine. They are employed, also, in the form of a liniment, mixed with the juice of the plant helixine: some, however, are content to beat up the snails with vinegar. Some say that salt, burnt in a new earthen vessel with a viper, and taken repeatedly, is curative of gout, and that it is an excellent plan to rub the feet with viper's fat. It is asserted, too, that similar results are produced by keeping a kite till it is dry, and then powdering it and taking it in water, a pinch in three fingers at a time; by rubbing the feet with the blood of that bird mixed with nettles; or by bruising the first feathers of a ring-dove with nettles. The dung of ring-doves is used as a liniment for pains in the joints; the ashes also of a burnt weasel, or of burnt snails, mixed with amylum or gum tragacanth.

A very excellent cure for contusions of the joints is a spider's web; but there are persons who give the preference to ashes of burnt cobwebs or of burnt pigeons' dung, mixed with polenta and white wine. For sprains of the joints a sovereign remedy is mutton suet, mixed with the ashes of a woman's hair; a good application, too, for chilblains is mutton suet, mixed with alum, or else ashes of a burnt dog's head or of burnt mouse-dung. Ulcers, free from discharge, are brought to cicatrize by using the above-named substances in combination with wax; ashes, also, of burnt dormice, mixed with oil; ashes of burnt wood-mice, mixed with honey; ashes of burnt earthworms, applied with old oil; or else ashes of the snails without a shell that are so commonly found. All ulcers on the feet are cured by the application of ashes of snails, burnt alive; and for excoriations of the feet, ashes of burnt poultry-dung are used, or ashes of burnt pigeons' dung, mixed with oil. When the feet have been galled

by the shoes, the ashes of an old shoe- sole are used, or the lights of a lamb or ram. For gatherings beneath the nails, a horse's tooth, powdered, is a sovereign remedy. A light application of a green lizard's blood, will cure the feet of man or beast when galled beneath.

For the removal of corns upon the feet, the urine of a mule of either sex is applied, mixed with the mud which it has formed upon the ground; sheep's dung, also; the liver of a green lizard, or the blood of that animal, applied in wool; earth-worms, mixed with oil; the head of a spotted lizard, pounded with an equal quantity of vitex and mixed with oil; or pigeons' dung, boiled with vinegar. For the cure of all kinds of warts, dogs' urine is applied fresh, with the mud which it has formed upon the ground; dogs' dung, also, reduced to ashes and mixed with wax; sheep's dung; the blood of mice, applied fresh, or the body of a mouse, split asunder; the gall of a hedgehog; a lizard's head or blood, or the ashes of that animal, burnt entire; the cast-off slough of a snake; or else poultry dung, applied with oil and nitre. Cantharides, also, bruised with Taminian grapes, act corrosively upon warts: but when warts have been thus removed, the remedies should be employed which we have pointed out for ulcerations on the skin.

[Detailed table of contents](#)

CHAP. 24. (10.)

REMEDIES FOR EVILS WHICH ARE LIABLE TO AFFECT THE WHOLE BODY.

We will now turn our attention to those evils which are a cause of apprehension, as affecting the whole body. According to what the magicians say, the gall of a male black dog is a counter-charm for the whole of a house; and it will be quite sufficient to make fumigations with it, or to use it as a purification, to ensure its preservation against all noxious drugs and preparations. They say the same, too, with reference to a dog's blood, if the walls are sprinkled with it; and the genitals of that animal, if buried beneath the threshold. This will surprise persons the less who are aware how highly these same magicians extol that most abominable insect, the tick, and all because it is the only one that has no passage for the evacuations, its eating ending only in its death, and it living all the longer for fasting: in this latter state it has been known to live so long as seven days, they say, but when it gorges to satiety it will burst in a much shorter period. According to these authorities, a tick from a dog's left ear, worn as an amulet, will allay all kinds of pains. They presage, too, from it on matters of life and death; for if the patient, they say, gives an answer to a person who has a tick about him, and, standing at the foot of the bed, asks how he is, it is an infallible sign that he will survive; while, on the other hand, if he makes no answer, he will be sure to die. They add, also, that the dog from whose left ear the tick is taken, must be entirely black. Nigidius has stated in his writings that dogs will avoid the presence all day of a person who has taken a tick from off a hog.

The magicians likewise assure us that patients suffering from delirium will recover their reason on being sprinkled with a mole's blood; and that persons who are apt to be troubled by the gods of the night and by Fauni, will experience relief by rubbing themselves morning and evening with the tongue, eyes, gall, and intestines of a dragon, boiled in oil, and cooled in the open air at night.

Detailed table of contents

CHAP. 25.

REMEDIES FOR COLD SHIVERINGS.

A remedy for cold shiverings, according to Nicander, is a dead amphisbæna, or its skin only, attached to the body: in addition to which, he informs us that if one of these reptiles is attached to a tree that is being felled, the persons hewing it will never feel cold, and will fell it all the more easily. For so it is, that this is the only one among all the serpents that faces the cold, making its appearance the first of all, and even before the cuckoo's note is heard. There is another marvellous fact also mentioned, with reference to the cuckoo: if, upon the spot where a person hears this bird for the first time, he traces round the space occupied by his right foot and then digs up the earth, it will effectually prevent fleas from breeding, wherever it is thrown.

Detailed table of contents

CHAP. 26.

REMEDIES FOR PARALYSIS.

For persons apprehensive of paralysis the fat of dormice and of field-mice, they say, is very useful, boiled: and for patients threatened with phthisis, millepedes are good, taken in drink, in manner already mentioned for the cure of quinzy. The same, too, with a green lizard, boiled down to one cyathus in three sextarii of wine, and taken in doses of one spoonful daily, until the patient is perfectly cured; the ashes also of burnt snails, taken in wine.

Detailed table of contents

CHAP. 27.

REMEDIES FOR EPILEPSY.

For the cure of epilepsy wool-grease is used, with a modicum of myrrh, a piece about the size of a hazel-nut being dissolved and taken after the bath, in two cyathi of wine: a ram's testes, also, dried and pounded, and taken in doses of half a denarius, in water, or in a semi-sextarius of asses' milk; the patient being forbidden wine five days before and after using the remedy. Sheep's blood, too, is mightily praised, taken in drink; sheep's gall, also, and lambs' gall in particular, mixed with honey; the flesh of a sucking puppy, taken with wine and myrrh, the head and feet being first removed; the callosities from a mule's legs, taken in three cyathi of oxymel; the ashes of a spotted lizard from beyond seas, taken in vinegar; the thin coat of a spotted lizard, which it casts like a snake, taken in drink — indeed some persons recommend the lizard itself; gutted with a reed and dried and taken in drink; while others, again, are for roasting it on a wooden spit and taking it with the food.

It is worth while knowing how the winter slough of this lizard is obtained when it casts it off, before it has had the opportunity of devouring it; there being no creature, it is said, that resorts in its spite to more cunning devices for the deception of man; a circumstance owing to which, the name of "stellio" has been borrowed as a name of reproach. The place to which it retires in summer is carefully observed, being generally some spot beneath the projecting parts of doors or windows, or else in vaults or tombs. In the early days of spring, cages made of split reeds are placed before these spots; and the narrower the interstices the more delighted is the animal with them, it being all the better enabled thereby to disengage itself of the coat which adheres to its body and impedes its freedom of action: when, however, it has once quitted it, the construction of the cage prevents its return. There is nothing whatever preferred to this lizard as a remedy for epilepsy. The brains of a weasel are also considered very good, dried and taken in drink; the liver, too, of that animal, or the testes, uterus, or paunch, dried and taken with coriander, in manner already mentioned; the ashes also of a burnt weasel; or a wild weasel, eaten whole with the food. All these properties are equally attributed to the ferret. A green lizard is sometimes eaten, dressed with seasonings to stimulate the appetite, the feet and head being first removed; the ashes, too, of burnt snails are used, as an ointment, with linseed, nettle-seed, and honey.

The magicians think highly of a dragon's tail, attached to the body, with a deer's sinews, in the skin of a gazelle; as also the small grits found in the crops of young swallows, tied to the left arm of the patient; for swallows, it is said, give small stones to their young the moment they are hatched. If, at the commencement of the first paroxysm, an epileptic patient eats the first of a swallow's brood that has been hatched, he will experience a perfect cure: but

at a later period the disease is treated by using swallow's blood with frankincense, or by eating the heart of the bird quite fresh. Nay, even more than this, a small stone taken from a swallow's nest will relieve the patient the moment it is applied, they say; worn, too, as an amulet, it will always act as a preservative against the malady. A kite's liver, too, eaten by the patient, is highly vaunted; the slough also of a serpent; a vulture's liver, beaten up with the blood of the bird, and taken thrice seven days in drink; or the heart of a young vulture, worn attached to the body.

And not only this, but the vulture itself is recommended as a food for the patient, and that, too, when it has been glutted with human flesh. Some recommend the breast of this bird to be taken in drink from a cup made of cerrus wood, or the testes of a dunghill cock to be taken in milk and water; the patient abstaining from wine the five preceding days, and the testes being dried for the purpose. There have been authorities found to recommend one-and-twenty red flies-and those found dead, too!-taken in drink, the number being reduced where the patient is of a feeble habit.

Detailed table of contents

CHAP. 28. (11.)

REMEDIES FOR JAUNDICE.

Jaundice is combated by administering ear-wax to the patient, or else the filth that adheres to the udders of sheep, in doses of one denarius, with a modicum of myrrh, in two cyathi of wine; the ashes, also, of a dog's head, mixed with honied wine; a millepede, in one semi-sextarius of wine; earth-worms, in hydromel with myrrh; wine in which a hen's feet have been washed, after being first cleansed with water — the hen must be one with yellow feet — the brains of a partridge or of an eagle, in three cyathi of wine; the ashes of a ring-dove's feathers or intestines, in honied wine, in doses of three spoonfuls; or ashes of sparrows burnt upon twigs, in doses of two spoonfuls, in hydromel.

There is a bird, known as the “icterus,” from its peculiar colour: if the patient looks at it, he will be cured of jaundice, they say, and the bird will die. In my opinion this is the same bird that is known in Latin by the name of “galgulus.”

Detailed table of contents

CHAP. 29.

REMEDIES FOR PHRENITIS.

In cases of phrenitis a sheep's lights, attached warm round the patient's head, would appear to be advantageous. But as to giving a man suffering from delirium a mouse's brains in water to drink, the ashes of a burnt weasel, or the dried flesh even of a hedgehog, who could possibly do it, supposing even the effects of the remedy were certain? I should be inclined, too, to rank the ashes of the eyes of a horned owl in the number of those monstrous prescriptions with which the adepts in the magic art abuse the credulity of mankind.

It is in cases, too, of fever, more particularly, that the acknowledged rules of medicine run counter to the prescriptions of these men: for they have classified the various modes of treating the disease in accordance with the twelve signs of the Zodiac, and relatively to the revolutions of the sun and moon, a system which deserves to be utterly repudiated, as I shall prove by a few instances selected from many. They recommend, for example, when the sun is passing through Gemini, that the patient should be rubbed with ashes of the burnt combs, ears, and claws of cocks, beaten up and mixed with oil. If, again, it is the moon that is passing through that sign, it is the spurs and wattles of cocks that must be similarly employed. When either of these luminaries is passing through Virgo, grains of barley must be used; and when through Sagittarius, a bat's wings. When the moon is passing through Leo, it is leaves of tamarisk that must be employed, and of the cultivated tamarisk, they add: if, again, the sign is Aquarius, the patient must use an application of box-wood charcoal, pounded.

Of the remedies, however, that we find recommended by them, I shall be careful to insert those only the efficacy of which has been admitted, or, at least, is probable in any degree; such, for instance, as the use of powerful odours, as an excitant for patients suffering from lethargy; among which, perhaps, may be reckoned the dried testes of a weasel, or the liver of that animal, burnt. They consider it a good plan, too, to attach a sheep's lights, made warm, round the head of the patient.

Detailed table of contents

CHAP. 30.

REMEDIES FOR FEVERS.

In the treatment of quartan fevers, clinical medicine is, so to say, pretty nearly powerless; for which reason we shall insert a considerable number of remedies recommended by professors of the magic art, and, first of all, those prescribed to be worn as amulets: the dust, for instance, in which a hawk has bathed itself, tied up in a linen cloth, with a red string, and attached to the body; the longest tooth of a black dog; or the wasp known by the name of "pseudosphecx," which is always to be seen flying alone, caught with the left hand and attached beneath the patient's chin. Some use for this purpose the first wasp that a person sees in the current year. Other amulets are, a viper's head, severed from the body and wrapped in a linen cloth; a viper's heart, removed from the reptile while still alive; the muzzle of a mouse and the tips of its ears, wrapped in red cloth, the animal being set at liberty after they are removed; the right eye plucked from a living lizard, and enclosed with the head, separated from the body, in goat's skin; the scarabæus also that forms pellets and rolls them along.

It is on account of this kind of scarabæus that the people of a great part of Egypt worship those insects as divinities; an usage for which Apion gives a curious reason, asserting, as he does, by way of justifying the rites of his nation, that the insect in its operations pictures the revolution of the sun. There is also another kind of scarabæus, which the magicians recommend to be worn as an amulet — the one that has small horns thrown backwards; it must be taken up, when used for this purpose, with the left hand. A third kind also, known by the name of "fullo," and covered with white spots, they recommend to be cut asunder and attached to either arm, the other kinds being worn upon the left arm. Other amulets recommended by them, are, the heart of a snake taken from the living animal with the left hand; or four joints of a scorpion's tail. together with the sting,, attached to the body in a piece of black cloth; due care being taken that the patient does not see the scorpion, which is set at liberty after the operation, or the person who has attached the amulet, for the space of three days: after the recurrence, too, of the third paroxysm, he must bury the whole in the ground. Some enclose a caterpillar in a piece of linen with a thread passed three times round it, and tie as many knots, repeating at each knot why it is that the patient performs that operation. A slug is sometimes wrapped in a piece of skin, or the heads of four slugs, cut from the body with a reed: a millepede is rolled up in wool: the small grubs that produce the gadfly, are used before the wings of the insect are developed; or any other kind of hairy grub is employed that is found adhering to prickly shrubs. Some persons attach to the body four of these grubs, enclosed in an empty walnut shell, or else some of the snails that are found without a shell.

In other cases, again, it is the practice to enclose a spotted lizard in a little box, and to place it beneath the pillow, of the patient, taking care to set it at liberty when the fever abates. It is recommended also, that the patient should swallow the heart of a sea-diver, removed from the bird without the aid of iron, it being first dried and then bruised and taken in warm water. The heart of a swallow is also recommended, with honey; and there are persons who say that, just before the paroxysms come on, the patient should take one drachma of swallow's dung in three cyathi of goats' milk or ewes' milk, or of raisin wine: others, again, are of opinion that the birds themselves should be taken, whole. The nations of Parthia, as a remedy for quartan fevers, take the skin of the asp, in doses of one sixth of a denarius, with an equal quantity of pepper. The philosopher Chrysippus has left a statement to the effect, that the phrygianion, worn as an amulet, is a remedy for quartan fevers; but what kind of animal this is he has nowhere informed us, nor have I been able to meet with any one who knows. Still, however, I felt myself bound to notice a remedy that was mentioned by an author of such high repute, in case any other person should happen to be more successful in his researches. To eat the flesh of a crow, and to use nitre in the form of a liniment, is considered highly efficacious for the treatment of chronic diseases.

In cases of tertian fever — so true it is that suffering takes delight in prolonging hope by trying every remedy — it may be worth while to make trial whether the web of the spider called “lycos” is of any use, applied, with the insect itself, to the temples and forehead in a compress covered with resin and wax; or the insect itself, attached to the body in a reed, a form in which it is said to be highly beneficial for other fevers. Trial may be made also of a green lizard, enclosed alive in a vessel just large enough to receive it, and worn as an amulet; a method, it is said, by which recurrent fevers are often dispelled.

Detailed table of contents

CHAP. 31.

REMEDIES FOR DROPSY.

For the cure of dropsy, wool-grease, a piece about the size of a hazel-nut, is given in wine, with the addition of a little myrrh: some add goose-grease, steeped in myrtle wine. The filth that adheres to the udders of sheep is productive of a similar effect, as also the dried flesh of a hedge-hog, taken with the food. Matter vomited by a dog, we are assured, applied to the abdomen, will draw off the water that has accumulated there.

Detailed table of contents

CHAP. 32. (12).

REMEDIES FOR ERYSIPELAS.

For the cure of erysipelas, wool-grease is used, with pomnpholix and oil of roses; the blood also extracted from a tick; earth worms, applied in vinegar; or else a cricket crushed between the hands — the good effect of this last being that the person who uses this precaution before the malady has made its appearance, will be preserved therefrom for a whole year. Care must be taken also that iron is used for the removal of the cricket, with some of the earth about its hole. Goose-grease is also employed for this purpose; a viper's head, dried and burnt, and applied with vinegar; or a serpent's slough, applied to the body, immediately after the bath, with bitumen and lamb suet.

Detailed table of contents

CHAP. 33.

REMEDIES FOR CARBUNCLES.

Carbuncles are removed by an application of pigeons' dung, either alone or in combination with linseed and oxymel; or of bees that have died in the honey. A sprinkling of polenta upon the sores is also used. For carbuncles and other sores of the generative organs, wool-grease is used as a remedy, with refuse of lead; and for incipient carbuncles, sheep's dung is employed.. Tumours and all other affections that stand in need of emollients are treated most effectually with goose-grease; that of cranes, too, is equally efficacious.

[Detailed table of contents](#)

CHAP. 34.

REMEDIES FOR BOILS.

For boils the following remedies are prescribed; a spider, applied before mentioning the insect by name, care being taken to remove it at the end of two days; a shrew-mouse, suspended by the neck till it is dead, care being taken not to let it touch the earth when dead, and to pass it three times around the boil, both operator and patient spitting on the floor each time; poultry-dung, that of a red colour in particular, applied fresh with vinegar; the crop of a stork, boiled in wine; flies, an uneven number of them, rubbed upon the patient with the ring finger; the filth from sheep's ears; stale mutton suet, with ashes of women's hair; ram suet also, with ashes of burnt pumice and an equal quantity of salt.

Detailed table of contents

CHAP. 35.

REMEDIES FOR BURNS.

For burns, the ashes of a dog's head are used; ashes of burnt dormice, with oil; sheep's dung, with wax; ashes also of burnt snails, an application so effectual, as not to leave a scar even. Viper's fat, too, is used, and ashes of burnt pigeons' dung, applied with oil.

Detailed table of contents

CHAP. 36.

REMEDIES FOR AFFECTIONS OF THE SINEWS.

For nodosities in the sinews, the ashes of a viper's head are applied, with oil of cyprus; or else earth-worms, with honey. Pains in the sinews should be treated with an application of grease; the body of a dead amphisbæna, worn as an amulet; vulture's grease, dried with the crop of the bird and beaten up with stale hog's lard; or else ashes of the head of a horned owl, taken in honied wine with a lily root—that is, if we believe what the magicians tell us. For contractions of the sinews, the flesh of ring-doves is very good, dried and taken with the food: and for spasmodic affections, the ashes of a hedge-hog or weasel are used. A serpent's slough, attached to the patient's body in a piece of bull's hide, is a preventive of spasms: and the dried liver of a kite, taken in doses of three oboli, in three cyathi of hydromel, is a preservative against opisthotony.

[Detailed table of contents](#)

CHAP. 37.

REMEDIES FOR MALADIES OF THE NAILS AND FINGERS.

Agnails and hangnails upon the fingers are removed by using the ashes of a burnt dog's head, or the uterus of a bitch boiled in oil, the fingers being first rubbed with a liniment of ewe-milk butter, mixed with honey. The gall-bladder, too, of any animal is very useful for this purpose. Malformed nails are healed with an application of canthlarides and pitch, which is removed at the end of two days; or else with locusts friel with he-goat suet; or with an application of mutton suet. Some mix mistletoe and purslain with these ingredients; while others, again, use verligrease and mistletoe, removing the application at the end of two days.

Detailed table of contents

CHAP. 38. (13.)

METHODS FOR ARRESTING HÆMORRHAGE.

Bleeding at the nostrils is arrested by mutton suet taken from the caul, introduced into the nostrils; by draing up rennet, lamb's rennet in particular, mixed with water, into the nostrils, or by using it as an injection, a remedy which succeeds even where other remedies; have failed: by making up goosegrease into a bolus with an equall quantity of butter, and plugging the nostrils with it; or by using the earth that adheres to snails, or else the snails themselves, extracted from the shell. Excessive discharges from the nostrils are arrested also by applying crushed snails, or cobwebs, to the forehead. For issues of blood from the brain, the blood or brains of poultry are used, as also pigeons' dung, thickened and kept for the purpose. In cases where there is and immoderate flow of blood from a wound, an application of horse-dung, burnt with egg-shells, is marvellously good for stopping it.

[Detailed table of contents](#)

CHAP. 39.

REMEDIES FOR ULCEROUS SORES AND WOUNDS.

For the cure of ulcers, wool-grease is used, with ashes of burnt barley and verdigrease, in equal quantities; a preparation which is good, too, for carcinomata and spreading sores. It cauterizes the flesh also around the margins of ulcers, and reduces and makes level fungous excrescences formed by sores. Ashes, too, of burnt sheep's dung, mixed with nitre, are of great efficacy for the cure of carcinomata; as also those of lambs' thigh-bones, in cases more particularly where ulcers refuse to cicatrize. Very considerable, too, is the efficacy of lights, ram's lights in particular, which are of the greatest utility for reducing and making level the fleshy excrescences formed by ulcerous sores. With sheep's dung, warmed beneath an earthen pan and kneaded, the swellings attendant upon wounds are reduced, and fistulous sores and epinystis are cleansed and made to heal.

But it is in the ashes of a burnt dog's head that the greatest efficacy is found; as it quite equals spodium in its property of cauterizing all kinds of fleshy excrescences, and causing sores to heal. Mouse-dung, too, is used as a cautery, and weasels' dung, burnt to ashes. Pounded millepedes, mixed with turpentine and earth of Sinope, are used for penetrating carcinomata and fleshy indurations in deep-seated sores; and the same substances are remarkably useful for the treatment of ulcers threatened with maggots.

Indeed the several varieties of worms themselves are possessed of marvellously useful properties. The worms, for instance, that breed in wood are curative of all kinds of ulcers: reduced to ashes, with an equal quantity of anise, and applied with oil, they heal cancerous sores. Earthworms are so remarkably healing for wounds recently inflicted, that it is a very general belief that by the end of seven days they will unite sinews even that have been cut as under: hence it is that it is recommended to keep them preserved in honey. Ashes of burnt earth-worms, in combination with tar or Simblan honey, cauterize the indurated margins of ulcerous sores. Some persons dry earthworms in the sun, and apply them to wounds with vinegar, the application not being removed till the end of a couple of days. The earth also that adheres to snails is useful, similarly employed; snails, too, taken whole from the shell, are pounded and applied to fresh wounds, to heal them, and they arrest the progress of cancerous sores.

There is an insect called "herpes" by the Greeks, which is particularly useful for the cure of all kinds of serpiginous sores. Snails, beaten up, shells and all, are very good for this purpose; and it is said that, with myrrh and frankincense, they will unite the sinews even when cut asunder. The fat, too, of a dragon, dried in the sun, is remarkably usefull, and so are the brains of a cock or capon for recent wounds. By taking with the food salt in which vipers

have been preserved, ulcers are rendered more easy of treatment, it is said, and are made to heal all the sooner. Antonius the physician, after operating in vain upon ulcers, that were incurable with the knife, used to prescribe viper's flesh to be eaten by the patient, whereby a marvellously speedy cure was effected.

The locust called "troxallis," reduced to ashes and applied with honey, removes the indurated margins of ulcerous sores: ashes, also, of burnt pigeons' dung, with arsenic and honey, are very effectual in all cases where a cautery is required. The brains of a horned owl, applied with goose-grease, are marvellously efficacious for uniting wounds, it is said. For the malignant ulcer known as "cacoëthes," the ashes of a ram's thigh-bones are used, mixed with woman's milk, the sores being washed with linen cloths well rinsed. For the same purpose, the bird known as the screech-owl is boiled in oil, ewe-milk butter and honey being added to the preparation, when properly dissolved. An application of bees that have died in the honey, acts emolliently upon the indurated margins of ulcerous sores; and for the cure of elephantiasis, the blood and ashes of a weasel are employed. Wounds and weals produced by blows are effaced by an application of sheep-skins fresh from the body.

Detailed table of contents

CHAP. 40.

REMEDIES FOR BROKEN BONES.

For fractures of the joints, ashes of sheep's thigh-bones are particularly useful, applied in combination with wax; and the remedy is all the more efficacious, if a sheep's jaw-bones are burnt with the other ingredients, together with a deer's antler, and some wax dissolved in oil of roses. For broken bones, a dog's brains are used, spread upon a linen cloth, with wool laid upon the surface and moistened every now and then. The fractured bone will mostly unite in the course of fourteen days; and a cure equally expeditious may be effected by using the ashes of burnt field-mice, with honey, or of burnt earthworms; a substance which is extremely useful for the extraction of splintered bones.

Detailed table of contents

CHAP. 41.

APPLICATIONS FOR CICATRIZATIONS, AND FOR, THE CURE OF MORPHEW.

Cicatrizations are restored to their original colour by applying sheep's lights, those of a ram in particular; mutton-suet, mixed with nitre; the ashes of a green lizard; a snake's slough, boiled in wine; or else pigeons' dung, mixed with honey; a preparation which, in combination with wine, is good for the removal of white morpew. For the cure, also, of morpew, cantharides are used, with two-thirds of rue-leaves; a preparation which the patient must keep applied, in the sun, till the skin itches and rises in blisters; after which it must be fomented and well rubbed with oil, and the application repeated. This must be done for several days in succession, due precautions being taken that the ulcerations do not penetrate too deep.

For the cure, too, of morpew, a liniment is recommended, made of flies and root of agrimony; the white part also of poultry dung, kept in a horn box with stale oil; a bat's blood; or else the gall of a hedge-hog applied with water. Itch-scab is cured by using the brains of a horned owl, incorporated with saltpetre; but dog's blood is the best thing to keep it in check. The small, broad, snail that is found, crushed and applied topically, is an effectual cure for itching sensations.

Detailed table of contents

CHAP. 42.

METHODS OF EXTRACTING FOREIGN SUBSTANCES FROM THE BODY.

Arrows, pointed weapons, and other foreign substances that require to be extracted from the body, are removed by the application of a mouse split asunder, or of a lizard more particularly, similarly divided, or else the head only of the animal, pounded with salt. The snails, too, that are found in clusters upon leaves, are pounded and applied with their shells on; as also those that are used as food, the shells being first removed, applied with hare's rennet in particular. The bones of a snake, applied with the rennet of any four-footed animal, will produce a similar effect before the end of two days: cantharides, also, bruised applied with barley-meal, are highly extolled.

Detailed table of contents

CHAP. 43. (14.)

REMEDIES FOR FEMALE COMPLAINTS.

For diseases incident to females, a ewe's placenta is very useful, as already mentioned by us, when speaking of goats: sheep's dung, too, is equally good. A fumigation of burnt locusts, applied to the lower parts, affords relief to strangury, in females more particularly. It; immediately after conception, a woman eats a cock's testes every now and then, the child of which she is pregnant will become a male, it is said. The ashes of a burnt porcupinel taken in drink, are a preventive of abortion: bitches' milk facilitates delivery: and the after-birth of a bitch, provided it has not touched the ground, will act as an expellent of the fœtus. Milk, taken as a drink, strengthens the loins of women when in travail. Mouse-dung, diluted with rain water, reduces the breasts of females, when swollen after delivery. The ashes of a burnt hedgehog, applied with oil, act as a preventive of abortion. Delivery is facilitated, in cases where the patient has taken, either goose-dung in two cyathi of water, or the liquid that escapes from the uterus of a weasel by its genitals.

Earth-worms, applied topically, effectually prevent pains in the sinews of the neck and shoulders; taken in raisin wine, they expel the after-birth, when retarded. Applied by themselves, earthworms ripen abscesses of the breasts, open them, draw the humours, and make them cicatrize: taken in honied wine, they promote the secretion of the milk. In hay-grass there are small worms found, which, attached to the neck, act as a preventive of premature delivery; they are removed, however, at the moment of childbirth, as otherwise they would have the effect of impeding delivery; care must be taken, also, not to put them on the ground. To promote conception, five or seven of them are administered in drink. Snails, taken with the food, accelerate delivery; and, applied with saffron, they promote conception. Used in the form of a liniment, with amyllum and gum tragacanth, they arrest uterine discharges. Taken with the food, they promote menstruation; and, mixed with deer's marrow, in the proportion of one denarius and the same quantity of cyprus to each snail, they reduce the uterus when displaced. Taken from the shell, and beaten up with oil of roses, they dispel inflations of the uterus; the snails of *Astypalæa* being those that are mostly chosen for these purposes.

Those of Africa, again, are employed in a different manner, two of them being beaten up with a pinch of fenulgreek in three fingers, and four spoonfuls of honey, and the preparation applied to the abdomen, after it has been rubbed with juice of iris. There is a kind of small, white, elongated snail, that is found straying here and there: dried upon tiles in the sun, and reduced to powder, these snails are mixed with bean-meal, in equal proportions, forming a cosmetic which whitens and softens the skin. The small, broad, kind of snail, mixed with polenta, is good for the removal of a tendency to scratch and rub

the skin.

If a pregnant woman steps over a viper, she will be sure to miscarry; the same, too, in the case of the anphisbæna, but only when it is dead. If, however, a woman carries about her a live amphlisbæna in a box, she may step over one with impunity, even though it be dead. An amphisbæna, preserved for the purpose, will ensure an easy delivery, even though it be dead. It is a truly marvellous fact, but if a pregnant woman steps over one of these serpents that has not been preserved, it will be perfectly harmless, provided she immediately steps over another that has been preserved. A fumigation made with a dried snake, acts powerfully as an emmenagogue.

[Detailed table of contents](#)

CHAP. 44.

METHODS OF FACILITATING DELIVERY.

The cast-off slough of a snake, attached to the loins, facilitates delivery: care must be taken, however, to remove it immediately after. It is administered, too, in wine, mixed with frankincense: taken in any other form, it is productive of abortion. A staff, by the aid of which a person has parted a frog from a snake, will accelerate parturition. Ashes of the troxallis, applied with honey, act as an emmenagogue; the same, too, with the spider that descends as it spins its thread from aloft; it must be taken, however, in the hollow of the hand, crushed, and applied accordingly: if, on the contrary, the spider is taken while ascending, it will arrest menstruation.

The stone aëtites, that is found in the eagle's nest, preserves the fœtus against all insidious attempts at producing abortion. A vulture's feather, placed beneath the feet of the woman, accelerates parturition. It is a well-known fact, that pregnant women must be on their guard against ravens' eggs, for if a female in that state should happen to step over one, she will be sure to miscarry by the mouth. A hawk's dung, taken in honied: wine, would appear to render females fruitful. Goose-grease, or that of the swan, acts emolliently upon indurations and abscesses of the uterus.

Detailed table of contents

CHAP. 45.

METHODS OF PRESERVING THE BREASTS FROM INJURY.

Goose-grease, mixed up with oil of roses and a spider, protects the breasts after delivery. The people of Phrygia and Lycaonia have made the discovery, that the grease of the otis is good for affections of the breasts, resulting from recent delivery: for females affected with suffocations of the uterus, they employ a liniment made of beetles. The shells of partridges' eggs, burnt to ashes and mixed with cadmia and wax, preserve the firmness of the breasts. It is generally thought, that if the egg of a partridge or * * * * is passed three times round a woman's breasts, they will never become flaccid; and that, if these eggs are swallowed, they will be productive of fruitfulness, and promote the plentiful secretion of the milk. It is believed, too, that by anointing a woman's breasts with goose-grease, pains therein may be allayed; that moles formed in the uterus may be dispersed thereby; and that itch of the uterus may be dispelled by the application of a liniment made of crushed bugs.

Detailed table of contents

CHAP. 46.

VARIOUS KINDS OF DEPILATORIES.

Bats' blood has all the virtues of a depilatory: but if applied to the cheeks of youths, it will not be found sufficiently efficacious, unless it is immediately followed up by an application of verdigrease or hemlock-seed; this method having the effect of entirely removing the hair, or at least reducing it to the state of a fine down. It is generally thought, too, that bats' brains are productive of a similar effect; there being two kinds of these brains, the red and the white. Some persons mix with the brains the blood and liver of the same animal: others, again, boil down a viper in three semisextarii of oil, and, after boning it, use it as a depilatory, first pulling out the hairs that are wanted not to grow. The gall of a hedgehog is a depilatory, more particularly if mixed with bats' brains and goats' milk: the ashes, too, of a burnt hedgehog are used for a similar purpose. If, after plucking out the hairs that are wanted not to grow, or if, before they make their appearance, the parts are well rubbed with the milk of a bitch with her first litter, no hairs will grow there. The same result is ensured, it is said, by using the blood of a tick taken from off a dog, or else the blood or gall of a swallow.

(15.) Ants' eggs, they say, beaten up with flies, impart a black colour to the eyebrows. If it is considered desirable that the colour of the infant's eyes should be black, the pregnant woman must eat a rat. Ashes of burnt earthworms, applied with oil, prevent the hair from turning white.

Detailed table of contents

CHAP. 47.

REMEDIES FOR THE DISEASES OF INFANTS.

For infants that are troubled with coagulation of the milk, a grand preservative is lamb's rennet, taken in water; and in cases where the milk has so coagulated, it may be remedied by administering rennet in vinegar. For the pains incident to dentition, sheep's brains are a very useful remedy. The inflammation called "siriasis," to which infants are liable, is cured by attaching to them the bones that are found in the dung of dogs. Hernia in infants is cured by letting a green lizard bite the child's body while asleep, after which the lizard is attached to a reed, and hung up in the smoke; by the time the animal dies, the child will be perfectly cured, it is said. The slime of snails, applied to the eyes of children, straightens the eyelashes, and makes them grow. Ashes of burnt snails, applied with frankincense and juice of white grapes, are a cure for hernia [in infants], if applied for thirty days consecutively. Within the horns of snails, there are certain hard substances found, like grits of sand: attached to infants, they facilitate dentition.

Ashes of empty snail-shells, mixed with wax, are a preventive of procidence of the rectum; but they must be used in combination with the matter that exudes from a viper's brains, on the head being pricked. Vipers' brains, attached to the infant's body in a piece of skin, facilitate dentition, a similar effect being produced by using the larger teeth of serpents. Ravens' dung, attached to an infant with wool, is curative of cough.

It is hardly possible to preserve one's seriousness in describing some of these remedies, but as they have been transmitted to us, I must not pass them in silence. For the treatment of hernia in infants, a lizard is recommended; but it must be a male lizard, a thing that may be ascertained by its having but one orifice beneath the tail. The method of proceeding, is for the lizard to bite the part affected through cloth of gold, cloth of silver, and cloth dyed purple; after which it is tied fast in a cup that has never been used, and smoked. Incontinence of urine in infants is checked by giving them boiled mice with their food. The large indented horns of the scarabmus, attached to the bodies of infants, have all the virtues of an amulet. In the head of the boa; there is a small stone, they say, which the serpent spits out, when it is in fear of death: if the reptile is taken by surprise, and the head cut off, and this stone extracted, it will aid dentition to a marvellous degree, attached to the neck of infants. The brains, too, of the same serpent are recommended to be attached to the body for a similar purpose, as also the small stone or bone that is found in the back of the slug.

An admirable promoter of dentition is found in sheep's brains, applied to the gums; and equally good for diseases of the ears, is an application of goose-grease, with juice of ocimum. Upon prickly plants there is found a kind

of rough, hairy, grub: attached to the neck of infants, these insects give instant relief, it is said, when any of the food has stuck in the throat.

Detailed table of contents

CHAP. 48.

PROVOCATIYES OF SLEEP.

As a soporific, wool-grease is employed, diluted in two cyathi of wine with a modicum of myrrh, or else mixed with goose-grease and myrtle wine. For a similar purpose also, a cuckoo is attached to the body in a hare's skin, or a young heron's bill to the forehead in an ass's skin: it is thought, too, that the beak alone, steeped in wine, is equally efficacious. On the other hand, a bat's head, dried and worn as an amulet, acts as a preventive of sleep.

Detailed table of contents

CHAP. 49.

APHRODISIACS AND ANTAPHRODISIACS.

A lizard drowned in a man's urine has the effect of an antaphrodisiac upon the person whose urine it is; for this animal is to be reckoned among the philtres, the magicians say. The same property is attributed to the excrements of snails, and to pigeons' dung, taken with oil and wine. The right lobe of a vulture's lungs, attached to the body in the skin of a crane, acts powerfully as a stimulant upon males: an effect equally produced by taking the yolks of five pigeons' eggs, in honey, mixed with one denarius of hog's lard; sparrows, or eggs of sparrows, with the food; or by wearing the right testicle of a cock, attached to the body in a ram's skin. The ashes of a burnt ibis, it is said, employed as a friction with goose-grease and oil of iris, will prevent abortion when a female has once, conceived; while the testes of a game-cock, on the other hand, rubbed with goose-grease and attached to the body in a ram's skin, have all the effect of an antaphrodisiac: the same, too, with the testes of any kind of dunghill cock, placed, together with the blood of a cock, beneath the bed. Hairs taken from the tail of a she-mule while being covered by the stallion, will make a woman conceive, against her will even, if knotted together at the moment of the sexual congress. If a man makes water upon a dog's urine, he will become disinclined to copulation, they say.

A singular thing, too, is what is told about the ashes of a spotted lizard — if indeed it is true — to the effect that, wrapped in linen and held in the left hand, they act as an aphrodisiac, while, on the contrary, if they are transferred to the right, they will take effect as an antaphrodisiac. A bat's blood, too, they say, received on a flock of wool and placed beneath a woman's head, will promote sexual desire; the same being the case also with a goose's tongue, taken with the food or drink.

Detailed table of contents

CHAP. 50.

REMEDIES FOR PHTHIRIASIS, AND FOR VARIOUS OTHER AFFECTIONS.

In phthiriasis, all the vermin upon the body may be killed in the course of three days, by taking the cast-off slough of a serpent, in drink, or else whey of milk after the cheese is removed, with a little salt, Cheese, it is said, will never become rotten with age or be touched by mice, if a weasel's brains have been mixed with the rennet. It is asserted, too, that if the ashes, of a burnt weasel are mixed with the cramming for chickens or young pigeons, they will be safe from the attacks of weasels. Beasts of burden, when troubled with pains in staling, find immediate relief, if a bat is attached to the body; and they are effectually cured of bots by passing a ring-dove three times round their generative parts — a truly marvellous thing to relate, the ring-dove, on being set at liberty, dies, and the beast is instantly relieved from pain.

Detailed table of contents

CHAP. 51.

REMEDIES FOR INTOXICATION.

The eggs of an owlet, administered to drunkards three days in wine, are productive of a distaste for that liquor. A sheep's lights roasted, eaten before drinking, act as a preventive of inebriety. The ashes of a swallow's beak, bruised with myrrh and sprinkled in the wine, act as a preservative against intoxication: Horus, king of Assyria, was the first to discover this.

Detailed table of contents

CHAP. 52.

PECULIARITIES RELATIVE TO CERTAIN ANIMALS.

In addition to these, there are some other peculiar properties attributed to certain animals, which require to be mentioned in the present Book. Some authors state that there is a bird in Sardinia, resembling the crane and called the “gromphena;” but it is no longer known even by the people of that country, in my opinion. In the same province, too, there is the ophion, an animal which resembles the deer in the hair only, and to be found nowhere else. The same authors have spoken also of the “subjugus,” but have omitted to state what animal it is, or where it is to be found. That it did formerly exist, however, I have no doubt, as certain remedies are described as being derived from it. M. Cicero speaks of animals called “biuri,” which gnaw the vines in Campania.

Detailed table of contents

CHAP. 53. (16.)

OTHER MARVELLOUS FACTS CONNECTED WITH ANIMALS.

There are still some other marvellous facts related, with reference to the animals which we have mentioned. A dog will not bark at a person who has any part of the secundines of a bitch about him, or a hare's dung or fur. The kind of gnats called "muliones," do not live more than a single day. Persons when taking honey from the hives, will never be touched by the bees if they carry the beak of a wood-pecker about them. Swine will be sure to follow the person who has given them a raven's brains, made up into a bolus. The dust in which a she-mule has wallowed, sprinkled upon the body, will allay the flames of desire. Rats may be put to flight by castrating a male rat, and setting it at liberty. If a snake's slough is beaten up with some spelt, salt, and wild thyme, and introduced into the throat of oxen, with wine, at the time that grapes are ripening, they will be in perfect health for a whole year to come: the same, too, if three young swallows are given to them, made up into three boluses. The dust gathered from the track of a snake, sprinkled among bees, will make them return to the hive. If the right testicle of a ram is tied up, he will generate females only. Persons who have about them the sinews taken from the wings or legs of a crane, will never be fatigued with any kind of laborious exertion. Mules will never kick when they have drunk wine.

Of all known substances, it is a mule's hoofs only that are not corroded by the poisonous waters of the fountain Styx: a memorable discovery made by Aristotle, to his great infamy, on the occasion when Antipater sent some of this water to Alexander the Great, for the purpose of poisoning him.

We will now pass on to the aquatic productions.

SUMMARY. — Remedies, narratives, and observations, eight hundred and fifty-four.

ROMAN AUTHORS QUOTED. — M. Varro, Nigidius, M. Cicero, Sextius Niger who wrote in Greek, Licinius Macer.

FOREIGN AUTHORS QUOTED. — Eudoxus, Aristotle, Hermippus, Homer, Apion, Orpheus, Democritus, Anaxilais.

MEDICAL AUTHORS QUOTED. — Botrys, Horus, Apollodorus, Menander, Archidemus, Aristogenes, Xenocrates, Diodorus, Chrysippus, Nicander, Apollonius of Pitanaë.

Detailed table of contents

BOOK XXXI. REMEDIES DERIVED FROM THE AQUATIC PRODUCTION

Detailed table of contents

CHAP. 1. (1.)

REMARKABLE FACTS CONNECTED WITH WATER.

WE have now to speak of the benefits derived, in a medicinal point of view, from the aquatic productions; for not here even has all-bounteous Nature reposed from her work. Amid waves and billows, and tides of rivers for ever on the ebb and flow, she still unceasingly exerts her powers; and nowhere, if we must confess the truth, does she display herself in greater might, for it is this among the elements that holds sway over all the rest. It is water that swallows up dry land, that extinguishes flame, that ascends aloft, and challenges possession of the very heavens: it is water that, spreading clouds as it does, far and wide, intercepts the vital air we breathe; and, through their collision, gives rise to thunders and lightnings, as the elements of the universe meet in conflict.

What can there be more marvellous than waters suspended aloft in the heavens? And yet, as though it were not enough to reach so high an elevation as this, they sweep along with them whole shoals of fishes, and often stones as well, thus lading themselves with ponderous masses which belong to other elements, and bearing them on high. Falling upon the earth, these waters become the prime cause of all that is there produced; a truly wondrous provision of Nature, if we only consider, that in order to give birth to grain and life to trees and to shrubs, water must first leave the earth for the heavens, and thence bring down to vegetation the breath of life! The admission must be surely extorted from us, that for all our resources the earth is indebted to the bounteousness of water. It will be only proper, therefore, in the first place to set forth some instances of the powerful properties displayed by this element; for as to the whole of them, what living mortal could describe them?

Detailed table of contents

CHAP. 2. (2.)

THE DIFFERENT PROPERTIES OF WATERS.

On all sides, and in a thousand countries, there are waters bounteously springing forth from the earth, some of them cold, some hot, and some possessed of these properties united: those in the territory of the Tarbelli, for instance, a people of Aquitania, and those among the Pyrenœan Mountains, where hot and cold springs are separated by only the very smallest distance. Then, again, there are others that are tepid only, or lukewarm, announcing thereby the resources they afford for the treatment of diseases, and bursting forth, for the benefit of man alone, out of so many animated beings.

Under various names, too, they augment the number of the divinities, and give birth to cities; Puteoli, for example, in Campania, Statyellæ in Liguria, and Sextiæ in the province of Gallia Narbonensis. But nowhere do they abound in greater number, or offer a greater variety of medicinal properties than in the Gulf of Baiæ; some being impregnated with sulphur, some with alum, some with salt, some with nitre, and some with bitumen, while others are of a mixed quality, partly acid and partly salt. In other cases, again, it is by their vapours that waters are so beneficial to man, being so intensely hot as to heat our baths even, and to make cold water boil in our sitting-baths; such, for instance, as the springs at Baiæ, now known as “Posidian,” after the name of a freedman of the Emperor Claudius; waters which are so hot as to cook articles of food even. There are others, too, — those, for example, formerly the property of Licinius Crassus — which send forth their vapours in the sea even, thus providing resources for the health of man in the very midst of the waves!

Detailed table of contents

CHAP. 3.

REMEDIES DERIVED FROM WATER.

According to their respective kinds, these waters are beneficial for diseases of the sinews, feet, or hips, for sprains or for fractures; they act, also, as purgatives upon the bowels, heal wounds, and are singularly useful for affections of the head and ears: indeed, the waters of Cicero are good for the eyes. The country-seat where these last are found is worthy of some further mention: travelling from Lake Avernus towards Puteoli, it is to be seen on the sea-shore, renowned for its fine portico and its grove. Cicero gave it the name of Academia, after the place so called at Athens: it was here that he composed those treatises of his that were called after it; it was here, too, that he raised those monuments to himself; as though, indeed, he had not already done so throughout the length and breadth of the known world.

Shortly after the death of Cicero, and when it had come into the possession of Antistius Vetus, certain hot springs burst forth at the very portals of this house, which were found to be remarkably beneficial for diseases of the eyes, and have been celebrated in verse by Laurea Tullius, one of the freedmen of Cicero; a fact which proves to demonstration that his servants even had received inspiration from that majestic and all-powerful genius of his. I will give the lines, as they deserve to be read, not there only, but everywhere:

Great prince of Roman eloquence, thy grove,
Where erst thou bad'st it rise, is verdant now;
Thy villa, from fair Academia nam'd,
From Vetus now its finish'd graces takes.
Here, too, fair streams burst forth, unknown before,
Which with their spray the languid eyes relieve.
The land, I ween, these bounteous springs reveal'd,
To honour Cicero, its ancient lord.
Throughout the world his works by eyes are scann'd;
May eyes unnumber'd by these streams be heal'd.

CHAP. 4.

WATERS PRODUCTIVE OF FECUNDITY. WATERS CURATIVE OF INSANITY.

In Campania, too, are the waters of Sinuessa, remedial, it is said, for sterility in females, and curative of insanity in men.

[Detailed table of contents](#)

CHAP. 5.

WATERS REMEDIAL FOR URINARY CALCULI.

The waters of the island of Ænaria are curative of urinary calculi, it is said; and the same is the case with the cold spring of Acidula, four miles distant from Teanum Sidicinum, the waters at Stabiæ, known as the Dimidiæ, and those in the territory of Venafrum, which take their rise in the spring of Acidula. Patients suffering from these complaints may be cured also by drinking the waters of Lake Velia; the same effects being produced by those of a spring in Syria, near Mount Taurus, M. Varro says, and by those of the river Gallus in Phrygia, as we learn from Callimachus. In taking the waters, however, of this last, the greatest moderation is necessary, as they are apt to cause delirium; an effect equally produced, Ctesias tells us, by the waters of the Red Fountain in Æthiopia.

Detailed table of contents

CHAP. 6.

WATERS CURATIVE OF WOUNDS.

The tepid waters of Albula, near Rome, have a healing effect upon wounds. Those of Cutilia, again, in the Sabine territory, are intensely cold, and by a kind of suction penetrate the body to such a degree as to have the effect of a mordent almost. They are remarkably beneficial for affections of the stomach, sinews, and all parts of the body, in fact.

Detailed table of contents

CHAP. 7.

WATERS PREVENTIVE OF ABORTION.

The waters of Thespiæ ensure conception to females; the same, too, with those of the river Elatus in Arcadia. The spring Linus, also in Arcadia, acts as a preservative of the fœtus, and effectually prevents abortion. The waters of the river Aphrodisius, on the other hand, in the territory of Pyrrhsæa, are productive of sterility.

Detailed table of contents

CHAP. 8.

WATERS WHICH REMOVE MORPHEW.

The waters of Lake Alphius remove white morpew, Varro tells us; who also mentions the fact that one Titius, a personage who had held the prætorship, had a face to all appearance like that of a marble statue, in consequence of this disease. The waters of the river Cydnus, in Cilicia, are curative of gout, as would appear from a letter addressed by Cassius of Parma to Marcus Antonius. At Trœzen, on the contrary, all the inhabitants are subject to diseases of the feet, owing to the bad quality of the water there. The state of the Tungri, in Gaul, has a spring of great renown, which sparkles as it bursts forth with bubbles innumerable, and has a certain ferruginous taste, only to be perceived after it has been drunk. This water is strongly purgative, is curative of tertian fevers, and disperses urinary calculi: upon the application of fire it assumes a turbid appearance, and finally turns red. The springs of Leucogæa, between Puteoli and Neapolis, are curative of eye diseases and of wounds. Cicero, in his work entitled “Admiranda,” has remarked that it is only by the waters of the marshes of Reate that the hoofs of beasts of burden are hardened.

Detailed table of contents

CHAP. 9.

WATERS WITCH COLOUR THE HAIR.

Eudicus informs us that in Hestiæotis there are two springs; one of which, Ceronia, renders sheep black that drink of it, while the other, called Neleus, turns them white: if, again, a sheep should happen to drink their waters mixed, its fleece will be mottled. According to Theophrastus, the water of the Crathis, a river of Thurii, makes sheep and cattle white, while that of the river Sybaris turns them black.

[Detailed table of contents](#)

CHAP. 10.

WATERS WHICH COLOUR THE HUMAN BODY.

And not only this, but human beings even, Theophrastus tells us, are sensible of this difference: for persons who drink the water of the Sybaris, he says, become more swarthy and more hardy, the hair inclining to curl: while those, again, who drink of the Crathis become fair and more soft-skinned, with the hair growing straight and long. So, too, in Macedonia, persons who wish the produce to be white, drive their cattle to the river Haliacmon, while those who desire a black or tawny colour, take them to water at the Axios. Upon the same authority, too, we learn that in certain localities, as in the country of the Messapii, for instance, all the productions, the cereals even, grow of a tawny colour; and that at Lusi, in Arcadia, there is a certain fountain in which land-mice live and dwell. The river Aleos, which passes through Erythræ, promotes the growth of hair upon the body.

[Detailed table of contents](#)

CHAP. 11.

WATERS WHICH AID THE MEMORY, OR ARE PRODUCTIVE OF FORGETFULNESS.

At the Temple of the god Trophonius, in Bœotia, near the river Hercynnus, there are two fountains, one of which aids the memory, while the other is productive of forgetfulness: hence the names which they respectively bear.

Detailed table of contents

CHAP. 12.

WATERS WHICH SHARPEN OR DULL THE SENSES. WATERS WHICH IMPROVE
THE VOICE.

Near the town of Cescum, in Cilicia, runs the river Nus, the waters of which, according to Varro, sharpen the intellect; while those of a certain spring in the island of Cea dull the senses. At Zama, in Africa, there is a spring, the waters of which render the voice more musical.

[Detailed table of contents](#)

CHAP. 13.

WATERS WHICH CAUSE A DISTASTE FOR WINE. WATERS WHICH PRODUCE
INEBRIETY.

Eudoxus says that persons who drink the water of Lake Clitorius take a distaste for wine, and Theopompus asserts that the waters of the springs already named are productive of inebriety. According to Mucianus, there is a fountain at Andros, consecrated to Father Liber, from which wine flows during the seven days appointed for the yearly festival of that god, the taste of which becomes like that of water the moment it is taken out of sight of the temple.

[Detailed table of contents](#)

CHAP. 14.

WATERS WHICH SERVE AS A SUBSTITUTE FOR OIL.

Polyclitus says, that the water of the river Liparis, near Soli, in Cilicia, is used as a substitute for oil, and Theophrastus mentions a spring of that name in Æthiopia, which is possessed of similar properties. Lycus says, that at Tasitia there is a fountain of it, the water of which emits light: the same is asserted, too, of a spring at Eebatana. According to Theopompus, there is a lake at Scotussa, the waters of which heal wounds.

[Detailed table of contents](#)

CHAP. 15.

SALT AND BITTER WATERS.

Juba says, that in the country of the Troglodytæ there is a lake, called the “Lake of Insanity,” from its highly noxious properties: thrice a day it becomes salt and bitter, and then again fresh, the same taking place as many times during the night. It is full, he says, of white serpents, twenty cubits long. He mentions, also, a certain spring in Arabia, which rises from the ground with such remarkable force, as to throw back any object pressed down upon it, however weighty.

[Detailed table of contents](#)

CHAP. 16.

WATERS WHICH THROW UP STONES. WATERS WHICH CAUSE LAUGHTER AND
WEEPING. WATERS WHICH ARE SAID TO BE CURATIVE OF LOVE.

Theophrastus makes mention of the fountain of Marsyas, near the city of Cellenæ, in Phrygia, which throws up masses of stone. Not far from it are two other springs, called Clæon and Gelon by the Greeks, from the effects which they respectively produce. At Cyzicus is a fountain known as that of Cupido, the waters of which, Mucianus believes, cure those who drink thereof of love.

Detailed table of contents

CHAP. 17.

WATERS WHICH PRESERVE THEIR WARMTH FOR THREE DAYS.

At Crannon there are certain hot springs, though not at boiling heat, the water of which, mixed with wine, preserves it warm in the vessels for a period of three days. The same is the case, too, with the springs of Mattiacum in Germany, beyond the river Rhenus, the water of which retains its boiling heat three days. The margin of these springs is covered with pumice, formed by the action of the water.

[Detailed table of contents](#)

CHAP. 18.

OTHER MARVELLOUS FACTS CONNECTED WITH WATER. WATERS IN WHICH EVERYTHING WILL SINK. WATERS IN WHICH NOTHING WILL SINK.

If any of the above-mentioned facts have the appearance of being incredible to a person, I would have him know that there is no department of Nature which presents greater marvels than this, independently of the numerous peculiarities which have been already mentioned in an earlier part of this work. Ctesias informs us that, in India, there is a lake of standing water, upon which nothing will float, every object instantly sinking to the bottom. Cælius says that in the waters of Lake Avernus, in our own part of the world, the very leaves of the trees even will sink; and, according to Varro, these waters are fatal to such birds as fly towards them.

On the other hand, again, in the waters of Lake Apuscidamus, in Africa, nothing will sink; the same, too, Apion tells us, with the fountain of Plinthia in Sicily, as also a certain lake in Media, and the well of Saturn. The spring of Limyra not unfrequently makes its way through the neighbouring localities, and when it does so, is always portentous of some coming event. It is a singular thing too, that the fish always accompany its waters on these occasions; the inhabitants of the adjoining districts being in the habit of consulting them by offering them food. When the fishes seize it with avidity, the answer is supposed to be favourable; but if, on the other hand, they reject the food, by flapping it with their tails, the response is considered to be unfavourable. The river Holcas, in Bithynia, runs close to Bryazus, the name of a temple and of a divinity there worshipped; persons guilty of perjury, it is said, cannot endure contact with its waters, which burn like flame.

The sources, too, of the Tamaricus, a river of Cantabria, are considered to possess certain powers of presaging future events: they are three in number, and, separated solely by an interval of eight feet, unite in one channel, and so form a mighty stream. These springs are often dry a dozen times in the day, sometimes as many as twenty, without there being the slightest trace of water there: while, on the other hand, a spring close at hand is flowing abundantly and without intermission. It is considered an evil presage when persons who wish to see these springs find them dry: a circumstance which happened very recently, for example, to Lartius Licinius, who held the office of legatus after his prætorship; for at the end of seven days after his visit he died.

In Judæa there is a river that is dry every Sabbath day.

CHAP. 19.

DEADLY WATERS. POISONOUS FISHES.

There are other marvels again, connected with water, but of a more fatal nature. Ctesias states in his writings, that there is a spring in Armenia, the fishes in which are black, and, if used as food, productive of instantaneous death. I have heard the same, too, with reference to the waters near the sources of the river Danuvius, until a spring is reached which is near its main channel, and beyond which this poisonous kind of fish is not to be found. Hence it is that this spot is generally looked upon as the source of the river. The same, too, is reported of the Lake of the Nymphs, in Lydia. Near the river Pheneus, in Achaia, there flows from the rocks a spring known as the Styx, the waters of which, as already stated, are instantly fatal. And not only this, but there are also small fish in it, Theophrastus says, which are as deadly as the water, a thing that is not the case with the fish of any other poisonous springs. Theopompus says, that at the town of Cychri, in Thrace, the waters are deadly; and Lycus states, that at Leontium there is a spring, the waters of which are fatal at the end of a couple of days to those who drink thereof. Varro speaks also of a spring upon Mount Soracte, some four feet in breadth, the waters of which bubble forth at sunrise, as though they were boiling; birds, he says, which only taste thereof, fall dead close by.

And then, besides, we meet with this insidious circumstance, that in some cases, waters of this nature are inviting even in their appearance; those at Nonacris, in Arcadia, for example, the water of which fountain possesses no apparent quality to excite mistrust, though, owing to its intense coldness, it is generally looked upon as highly injurious, seeing that it petrifies as it flows. It is otherwise with the waters of Tempe, in Thessaly, their baneful properties inspiring universal terror, and possessing the property of corroding copper even and iron, it is said. This stream runs a short distance only, as already stated; and it is truly marvellous that, according to general report, the banks of its source are surrounded with the roots of a wild carob, always covered with purple flowers, while the margin is clothed with a green herbaceous plant of a peculiar species. In Macedonia, not far from the tomb of the Poet Euripides, is the confluence of two streams, the water of one of which is extremely wholesome, that of the other fatal.

Detailed table of contents

CHAP. 20.

WATERS WHICH PETRIFY, THEMSELVES, OR CAUSE OTHER OBJECTS TO PETRIFY.

At Perperena, there is a spring which petrifies the ground wherever it flows, the same being the case also, with the hot waters at Ædepsus, in Eubœa; for there, wherever the stream falls, the rocks are continually increasing in height. At Eury- mente, chaplets, when thrown into the waters of a certain fountain there, are turned to stone. At Colossæ there is a river, into the water of which if bricks are thrown, when taken out they are found changed into stone. In the mines of Scyros, the trees petrify that are watered by the river, branches and all. In the caverns of Mount Corycus, the drops of water that trickle down the rocks become hard in the form of a stone. At Mieza, too, in Macedonia, the water petrifies as it hangs from the vaulted roofs of the rocks; but at Corycus it is only when it has fallen that it becomes hard.

In other caverns, again, the water petrifies both ways, and so forms columns; as we find the case in a vast grotto at Phlan- sia, a town of the Chersonesus of the Rhodians, the columns of which are tinted with various colours. These instances will suffice for the present.

CHAP. 21. (3.)

THE WHOLESOMIENESS OF WATERS.

It is a subject of enquiry among medical men, which kind of water is the most beneficial. They condemn, and with justice, all stagnant, sluggish, waters, and are of opinion that running water is the best, being rendered lighter and more salubrious by its current and its continuous agitation. Hence it is that I am much surprised that persons should be found to set so high a value as they do, upon cistern water. These last give as their reason, however, that rain-water must be the lightest water of all, seeing that it has been able to rise aloft and remain suspended in the air. Hence it is, too, that they prefer snow-water to rain-water, and ice, again, to snow, as being water subtilized to the highest possible degree; on the ground that snow-water and ice-water must be lighter than ordinary water, and ice, of necessity, considerably lighter. It is for the general interest, however, of mankind, that these notions should be refuted. For, in the first place, this comparative lightness which they speak of, could hardly be ascertained in any other way than by the sensation, there being pretty nearly no difference at all in weight between the kinds of water. Nor yet, in the case of rain-water, is it any proof of its lightness that it has made its way upwards into the air, seeing that stones, it is quite evident, do the same: and then, besides, this water, while falling, must of necessity become tainted with the vapours which rise from the earth; a circumstance owing to which it is, that such numerous impurities are to be detected in rain-water, and that it ferments with such extreme rapidity.

I am, surprised, too, that snow and ice should be regarded as the most subtilized states of this element, in juxtaposition with the proofs supplied us by hail, the water of which, it is generally agreed, is the most pernicious of all to drink. And then, besides, there are not a few among the medical men themselves, who assert that the use of ice-water and snow-water is highly injurious, from the circumstance that all the more refined parts thereof have been expelled by congelation. At all events, it is a well-ascertained fact that the volume of every liquid is diminished by congelation; as also that excessive dews a reproductive of blight in corn, and that hoar-frosts result in blast; of a kindred nature, both of them, to snow. It is generally agreed, too, that rain-water putrefies with the greatest rapidity, and that it keeps but very badly on a voyage. Epigenes, however, assures us that water which has putrefied seven times and as often purified itself, will no longer be liable to putrefaction. As to cistern-water, medical men assure us that, owing to its harshness, it is bad for the bowels and throat: and it is generally admitted by them that there is no kind of water that contains more slime or more numerous insects of a disgusting nature. But it does not, therefore, follow that river water is the best of all, or that, in fact, of any running stream, the water

of many lakes being found to be wholesome in the very highest degree.

What water, then, out of all these various kinds, are we to look upon as best adapted for the human constitution? Different kinds in different localities, is my answer. The kings of Parthia drink no water but that of the Choaspes or of the Eulæus, and, however long their journies, they always have this water carried in their suite. And yet it is very evident that it is not merely because this water is river-water that it is thus pleasing to them, seeing that they decline to drink the water of the Tigris, Euphrates, and so many other streams.

[Detailed table of contents](#)

CHAP. 22.

THE IMPURITIES OF WATER.

Slime is one great impurity of water: still, however, if a river of this description is full of eels, it is generally looked upon as a proof of the salubrity of its water; just as it is regarded as a sign of its freshness when long worms breed in the water of a spring. But it is bitter water, more particularly, that is held in disesteem, as also the water which swells the stomach the moment it is drunk, a property which belongs to the water at Trøezen. As to the nitrous and salso-acid waters which are found in the deserts, persons travelling across towards the Red Sea render them potable in a couple of hours by the addition of polenta, which they use also as food. Those springs are more particularly condemned which secrete mud, or which give a bad complexion to persons who drink thereof. It is a good plan, too, to observe if water leaves stains upon copper vessels; if leguminous vegetables boil with difficulty in it; if, when gently decanted, it leaves an earthy deposit; or if, when boiled, it covers the vessel with a thick crust.

It is a fault also in water but to have any flavour not only to have a bad smell, at all, even though it be a flavour pleasant and agreeable in itself, or closely approaching, as we often find the case, the taste of milk. Water, to be truly wholesome, ought to resemble air as much as possible. There is only one spring of water in the whole universe, it is said, that has an agreeable smell, that of Chabura, namely, in Mesopotamia: the people give a fabulous reason for it, and say that it is because Juno bathed there. Speaking in general terms, water, to be wholesome, should have neither taste nor smell.

Detailed table of contents

CHAP. 23.

THE MODES OF TESTING WATER.

Some persons judge of the wholesomeness of water through the agency of a balance: their pains, however, are expended to little purpose, it being but very rarely that one water is lighter than another. There is, however, a more certain mode of ascertaining the difference in quality, that water being the better of the two which becomes hot and cold with the greatest rapidity: in addition to which, not to keep poising a balance, after water has been drawn up in vessels, if it is good, it should gradually become warmer, they say, when placed upon the ground. Which water, then, of the several kinds will be most likely to be good and wholesome? Well-water, no doubt, if we are to judge from the general use made of it in cities: but only in the case of wells in which it is kept in continual agitation by repeated drawing, and is refined by the earth acting as a filter. These conditions are sufficient to ensure salubrity in water: in regard to coolness, the well must be in a shaded spot, and the water kept exposed to the air. There is, however, one thing above all to be observed, a point, too, of considerable importance with reference to the continuance of the flow — the spring must issue from the bed of the well, and not from the sides. To make water cold to the touch may be effected artificially even, either by forcing it to rise aloft or by making it fall from a height, and so come in collision with the air, and become incorporated therewith: for in swimming, we find, when we hold our breath, the water is felt to be all the colder.

It was the Emperor Nero's invention to boil water, and then enclose it in glass vessels and cool it in snow; a method which ensures all the enjoyment of a cold beverage, without any of the inconveniences resulting from the use of snow. Indeed, it is generally admitted that all water is more wholesome when it has been boiled; as also, that water when it has once been heated, will become more intensely cold than before — a most ingenious discovery. The best corrective of unwholesome water is to boil it down to one half. Cold water, taken internally, arrests hæmorrhage. By keeping cold water in his mouth, a person may render himself proof against the intense heat of the bath. Many a person knows by his own every-day experience, that water which is the coldest to drink is not of necessity the coldest to the touch, this delightful property being subject to considerable fluctuations.

Detailed table of contents

CHAP. 24.

THE MARCIAN WATERS.

The most celebrated water throughout the whole world, and the one to which our city gives the palm for coolness and salubrity, is that of the Marcian Spring, accorded to Rome among the other bounties of the gods: the name formerly given to the stream was the “Aufeian,” the spring itself being known as “Pitonia.” It rises at the extremity of the mountains of the Peligni, passes through the territory of the Marsi and through Lake Fucinus, and then, without deviating, makes directly for Rome: shortly after this, it loses itself in certain caverns, and only reappears in the territory of Tibur, from which it is brought to the City by an arched aqueduct nine miles in length. Ancus Marcius, one of the Roman kings, was the first who thought of introducing this water into the City. At a later period, the works were repaired by Quintus Marcius Rex: and, more recently, in his prætorship, by M. Agrippa.

[Detailed table of contents](#)

CHAP. 25.

THE VIRGIN WATERS.

It was he, too, who brought the Virgin Waters from the bye-road situate at the eighth milestone from the City, which runs for two miles along the Prænestine Way. Near these waters is the stream of Hercules, which the former shun, to all appearance, and have thence obtained the name of “Virgin Waters.” On instituting a comparison between the waters of these streams, the difference above-mentioned may be immediately detected, the Virgin water being as much cooler to the touch, as the Marcian water is in taste. And yet, for this long time past, the pleasure of drinking these waters has been lost to the City, owing to the ambition and avarice of certain persons who have turned them out of their course for the supply of their country-seats and of various places in the suburbs, to the great detriment of the public health.

Detailed table of contents

CHAP. 26.

TE METHOD OF SEARCHING FOR WATER.

It will not be out of place to append here an account of the method employed in searching for water. Water is mostly to be found in valleys, whether formed by the intersection of declivities or lying at the lower part of mountains. Many persons have been of opinion that all places with a northern aspect are naturally provided with water: a point upon which it will not be amiss to explain the diversities presented to us by Nature. On the south side of the mountains of Hyrcania it never rains; and hence it is that it is only on the northeast side that they are wooded. As for Olympus, Ossa, Parnassus, the Apennines, and the Alps, they are covered with wood on every side, and abundantly watered with streams. Some mountains, again, are wooded on the south side, the White Mountains in Crete, for example. On this point, therefore, we may come to the conclusion that there is no rule which in all cases holds good.

Detailed table of contents

CHAP. 27.

SIGNS INDICATIVE OF THE PRESENCE OF WATER.

The following are indications of the presence of water: — rushes, reeds, the plant mentioned with reference to this point already, or frogs sitting squatted on a spot for a long time together. As to the wild willow, alder, vitex, reed, and ivy, all of which grow spontaneously on low grounds in which there is a settling of rain water from higher localities, considered as indications of the presence of water, they are all of them of a deceptive nature. A sign much more to be depended upon, is a certain misty exhalation, visible from a distance before sunrise. The better to observe this, some persons ascend an eminence, and lie flat at full length upon the ground, with the chin touching the earth. There is also another peculiar method of judging upon this point, known only to men of experience in these matters: in the very middle of the heats of summer they select the hottest hours of the day, and observe how the sun's rays are reflected in each spot; and if, notwithstanding the general dryness of the earth, a locality is observed to present a moist appearance, they make no doubt of finding water there.

But so intense is the stress upon the eyes in doing this, that it is very apt to make them ache; to avoid which inconvenience, they have recourse to other modes of testing. They dig a hole, for instance, some five feet in depth, and cover it with vessels of unbaked pottery, or with a copper basin well-oiled; they then place a burning lamp on the spot, with an arch-work over it of leaves, and covered with earth on the top. If, after a time, they find the pots wet or broken, the copper covered with moisture, or the lamp extinguished, but not from want of oil, or if a lock of wool that has been left there is found to be moist, it is a sign of the presence of water, beyond all doubt. With some persons it is the practice to light a fire on the spot before they dig the hole, a method which renders the experiment with the vessels still more conclusive.

Detailed table of contents

CHAP. 28.

DIFFERENCES IN WATERS, ACCORDING TO THE NATURE OF THE SOIL.

The soil itself, too, gives indications of the presence of water, by presenting white spots, or an uniformly green appearance: for where the stratum is black the springs are mostly not of a permanent nature. The presence of potter's clay always puts an end to all hopes of finding water, and the excavation is immediately abandoned; an eye being carefully kept to the strata of the earth, to see whether, beginning with black mould, it successively presents the appearances above-mentioned. The water is always fresh that is found in argillaceous soils, but in a stratum of tufa it is colder than elsewhere; this, indeed, being a soil which is highly approved of, as having a tendency to make the water pure and extremely light to the stomach, and, by its action as a filter, to withhold all impurities. The presence of sand gives indications of springs of but limited extent, and of water impregnated with slime; while that of gravel announces the presence of water of excellent flavour, but not to be depended upon for permanence. Male: sand, fine sea-sand, and charcoal earth, yield a constant supply of water of a highly wholesome quality; but it is the presence of red stones that is the most to be depended upon, and the water found there is of the very finest quality. Craggy localities at the foot of mountains, and silicious soils, are equally good; in addition to which, the water found there is cooler than elsewhere.

In boring for water, the soil should always become more and more humid, and, the deeper the descent, with the greater facility the implements should penetrate. In deep-sunk wells, the presence of sulphureous or aluminous substances is fatal to the sinkers; a danger that may be guarded against by letting down a lighted lamp, and ascertaining whether the flame is extinguished. When such is found to be the case, it is the practice to sink vent-holes on each side of the well, both right and left, in order to receive and carry off the noxious exhalations. Independently of these evils, the air becomes heavier, from the great depth merely of the excavation, an inconvenience which is remedied by keeping up a continual circulation with ventilators of linen cloth. As soon as water is reached, walls are constructed at the bottom, but without cement, in order that the springs may not be intercepted.

Some waters, the sources of which do not lie on elevated ground, are coldest at the beginning of spring, being maintained by the winter rains in fact. Others, again, are coldest at the rising of the Dog-star — peculiarities, both of them, to be witnessed at Pella in Macedonia; for in front of that city there is a marsh-spring, which at the beginning of summer is cold, while in the more elevated parts of the city the water is ice-cold in the hottest days of summer. The same is the case, too, at Chios, the water-supply of the harbour and of the city occupying the same relative positions. At Athens, the water of

the Fountain Enneacrunos is colder in a cloudy summer than the well there in the garden of Jupiter; while on the other hand, this last is ice-cold during the drought of a hot summer. For the most part, however, wells are coldest about the rising of Arcturus.

(4.) The water-supply of wells never fails in summer, but in all cases it falls low during four days at the rising of the constellation above-mentioned. Throughout the whole winter, on the other hand, many wells entirely fail; as in the neighbourhood of Olynthus, for example, where the water returns in the early days of spring. In Sicily too, in the vicinity of Messina and Mylæ, the springs are entirely dry throughout the winter, while in summer they overflow and form quite a river. At Apollonia in Pontus there is to be seen, near the sea-shore, a fountain which overflows in summer only, and mostly about the rising of the Dog-star; should the summer, however, not be so hot as usual, its water is less abundant. Certain soils become drier in consequence of rain, that in the territory of Narnia for example: a fact which M. Cicero has mentioned in his “Admiranda,” with a statement that drought is there productive of mud, and rain of dust.

Detailed table of contents

CHAP. 29.

THE QUALITIES OF WATER AT THE DIFFERENT SEASONS OF THE YEAR.

Every kind of water is freshest in winter, not so fresh in summer, still less so in autumn, and least of all in times of drought. River-water, too, is by no means always the same in taste, the state of the bed over which it runs making a considerable difference. For the quality of water, in fact, depends upon the nature of the soil through which it flows, and the juices of the vegetation watered by it; hence it is that the water of the same river is found in some spots to be comparatively unwholesome. The confluents, too, of rivers, are apt to change the flavour of the water, impregnating the stream in which they are lost and absorbed; as in the case of the Borysthenes, for example. In some instances, again, the taste of river-water is changed by the fall of heavy rains. It has happened three times in the Bosphorus that there has been a fall of salt rain, a phænomenon which proved fatal to the crops. On three occasions, also, the rains have imparted a bitterness to the overflowing streams of the Nilus, which was productive of great pestilence throughout Egypt.

CHAP. 30.

HISTORICAL OBSERVATIONS UPON WATERS WHICH HAVE SUDDENLY MADE THEIR APPEARANCE OR SUDDENLY CEASED.

It frequently happens that in spots where forests have been felled, springs of water make their appearance, the supply of which was previously expended in the nutriment of the trees. This was the case upon Mount Hæmus for example, when, during the siege by Cassander, the Gauls cut down a forest for the purpose of making a rampart. Very often too, after removing the wood which has covered an elevated spot and so served to attract and consume the rains, devastating torrents are formed by the concentration of the waters. It is very important also, for the maintenance of a constant supply of water, to till the ground and keep it constantly in motion, taking care to break and loosen the callosities of the surface crust: at all events, we find it stated, that upon a city of Crete, Arcadia by name, being razed to the ground, the springs and water-courses, which before were very numerous in that locality, all at once dried up; but that, six years after, when the city was rebuilt, the water again made its appearance, just as each spot was again brought into cultivation.

(5.) Earthquakes also are apt to discover or swallow up springs of water; a thing that has happened, it is well known, on five different occasions in the vicinity of Pheneus, a town of Arcadia. So too, upon Mount Corycus, a river burst forth; after which, the soil was subjected to cultivation. These changes are very surprising where there is no apparent cause for them; such as the occurrence at Magnesia, for instance, where the warm waters became cold, but without losing their brackish flavour; and at the Temple of Neptune in Caria, where the water of the river, from being fresh, became salt. Here, too, is another fact, replete with the marvellous — the fountain of Arethusa at Syracuse has a smell of dung, they say, during the celebration of the games at Olympia, a thing that is rendered not improbable by the circumstance, that the river Alpheus makes its way to that island beneath the bed of the sea. There is a spring in the Chersonesus of the Rhodians which discharges its accumulated impurities every nine years.

Waters, too, sometimes change their colour; as at Babylon, for example, where the water of a certain lake for eleven days in summer is red. In the summer season, too, the current of the Borysthenes is blue, it is said, and this, although its waters are the most rarefied in existence, and hence float upon the surface of those of the Hypanis; — though at the same time there is this marvellous fact, that when south winds prevail, the waters of the Hypanis assume the upper place. Another proof, too, of the surpassing lightness of the water of the Borysthenes, is the fact that it emits no exhalations, nor, indeed, the slightest vapour even. Authors that would have the credit of diligent research in these enquiries, assure us that water becomes heavier after the winter-solstice.

Detailed table of contents

CHAP. 31. (6.)

THE METHOD OF CONVEYING WATER.

The most convenient method of making a watercourse from the spring is by employing earthen pipes, two fingers in thickness, inserted in one another at the points of junction — the one that has the higher inclination fitting into the lower one — and coated with quick-lime macerated in oil. The inclination, to ensure the free flow of the water, ought to be at least one-fourth of an inch to every hundred feet; and if the water is conveyed through a subterraneous passage, there should be air-holes let in at intervals of every two actus. Where the water is wanted to ascend aloft, it should be conveyed in pipes of lead: water, it should be remembered, always rises to the level of its source. If, again, it is conveyed from a considerable distance, it should be made to rise and fall every now and then, so as not to lose its motive power. The proper length for each leaden pipe is ten feet; and if the pipe is five fingers in circumference its weight should be sixty pounds; if eight feet, one hundred; if ten, one hundred and twenty; and so on in the same proportion.

A pipe is called “a ten-finger” pipe when the sheet of metal is ten fingers in breadth before it is rolled up; a sheet one half that breadth giving a pipe “of five fingers.” In all sudden changes of inclination in elevated localities, pipes of five fingers should be employed, in order to break the impetuosity of the fall: reservoirs, too, for branches should be made as circumstances may demand.

CHAP. 32

HOW MINERAL WATERS SHOULD BE USED.

I am surprised that Homer has made no mention of hot springs, when, on the other hand, he has so frequently introduced the mention of warm baths: a circumstance from which we may safely conclude that recourse was not had in his time to mineral waters for their medicinal properties, a thing so universally the case at the present day. Waters impregnated with sulphur are good for the sinews, and aluminous waters are useful for paralysis and similar relaxations of the system. Those, again, which are impregnated with bitumen or nitre, the waters of Cutilia, for example, are drunk as a purgative.

Many persons quite pride themselves on enduring the heat of mineral waters for many hours together; a most pernicious practice, however, as they should be used but very little longer than the ordinary bath, after which the bather should be shampooed with cold water, and not leave the bath without being rubbed with oil. This last operation, however, is commonly regarded as altogether foreign to the use of mineral baths; and hence it is, that there is no situation in which men's bodies are more exposed to the chances of disease, the head becoming saturated with the intensity of the odours exhaled, and left exposed, perspiring as it is, to the coldness of the atmosphere, while all the rest of the body is immersed in the water.

There is another mistake, also, of a similar description, made by those who pride themselves upon drinking enormous quantities of these waters; and I myself have seen persons, before now, so swollen with drinking it that the very rings on their fingers were entirely concealed by the skin, owing to their inability to discharge the vast quantities of water which they had swallowed. It is for this reason, too, that these waters should never be drunk without taking a taste of salt every now and then. The very mud, too, of mineral springs may be employed to good purpose; but, to be effectual, after being applied to the body, it must be left to dry in the sun.

It must not be supposed, however, that all hot waters are of necessity medicated, those of Segesta in Sicily, for example, of Larissa, Troas, Magnesia, Melos, and Lipara. Nor is the very general supposition a correct one, that waters, to be medicinal, must of necessity discolour copper or silver; no such effect being produced by those of Patavium, or there being the slightest difference perceptible in the smell.

CHAP. 33.

THE USES OF SEA-WATER. THE ADVANTAGES OF A SEA-VOYAGE.

Sea-water also is employed in a similar manner for the cure of diseases. It is used, made hot, for the cure of pains in the sinews, for reuniting fractured bones, and for its desiccative action upon the body: for which last purpose, it is also used cold. There are numerous other medicinal resources derived from the sea; the benefit of a sea-voyage, more particularly, in cases of phthisis, as already mentioned, and where patients are suffering from hæmoptosis, as lately experienced, in our own memory, by Annæus Gallio, at the close of his consulship: for it is not for the purpose of visiting the country, that people so often travel to Egypt, but in order to secure the beneficial results arising from a long sea-voyage. Indeed, the very sea-sickness that is caused by the rocking of the vessel to and fro, is good for many affections of the head, eyes, and chest, all those cases, in fact, in which the patient is recommended to drink an infusion of hellebore. Medical men consider sea-water, employed by itself, highly efficacious for the dispersion of tumours, and, boiled with barley-meal, for the successful treatment of imposthumes of the parotid glands: it is used also as an ingredient in plasters, white plasters more particularly, and for emollient poultices. Sea-water is very good, too, employed as a shower-bath; and it is taken internally, though not without injury to the stomach, both as a purgative and as an expellent, by vomit and by alvine evacuation, of black bile or coagulated blood, as the case may be.

Some authorities prescribe it, taken internally, for quartan fevers, as also for tenesmus and diseases of the joints; purposes for which it is kept a considerable time, to mellow with age, and so lose its noxious properties. Some, again, are for boiling it, but in all cases it is recommended to be taken from out at sea, and untainted with the mixture of fresh water, an emetic also being taken before using it. When used in this manner, vinegar or wine is generally mixed with the water. Those who give it unmixed, recommend radishes with oxymel to be eaten upon it, in order to provoke vomiting. Sea-water, made hot, is used also as an injection; and there is nothing in existence preferred to it as a fomentation for swellings of the testes, or for chilblains before they ulcerate. It is similarly employed, also, for the cure of prurigo, itch-scab, and lichens. Lice and other foul vermin of the head, are removed by the application of sea-water, and lividities of the skin are restored to their natural colour; it being a remarkably good plan, in such cases, after applying the sea-water, to foment the parts with hot vinegar.

It is generally considered, too, that sea-water is highly efficacious for the stings of venomous insects, those of the phalangium and scorpion, for example, and as an antidote to the poisonous secretions of the asp, known as the "ptyas;" in all which cases it is employed hot. Fumigations are also made

of it, with vinegar, for the cure of head-ache; and, used warm as at injection, it allays griping pains in the bowels and cholera. Things that have been heated in sea-water are longer than ordinary in cooling. A sea-water bath is an excellent corrective for swelling of the bosoms in females, affections of the thoracic organs, and emaciation of the body. The steam also of sea-water boiled with vinegar, is used for the removal of hardness of hearing and head-ache. An application of sea-water very expeditiously removes rust upon iron; it is curative also of scab in sheep, and imparts additional softness to the wool.

Detailed table of contents

CHAP. 34.

HOW ARTIFICIAL SEA-WATER MAY BE MADE IN PLACES AT A DISTANCE FROM THE SEA.

I am by no means unaware that these details may very possibly appear superfluous to persons who live at a distance from the sea; but scientific research has made provision against this objection, by discovering a method of enabling every one to make sea-water for himself. It is a singular fact in connexion with this discovery, that if more than one sextarius of salt is put into four sextarii of water, the liquefying properties of the water will be overpowered, and the salt will no longer melt. On the other hand, again, a mixture of one sextarius of salt with four sextarii of water, acts as a good substitute for the efficacy and properties of the very saltiest sea-water. The most reasonable proportion, however, is generally thought to be eight cyathi of salt, diluted in the quantity of water above mentioned; a preparation which has been found to have a warming effect upon the sinews, without in any degree chafing the body.

Detailed table of contents

CHAP. 35.

HOW THALASSOMELI IS MADE.

There is also a composition made to ripen for use, known as “thalassomeli,” and prepared with equal parts of sea-water, honey, and rain-water. For this purpose, also, the water is brought from out at sea, and the preparation is kept in an earthen vessel well pitched. It acts most efficiently as a purgative, and without in the least fatiguing the stomach; the taste, too, and smell of it, are very agreeable.

Detailed table of contents

CHAP. 36.

How HYDROMELI IS MADE.

Hydromeli, also, was a mixture formerly made with pure rain-water and honey, and was prescribed for patients who, were anxious for wine, as being a more harmless drink. For these many years past, however, it has been condemned, as having in reality all the inconveniences of wine, without the advantages.

CHAP. 37.

METHODS OF PROVIDING AGAINST THE INCONVENIENCE OF DRINKING SUSPECTED WATER.

As persons out at sea often suffer great inconvenience from the want of fresh water, we will here describe some methods of obviating it. Fleeces are spread round the ship, and on becoming moistened with the exhalations arising from the sea, the water is wrung from them, and found to be quite fresh. Hollow balls of wax, also, or empty vessels sealed at the mouth, upon being let down into the sea in a net, become filled with water that is fresh and potable. On shore, too, sea-water may be made fresh, by filtering it through argillaceous earth.

By swimming in water of any kind, sprains of the limbs in man or beast are reduced with the greatest facility. Persons when travelling, are sometimes apprehensive that the use of water, the quality of which is unknown to them, may prove injurious to their health: as a precaution against this, they should drink the suspected water cold, immediately after leaving the bath.

CHAP. 38.

SIX REMEDIES DERIVED FROM MOSS. REMEDIES DERIVED FROM SAND.

Moss which has grown in water is excellent as a topical application for gout; and, in combination with oil, it is good for pains and swellings in the ankles. The foam that floats upon the surface of the water, used as a friction, causes warts to disappear. The sand, too, of the sea-shore, that more particularly which is very fine and burnt white by the heat of the sun, is used remedially for its desiccative properties, the bodies of dropsical or rheumatic patients being entirely covered with it.

Thus much with reference to water itself; we will now turn to the aquatic productions, beginning, as in all other instances, with the principal of them, namely, salt and sponge.

Detailed table of contents

CHAP. 39. (7.)

THE VARIOUS KINDS OF SALT; THE METHODS OF PREPARING IT, AND THE
REMEDIES DERIVED FROM IT. TWO HUNDRED AND FOUR OBSERVATIONS
THERE UPON.

All salt is either native or artificial; both kinds being formed in various ways, but produced from one of these two causes, the condensation or the desiccation, of a liquid. The Lake of Tarentum is dried up by the heat of the summer sun, and the whole of its waters, which are at no time very deep, not higher than the knee in fact, are changed into once mass of salt. The same, too, with a lake in Sicily, Cocanicus by name, and another in the vicinity of Gela. But in the case of these two last, it is only the sides that are thus dried up: whereas in Phrygia, in Cappadocia, and at Aspendus, where the same phænomena are observable, the water is dried up to a much larger extent, to the very middle of the lake, in fact. There is also another marvellous circumstance connected with this last — however much salt is taken out of it in the day, its place is supplied again during the night. Every kind of lake- salt is found in grains, and not in the form of blocks.

Sea-water, again, spontaneously produces another kind of salt, from the foam which it leaves on shore at high-water n-ark, or adhering to rocks; this being, in all cases, condensed by the action of the sun, and that salt being the most pun- gent of the two which is found upon the rocks.

There are also three different kinds of native salt. In Bac- triana there are two vast lakes; one of them situate on the side of Scythia, the other on that of Ariana, both of which throw up vast quantities of salt. So, too, at Citium, in Cyprus; and, in the vicinity of Memphis, they extract salt from the lake and dry it in the sun. The surface-waters of some rivers, also, condense in the form of salt, the rest of the stream flowing beneath, as though under a crust of ice; such as the running waters near the Caspian Gates for instance, which are known as the “Rivers of Salt.” The same is the case, too, in the vicinity of the Mardi and of the people of Armenia. In Bactriana, also, the rivers Ochus and Oxus carry down from the mountains on their banks, fragments of salt. There are also in Africa some lakes, the waters of which are turbid, that are productive of salt. Some hot springs, too, produce salt-those at Pagasæ for example. Such, then, are the various kinds of salt produced spontaneously by water.

There are certain mountains, also, formed of native salt; that of Oromenus, in India, for example, where it is cut out like blocks from a quarry, and is continually reproduced, bringing in a larger revenue to the sovereigns of those countries than that arising from their gold and pearls. In some instances it is dug out of the earth, being formed there, evidently, by the condensation of the moisture, as in Cappadocia for example, where it is cut in sheets, like those of mirror-stone. The blocks of it are very heavy, the name commonly given to

them being "mica." At Gerrhæ, a city of Arabia, the ramparts and houses are constructed of blocks of salt, which are soldered together by being moistened with water. King Ptolemæus discovered salt also in the vicinity of Pelusium, when he encamped there; a circumstance which induced other persons to seek and discover it in the scorched tracts that lie between Egypt and Arabia, beneath the sand. In the same manner, too, it has been found in the thirsting deserts of Africa, as far as the oracle of Hammon, a locality in which the salt increases at night with the increase of the moon.

The districts of Cyrenaica are ennobled, too, by the production of ammoniacum, a salt so called from the fact of its being found beneath the sands there. It is similar in colour to the alum known as "schiston," and consists of long pieces, by no means transparent, and of an unpleasant flavour, but highly useful in medicine; that being held in the highest esteem, which is the clearest and divides into straight flakes. There is one remarkable fact mentioned in connexion with it: so long as it lies under ground in its bed it is extremely light, but the moment it is exposed to the light, it is hardly credible to what an extent its weight is increased. The reason for this is evident: the humid vapours of the excavations bear the masses upwards, as water does, and so aid the workmen. It is adulterated with the Sicilian salt which we have mentioned as being found in Lake Cocanicus, as also with that of Cyprus, which is marvellously like it. At Egelasta, in Nearer Spain, there is a salt, hewn from the bed in almost transparent blocks, and to which for this long time past most medical men, it is said, have given the preference over all other salt. Every spot in which salt is found is naturally barren, and produces nothing. Such are the particulars, in general, which have been ascertained with reference to native salt.

Of artificial salt there are several kinds; the common salt, and the most abundant, being made from sea-water drained into salt-pans, and accompanied with streams of fresh water; but it is rain more particularly, and, above all things, the sun, that aids in its formation; indeed without this last it would never dry. In the neighbourhood of Utica, in Africa, they build up masses of salt, like hills in appearance; and when these have been hardened by the action of the sun and moon, no moisture will ever melt them, and iron can hardly divide them. In Crete, however, salt is made without the aid of fresh water, and merely by introducing sea-water into the salt-pans. On the shores of Egypt, salt is formed by the overflow of the sea upon the land, already prepared for its reception, in my opinion, by the emanations of the river Nilus. It is made here, also, from the water of certain wells, discharged into salt-pans. At Babylon, the result of the first condensation is a bituminous liquid, like oil, which is used for burning in lamps; when this is skimmed off, the salt is found beneath. In Cappadocia, also, both well and spring-water are introduced into the salt-pans. In Chaonia there is a spring, from the water of which, when boiled and left to cool, there is an inert salt obtained, not so white as ordinary salt. In the Gallic provinces and in Germany, it is the

practice to pour salt-water upon burning wood.

Detailed table of contents

CHAP. 40.

MURIA.

In one part of Spain, they draw a brine for this purpose from deep — sunk pits, to which they give the name of “muria;” being of opinion, also, that it makes a considerable difference upon what kind of wood it is poured. That of the quercus they look upon as the best, as the ashes of it, unmixed, have the pungency of salt. In other places, again, the wood of the hazel is held in high esteem; and thus, we see, by pouring brine upon it, charcoal even is converted into salt. All salt that is thus prepared with burning wood is black. I find it stated by Theophrastus, that the Umbri are in the habit of boiling ashes of reeds and bulrushes in water, till there remains but little moisture unconsumed. The brine, too, of salted provisions is sometimes boiled over again, and, as soon as all the moisture has evaporated, the salt resumes its original form. That prepared from the pickle of the mæna has the finest flavour.

[Detailed table of contents](#)

CHAP. 41.

THE VARIOUS PROPERTIES OF SALT: ONE HUNDRED AND TWENTY HISTORICAL REMARKS RELATIVE THERETO.

Of the various kinds of sea-salt, the most esteemed is that of Salamis, in Cyprus; and of the lake-salts, that of Tarentum, and the salt known as Tattæan salt, which comes from Phrygia: these last two are also good for the eyes. That of Capadocia, which is imported in small cubes, imparts a fine colour, it is said, to the skin; but, for effacing wrinkles, that which we have already spoken of as the salt of Citium is the best: hence it is that, in combination with gith, it is used by females as a liniment for the abdomen after childbirth. The drier the salt, the stronger it is in taste; but the most agreeable of all, and the whitest known, is that of Tarentum. In addition to these particulars, we would remark also, that the whiter salt is, the more friable it is. Rain-water deadens every kind of salt, but dew-water makes it more delicate in flavour. North-easterly winds render the formation of salt more abundant, but, while south winds prevail, it never increases. It is only while north-easterly winds prevail, that flower of salt is formed. Neither the salt of Trgasa, nor the Acanthian salt — so called from the town where it is found — will decrepitate or crackle in the fire; nor will the froth of salt do so, or the outside scrapings, or refined salt. The salt of Agrigentum resists fire, but decrepitates in water.

There are differences, too, in the colour of salt: at Memphis it is deep red, russet-coloured in the vicinity of the Oxus, purple at Centuripa, and so remarkably bright at Gela, situate also in Sicily, as to reflect the image of objects. In Cappadocia there is a saffron-coloured fossil salt, transparent and remarkably odoriferous. For medicinal purposes, the ancients esteemed the salt of Tarentum in particular, and next to that all the marine salts, those collected from sea-foam more especially. For maladies of the eyes in cattle and beasts of burden, the salt of Tragasa and that of Bætica are employed. For made dishes and ordinary food, the more easily a salt liquefies and the moister it is, the more highly it is esteemed; there being less bitterness in salt of this description, that of Attica and of Eubœa, for example. For keeping meat, a pungent, dry, salt, like that of Megara, is best. A conserve of salt is also made, with the addition of various odoriferous substances, which answers all the purpose of a choice sauce, sharpening the appetite, and imparting a relish to all kinds of food: indeed, among the innumerable condiments which we use, the flavour of salt is always distinctly perceptible; and when we take garum with our food, it is its salt flavour that is considered so exquisite. And not only this, but sheep even, cattle, and beasts of burden, are induced to graze all the better by giving them salt; it having the effect, also, of considerably augmenting the milk, and imparting a superior flavour to the cheese.

We may conclude, then, by Hercules! that the higher enjoyments of life could not exist without the use of salt: indeed, so highly necessary is this

substance to mankind, that the pleasures of the mind, even, can be expressed by no better term than the word “salt,” such being the name given to all effusions of wit. All the amenities, in fact, of life, supreme hilarity, and relaxation from toil, can find no word in our language to characterize them better than this. Even in the very honours, too, that are bestowed upon successful warfare, salt plays its part, and from it, our word “salarium” is derived. That salt was held in high esteem by the ancients, is evident from the Salarian Way, so named from the fact that, by agreement, the Sabini carried all their salt by that road. King Ancus Martius gave six hundred modii of salt as a largess to the people, and was the first to establish salt-works. Varro also informs us, that the ancients used salt by way of a relishing sauce; and we know, from an old proverb, that it was the practice with them to eat salt with their bread. But it is in our sacred rites more particularly, that its high importance is to be recognized, no offering ever being made unaccompanied by the salted cake.

Detailed table of contents

CHAP. 42.

FLOWER OF SALT: TWENTY REMEDIES. SALSUGO: TWO REMEDIES.

That which mainly distinguishes the produce of salt-works, in respect of its purity, is a sort of efflorescence, which forms the lightest and whitest part of salt. The name “flower of salt” is given, also, to a substance of an entirely different character, more humid by nature, and of a red or saffron colour; a kind of “rust of salt,” as it were, with an unpleasant smell like that of garum, and differing therein not only from froth of salt, but from salt itself. This substance is found in Egypt, and, as it would appear, is conveyed thither by the waters of the Nilus; though it is to be found floating upon the surface of certain springs as well. The best kind is that which yields a certain fatty substance, like oil — for salt even, a thing that is quite marvellous to think of, is not without a degree of unctuousness.

This substance is sophisticated, and coloured with red earth, or, in most instances, with powdered potsherds; an adulteration to be detected by the agency of water, which washes off the fictitious colour, the natural colour being only removable by the agency of oil. Indeed, it is for its colour that perfumers more particularly make such extensive use of this drug. When seen in the vessels, the surface of it is white, but that which lies in the middle is moister, as already stated. It is of an acrid nature, calorific, and bad for the stomach. It acts also as a sudorific, and, taken with wine and water, has a purgative effect upon the bowels. It is very useful, also, as an ingredient in acopa and in deterative compositions, and is remarkably efficacious for the removal of hairs from the eye-lids. It is the practice to shake up the sediment, in order to renovate the saffron colour of the drug.

In addition to these substances, there is another, known in the salt-works by the name of “salsugo,” or “salsilago:” it is quite liquid, salter in taste than sea-water, but inferior to it in its properties.

Detailed table of contents

CHAP. 43.

GARUM: FIFTEEN REMEDIES.

Another liquid, too, of a very exquisite nature, is that known as “garuim:” it is prepared from the intestines of fish and various parts which would otherwise be thrown away, macerated in salt; so that it is, in fact, the result of their putrefaction. Garum was formerly prepared from a fish, called “garos” by the Greeks; who assert, also, that a fumigation made with its head has the effect of bringing away the afterbirth.

(8.) At the present day, however, the most esteemed kind of garum is that prepared from the scomber, in the fisheries of Carthago Spartaria: it is known as “garumn of the allies,” and for a couple of congii we have to pay but little less than one thousand sesterces. Indeed, there is no liquid hardly, with the exception of the unguents, that has sold at higher prices of late; so much so, that the nations which produce it have become quite ennobled thereby. There are fisheries, too, of the scomber on the coasts of Mauretania and at Carteia in Bætica, near the Straits which lie at the entrance to the Ocean; this being the only use that is made of the fish. For the production of garum, Clazomenæ is also famed, Pompeii, too, and Leptis; while for their muria, Antipolis, Thurii, and of late, Dalmatia, enjoy a high reputation.

Detailed table of contents

CHAP. 44.

ALEX: EIGHT REMEDIES.

Alex, which is the refuse of garum, properly consists of the dregs of it, when imperfectly strained: but of late they have begun to prepare it separately, from a small fish that is otherwise good for nothing, the apua of the Latins, or aphua of the Greeks, so called from the fact of its being engendered from rain. The people of Forum Julii make their garum from a fish to which they give the name of “lupus.” In process of time, alex has become quite an object of luxury, and the various kinds that are now made are infinite in number. The same, too, with garum, which is now prepared in imitation of the colour of old honied wine, and so pleasantly flavoured as to admit of being taken as a drink. Another kind, again, is dedicated to those superstitious observances which enjoin strict chastity, and that prepared from fish without scales, to the sacred rites of the Jews. In the same way, too, alex has come to be manufactured from oysters, sea-urchins, sea-nettles, cammari, and the liver of the surmullet; and a thousand different methods have been devised of late for ensuring the putrefaction of salt in such a way as to secure the flavours most relished by the palate.

Thus much, by the way, with reference to the tastes of the present day; though at the same time, it must be remembered, these substances are by no means without their uses in medicine. Alex, for instance, is curative of scab in sheep, incisions being made in the skin, and the liquor poured therein. It is useful, also, for the cure of wounds inflicted by dogs or by the sea-dragon, the application being made with lint. Recent burns, too, are healed by the agency of garum, due care being taken to apply it without mentioning it by name. It is useful, too, for bites inflicted by dogs, and for that of the crocodile in particular; as also for the treatment of serpiginous or sordid ulcers. For ulcerations, and painful affections of the mouth and ears, it is a marvellously useful remedy.

Muria, also, as well as the salsugo which we have mentioned, has certain astringent, mordent, and discussive properties, and is highly useful for the cure of dysentery, even when ulceration has attacked the intestines. Injections are also made of it for sciatica, and for cœliac fluxes of an inveterate nature. In spots which lie at a distance in the interior, it is used as a fo- mentation, by way of substitute for sea-water.

CHAP. 45. (9.)

THE NATURE OF SALT.

Salt, regarded by itself, is naturally igneous, and yet it manifests an antipathy to fire, and flies from it. It consumers everything, and yet upon living bodies it has an astringent, desiccative, and binding effect, while the dead it preserves from putrefaction, and makes them last for ages even. In respect, however, of its medicinal properties, it is of a mordent, burning, detergent, attenuating, and resolvent nature; it is, however, injurious to the stomach, except that it acts as a stimulant to the appetite. For the cure of injuries inflicted by serpents, it is used with origanum, honey, and hyssop; and for the sting of the cerastes, with origanum, cedar-resin, pitch, or honey. Taken internally with vinegar, it is good for injuries caused by the scolopendra; and, applied topically, with an equal proportion of linseed, in oil or vinegar, for stings inflicted by scorpions. For stings of hornets, wasps, and insects of a similar description, it is applied with vinegar; and, for the cure of hemicrania, ulcers on the head, blisters, pimples, and incipient warts, with veal-suet. It is used also among the remedies for the eyes, and for the removal of fleshy exrescences upon those organs, as also of hangnails upon the fingers or toes. For webs that form upon the eyes it is peculiarly useful, and hence it is that it is so commonly employed as an ingredient in eye-salves, as well as plasters. For all these last-mentioned purposes, the salt of Tatta or of Caunus is more particularly in request.

In cases where there is ecchymosis of the eyes, or a bruise from the effects of a blow, salt is applied, with an equal quantity of myrrh and honey, or with hyssop in warm water, the eyes being also fomented with salsugo. For this last-mentioned purpose, the Spanish salt is preferred; and when wanted for the treatment of cataract, it is ground upon small whet-stones, with milk. For bruises it is particularly useful, wrapped in a linen pledget and renewed from time to time, being first dipped in boiling water. For the cure of running ulcers of the mouth, it is applied with lint; gum-boils are also rubbed with it; and, broken to pieces and powdered fine, it removes granulations on the tongue. The teeth, it is said, will never become carious or corroded, if a person every morning puts some salt beneath his tongue, fasting, and leaves it there till it has melted. Salt effects the cure also of leprosy, boils, lichens, and itch-scabs; for all which purposes it is applied with raisins — the stones being first removed — beef-suet, origanum, and leaven, or else bread. In such cases it is the salt from Thebaïs that is mostly used; the same salt being considered preferable for the treatment of prurigo, and being highly esteemed for affections of the uvula and tonsillary glands, in combination with honey.

Every kind of salt is useful for the cure of quinzey; but, in addition to this, it is necessary to make external applications simultaneously with oil, vinegar,

and tar. Mixed with wine, it is a gentle aperient to the bowels, and, taken in a similar manner, it acts as an expellent of all kinds of intestinal worms. Placed beneath the tongue, it enables convalescents to support the heat of the bath. Burnt more than once upon a plate at a white heat, and then enclosed in a bag, it alleviates pains in the sinews, about the shoulders and kidneys more particularly. Taken internally, and similarly burnt at a white heat and applied in bags, it is curative of colic, griping pains in the bowels, and sciatica. Beaten up in wine and honey, with meal, it is a remedy for gout; a malady for the especial behoof of which the observation should be borne in mind, that there is nothing better for all parts of the body than sun and salt: hence it is that we see the bodies of fishermen as hard as horn — gout, however, is the principal disease for the benefit of which this maxim should be remembered.

Salt is useful for the removal of corns upon the feet, and of chilblains: for the cure of burns also, it is applied with oil, or else chewed. It acts as a check also upon blisters, and, in cases of erysipelas and seriginous ulcers, it is applied topically with vinegar or with hyssop. For the cure of carcinoma it is employed in combination with Taminian grapes; and for phagedænic ulcers it is used parched with barley-meal, a linen pledget steeped in wine being laid upon it. In cases of jaundice, it is employed as a friction before the fire, with oil and vinegar, till the patient is made to perspire, for the purpose of preventing the itching sensations attendant upon that disease. When persons are exhausted with fatigue, it is usual to rub them with salt and oil. Many have treated dropsy with salt, have used external applications of salt and oil for the burning heats of fever, and have cured chronic coughs by laying salt upon the patient's tongue. Salt has been used, also, as an injection for sciatica, and has been applied to ulcers of a fungous or putrid nature.

To bites inflicted by the crocodile, salt is applied, the sores being tightly bandaged with linen cloths, first dipped in vinegar. It is taken internally, with hydromel, to neutralize the effects of opium, and is applied topically, with meal and honey, to sprains and fleshy excrescences. In cases of toothache, it is used as a collutory with vinegar, and is very useful, applied externally, with resin. For all these purposes, however, froth of salt is found to be more agreeable and still more efficacious. Still, however, every kind of salt is good as an ingredient in acopa, when warming properties are required: the same, too, in the case of detersive applications, when required for plumping out and giving a smooth surface to the skin. Employed topically, salt is curative of itch-scab in sheep and cattle, for which disease it is given them to lick. It is injected, also, with the spittle, into the eyes of beasts of burden. Thus much with reference to salt.

CHAP. 46. (10.)

THE VARIOUS KINDS OF NITRUM, THE METHODS OF PREPARING IT, AND THE
REMEDIES DERIVED FROM IT: TWO HUNDRED AND TWENTY-ONE
OBSERVATIONS THEREON.

And here we must no longer defer giving an account of nitrum; which in its properties does not greatly differ from salt, and deserves all the more to be attentively considered, from the evident fact that the medical men who have written upon it were ignorant of its nature; of all which authors Theophrastus is the one that has given the greatest attention to the point. It is found in small quantities in Media, in certain valleys there that are white with heat and drought; the name given to it being "halmyrax." In Thracia, too, near Philipli, it is found, but in smaller quantities, and deteriorated with earthy substances, being known there as "agrimon." As to that prepared from the burnt wood of the quercus, it never was made to any very great extent, and the manufacture of it has been long since totally abandoned. Nitrous waters are also found in numerous places, but not sufficiently impregnated to admit of condensation.

The best and most abundant supply is found at Litæ, in Macedonia, where it is known as "Chalasticum:" it is white and pure, and closely resembles salt. In the middle of a certain nitrous lake there, a spring of fresh water issues forth. In this lake the nitrum forms for nine days, about the rising of the Dog-star, and then ceases for the same period, after which it again floats upon the surface, and then again ceases: facts which abundantly prove that it is the peculiar nature of the soil which generates the nitrum, it being very evident that, when the formation is there interrupted, neither the heat of the sun nor the fall of rain is productive of the slightest effect. It is also a truly marvellous fact, that though the spring of fresh water is always uninterruptedly flowing, the waters of the lake never increase or overflow. If it happens to rain on the days during which the nitrum is forming, the result is, that it is rendered additionally salt thereby: the prevalence of northeast winds, too, still more deteriorates its quality, as they have a tendency to stir up the mud at the bottom. Such is the formation of native nitrum.

In Egypt, again, it is made artificially, and in much greater abundance, but of inferior quality, being tawny and full of stones. It is prepared in pretty nearly the same manner as salt, except that in the salt-pans it is sea-water that is introduced, whereas in the nitre-beds it is the water of the river Nilus; a water which, upon the subsidence of the river, is impregnated with nitrum for forty days together, and not, as in Macedonia, at intermittent periods only. On occasions when there has been a fall of rain, a smaller proportion of river water is employed. As soon, too, as any quantity of nitrum has formed, it is immediately removed, in order that it may not melt in the beds. This substance, also, contains a certain proportion of oil, which is very useful for the cure of scab in animals. Piled up in large heaps, it keeps for a very

considerable time. It is a marvellous fact, that, in Lake Ascanius and in certain springs in the vicinity of Chalcis, the water is fresh and potable on the surface, and nitrous below. The lightest part of nitrum is always considered the best, and hence it is that the froth of it is so much preferred. Still, however, when in an impure state, it is very useful for some purposes, colouring purple cloth, for instance, and, indeed, all kinds of dyeing. It is employed, also, very extensively in the manufacture of glass, as we shall more fully mention on the appropriate occasion.

The only nitre-works in Egypt were formerly those in the vicinity of Naucratis and Memphis; those near Memphis being inferior to the others, the piles of nitrum there prepared being as hard as stone, and many of the heaps having become changed into rocks. When in this state, vessels are made of it, and very frequently they melt it with sulphur on a charcoal fire. When substances are wanted to keep, they employ this last kind of nitrum. In Egypt there are also nitre-beds, the produce of which is red, owing to the colour of the earth in the same locality. Froth of nitrum, a substance held in very high esteem, could only be made, according to the ancients, when dews had fallen; the pits being at the moment saturated with nitrum, but not having arrived at the point of yielding it. On the other hand, again, when the pits were in fall activity, no froth would form, it was said, even though dews should fall. Others, again, have attributed the formation of this last substance to the fermentation of the heaps of nitrum. In a succeeding age, the medical men, speaking of it under the name of "aphronitrum," have stated that it was collected in Asia, where it was to be found oozing from the soft sides of certain mines — the name given to which was "colyces" — and that it was then dried in the sun. The very best is thought to be that which comes from Lydia; the test of its genuineness being its extreme lightness, its friability, and its colour, which should be almost a full purple. This last is imported in tablets, while that of Egypt comes enclosed in vessels pitched within, to prevent its melting, the vessels being previously prepared by being thoroughly dried in the sun.

To be good, nitrum should be very fine, and extremely spongy and porous. In Egypt, it is sophisticated with lime, an adulteration easily detected by tasting it; for when pure, it liquefies immediately, while that which has been adulterated, remains undissolved sufficiently long to leave a pungent taste in the mouth. It is burnt in a close earthen vessel, as otherwise it would decrepitate: except in this last case, however, the action of fire does not cause it to decrepitate. This substance neither produces nor nourishes anything; while, in the salt-pans, on the other hand, we see plants growing, and the sea, we know, produces immense numbers of animated beings, though, as to plants, sea-weed only. It is evident, too, that the acidity of nitrum must be much greater than that of salt, not only from the fact last mentioned, but from the circumstance also, that at the nitre-beds the shoes wear out with the greatest rapidity; localities which are otherwise very healthy, and remarkably

beneficial for the eye-sight. At the nitre-works ophthalmia is a thing unknown: persons, too, that come there with ulcers upon them experience a rapid cure; though ulcerations formed upon the spot are but slow in healing. Used as a friction with oil, nitrum is a sudorific, and acts emolliently upon the body. That of Chalastra is used as a substitute for salt, in making bread, and the Egyptian nitrum is eaten with radishes, it having the effect of making them more tender; though as to other edibles it turns them white and spoils them. To vegetables it imparts an additional greenness.

Viewed medicinally, nitrum is calorific, attenuant, mordent, astringent, desiccative, and ulcerating: it is good, too, in all cases where certain humours require to be drawn out or dispersed, or where gentle mordents or attenuants are required, as in the case of pustules and pimples, for example. Some persons ignite it for this purpose, and, after quenching it in astringent wine, bruise and use it, without oil, at the bath. Applied with dried iris powdered, and green olive oil, it checks immoderate perspiration. Applied topically with a fig, or boiled down to one half in raisin wine, it removes marks upon the eyes and granulations of the eyelids. It is used, also, for the removal of argema, boiled in a pomegranate rind with raisin wine. Used as an ointment, in combination with honey, it improves the eye-sight. It is very useful, also, for tooth-ache, taken as a collutory with wine and pepper, or boiled with a leek. Burnt, and employed as a dentifrice, it restores teeth to their original colour that have turned black; and an application of it, with Samian earth and oil, kills nits and other vermin of the head. Dissolved in wine, it is used as an injection for suppurations of the ears, and, applied with vinegar, it consumes filth that has accumulated there. Introduced dry into the ears, it disperses singings and tinglings in those organs. Applied topically, in the sun, with an equal quantity of Cimolian chalk dissolved in vinegar, it removes white morpew; and a mixture of it with resin, or with white raisins — the stones being beaten up as well — is an excellent cure for boils. It is useful, also, for inflammations of the testes; and, in combination with axle-grease, for pituitous eruptions on all parts of the body. For the cure of bites inflicted by dogs, it is used with resin, the application being made at first with vinegar. With lime and vinegar, it is used as a liniment for stings inflicted by serpents, as, also, for ulcerations, whether phagedenic, putrid, or serpiginous; in cases, too, of dropsy, it is employed both internally and externally, beaten up with figs. Taken internally as a decoction, in doses of one drachma, with rue, dill, or cummin, it effectually removes griping pains in the bowels. An external application of it, with oil and vinegar, is highly refreshing to persons exhausted with fatigue; and it is equally beneficial for shudderings and cold shiverings, the feet and hands of the patient being well rubbed with it, mixed with oil. It allays the itching sensations attendant upon jaundice, more particularly when it is administered to the patient while perspiring, with vinegar. Taken internally in oxycrate, it is an antidote to the poison of fungi; and, taken with water, it acts beneficially, as an emetic, in cases where the

buprestis has been swallowed.

To persons who have taken bull's blood, nitrum is administered, in combination with laser. Mixed with honey and cow's milk, it is curative of ulcers upon the face. For the cure of burns, it is applied pounded, being first parched till it turns black. For pains in the bowels and kidneys, and for rigidities of the limbs and pains in the sinews, it is used in the form of an injection. For the cure of paralysis of the tongue, it is applied to that organ with bread, and to asthmatic patients it is administered in a ptisan. Flower of nitrum, used in combination with equal proportions of galbanum and turpentine respectively, is curative of chronic coughs; the mixture being taken in pieces the size of a bean. Nitrum itself, boiled and melted with tar, is given to patients to swallow, for quinzy.

Flower of nitrum, mixed with oil of cyprus, and applied in the sun, is a soothing liniment for pains in the joints. Taken internally with wine, it is curative of jaundice. It acts as a carminative also; and it arrests bleeding at the nose, the vapour of it in boiling water being inhaled by the patient. Mixed with alum, it removes porrigo; and, used daily with water, as a fomentation,, it removes offensive odours of the armpits. Used in combination with wax, it heals ulcers produced by pituitous secretions, and, similarly employed, it is very useful for affections of the sinews. For the cure of the coeliac flux, it is used in the form of an injection. Many authorities recommend the use of it, with oil, as a friction when cold shiverings are just coming on; as also, for the removal of leprous spots and freckles. It is a good plan also, to use a sitting-bath made with an infusion of nitrum, for the cure of gout, atrophy, opisthotony, and tetanus.

Both salt and nitre, boiled with sulphur, become petrified.

CHAP. 47. (11.)

SPONGES, AND THE REMEDIES DERIVED FROM THEM: NINETY-TWO OBSERVATIONS THEREON.

We have already, when speaking of the marine productions, described the various kinds of sponge. Some authorities make the following distinctions: they regard as males those sponges which are pierced with more diminutive holes, are more compact in form and more ready to imbibe, and are stained, to satisfy luxurious tastes, in various colours, sometimes purple even: those, on the other hand, which have holes, larger and running into one another, they consider to be females. Among the male sponges, too, there is one kind, harder than the others, the name given to which is “tragi,” and the holes of which are extremely small and numerous. Sponges are made white artificially; the softest being chosen for the purpose, and after they have been steeped the whole summer through with the foam of the sea. They are then exposed to the action of the moon and hoar-frosts, being turned upside down, or, in other words, with that part upwards by which they formerly adhered to the rocks, the object being that they may become white throughout.

That sponges are animated beings, we have already stated; and not only this, but they have a coat of blood even, adhering to them. Some say that they regulate their movements by the sense of hearing, and that at the slightest noise they contract themselves, and emit an abundant moisture: when such is the case, it is said, it is impossible to tear them away from the rocks, and consequently they must be cut, an operation during which they emit a sanious secretion. Those sponges, too, are preferred to all others, which are grown on spots with a north-east aspect, the physicians assuring us that these retain the breath of life the longest of all; a circumstance which renders them additionally useful to the human body, from the union which is thereby effected of their vital principle with our own. It is for this reason, too, that they are preferred as fresh as possible, and in a moist state rather than dry. They are not so useful, however, if applied with hot water, and still less so if they are oiled, or applied to the body when just anointed. The compact sponges, it is thought, have less adhesive power than the others.

The softest kind of sponge are those employed for tents. Applied with honied wine, sponges reduce swellings of the eyes, and are extremely useful for the removal of rheum from those organs, the very finest and softest being of necessity selected for the purpose. Sponges are applied, also, with oxycrate, to defluxions of the eyes, and, with warm vinegar, for head-ache. In addition to these properties, fresh sponges are resolvent, emollient, and soothing; but when old, they lose their healing properties for wounds. They are employed, also, in medicine, for cleansing sores, and for either fomenting or cover — ing the parts fomented, till some other application is made. Applied topically, they have a healing effect upon running ulcers, and upon sores on the bodies of

aged persons. Fractures, too, and wounds are most effectually fomented with sponge; and when surgical operations are performed, it instantly absorbs the blood, so as to allow the incision to be seen. Sponges are applied, also, as a bandage, to inflamed wounds, sometimes dry, and, in some cases, moistened with vinegar, wine, or cold water. Soaked in rain-water, and applied to the incision, they prevent cuts recently inflicted from swelling. They are used as an application for such parts of the body, though apparently uninjured, as are threatened with occult humours which require to be dispersed; as also for reducing the tumours known to us as “apostemes,” the parts being first fomented with a decoction of honey. Sponges are employed, also, for affections of the joints, steeped in vinegar and salt, or in oxycrate: in cases, however, where the attack is attended with fever, water alone is used with the sponge. Soaked in salt and water, sponges are applied to callosities; and, with vinegar, they are used for stings inflicted by scorpions.

In the treatment of wounds, sponges are sometimes used as a substitute for greasy wool, either with wine and oil, or with salt and water; the only difference being, that wool acts emolliently upon sores, whereas sponge has an astringent action, and absorbs the vitiated humours. To dropsical patients, bandages of sponge are applied, either dry or steeped in warm water or oxycrate, according as there is a necessity for soothing the skin, or for covering it up and drying it. Sponges are applied, also, in all those diseases where warmth is required, being first soaked in boiling water and then squeezed out between a couple of boards. Employed in this manner, too, they are very useful for affections of the stomach and for the excessive heats attendant upon fever. Steeped in oxycrate, they are good for diseases of the spleen, and in vinegar for erysipelas; nothing, in fact, being equally efficacious. Sponge, when thus used, should ways be so applied as amply to cover the adjacent parts that are not affected.

Employed with vinegar or cold water, sponge arrests hæmorrhage; soaked in warm salt and water, and frequently renewed, it removes the lividity which results from a recent blow. Used with oxycrate, it disperses pains and swellings in the testes. To bites inflicted by dogs, it is a good plan to apply sponge, from time to time, cut fine, and moistened with vinegar, cold water, or honey. Ashes of African sponge, with juice of cut-leek and a mixture of salt and cold water, are good, taken internally, for patients suffering from discharges of blood: applied topically to the forehead, with oil or vinegar, they are curative of tertian fevers. The sponge of Africa, more particularly, soaked in oxycrate, disperses tumours. Ashes of any kind of sponge burnt with pitch, arrest the discharge of blood from wounds; though some recommend, for this purpose, the sponge with large pores only, burnt with pitch. For affections of the eyes, sponge is burnt in vessels of unbaked earthenware; the ashes being found highly efficacious for granulations of the eyelids, fleshy excrescences, and all diseases of those parts which require detergents, astringents, or expletives. For all these purposes, however, it is the best plan

first to rinse the ashes. When the body is in a diseased state, sponge acts as a substitute for body-scrapers and linen towels, and it protects the head most efficiently against the action of the sun.

Medical men, in their ignorance, comprehend all sponges under two names; African sponge, the substance of which is tougher and firmer; and Rhodian sponge, which is softer and better adapted for fomentations. At the present day, however, the softest sponges of all are those found about the walls of the city of Antiphellos. Trogus informs us that the softest tent sponges are found out at sea, off the coast of Lycia, upon spots from which the sponge has been previously removed: we learn, too, from Polybius, that these fine sponges, suspended over a patient's bed, will ensure him additional repose at right.

We will now turn to the remedies derived from the marine and aquatic animals.

SUMMARY. — Remedies, narratives, and observations, nine hundred and twenty-four.

ROMAN AUTHORS QUOTED. — M. Varro, Cassius of Parma, Cicero, Mucianus, Cælius, Celsus, Trogus, Ovid, Polybius, Sornatius.

FOREIGN AUTHORS QUOTED. — Callimachus, Ctesias, Eudicus, Theophrastus, Eudoxus, Theopompus, Polycritus, Juba, Lycus, Apion, Epigenes, Pelops, Apelles, Democritus, Thrasyllus, Nicander, Menander the Comic writer, Attalus, Sallustius Dionysius, Andreas, Niceratus, Hippocrates, Anaxilaüs.

BOOK XXXII. REMEDIES DERIVED FROM AQUATIC ANIMALS.

Detailed table of contents

CHAP. 1. (1.)

THE POWER OF NATURE AS MANIFESTED IN ANTIPATHIES. THE ECHENEÏS: TWO REMEDIES.

FOLLOWING the proper order of things, we have now arrived at the culminating point of the wonders manifested to us by the operations of Nature. And even at the very outset, we find spontaneously presented to us an incomparable illustration of her mysterious powers: so much so, in fact, that beyond it we feel ourselves bound to forbear extending our enquiries, there being nothing to be found either equal or analogous to an element in which Nature quite triumphs over herself, and that, too, in such numberless ways. For what is there more unruly than the sea, with its winds, its tornadoes, and its tempests? And yet in what department of her works has Nature been more seconded by the ingenuity of man, than in this, by his inventions of sails and of oars? In addition to this, we are struck with the ineffable might displayed by the Ocean's tides, as they constantly ebb and flow, and so regulate the currents of the sea as though they were the waters of one vast river.

And yet all these forces, though acting in unison, and impelling in the same direction, a single fish, and that of a very diminutive size — the fish known as the “echeneïs” — possesses the power of counteracting. Winds may blow and storms may rage, and yet the echeneïs controls their fury, restrains their mighty force, and bids ships stand still in their career; a result which no cables, no anchors, from their ponderousness quite incapable of being weighed, could ever have produced! A fish bridles the impetuous violence of the deep, and subdues the frantic rage of the universe — and all this by no effort of its own, no act of resistance on its part, no act at all, in fact, but that of adhering to the bark! Trifling as this object would appear, it suffices to counteract all these forces combined, and to forbid the ship to pass onward in its way! Fleets, armed for war, pile up towers and bulwarks on their decks, in order that, upon the deep even, men may fight from behind ramparts as it were. But alas for human vanity! — when their prows, beaked as they are with brass and with iron, and armed for the onset, can thus be arrested and rivetted to the spot by a little fish, no more than some half foot in length!

At the battle of Actium, it is said, a fish of this kind stopped the prætorian ship of Antonius in its course, at the moment that he was hastening from ship to ship to encourage and exhort his men, and so compelled him to leave it and go on board another. Hence it was, that the fleet of Cæsar gained the advantage in the onset, and charged with a redoubled impetuosity. In our own time, too, one of these fish arrested the ship of the Emperor Caius in its course, when he was returning from Astura to Antium: and thus, as the result proved, did an insignificant fish give presage of great events; for no sooner had the emperor returned to Rome than he was pierced by the weapons of his own soldiers. Nor did this sudden stoppage of the ship long remain a mystery,

the cause being perceived upon finding that, out of the whole fleet, the emperor's five-banked galley was the only one that was making no way. The moment this was discovered, some of the sailors plunged into the sea, and, on making search about the ship's sides, they found an echeneïs adhering to the rudder. Upon its being shown to the emperor, he strongly expressed his indignation that such an obstacle as this should have impeded his progress, and have rendered powerless the hearty endeavours of some four hundred men. One thing, too, it is well known, more particularly surprised him, how it was possible that the fish, while adhering to the ship, should arrest its progress, and yet should have no such power when brought on board.

According to the persons who examined it on that occasion, and who have seen it since, the echeneïs bears a strong resemblance to a large slug. The various opinions entertained respecting it we have already noticed, when speaking of it in the Natural History of Fishes. There is no doubt, too, that all fish of this kind are possessed of a similar power; witness, for example, the well-known instance of the shells which are still preserved and consecrated in the Temple of Venus at Cnidos, and which, we are bound to believe, once gave such striking evidence of the possession of similar properties. Some of our own authors have given this fish the Latin name of "mora." It is a singular thing, but among the Greeks we find writers who state that, worn as an amulet, the echeneïs has the property, as already mentioned, of preventing miscarriage, and of reducing procidence of the uterus, and so permitting the fœtus to reach maturity: while others, again, assert that, if it is preserved in salt and worn as an amulet, it will facilitate parturition; a fact to which it is indebted for another name which it bears, "odinolytes." Be all this as it may, considering this most remarkable fact of a ship being thus stopped in its course, who can entertain a doubt as to the possibility of any manifestation of her power by Nature, or as to the effectual operation of the remedies which she has centred in her spontaneous productions?

Detailed table of contents

CHAP. 2.

THE TORPEDO: NINE REMEDIES.

And then, besides, even if we had not this illustration by the agency of the echeneïs, would it not have been quite sufficient only to cite the instance of the torpedo, another inhabitant also of the sea, as a manifestation of the mighty powers of Nature? From a considerable distance even, and if only touched with the end of a spear or staff, this fish has the property of benumbing even the most vigorous arm, and of rivetting the feet of the runner, however swift he may be in the race. If, upon considering this fresh illustration, we find ourselves compelled to admit that there is in existence a certain power which, by the very exhalations and, as it were, emanations therefrom, is enabled to affect the members of the human body, what are we not to hope for from the remedial influences which Nature has centred in all animated beings?

Detailed table of contents

CHAP. 3.

THE SEA HARE: FIVE REMEDIES.

No less wonderful, too, are the particulars which we find stated relative to the sea-hare. Taken with the food or drink, it is a poison to some persons; while to others, again, the very sight of it is venomous. Indeed, if a woman in a state of pregnancy so much as looks upon one of these fishes, she is immediately seized with nausea and vomiting — a proof that the injury has reached the stomach — and abortion is the ultimate result. The proper preservative against these baneful effects is the male fish, which is kept dried for the purpose in salt, and worn in a bracelet upon the arm. And yet this same fish, while in the sea, is not injurious, by its contact even. The only animal that eats it without fatal consequences, is the mullet; the sole perceptible result being that its flesh is rendered more tender thereby, but deteriorated in flavour, and consequently not so highly esteemed.

Persons when poisoned by the sea-hare smell strongly of the fish — the first sign, indeed, by which the fact of their having been so poisoned is detected. Death also ensues at the end of as many days as the fish has lived: hence it is that, as Licinius Macer informs us, this is one of those poisons which have no definite time for their operation. In India, we are assured, the sea-hare is never taken alive; and, we are told that, in those parts of the world, man, in his turn, acts as a poison upon the fish, which dies instantly in the sea, if it is only touched with the human finger. There, like the rest of the animals, it attains a much larger size than it does with us.

CHAP. 4.

MARVELS OF THE RED SEA.

Juba, in those books descriptive of Arabia, which he has dedicated to Caius Cæsar, the son of Augustus, informs us that there are mussels on those coasts, the shells of which are capable of holding three semisextarii; and that, on one occasion, a whale, six hundred feet in length and three hundred and sixty feet broad, made its way up a river of Arabia, the blubber of which was bought up by the merchants there. He tells us, too, that in those parts they anoint their camels with the grease of all kinds of fish, for the purpose of keeping off the gad-flies by the smell.

Detailed table of contents

CHAP. 5. (2.)

THE INSTINCTS OF FISHES.

The statements which Ovid has made as to the instincts of fish, in the work of his known as the “Halieuticon,” appear to me truly marvellous. The scarus, for instance, when enclosed in the wicker kype, makes no effort to escape with its head, nor does it attempt to thrust its muzzle between the oziers; but turning its tail towards them, it enlarges the orifices with repeated blows therefrom, and so makes its escape backwards. Should, too, another scarus, from without, chance to see it thus struggling within the kype, it will take the tail of the other in its mouth, and so aid it in its efforts to escape. The lupus, again, when surrounded with the net, furrows the sand with its tail, and so conceals itself, until the net has passed over it. The muræna, trusting in the slippery smoothness of its rounded back, boldly faces the meshes of the net, and by repeatedly wriggling its body, makes its escape. The polyp makes for the hooks, and, without swallowing the bait, clasps it with its feelers; nor does it quit its hold until it has eaten off the bait, or perceives itself being drawn out of the water by the rod.

The mullet, too, is aware that within the bait there is a hook concealed, and is on its guard against the ambush; still however, so great is its voracity, that it beats the hook with its tail, and strikes away from it the bait. The lupus, again, shows less foresight and address, but repentance at its imprudence arms it with mighty strength; for, when caught by the hook, it flounders from side to side, and so widens the wound, till at last the insidious hook falls from its mouth. The muræna not only swallows the hook, but catches at the line with its teeth, and so gnaws it asunder. The anthias, Ovid says, the moment it finds itself caught by the hook, turns its body with its back downwards, upon which there is a sharp knife-like fin, and so cuts the line asunder.

According to Licinius Macer, the muræna is of the female sex only, and is impregnated by serpents, as already mentioned; and hence it is that the fishermen, to entice it from its retreat, and catch it, make a hissing noise in imitation of the hissing of a serpent. He states, also, that by frequently beating the water it is made to grow fat, that a blow with a stout stick will not kill it, but that a touch with a stalk of fennel- giant is instantly fatal. That in the case of this animal, the life is centred in the tail, there can be no doubt, as also that it dies immediately on that part of the body being struck; while, on the other hand, there is considerable difficulty in killing it with a blow upon the head. Persons who have come in contact with the razor-fish smell of iron. The hardest of all fishes, beyond a doubt, is that known as the “orbis:” it is spherical, destitute of scales, and all head.

CHAP. 6.

MARVELLOUS PROPERTIES BELONGING TO CERTAIN FISHES.

Trebius Niger informs us that whenever the loligo is seen darting above the surface of the water, it portends a change of weather: that the xiphias, or, in other words, the swordfish, has a sharp-pointed muzzle, with which it is able to pierce the sides of a ship and send it to the bottom: instances of which have been known near a place in Mauritania, known as Cotte, not far from the river Lixus. He says, too, that the loligo sometimes darts above the surface, in such vast numbers, as to sink the ships upon which they fall.

CHAP. 7.

PLACES WHERE FISH EAT FROM THE HAND.

At many of the country-seats belonging to the Emperor the fish eat from the hand: but the stories of this nature, told with such admiration by the ancients, bear reference to lakes formed by Nature, and not to fish-preserves; that at Elorus, a fortified place in Sicily, for instance, not far from Syracuse. In the fountain, too, of Jupiter, at Labranda, there are eels which eat from the hand, and wear ear-rings, it is said. The same, too, at Chios, near the Old Men's Temple there; and at the Fountain of Chabura in Mesopotamia, already mentioned.

[Detailed table of contents](#)

CHAP. 8.

PLACES WHERE FISH RECOGNIZE THE HUMAN VOICE. ORACULAR RESPONSES GIVEN BY FISH.

At Myra, too, in Lycia, the fish in the Fountain of Apollo, known as Surium, appear and give oracular presages, when thrice summoned by the sound of a flute. If they seize the flesh thrown to them with avidity, it is a good omen for the person who consults them; but if, on the other hand, they flap at it with their tails, it is considered an evil presage. At Hierapolis in Syria, the fish in the Lake of Venus there obey the voice of the officers of the temple: bedecked with ornaments of gold, they come at their call, fawn upon them while they are scratched, and open their mouths so wide as to admit of the insertion of the hands.

Off the Rock of Hercules, in the territory of Stabiæ in Campania, the melanuri seize with avidity bread that is thrown to them in the sea, but they will never approach any bait in which there is a hook concealed.

Detailed table of contents

CHAP. 9.

PLACES WHERE BITTER FISH ARE FOUND, SALT, OR SWEET.

Nor is it by any means the least surprising fact, that off the island of Pele, the town of Clazomenæ, the rock [of Scylla] in Sicily, and in the vicinity of Leptis in Africa, Eubœa, and Dyrrhachium, the fish are bitter. In the neighbourhood of Cephallenia, Ampelos, Paros, and the rocks of Delos, the fish are so salt by nature that they might easily be taken to have been pickled in brine. In the harbour, again, of the last-mentioned island, the fish are sweet: differences, all of them, resulting, no doubt, from the diversity of their food.

Apion says that the largest among the fishes is the seapig, known to the Lacedæmonians as the “orthagoriscos;” he states also that it grunts like a hog when taken. These accidental varieties in the natural flavour of fish — a thing that is still more surprising — may, in some cases, be owing to the nature of the locality; an apposite illustration of which is, the well-known fact that, at Beneventum in Italy, salted provisions of all kinds require to be salted over again.

WHEN SEA-FISH WERE FIRST EATEN BY THE PEOPLE OF ROME. THE
ORDINANCE OF KING NUMA AS TO FISH.

Cassius Hemina informs us that sea-fish have been in use at Rome from the time of its foundation. I will give his own words, however, upon the subject: — “Numa ordained that fish without scales should not be served up at the Festivals of the Gods; a piece of frugality, the intention of which was, that the banquets, both public and private, as well as the repasts laid before the couches of the gods, might be provided at a smaller expense than formerly: it being also his wish to preclude the risk that the caterers for the sacred banquets would spare no expense in buying provisions, and so forestall the market.”

CHAP. 11.

CORAL: FORTY-THREE REMEDIES AND OBSERVATIONS.

In the same degree that people in our part of the world set a value upon the pearls of India — a subject on which we have already spoken on the appropriate occasion at sufficient length — do the people of India prize coral: it being the prevailing taste in each nation respectively that constitutes the value of things. Coral is produced in the Red Sea also, but of a more swarthy hue than ours. It is to be found also in the Persian Gulf, where it is known by the name of “iace.” But the most highly-esteemed of all, is that produced in the vicinity of the islands called Stœchades, in the Gallic Gulf, and near the Æolian Islands and the town of Drepana in the Sea of Sicily. Coral is to be found growing, too, at Gravisçæ, and off the coast of Neapolis in Campania: as also at Erythræ, where it is intensely red, but soft, and consequently little valued.

Its form is that of a shrub, and its colour green: its berries are white and soft while under water, but the moment they are removed from it, they become hard and red, resembling the berries of cultivated cornel in size and appearance. They say that, while alive, if it is only touched by a person, it will immediately become as hard as stone; and hence it is that the greatest pains are taken to prevent this, by tearing it up from the bottom with nets, or else cutting it short with a sharp-edged instrument of iron: from which last circumstance it is generally supposed to have received its name of “curalium.” The reddest coral and the most branchy is held in the highest esteem; but, at the same time, it must not be rough or hard like stone; nor yet, on the other hand, should it be full of holes or hollow.

The berries of coral are no less esteemed by the men in India than are the pearls of that country by the females among us: their soothsayers, too, and diviners look upon coral as an amulet endowed with sacred properties, and a sure preservative against all dangers: hence it is that they equally value it as an ornament and as an object of devotion. Before it was known in what estimation coral was held by the people of India, the Gauls were in the habit of adorning their swords, shields, and helmets with it; but at the present day, owing to the value set upon it as an article of exportation, it has become so extremely rare, that it is seldom to be seen even in the regions that produce it. Branches of coral, hung at the neck of infants, are thought to act as a preservative against danger. Calcined, pulverized, and taken in water, coral gives relief to patients suffering from griping pains in the bowels, affections of the bladder, and urinary calculi. Similarly taken in wine, or, if there are symptoms of fever, in water, it acts as a soporific. It resists the action of fire a considerable time before it is calcined.

There is also a statement made that if this medicament is frequently taken

internally, the spleen will be gradually consumed. Powdered coral, too, is an excellent remedy for patients who bring up or spit blood. Calcined coral is used as an ingredient in compositions for the eyes, being productive of certain astringent and cooling effects: it makes flesh, also, in the cavities left by ulcers, and effaces scars upon the skin.

CHAP. 12.

THE ANTIPATHIES AND SYMPATHIES WHICH EXIST BETWEEN CERTAIN OBJECTS. THE HATREDS MANIFESTED BY CERTAIN AQUATIC ANIMALS. THE PASTINACA: EIGHT REMEDIES. THE GALEOS: FIFTEEN REMEDIES. THE SUR-MULLET: FIFTEEN REMEDIES.

In reference to that repugnance which exists between certain things, known to the Greeks as “antipathia,” there is nothing more venomous than the pastinaca, a sea-fish which kills trees even with its sting, as already stated. And yet, poisonous as it is, the galeos pursues it; a fish which, though it attacks other marine animals as well, manifests an enmity to the pastinaca in particular, just as on dry land the weasel does to serpents; with such avidity does it go in pursuit of what is poisonous even! Persons stung by the pastinaca find a remedy in the flesh of the galeos, as also in that of the sur-mullet and the vegetable production known as laser.

CHAP. 13. (3).

AMPHIBIOUS ANIMALS. CASTOREUM: SIXTY-SIX REMEDIES AND OBSERVATIONS.

The might of Nature, too, is equally conspicuous in the animals which live upon dry land as well; the beaver, for instance, more generally known as “castor,” and the testes of which are called in medicine “castorea.” Sextius, a most careful enquirer into the nature and history of medicinal substances, assures us that it is not the truth that this animal, when on the point of being taken, bites off its testes: he informs us, also, that these substances are small, tightly knit, and attached to the back-bone, and that it is impossible to remove them without taking the animal’s life. We learn from him that there is a mode of adulterating them by substituting the kidneys of the beaver, which are of considerable size, whereas the genuine testes are found to be extremely diminutive: in addition to which, he says that they must not be taken to be bladders, as they are two in number, a provision not to be found in any animal. Within these pouches, he says, there is a liquid found, which is preserved by being put in salt; the genuine castoreum being easily known from the false, by the fact of its being contained in two pouches, attached by a single ligament. The genuine article, he says, is sometimes fraudulently sophisticated by the admixture of gum and blood, or else hammoniacum: as the pouches, in fact, ought to be of the same colour as this last, covered with thin coats full of a liquid of the consistency of honey mixed with wax, possessed of a fetid smell, of a bitter, acrid taste, and friable to the touch.

The most efficacious castoreum is that which comes from Pontus and Galatia, the next best being the produce of Africa. When inhaled, it acts as a sternutatory. Mixed with oil of roses and peucedanum, and applied to the head, it is productive of narcotic effects — a result which is equally produced by taking it in water; for which reason it is employed in the treatment of phrenitis. Used as a fumigation, it acts as an excitant upon patients suffering from lethargy: and similarly employed, or used in the form of a suppository, it dispels hysterical suffocations. It acts also as an emmenagogue and as an expellent of the afterbirth, being taken by the patient, in doses of two drachmæ, with pennyroyal, in water. It is employed also for the cure of vertigo, opisthotony, fits of trembling, spasms, affections of the sinews, sciatica, stomachic complaints, and paralysis, the patient either being rubbed with it all over, or else taking it as an electuary, bruised and incorporated with seed of vitex, vinegar, and oil of roses, to the consistency of honey. In the last form, too, it is taken for the cure of epilepsy, and in a potion, for the purpose of dispelling flatulency and gripings in the bowels, and for counteracting the effects of poison.

When taken as a potion, the only difference is in the mode of mixing it, according to the poison that it is intended to neutralize; thus, for example,

when it is taken for the sting of the scorpion, wine is used as the medium; and when for injuries inflicted by spiders or by the phalangium, honied wine where it is intended to be brought up again, and rue where it is desirable that it should remain upon the stomach. For injuries inflicted by the chalcis, it is taken with myrtle wine; for the sting of the cerastes or prester with panax or rue in wine; and for those of other serpents, with wine only. In all these cases two drachmæ of castoreum is the proper dose, to one of the other ingredients respectively. It is particularly useful, also, in combination with vinegar, in cases where viscus has been taken internally, and, with milk or water, as a neutralizer of aconite: as an antidote to white hellebore it is taken with hydromel and nitre. It is curative, also, of tooth-ache, for which purpose it is beaten up with oil and injected into the ear, on the side affected. For the cure of ear-ache, the best plan is to mix it with meconium. Applied with Attic honey in the form of an ointment, it improves the eyesight, and taken with vinegar it arrests hiccup.

The urine, too, of the beaver, is a neutralizer of poisons, and for this reason is used as an ingredient in antidotes. The best way of keeping it, some think, is in the bladder of the animal.

Detailed table of contents

CHAP. 14. (4)

THE TORTOISE: SIXTY-SIX REMEDIES AND OBSERVATIONS.

The tortoise, too, is an animal that is equally amphibious with the beaver, and possessed of medicinal properties as strongly developed; in addition to which, it claims an equal degree of notice for the high price which luxury sets upon its shell, and the singularity of its conformation. Of tortoises, there are various kinds, land tortoises, sea tortoises, tortoises which live in muddy waters, and tortoises which live in fresh; these last being known to some Greek authors by the name of "emydes." The flesh of the land-tortoise is employed for fumigations more particularly, and we find it asserted that it is highly salutary for repelling the malpractices of magic, and for neutralizing poisons. These tortoises are found in the greatest numbers in Africa; where the head and feet being first cut off, it is said, they are given to persons by way of antidote. Eaten, too, in a broth made from them, they are thought to disperse scrofula, diminish the volume of the spleen, and effect the cure of epilepsy. The blood of the land-tortoise improves the eyesight, and removes cataract: it is kept also, made up with meal into pills, which are given with wine when necessary, to neutralize the poison of all kinds of serpents, frogs, spiders, and similar venomous animals. It is found a useful plan, too, in cases of glaucoma, to anoint the eyes with gall of tortoises, mixed with Attic honey, and, for the cure of injuries inflicted by scorpions, to drop the gall into the wound.

Ashes of tortoiseshell, kneaded up with wine and oil, are used for the cure of chaps upon the feet, and of ulcerations. The shavings of the surface of the shell, administered in drink, act as an antaphrodisiac: a thing that is the more surprising, from the fact that a powder prepared from the whole of the shell has the reputation of being a strong aphrodisiac. As to the urine of the land-tortoise, I do not think that it can be obtained otherwise than by opening it and taking out the bladder; this being one of those substances to which the adepts in magic attribute such marvellous properties. For the sting of the asp, they say, it is wonderfully effectual; and even more so, if bugs are mixed with it. The eggs of the tortoise, hardened by keeping, are applied to scrofulous sores and ulcers arising from burns or cold: they are taken also for pains in the stomach.

The flesh of the sea-tortoise, mixed with that of frogs, is an excellent remedy for injuries caused by the salamander; indeed there is nothing that is a better neutralizer of the secretions of the salamander than the sea-tortoise. The blood of this animal reproduces the hair when lost through alopecia, and is curative of porrigo and all kinds of ulcerations of the head; the proper method of using it being to let it dry, and then gently wash it off. For the cure of ear-ache, this blood is injected with woman's milk, and for epilepsy it is eaten with fine wheaten flour, three heminae of the blood being mixed with one

hemina of vinegar. It is prescribed also for the cure of asthma; but in this case in combination with one hemina of wine. Sometimes, too, it is taken by asthmatic patients, with barley-meal and vinegar, in pieces about the size of a bean; one of these pieces being taken each morning and evening at first, but after some days, two in the evening. In cases of epilepsy, the mouth of the patient is opened and this blood introduced. For spasmodic affections, when not of a violent nature, it is injected, in combination with castoreum, as a clyster. If a person rinses his teeth three times a year with blood of tortoises, he will be always exempt from tooth-ache. This blood is also a cure for asthmatic affections, and for the malady called "orthopnœa," being administered for these purposes in polenta.

The gall of the tortoise improves the eye-sight, effaces scars, and cures affections of the tonsillary glands, quinsy, and all kinds of diseases of the mouth, cancers of that part more particularly, as well as cancer of the testes. Applied to the nostrils it dispels epilepsy, and sets the patient on his feet: incorporated in vinegar with the slough of a snake, it is a sovereign remedy for purulent discharges from the ears. Some persons add ox-gall and the broth of boiled tortoise-flesh, with an equal proportion of snake's slough; but in such case, care must be taken to boil the tortoise in wine. Applied with honey, this gall is curative of all diseases of the eyes; and for the cure of cataract, gall of the sea-tortoise is used, in combination with blood of the river-tortoise and milk. The hair, too, of females, is dyed with this gall. For the cure of injuries inflicted by the salamander, it will be quite sufficient to drink the broth of boiled tortoise-flesh.

There is, again, a third kind of tortoise, which inhabits mud and swampy localities: the shell on its back is flat and broad, like that upon the breast, and the callipash is not arched and rounded, the creature being altogether of a repulsive appearance. However, there are some remedial medicaments to be derived even from this animal. Thus, for instance, three of them are thrown into a fire made with wood cuttings, and the moment their shells begin to separate they are taken off: the flesh is then removed, and boiled with a little salt, in one congius of water. When the water has boiled down to one third, the broth is used, being taken by persons apprehensive of paralysis or of diseases of the joints. The gall, too, is found very useful for carrying off pituitous humours and corrupt blood: taken in cold water, it has an astringent effect upon the bowels.

There is a fourth kind of tortoise, which frequents rivers. When used for its remedial properties, the shell of the animal is removed, and the fat separated from the flesh and beaten up with the plant aizoon, in combination with unguent and lily seed: a preparation highly effectual, it is said, for the cure of quartan fevers, the patient being rubbed with it all over, the head excepted, just before the paroxysms come on, and then well wrapped up and made to drink hot water. It is stated also, that to obtain as much fat as possible, the tortoise should be taken on the fifteenth day of the moon, the patient being

anointed on the sixteenth. The blood of this tortoise, dropt, by way of embrocation, upon the region of the brain, allays head-ache; it is curative also of scrofulous sores. Some persons recommend that the tortoise should be laid upon its back and its head cut off with a copper knife, the blood being received in a new earthen vessel; and they assure us that the blood of any kind of tortoise, when thus obtained, will be an excellent liniment for the cure of erysipelas, running ulcers upon the head, and warts. Upon the same authority, too, we are assured that the dung of any kind of tortoise is good for the removal of inflammatory tumours. Incredible also as the statement is, we find it asserted by some, that ships make way more slowly when they have the right foot of a tortoise on board.

CHAP. 15.

REMEDIES DERIVED FROM THE AQUATIC ANIMALS, CLASSIFIED ACCORDING TO THE RESPECTIVE DISEASES.

We will now proceed to classify the various remedies derived from the aquatic animals, according to the several diseases; not that we are by any means unaware that an exposition of all the properties of each animal at once, would be more to the reader's taste, and more likely to excite his admiration; but because we consider it more conducive to the practical benefit of mankind to have the various recipes thus grouped and classified; seeing that this thing may <*> good for one patient, that for another, and that some of these remedies may be more easily met with in one place and some in another.

Detailed table of contents

CHAP. 16. (5.)

REMEDIES FOR POISONS, AND FOR NOXIOUS SPELLS. THE DORADE: FOUR
REMEDIES. THE SEA-STAR: SEVEN REMEDIES.

We have already stated in what country the honey is venomous: the fish known as the dorade is an antidote to its effects. Honey, even in a pure state, is sometimes productive of surfeit, and of fits of indigestion, remarkable for their severity; the best remedy in such case, according to Pelops, is to cut off the feet, head, and tail, of a tortoise, and boil and eat the body; in place, however, of the tortoise, Apelles mentions the scincus, an animal which has been described elsewhere We have already mentioned too, on several occasions, how highly venomous is the menstruous fluid: the surmullet, as already stated, entirely neutralizes its effects. This last fish, too, either applied topically or taken as food, acts as an antidote to the venom of the pastinaca, the land and sea scorpion, the dragon, and the phalangium. The head of this fish, taken fresh and reduced to ashes, is an active neutralizer of all poisons, that of fungi more particularly.

It is asserted also, that if the fish called the sea-star is smeared with a fox's blood, and then nailed to the upper lintel of the door, or to the door itself, with a copper nail, no noxions spells will be able to obtain admittance, or, at all events, to be productive of any ill effects.

Detailed table of contents

CHAP. 17.

REMEDIES FOR THE STINGS OF SERPENTS, FOR THE BITES OF DOGS, AND FOR INJURIES INFLICTED BY VENOMOUS ANIMALS, THE SEA-DRAGON: THREE REMEDIES. TWENTY-FIVE REMEDIES DERIVED FROM SALTED FISH. THE SARDA: ONE REMEDY. ELEVEN REMEDIES DERIVED FROM CYBIUM.

Stings inflicted by the sea-dragon or by the sea-scorpion, are cured by an application of the flesh of those animals to the wound; the bites, too, of spiders are healed by the same means. In fine, as an antidote to every kind of poison, whether taken internally or acting through the agency of a sting or bite, there is considered to be nothing in existence more effectual than a decoction of the sea-dragon and sea-scorpion.

There are also certain remedies of this nature derived from preserved fish. Persons, for instance, who have received injuries from serpents, or have been bitten by other venomous animals, are recommended to eat salt fish, and to drink undiluted wine every now and then, so as, through its agency, to bring up the whole of the food again by vomit: this method being particularly good in cases where injuries have been received from the lizard called “chalcis,” the cerastes, the reptile known as the “seps,” the elops, or the dipsas. For the sting of the scorpion, salted fish should be taken in larger quantities, but not brought up again, the patient submitting to any amount of thirst it may create: salt fish, too, should be applied, by way of plaster, to the wound. For the bite of the crocodile there is no more efficient remedy known. For the sting of the serpent called “prester,” the sarda is particularly good. Salt fish is employed also as a topical application for the bite of the mad dog; and even in cases where the wound has not been cauterized with hot iron, this is found to be sufficiently effectual as a remedy. For injuries, also, inflicted by the sea-dragon, an application is made of salt fish steeped in vinegar. Cybium, too, is productive of similar effects. As a cure for the venomous sting inflicted with its stickle by the sea-dragon, the fish itself is applied topically to the wound, or else its brain, extracted whole.

Detailed table of contents

CHAP. 18.

THE SEA-FROG: SIX REMEDIES. THE RIVER-FROG: FIFTY-TWO REMEDIES. THE BRAMBLE-FROG: ONE REMEDY. THIRTY-TWO OBSERVATIONS ON THESE ANIMALS.

The broth prepared from sea-frogs, boiled in wine and vinegar, is taken internally as a neutralizer of poisons and of the venom of the bramble-frog, as also for injuries inflicted by the salamander. For the cure of injuries caused by the seahare and the various serpents above mentioned, it is a good plan to eat the flesh of river-frogs, or to drink the liquor in which they have been boiled: as a neutralizer, too, of the venom of the scorpion, river-frogs are taken in wine. Democritus assures us that if the tongue is extracted from a live frog, with no other part of the body adhering to it, and is then applied — the frog being first replaced in the water — to a woman while asleep, just at the spot where the heart is felt to palpitate, she will be sure to give a truthful answer to any question that may be put to her.

To this the Magi add some other particulars, which, if there is any truth in them, would lead us to believe that frogs ought to be considered much more useful to society than laws. They say, for instance, that if a man takes a frog and transfixes it with a reed, entering the body at the sexual parts and coming out at the mouth, and then dips the reed in the menstrual discharge of his wife, she will be sure to conceive an aversion for all paramours. That the flesh of frogs, attached to the kype or hook, as the case may be, makes a most excellent bait, for purples more particularly, is a well-known fact. Frogs, they say, have a double liver; and of this liver, when exposed to the attacks of ants, the part that is most eaten away is thought to be an effectual antidote to every kind of poison.

There are some frogs, again, which live only among brakes and thickets, for which reason they have received the name of “rubetæ,” or “bramble-frogs,” as already stated. The Greeks call them “phryni:” they are the largest in size of all the frogs, have two protuberances like horns, and are full of poison. Authors quite vie with one another in relating marvellous stories about them; such, for instance, as that if they are brought into the midst of a concourse of people, silence will instantly prevail; as also that by throwing into boiling water a small bone that is found in their right side, the vessel will immediately cool, and the water refuse to boil again until it has been removed. This bone, they say, may be found by exposing a dead bramble-frog to ants, and letting them eat away the flesh: after which the bones must be put into the vessel, one by one.

On the other hand, again, in the left side of this reptile there is another bone, they say, which, thrown into water, has all the appearance of making it boil, and the name given to which is “apocynon.” This bone, it is said, has the property of assuaging the fury of dogs, and, if put into the drink, of

conciliating love and ending discord and strife. Worn, too, as an amulet, it acts as an aphrodisiac, we are told. The bone, on the contrary, which is taken from the right side, acts powerfully as a refrigerative upon boiling liquids, it is said: attached to the patient in a piece of fresh lamb's-skin, it has the repute of assuaging quartan and other fevers, and of checking amorous propensities. The spleen of these frogs is used as an antidote to the various poisons that are prepared from them; and for all these purposes the liver is considered still more efficacious.

[Detailed table of contents](#)

CHAP. 19.

THE ENHYDRIS: SIX REMEDIES. THE RIVER-CRAB: FOURTEEN REMEDIES. THE SEA-CRAB: SEVEN REMEDIES. THE RIVER-SNAIL: SEVEN REMEDIES. THE CORACINUS: FOUR REMEDIES. THE SEA-PIG: TWO REMEDIES.

There is also a snake which lives in the water, the fat and gall of which, carried about them by persons when in pursuit of the crocodile, are said to be marvellously efficacious, the beast not venturing, in such case, to make an attack upon them. As such preservative, they are still more effectual if mixed with the herbaceous plant known as potamogiton. River-crabs, taken fresh and beaten up and drunk in water, or the ashes of them, kept for the purpose, are useful in all cases of poisoning, as a counter-poison: taken with asses' milk they are particularly serviceable as a neutralizer of the venom of the scorpion; goats' milk or any other kind of milk being substituted where asses' milk cannot be procured. Wine, too, should also be used in all such cases. River-crabs, beaten up with ocimum, and applied to scorpions, are fatal to them. They are possessed of similar virtues, also, for the bites of all other kinds of venomous animals, the scytale in particular, adders, the sea-hare, and the bramble-frog. The ashes of them, preserved, are good for persons who give symptoms of hydrophobia after being bitten by a mad dog, some adding gentian as well, and administering the mixture in wine. In cases, too, where hydrophobia has already appeared, it is recommended that these ashes should be kneaded up into boluses with wine, and swallowed. If ten of these crabs are tied together with a handful of ocimum, all the scorpions in the neighbourhood, the magicians say, will be attracted to the spot. They recommend, also, that to wounds inflicted by the scorpion, these crabs, or the ashes of them, should be applied, with ocimum. For all these purposes, however, sea-crabs, it should be remembered, are not so useful. Thrasyllus informs us that there is nothing so antagonistic to serpents as crabs; that swine, when stung by a serpent, cure themselves by eating them; and that, while the sun is in the sign of Cancer, serpents suffer the greatest tortures.

The flesh, too, of river-snails, eaten either raw or boiled, is an excellent antidote to the venom of the scorpion, some persons keeping them salted for the purpose. These snails are applied, also, topically to the wound.

The coracinus is a fish peculiar to the river Nilus, it is true, but the particulars we are here relating are for the benefit of all parts of the world: the flesh of it is most excellent as an application for the cure of wounds inflicted by scorpions. In the number of the poisonous fishes we ought to reckon the sea-pig, a fish which causes great suffering to those who have been pierced with the pointed fin upon its back: the proper remedy in such case is the slime taken from the other parts of the body of the fish.

CHAP. 20.

THE SEA-CALF: TEN REMEDIES. THE MURÆNA: ONE REMEDY. THE HIPPOCAMPUS: NINE REMEDIES. THE SEA-URCHIN: ELEVEN REMEDIES.

In cases of hydrophobia resulting from the bite of the mad dog, the practice is to rub the patient's face with the fat of the sea-calf; an application rendered still more efficacious by the admixture of hyæna's marrow, oil of mastich, and wax. Bites inflicted by the muræna are cured by an application of the head of that fish, reduced to ashes. The pastinaca, also, is remedial for its own bite, the ashes of the same fish, or of another of the same genus, being applied to the wound with vinegar. When this fish is intended for food, every portion of the back that is of a saffron colour should be removed, as well as the whole of the head: care, too, should be taken not to wash it over much; an observation equally applicable to all kinds of shell-fish, when intended for food, the flavour being deteriorated thereby.

The hippocampus, taken in drink, neutralizes the poison of the sea-hare. As a counter-poison to dorycnium, sea-urchins are remarkably useful; as also in cases where persons have taken juice of carpathum internally; more particularly if the urchins are used with the liquor in which they are boiled. Boiled sea-crabs, too, are looked upon as highly efficacious in cases of poisoning by dorycnium; and as a neutralizer of the venom of the sea-hare they are particularly good.

Detailed table of contents

CHAP. 21. (6.)

THE VARIOUS KINDS OF OYSTERS: FIFTY-EIGHT REMEDIES AND OBSERVATIONS. PURPLES: NINE REMEDIES.

Oysters, too, neutralize the venom of the sea-hare — and now that we are speaking of oysters, it may possibly be thought that I have not treated of this subject at sufficient length in the former part of my work, seeing that for this long time past the palm has been awarded to them at our tables as a most exquisite dish. Oysters love fresh water and spots where numerous rivers discharge themselves into the sea; hence it is that the pelagia are of such small size and so few in number. Still, however, we do find them breeding among rocks and in places far remote from the contact of fresh water, as in the neighbourhood of Grynium and of Myrina, for example. Generally speaking, they increase in size with the increase of the moon, as already stated by us when treating of the aquatic animals: but it is at the beginning of summer, more particularly, and when the rays of the sun penetrate the shallow waters, that they are swollen with an abundance of milk. This, too, would appear to be the reason why they are so small when found out at sea; the opacity of the water tending to arrest their growth, and the moping consequent thereon producing a comparative indisposition for food.

Oysters are of various colours; in Spain they are red, in Illyricum of a tawny hue, and at Circeii black, both in meat and shell. But in every country, those oysters are the most highly esteemed that are compact without being slimy from their secretions, and are remarkable more for their thickness than their breadth. They should never be taken in either muddy or sandy spots, but from a firm, hard bottom; the meat should be compressed, and not of a fleshy consistence; and the oyster should be free from fringed edges, and lying wholly in the cavity of the shell. Persons of experience in these matters add another characteristic; a fine purple thread, they say, should run round the margins of the beard, this being looked upon as a sign of superior quality, and obtaining for them their name of “calliblephara.”

Oysters are all the better for travelling and being removed to new waters; thus, for example, the oysters of Brundisium, it is thought, when fed in the waters of Avernus, both retain their own native juices and acquire the flavour of those of Lake Lucrinus. Thus much with reference to the meat of the oyster; we will now turn to the various countries which produce it, so that no coast may be deprived of the honours which properly belong to it. But in giving this description we will speak in the language of another, using the words of a writer who has evinced more careful discernment in treating of this subject than any of the other authors of our day. These then are the words of Mucianus, in reference to the oyster:— “The oysters of Cyzicus are larger than those of Lake Lucrinus, fresher than those of the British coasts, sweeter than those of Medulæ, more tasty than those of Ephesus, more plump than

those of Lucus, less slimy than those of Coryphas, more delicate than those of Istria, and whiter than those of Circeii.” For all this, however, it is a fact well ascertained that there are no oysters fresher or more delicate than those of Circeii, last mentioned.

According to the historians of the expedition of Alexander, there were oysters found in the Indian Sea a foot in diameter: among ourselves, too, the nomenclature of some spendthrift and gourmand has found for certain oysters the name of “tridacna,” wishing it to be understood thereby, that they are so large as to require three bites in eating them. We will take the present opportunity of stating all the medicinal properties that are attributed to oysters. They are singularly refreshing to the stomach, and tend to restore the appetite. Luxury, too, has imparted to them an additional coolness by burying them in snow, thus making a medley of the produce of the tops of mountains and the bottom of the sea. Oysters are slightly laxative to the bowels; and boiled in honied wine, they relieve tenesmus, in cases where it is unattended with ulceration. They act detergently also upon ulcerations of the bladder. Boiled in their shells, unopened just as they come to hand, oysters are marvellously efficacious for rheumatic defluxions. Calcined oyster-shells, mixed with honey, allay affections of the uvula and of the tonsillary glands: they are similarly used for imposthumes of the parotid glands, inflamed tumours, and indurations of the mamillæ. Applied with water, these ashes are good for ulcerations of the head, and impart a plumpness to the skin in females. They are sprinkled, too, upon burns, and are highly esteemed as a dentifrice. Applied with vinegar, they are good for the removal of prurigo and of pituitous eruptions. Beaten up in a raw state, they are curative of scrofula and of chilblains upon the feet.

Purples, too, are useful as a counterpoison.

CHAP. 22.

SEA-WEED: TWO REMEDIES.

According to Nicander, sea-weed is also a theriac. There are numerous varieties of it, as already stated; one, for instance, with an elongated leaf, another red, another again with a broader leaf, and another crisped. The most esteemed kind of all is that which grows off the shores of Crete, upon the rocks there, close to the ground: it being used also for dyeing wool, as it has the property of so fixing the colours as never to allow of their being washed out. Nicander recommends it to be taken with wine.

CHAP. 23. (7.)

REMEDIES FOR ALOPECY, CHANGE OF COLOUR IN THE HAIR, AND
ULCERATIONS OF THE HEAD. THE SEA-MOUSE: TWO REMEDIES. THE SEA-
SCORPION: TWELVE REMEDIES. THE LEECH: SEVEN REMEDIES. THE MUREX:
THIRTEEN REMEDIES. THE CONCHYLUM: FIVE REMEDIES.

Ashes of the hippocampus, mixed with nitre and hog's lard, or else used solely with vinegar, are curative of alopecy; the skin being first prepared for the reception of the necessary medicaments by an application of powdered bone of sæpia. Alopecy is cured also with ashes of the sea-mouse, mixed with oil; ashes of the sea-urchin, burnt, flesh and all together; the gall of the sea-scorpion; or else ashes of three frogs burnt alive in an earthen pot, applied with honey, or what is still better, in combination with tar. Leeches left to putrefy for forty days in red wine stain the hair black. Others, again, recommend one sextarius of leeches to be left to putrefy the same number of days in a leaden vessel, with two sextarii of vinegar, the hair to be well rubbed with the mixture in the sun. According to Sornatius, this preparation is naturally so penetrating, that if females, when they apply it, do not take the precaution of keeping some oil in the mouth, the teeth even will become blackened thereby. Ashes of burnt shells of the murex or purple are used as a liniment, with honey, for ulcerations of the head; the shells, too, of other shell-fish, powdered merely, and not calcined, are very useful for the same purpose, applied with water. For the cure of head-ache, castoreum is employed, in combination with peucedanum and oil of roses.

Detailed table of contents

CHAP. 24.

REMEDIES FOR DISEASES OF THE EYES AND EYE-LIDS. TWO REMEDIES
DERIVED FROM THE FAT OF FISHES. THE CALLIONYMUS: THREE REMEDIES.
THE GALL OF THE CORACINUS: ONE REMEDY. THE SÆPIA: TWENTY-FOUR
REMEDIES. ICHTHYOCOLLA: FIVE REMEDIES.

The fat of all kinds of fish, both fresh-water as well as sea fish, melted in the sun and incorporated with honey, is an excellent improver of the eye-sight; the same, too, with castoreum, in combination with honey. The gall of the callionymus heals marks upon the eyes and cauterizes fleshy excrescences about those organs: indeed, there is no fish with a larger quantity of gall than this, an opinion expressed too by Menander in his Comedies. This fish is known also as the “*uranoscopos*,” from the eyes being situate in the upper part of the head. The gall, too, of the coracinus has the effect of sharpening the eyesight.

The gall of the red sea-scorpion, used with stale oil or Attic honey, disperses incipient cataract; for which purpose, the application should be made three times, on alternate days. A similar method is also employed for removing indurations of the membrane of the eyes. The surmullet, used as a diet, weakens the eyesight, it is said. The sea-hare is poisonous itself, but the ashes of it are useful as an application for preventing superfluous hairs on the eyelids from growing again, when they have been once pulled out by the roots. For this purpose, however, the smaller the fish is, the better. Small scallops, too, are salted and beaten up with cedar resin for a similar purpose, or else the frogs known as “*diopetes*” and “*calamitæ*,” are used; the blood of them being applied with vine gum to the eyelids, after the hairs have been removed.

Powdered shell of *sæpia*, applied with woman’s milk, allays swellings and inflammations of the eyes; employed by itself it removes eruptions of the eyelids. When this remedy is used, it is the practice to turn up the eyelids, and to leave the medicament there a few moments only; after which, the part is anointed with oil of roses, and the inflammation modified by the application of a bread-poultice. Powdered bone of *sæpia* is used also for the treatment of nyctalopy, being applied to the eyes with vinegar. Reduced to ashes, this substance removes scales upon the eyes: applied with honey, it effaces marks upon those organs: and used with salt and *cadmia*, one drachma of each, it disperses webs which impede the eyesight, as also albugo in the eyes of cattle. They say, too, that if the eyelids are rubbed with the small bone taken from this fish, a perfect cure will be experienced.

Sea-urchins, applied with vinegar, cause epinyctis to disappear. According to what the magicians say, they should be burnt with vipers’ skins and frogs, and the ashes sprinkled in the drink; a great improvement of the eyesight being guaranteed as the sure result.

“Ichthyocolla” is the name given to a fish with a glutinous skin; the glue made from which is also known by the same name, and is highly useful for the removal of epinyctis. Some persons, however, assert that it is from the belly of the fish, and not the skin — as in the case of bull glue — that the ichthyocolla is prepared. That of Pontus is highly esteemed: it is white, free from veins or scales, and dissolves with the greatest rapidity. The proper way of using it, is to cut it into small pieces, and then to leave it to soak in water or vinegar a night and a day, after which it should be pounded with sea-shore pebbles, to make it melt the more easily. It is generally asserted that this substance is good for pains in the head and for tetanus.

The right eye of a frog, suspended from the neck in a piece of cloth made from wool of the natural colour, is a cure for ophthalmia in the right eye; and the left eye of a frog, similarly suspended, for ophthalmia in the left. If the eyes, too, of a frog are taken out at the time of the moon’s conjunction, and similarly worn by the patient, enclosed in an eggshell, they will effectually remove indurations of the membrane of the eyes. The rest of the flesh applied topically, removes all marks resulting from blows. The eyes, too, of a crab, worn attached to the neck, by way of amulet, are a cure for ophthalmia, it is said. There is a small frog which lives in reed-beds and among grass more particularly, never croaks, being quite destitute of voice, is of a green colour, and is apt to cause tympanitis in cattle, if they should happen to swallow it. The slimy moisture on this reptile’s body, scraped off with a spatula and applied to the eyes, greatly improves the sight, they say: the flesh, too, is employed as a topical application for the removal of pains in the eyes.

Some persons take fifteen frogs, and after spitting them upon as many bulrushes, put them into a new earthen vessel: they then mix the juices which flow from them, with gum of the white vine, and use it as an application for the eye-lids; first pulling out such eye-lashes as are in the way, and then dropping the preparation with the point of a needle into the places from which the hairs have been removed. Meges used to prepare a depilatory for the eyelids, by killing frogs in vinegar, and leaving them to putrefy; for which purpose he employed the spotted frogs which make their appearance in vast numbers during the rains of autumn. Ashes of burnt leeches, it is thought, applied in vinegar, are productive of a similar effect; care must be taken, however, to burn them in a new earthen vessel. Dried liver, too, of the tunny, made up into an ointment, in the proportion of four denarii, with oil of cedar, and applied as a depilatory for nine months together, is considered to be highly effectual for this purpose.

CHAP. 25.

REMEDIES FOR DISEASES OF THE EARS. THE BATIA: ONE REMEDY. THE BACCHUS OR MYXON: TWO REMEDIES. THE SEA-LOUSE: TWO REMEDIES.

For diseases of the ears, fresh gall of the fish called “batia” is remarkably good; the same, too, when it has been kept in wine. The gall, also, of the bacchus, by some known as the “myxon,” is equally good; as also that of the callionymus, injected into the ears with oil of roses, or else castoreum, used with poppy-juice. There are certain animals too, known as “sea-lice,” which are recommended as an injection for the ears, beaten up with vinegar. Wool, too, that has been dyed with the juice of the murex, employed by itself, is highly useful for this purpose; some persons, however moisten it with vinegar and nitre.

Others, again, more particularly recommend for all affections of the ears one cyathus of the best garum, with one cyathus and a half of honey, and one cyathus of vinegar, the whole gently boiled in a new pot over a slow fire, and skimmed with a feather every now and then: when it has become wholly free from scum, it is injected lukewarm into the ears. In cases where the ears are swollen, the same authorities recommend that the swellings should be first reduced with juice of coriander. The fat of frogs, injected into the ears, instantly removes all pains in these organs. The juice of river-crabs, kneaded up with barley-meal, is a most effectual remedy for wounds in the ears. Shells of the murex, reduced to ashes, and applied with honey, or the burnt shells of other shellfish, used with honied wine, are curative of imposthumes of the parotid glands.

Detailed table of contents

CHAP. 26.

REMEDIES FOR TOOTH-ACHE. THE DOG-FISH : FOUR REMEDIES. WHALE'S FLESH.

Tooth-ache is alleviated by scarifying the gums with bones of the sea-dragon, or by rubbing the teeth once a year with the brains of a dog-fish boiled in oil, and kept for the purpose. It is a very good plan too, for the cure of tooth-ache, to lance the gums with the sting of the pastinaca in some cases. This sting, too, is pounded, and applied to the teeth with white hellebore, having the effect of extracting them without the slightest difficulty. Another of these remedies is, ashes of salted fish calcined in an earthen vessel, mixed with powdered marble. Stale cybium, rinsed in a new earthen vessel, and then pounded, is very useful for the cure of tooth-ache. Equally good, it is said, are the back-bones of all kinds of salt fish, pounded and applied in a liniment. A decoction is made of a single frog boiled in one hemina of vinegar, and the teeth are rinsed with it, the decoction being retained in the mouth. In cases where a repugnance existed to making use of this remedy, Sallustius Dionysius used to suspend frogs over boiling vinegar by the hind legs, so as to make them discharge their humours into the vinegar by the mouth, using considerable numbers of frogs for the purpose: to those, however, who had a stronger stomach, he prescribed the frogs themselves, eaten with their broth. It is generally thought, too, that this recipe applies more particularly to the double teeth, and that the vinegar prepared as above-mentioned, is remarkably useful for strengthening them when loose.

For this last purpose, some persons cut off the legs of two frogs, and then macerate the bodies in two heminæ of wine, recommending this preparation as a collutory for strengthening loose teeth. Others attach the frogs, whole, to the exterior of the jaws : and with some it is the practice to boil ten frogs, in three sextarii of vinegar, down to one-third, and to use the decoction as a strengthener of loose teeth. By certain authorities, too, it has been recommended to boil the hearts of six-and-thirty frogs beneath a copper vessel, in one sextarius of old oil, and then to inject the decoction into the ear on the same side of the jaw as the part affected: while others again have used, as an application for the teeth, a frog's liver, boiled, and beaten up with honey. All the preparations above described will be found still more efficacious if made from the seafrog. In cases where the teeth are carious and emit an offensive smell, it is recommended to dry some whale's flesh in an oven for a night, and then to add an equal quantity of salt, and use the mixture as a dentifrice. "Enhydriis" is the name given by the Greeks to a snake that lives in the water. With the four upper teeth of this reptile, it is the practice, for the cure of aching in the upper teeth, to lance the upper gums, and with the four lower teeth, for aching in the lower. Some persons, however, content themselves with using an eyetooth only. Ashes, too, of burnt crabs are used

for this purpose; and the murex, reduced to ashes, makes an excellent dentifrice.

Detailed table of contents

CHAP. 27.

REMEDIES FOR LICHENS, AND FOR SPOTS UPON THE FACE. THE DOLPHIN: NINE REMEDIES. COLUTHIA OR CORYPHIA: THREE REMEDIES. HALCYONEUM : SEVEN REMEDIES. THE TUNNY : FIVE REMEDIES.

Lichens and leprous spots are removed by applying the fat of the sea-calf, ashes of the mæna in combination with three oboli of honey, liver of the pastinaca boiled in oil, or ashes of the dolphin or hippocampus mixed with water. After the parts have been duly excoriated, a cicatrizing treatment ought to be pursued. Some persons bake dolphin's liver in an earthen vessel, till a grease flows therefrom like oil in appearance: this they use by way of ointment for these diseases.

Burnt shells of the murex or purple, applied with honey, have a detergent effect upon spots on the face in females: used as an application for seven consecutive days, a fomentation made of white of eggs being substituted on the eighth, they efface wrinkles, and plump out the skin. To the genus "murex" belong the shell-fish known by the Greeks as "coluthia" or "coryphia," equally turbinated, but considerably smaller: for all the above purposes they are still more efficacious, and the use of them tends to preserve the sweetness of the breath. Fish-glue effaces wrinkles and plumps out the skin; being boiled for the purpose in water some four hours, and then pounded and kneaded up till it attains a thin consistency, like that of honey. After being thus prepared, it is put by in a new vessel for keeping; and, when wanted for use, is mixed, in the proportion of four drachmæ, with two drachmæ of sulphur, two of alkanet, and eight of litharge; the whole being sprinkled with water and beaten up together. The preparation is then applied to the face, and is washed off at the end of four hours. For the cure of freckles and other affections of the face, calcined bones of cuttle-fish are also used; an application which is equally good for the removal of fleshy excrescences and the dispersion of running sores.

(8.) For the cure of itch-scab, a frog is boiled in five semisextarii of sea-water, the decoction being reduced to the consistency of honey. There is a sea production called "halcyoneum," composed, as some think, of the nests of the birds known as the "halcyon" and "ceyx," or, according to others, of the concretion of sea-foam, or of some slime of the sea, or a certain lanuginous inflorescence thrown up by it. Of this halcyoneum there are four different kinds; the first, of an ashy colour, of a compact substance, and possessed of a pungent odour; the second, soft, of a milder nature, and with a smell almost identical with that of sea-weed; the third, whiter, and with a variegated surface; the fourth, more like pumice in appearance, and closely resembling rotten sponge. The best of all is that which nearly borders upon a purple hue, and is known as the "Milesian" kind: the whiter it is, the less highly it is esteemed.

The properties of halcyoneum are ulcerative and detergent: when required for use, it is parched and applied without oil. It is quite marvellous how efficiently it removes leprous sores, lichens, and freckles, used in combination with lupines and two oboli of sulphur. It is employed, also, for the removal of marks upon the eyes. Andreas has recommended for the cure of leprosy ashes of burnt crabs, with oil; and Attalus, fresh fat of tunny.

Detailed table of contents

CHAP. 28.

REMEDIES FOR SCROFULA, IMPOSTHUMES OF THE PAROTID GLANDS, QUINSY, AND DISEASES OF THE FAUCES. THE MÆNA: THIRTEEN REMEDIES. THE SEA-SCOLOPENDRA: TWO REMEDIES. THE SAURUS: ONE REMEDY. SHELL-FISH: ONE REMEDY. THE SILURUS: FIFTEEN REMEDIES.

Ulcerations of the mouth are cured by an application of brine in which mænæ have been pickled, in combination with calcined heads of the fish, and honey. For the cure of scrofula, it is a good plan to prick the sores with the small bone that is found in the tail of the fish known as the sea-frog; care being taken to avoid making a wound, and to repeat the operation daily, until a perfect cure is effected. The same property, too, belongs to the sting of the pastinaca, and to the sea-hare, applied topically to the sores: but in both cases due care must be taken to remove them in an instant. Shells of sea-urchins are bruised, also, and applied with vinegar; shells also of sea-scolopendræ, applied with honey; and river-crabs pounded or calcined, and applied with honey. Bones, too, of the sæpia, triturated and applied with stale axle-grease, are marvellously useful for this purpose.

This last preparation is used, also, for the cure of imposthumes of the parotid glands; a purpose for which the liver of the sea-fish known as the “saurus” is employed. Nay, even more than this, fragments of earthen vessels in which salt fish have been kept are pounded with stale axle-grease, and applied to scrofulous sores and imposthumes of the parotid glands; as also calcined murex, incorporated with oil. Stiffness in the neck is allayed by taking what are known as sea-lice, in doses of one drachma in drink, taking castoreum mixed with pepper in honied wine, or making a decoction of frogs in oil and salt, and taking the liquor.

Opisthotony, too, and tetanus are treated in a similar manner; and spasms, with the addition of pepper. Ashes of burnt heads of salted mænæ are applied externally, with honey, for the cure of quinsy; as also a decoction of frogs, boiled in vinegar, a preparation which is equally good for affections of the tonsillary glands. River-crabs, pounded, one to each hemina of water, are used as a gargle for the cure of quinsy; or else they are taken with wine and hot water. Garum, put beneath the uvula with a spoon, effectually cures diseases of that part. The silurus, used as food, either fresh or salted, improves the voice.

CHAP. 29.

REMEDIES FOR COUGH AND DISEASES OF THE CHEST.

Surmullets act as an emetic, dried and pounded, and taken in drink. Castoreum, taken fasting, with a small quantity of hammoniacum in oxymel, is extremely good for asthma: spasms, too, in the stomach are assuaged by taking a similar potion with warm oxymel. Frogs stewed in their own liquor in the saucepan, the same way in fact that fish are dressed, are good for a cough, it is said. In some cases, also, frogs are suspended by the legs, and after their juices have been received in a platter, it is recommended to gut them, and the entrails being first carefully removed, to preserve them for the above purpose. There is a small frog, also, which ascends trees, and croaks aloud there: if a person suffering from cough spits into its mouth and then lets it go, he will experience a cure, it is said. For cough attended with spitting of blood, it is recommended to beat up the raw flesh of a snail, and to drink it in hot water.

Detailed table of contents

CHAP. 30. (9.)

REMEDIES FOR PAINS IN THE LIVER AND SIDE. THE ELONGATED CONCH: SIX
REMEDIES. THE TETHEA: FIVE REMEDIES.

For pains in the liver, a sea-scorpion is killed in wine, and the liquid is taken. The meat, too, of the elongated conch is taken with honied wine and water, in equal quantities, or, if there are symptoms of fever, with hydromel. Pains in the side are assuaged by taking the flesh of the hippocampus, grilled, or else the tethea, very similar to the oyster, with the ordinary food. For sciatica, the pickle of the silurus is injected, by way of clyster. The flesh of conchs, too, is prescribed, for fifteen days, in doses of three oboli soaked in two sextarii of wine.

Detailed table of contents

CHAP. 31.

REMEDIES FOR DISEASES OF THE BOWELS. SEA-WORT: ONE REMEDY. THE MYAX: TWENTY-FIVE REMEDIES. THE MITULUS: EIGHT REMEDIES. PELORIDES: ONE REMEDY. SERIPHUM: TWO REMEDIES. THE ERYTHINUS: TWO REMEDIES.

The silurus, taken in its broth, or the torpedo, used as food, acts as a laxative upon the bowels. There is a sea-wort, also, similar in appearance to the cultivated cabbage: it is injurious to the stomach, but acts most efficiently as a purgative, requiring to be cooked with fat meat for the purpose, in consequence of its extreme acidity. The broth, too, of all boiled fish is good for this purpose; it acting, also, as a strong diuretic, taken with wine more particularly. The best kind of all is that prepared from the sea-scorpion, the iulis, and rock-fish in general, as they are destitute of all rankness and are free from fat. The proper way of cooking them is with dill, parsley, coriander, and leeks, with the addition of oil and salt. Stale cybium, too, acts as a purgative, and is particularly useful for carrying off crudities, pituitous humours, and bile.

The myax is of a purgative nature, a shell-fish of which we shall take this opportunity of giving the natural history at length. These fish collect together in masses, like the murex, and are found in spots covered with sea-weed. They are the finest eating in autumn, and are found in the greatest perfection in places where fresh-water streams discharge themselves into the sea; for which reason it is that those of Egypt are held in such high esteem. As the winter advances, they contract a bitter flavour, and assume a reddish hue. The liquor of these fish, it is said, acts as a purgative upon the bowels and bladder, has a detergent effect upon the intestines, acts aperiently upon all the passages, purges the kidneys, and diminishes the blood and adipose secretions. Hence it is that these shell-fish are found of the greatest use for the treatment of dropsy, for the regulation of the catamenia, and for the removal of jaundice, all diseases of the joints, and flatulency. They are very good, also, for the reduction of obesity, for diseases of the bile and of the pituitous secretions, for affections of the lungs, liver, and spleen, and for rheumatic defluxions. The only inconvenience resulting from them is, that they irritate the throat and impede the articulation. They have, also, a healing effect upon ulcers of a serpiginous nature, or which stand in need of detergents, as also upon carcinomatous sores. Calcined, the same way as the murex, and employed with honey, they are curative of bites inflicted either by dogs or human beings, and of leprous spots or freckles. The ashes of them, rinsed, are good for the removal of films upon the eyes, granulations of those organs and indurations of the membrane, as also for diseases of the gums and teeth, and for pituitous eruptions. They serve, also, as an antidote to dorycnium and to opocarpathon.

There are two species of this shell-fish, of a degenerate kind: the mitulus,

which has a strong flavour, and a saltish taste; and the myisca, which differs from the former in the roundness of its shell, is somewhat smaller, and is covered with filaments, the shell being thinner, and the meat of a sweeter flavour. The ashes, also, of the mitulus, like those of the murex, are possessed of certain caustic properties, and are very useful for the removal of leprous spots, freckles, and blemishes of the skin. They are rinsed, too, in the same manner as lead, for the removal of swellings of the eyelids, of indurations of the membranes, and of films upon the eyes, as also of sordid ulcers upon other parts of the body, and of pustules upon the head. The meat of them, also, is employed as an application for bites inflicted by dogs.

As to pelorides, they act as a gentle laxative upon the bowels, an effect equally produced by castoreum, taken in doses of two drachmæ, in hydromel: where, however, a more drastic purgative is required, one drachma of dried garden-cucumber root is added, and two drachmæ of aphronitrum. The tethea is good for griping pains in the bowels and for attacks of flatulency: they are generally found adhering to the leaves of marine plants, sucking their nutriment therefrom, and may be rather looked upon as a sort of fungus than as a fish. They are useful, also, for the removal of tenesmus and of diseases of the kidneys.

There grows also in the sea a kind of absinthium, known by some persons as “seriphum,” and found in the vicinity of Taposiris, in Egypt, more particularly. It is of a more slender form than the land absinthium, acts as a purgative upon the bowels, and effectually removes intestinal worms. The sœpia, too, is a laxative; for which purpose these fish are administered with the food, boiled with a mixture of oil, salt, and meal. Salted mænæ, applied with bull’s gall to the navel, acts as a purgative upon the bowels.

The liquor of fish, boiled in the saucepan with lettuces, dispels tenesmus. River-crabs, beaten up and taken with water, act astringently upon the bowels, and they have a diuretic effect, if taken with white wine. Deprived of the legs, and taken in doses of three oboli with myrrh and iris, one drachma of each, they disperse urinary calculi. For the cure of the iliac passion and of attacks of flatulency, castoreum should be taken, with seed of daucus and of parsley, a pinch in three fingers of each, the whole being mixed with four cyathi of warm honied wine. Griping pains in the bowels should be treated with castoreum and a mixture of dill and wine. The fish called “erythinus,” used as food, acts astringently upon the bowels. Dysentery is cured by taking frogs boiled with squills, and prepared in the form of boluses, or else hearts of frogs beaten up with honey, as Niceratus recommends. For the cure of jaundice, salt fish should be taken with pepper, the patient abstaining from all other kinds of meat.

CHAP. 32.

REMEDIES FOR DISEASES OF THE SPLEEN, FOR URINARY CALCULI, AND FOR AFFECTIONS OF THE BLADDER. THE SOLE: ONE REMEDY. THE TURBOT: ONE REMEDY. THE BLENDIUS: ONE REMEDY. THE SEA-NETTLE: SEVEN REMEDIES. THE PULMO MARINUS: SIX REMEDIES. ONYCHES: FOUR REMEDIES.

For the cure of spleen diseases, the fish known as the sole is applied to that part; the torpedo, also, or else a live turbot; it being then set at liberty in the sea. The seascorpion, killed in wine, is a cure for diseases of the bladder and for urinary calculi; the stone, also, that is found in the tail of this last fish, taken in drink, in doses of one obolus; the liver of the enhydris; and the ashes of the fish called “blendius; taken with rue. In the head, too, of the fish called “bacchus,” there are found certain small stones, as it were: these, taken in water, six in number, are an excellent cure for urinary calculi. They say, too, that the sea-nettle, taken in wine, is very useful for this purpose, as also the pulmo marinus, boiled in water. The eggs of the sœpia have a diuretic effect, and carry off pituitous humours from the kidneys. Ruptures and convulsions are very effectually treated by taking river-crabs, bruised in asses’ milk more particularly; and urinary calculi by drinking sea-urchins pounded, spines and all, in wine; the due proportion being one semisextarius of wine for each urchin, and the treatment being continued till its good effects are visible. The flesh, too, of the sea-urchin, taken as food, is very useful as a remedy for the same malady.

Scallops also, taken as food, act detergently upon the bladder: the male fish is by some persons called “donax,” and by others “aulos,” the female being known as “onyx.” The male scallop has a diuretic effect: the flesh of the female is sweeter than that of the male, and of an uniform colour. The eggs, too, of the sœpia promote the urinary secretions, and act detergently upon the kidneys.

Detailed table of contents

CHAP. 33.

REMEDIES FOR INTESTINAL HERNIA, AND FOR DISEASES OF THE RECTUM. THE WATER-SNAKE: ONE REMEDY. THE HYDRUS: ONE REMEDY. THE MULLET: ONE REMEDY. THE PELAMIS: THREE REMEDIES.

For the cure of intestinal hernia the sea-hare is applied, bruised with honey. The liver of the water-snake, and that of the hydrus, bruised and taken in drink, are remedial for urinary calculi. Sciatica is cured by using the pickle of the silurus as a clyster, the bowels being first thoroughly purged. For chafing of the fundament, an application is made of heads of mullets and surmulletts, reduced to ashes; for which purpose they are calcined in an earthen vessel, and must be applied in combination with honey. Calcined heads, too, of the fish known as mænæ are useful for the cure of chaps and condylomata; as also heads of salted pelamides, reduced to ashes, or calcined cybium, applied with honey.

The torpedo, applied topically, reduces procidence of the rectum. River-crabs, reduced to ashes, and applied with oil and wax, are curative of chaps of the fundament: sea-crabs, too, are equally useful for the purpose.

Detailed table of contents

CHAP. 34.

REMEDIES FOR INFLAMED TUMOURS, AND FOR DISEASES OF THE
GENERATIVE ORGANS. THE SCIÆNA: ONE REMEDY. THE PERCH: FOUR
REMEDIES. THE SQUATINA: THREE REMEDIES. THE SMARIS: THREE REMEDIES.

The pickle of the coracinus disperses inflammatory tumours; an effect which is equally produced by using the calcined intestines and scales of the sciæna. The sea-scorpion, too, is used for the same purpose, boiled in wine, and applied as a fomentation to the part affected. Shells of sea-urchins, bruised and applied with water, act as a check upon incipient inflammatory tumours. Ashes of the murex, or of the purple, are employed in either case, whether it is wanted to disperse inflammatory tumours in an incipient state, or to bring them to a head and break them. Some authorities prescribe the following preparation: of wax and frankincense twenty drachmæ, of litharge forty drachmæ, of calcined murex ten drachmæ, and of old oil, one semisextarius. Salt fish, boiled and applied by itself, is highly useful for the above purposes.

River crabs, bruised and applied, disperse pustules on the generative organs: the same, too, with calcined heads of mænæ, or the flesh of that fish, boiled and applied. Heads of salted perch, reduced to ashes, and applied with honey, are equally useful for the purpose; or else calcined heads of pelamides, or skin of the squatina reduced to ashes. It is the skin of this fish that is used, as already stated, for giving a polish to wood; for the sea even, we find, furnishes its aid to our artificers. For a similar purpose the fishes called “smarides” are applied topically; as also ashes of the shell of the murex or of the purple, applied with honey; which last are still more efficacious when the flesh has been burnt with the shell.

Salt fish, boiled with honey, is particularly good for the cure of carbuncles upon the generative organs. For relaxation of the testes, the slime of snails is recommended, applied in the form of a liniment.

The flesh of hippocampi, grilled and taken frequently as food, is a cure for incontinence of urine; the ophidion, too, a little fish similar to the conger in appearance, eaten with a lily root; or the small fry found in the bellies of larger fish that have swallowed them, reduced to ashes and taken in water. It is recommended, too, to burn African snails, both shells and flesh, and to administer the ashes with wine of Signia.

CHAP. 36.

REMEDIES FOR GOUT, AND FOR PAINS IN THE FEET. THE BEAVER: FOUR
REMEDIES. BRYON: ONE REMEDY.

For the cure of gout and of diseases of the joints, oil is useful in which the intestines of frogs have been boiled. Ashes, too, of burnt bramble-frogs are similarly employed, with stale grease; in addition to which, some persons use calcined barley, the three ingredients being mixed in equal proportions. It is recommended too, in cases of gout, to rub the parts affected with a sea-hare, fresh caught, and to wear shoes made of beaver's skin, Pontic beaver more particularly, or else of sea-calf's skin, an animal the fat of which is very useful for the purpose: the same being the case also with bryon, a plant of which we have already spoken, similar to the lettuce in appearance, but with more wrinkled leaves, and destitute of stem. This plant is of a styptic nature, and, applied topically, it tends to modify the paroxysms of gout. The same, too, with sea-weed, of which we have also spoken already; due precaution being taken not to apply it dry.

Chilblains are cured by applying the pulmo marinus; ashes of sea-crabs with oil; river crabs, bruised and burnt to ashes and kneaded up with oil; or else fat of the silurus. In diseases of the joints, the paroxysms are modified by applying fresh frogs every now and then: some authorities recommend that they should be split asunder before being applied. The liquor from mussels and other shell-fish has a tendency to make flesh.

Detailed table of contents

CHAP. 37.

REMEDIES FOR EPILEPSY.

Epileptic patients, as already stated, are recommended to drink the rennet of the sea-calf, mixed with mares' milk or asses' milk, or else with pomegranate juice, or, in some cases, with oxymel: some persons, too, swallow the rennet by itself, in the form of pills. Castoreum is sometimes administered, in three cyathi of oxymel, to the patient fasting; but where the attacks are frequent, it is employed in the form of a clyster, with marvellous effect. The proper proportions, in this last case, are two drachmæ of castoreum, one sextarius of oil and honey, and the same quantity of water. At the moment that the patient is seized with a fit, it is a good plan to give him castoreum, with vinegar, to smell. The liver, too, of the sea- weasel is given to epileptic patients, or else that of sea-mice, or the blood of tortoises.

Detailed table of contents

CHAP. 38. (10.)

REMEDIES FOR FEVERS. THE FISH CALLED ASELLUS: ONE REMEDY. THE PHAGRUS: ONE REMEDY. THE BALÆNA: ONE REMEDY.

Recurrent fevers are effectually checked by making the patient taste the liver of a dolphin, just before the paroxysm comes on. Hippocampi are stifled in oil of roses, and the patients are rubbed therewith in cold agues, the fish, also, being worn as an amulet by the patient. In the same way, too, the small stones that are found at full moon in the head of the fish called “asellus” are worn, attached in a piece of linen cloth to the patient’s body. A similar virtue is attributed to the longest tooth of the river-fish called phagrus, attached to the patient with a hair, provided he does not see the person who attaches it to him for five days. Frogs are boiled in oil in a spot where three roads meet, and, the flesh being first thrown away, the patients are rubbed with the decoction, by way of cure for quartan fever. Some persons, again, suffocate frogs in oil, and, after attaching them to the patient without his knowing it, anoint him with the oil. The heart of a frog, worn as an amulet, modifies the cold chills in fevers; the same, too, with oil in which the intestines of frogs have been boiled. But the best remedy for quartan fevers, is to wear attached to the body either frogs from which the claws have been removed, or else the liver or heart of a bramble-frog, attached in a piece of russet-coloured cloth.

River-crabs, bruised in oil and water, are highly beneficial in fevers, the patient being anointed with the preparation just before the paroxysms come on: some authorities recommend the addition of pepper to the mixture. Others prescribe for quartan fevers a decoction of river-crabs in wine, boiled down to one fourth, the patient taking it at the moment of leaving the bath: by some, too, it is recommended to swallow the left eye of a river-crab. The magicians engage to cure a tertian fever, by attaching as an amulet to the patient, before sunrise, the eyes of river-crabs, the crabs when thus blinded being set at liberty in the water. They say, too, that these eyes, attached to the body in a piece of deer’s hide, with the flesh of a nightingale, will dispel sleep and promote watchfulness. In cases where there are symptoms of lethargy, the rennet of the balæna or of the sea-calf is given to the patient to smell; some persons, too, use the blood of tortoises as a liniment for lethargic patients.

Tertian fevers, it is said, may be cured by wearing one of the vertebræ of a perch attached to the body, and quartan fevers by using fresh river snails, as an aliment. Some persons preserve these snails in salt for this purpose, and give them, pounded, in drink.

CHAP. 39.

REMEDIES FOR LETHARGY, CACHEXY, AND DROPSY.

Strombi, left to putrefy in vinegar, act as an excitant upon lethargic patients by their smell; they are very useful, too, for the cure of cardiac diseases. For cachectic patients, where the body is wasting with consumption, tetheæ are considered beneficial, mixed with rue and honey. For the cure of dropsy, dolphin's fat is melted and taken with wine, the repulsive taste of it being neutralized by first touching the nostrils with unguent or some other odoriferous substance, or else by plugging the nostrils in some way or other. The flesh of strombi, pounded and given in three heminæ of honied wine and the same quantity of water, or, if there is fever, in hydromel, is very useful for dropsy: the same, too, with the juice of river-crabs, administered with honey. Water frogs, too, are boiled with old wine and spelt, and taken as food, the liquor in which they have been boiled being drunk from the same vessel: or else the feet, head, and tail of a tortoise are cut off, and the intestines removed, the rest of the flesh being seasoned in such a manner as to allow of its being taken without loathing. River-crabs, too, eaten with their broth, are said to be very good for the cure of phthisis.

[Detailed table of contents](#)

CHAP. 40.

REMEDIES FOR BURNS AND FOR ERYSIPELAS.

Burns are cured by applying ashes of calcined sea-crabs or river-crabs with oil: fish-glue, too, and calcined frogs are used as an application for scalds produced by boiling water. The same treatment also restores the hair, provided the ashes are those of river-crabs: it is generally thought, too, that the preparation should be applied with wax and bears' grease. Ashes, too, of burnt beaver-skin are very useful for these purposes. Live frogs act as a check upon erysipelas, the belly side being applied to the part affected: it is recommended, too, to attach them lengthwise by the hinder legs, so as to render them more beneficial by reason of their increased respiration. Heads, too, of salted siluri are reduced to ashes and applied with vinegar.

Prurigo and itch-scab, not only in man but in quadrupeds as well, are most efficaciously treated with the liver of the *pastinaca* boiled in oil.

Detailed table of contents

CHAP. 41.

REMEDIES FOR DISEASES OF THE SINEWS.

The exterior callosity with which the flesh of purples is covered, beaten up, unites the sinews, even when they have been severed asunder. It is a good plan, for patients suffering from tetanus, to take sea-calf's rennet in wine, in doses of one obolus, as also fish-glue. Persons affected with fits of trembling find much relief from castoreum, provided they are well anointed with oil. I find it stated that the surmullet, used as an article of diet, acts injuriously upon the sinews.

Detailed table of contents

CHAP. 42.

METHODS OF ARRESTING HÆMORRHAGE AND OF LETTING BLOOD. THE POLYP: ONE REMEDY.

Fish, used as an aliment, it is generally thought, make blood. The polyp, bruised and applied, arrests hæmorrhage, it is thought: in addition to which we find stated the following particulars respecting it — that of itself it emits a sort of brine, in consequence of which, there is no necessity to use any in cooking it — that it should always be sliced with a reed — and that it is spoiled by using an iron knife, becoming tainted thereby, owing to the antipathy which naturally exists (between it and iron). For the purpose also of arresting hæmorrhage, ashes of burnt frogs are applied topically, or else the dried blood of those animals. Some authorities recommend the frog to be used, that is known by the Greeks as “calamites,” from the fact that it lives among reeds and shrubs; it is the smallest and greenest of all the frogs, and either the blood or the ashes of it are recommended to be employed. Others, again, prescribe, in cases of bleeding at the nostrils, an injection of the ashes of young water-frogs, in the tadpole state, calcined in a new earthen vessel.

On the other hand, again, in cases where it is required to let blood, the kind of leech is used which is known among us by the name of “sanguisuga.” Indeed, the action of these leeches is looked upon as pretty much the same as that of the cupping-glasses used in medicine, their effect being to relieve the body of superfluous blood, and to open the pores of the skin. Still, however, there is this inconvenience attending them — when they have been once applied, they create a necessity for having recourse to the same treatment at about the same period in every succeeding year. Many physicians have been of opinion also, that leeches may be successfully applied in cases of gout. When gorged, they fall off in consequence of losing their hold through the weight of the blood, but if not, they must be sprinkled with salt for the purpose.

Leeches are apt, however, to leave their heads buried in the flesh; the consequence of which is an incurable wound, which has caused death in many cases, that of Messalinus, for example, a patrician of consular rank, after an application of leeches to his knee. When this is the case, that which was intended as a remedy is turned into an active poison; a result which is to be apprehended in using the red leeches more particularly. Hence it is that when these last are employed, it is the practice to snip them with a pair of scissors while sucking; the consequence of which is, that the blood oozes forth, through a siphon, as it were, and the head, gradually contracting as the animal dies, is not left behind in the wound. There is a natural antipathy existing between leeches and bugs, and hence it is that the latter are killed by the aid of a fumigation made with leeches. Ashes of beaver-skin burnt with tar, kneaded up with leek-juice, arrest bleeding at the nostrils.

Detailed table of contents

CHAP. 43.

METHODS OF EXTRACTING FOREIGN BODIES FROM THE FLESH.

To extract pointed weapons which have pierced the flesh, ashes of calcined shells of the *sæpia* are used, as also of the purple, the meat of salted fish, bruised river-crabs, or flesh of the *silurus* (a river-fish that is found in other streams as well as the Nilus), applied either fresh or salted. The ashes also of this fish, as well as the fat, have the property of extracting pointed bodies, and the back-bone, in a calcined state, is used as a substitute for spodium.

Detailed table of contents

CHAP. 44.

REMEDIES FOR ULCERS, CARCINOMATA, AND CARBUNCLES.

Ulcers of a serpiginous nature, as also the fleshy excrescences which make their appearance in them, are kept in check by applying ashes of calcined heads of mænæ, or else ashes of the silurus. Carcinomata, too, are treated with heads of salted perch, their efficacy being considerably increased by using some salt along with the ashes, and kneading them up with heads of cunila and olive-oil. Ashes of sea-crabs, calcined with lead, arrest the progress of carcinomatous sores: a purpose for which ashes of river-crabs, in combination with honey and fine lint, are equally useful; though there are some authorities which prefer mixing alum and barley with the ashes. Phagedænic ulcers are cured by an application of dried silurus pounded with sandarach; malignant cancers, corrosive ulcers, and putrid sores, by the agency of stale cybium.

Maggots that breed in sores are removed by applying frogs' gall; and fistulas are opened and dried by introducing a tent made of salt fish, with a dossil of lint. Salt fish, kneaded up and applied in the form of a plaster, will remove all proud flesh in the course of a day, and will arrest the further progress of putrid and serpiginous ulcers. Alex, applied in lint, acts detergently, also, upon ulcers; the same, too, with the ashes of calcined shells of sea-urchins. Salted slices of the coracinus disperse carbuncles, an effect equally produced by the ashes of salted surmullets. Some persons, however, use the head only of the surmullet, in combination with honey or with the flesh of the coracinus. Ashes of the murex, applied with oil, disperse tumours, and the gall of the sea-scorpion makes scars disappear.

Detailed table of contents

CHAP. 45.

REMEDIES FOR WARTS, AND FOR MALFORMED NAILS. THE GLANIS: ONE
REMEDY.

To remove warts, the liver of the glanis is applied to the part; ashes also of heads of mænæ bruised with garlic — substances which should be used raw where it is thymewarts that require to be removed — the gall of the red seascorpion, smarides pounded and applied, or alex thoroughly boiled. Ashes of calcined heads of mænæ are used to rectify malformed nails.

[Detailed table of contents](#)

CHAP. 46.

REMEDIES FOR FEMALE DISEASES. THE GLAUCISCUS: ONE REMEDY.

The milk is increased in females by eating the glauciscus in its own liquor, or else smarides with a ptisan, or boiled with fennel. Ashes of calcined shells of the murex or purple, applied with honey, are an effectual cure for affections of the mamillæ; river-crabs, too, and sea-crabs, applied topically, are equally good. The meat of the murex, applied to the mamillæ, removes hairs growing upon those parts. The squatina, applied topically, prevents the mamillæ from becoming too distended. Lint greased with dolphin's fat, and then ignited, produces a smoke which acts as an excitant upon females suffering from hysterical suffocations; the same, too, with strombi, left to putrefy in vinegar. Heads of perch or of mænæ, calcined and mixed with salt, oil, and cunila, are curative of diseases of the uterus: used as a fumigation, they bring away the afterbirth. Fat, too, of the sea-calf, melted by the agency of fire, is introduced into the nostrils of females when swooning from hysterical suffocations; and for a similar purpose, the rennet of that animal is applied as a pessary, in wool.

The pulmo marinus, attached to the body as an amulet, is an excellent promoter of menstruation; an effect which is equally produced by pounding live sea-urchins, and taking them in sweet wine. River-crabs, bruised in wine, and taken internally, arrest menstruation. The silurus, that of Africa more particularly, used as a fumigation, facilitates parturition, it is said. Crabs, taken in water, arrest menstruation; but used with hyssop, they act as an emmenagogue, we are told. In cases, too, where the infant is in danger of suffocation at the moment of delivery, a similar drink, administered to the mother, is highly efficacious. Crabs, too, either fresh or dried, are taken in drink, for the purpose of preventing abortion. Hippocrates prescribes them as a promoter of menstruation, and as an expellent of the dead fœtus, beaten up with five roots of lapathum and rue and some soot, and administered in honied wine. Crabs, boiled and taken in their liquor, with lapathum and parsley, promote the menstrual discharge, and increase the milk. In cases of fever, attended with pains in the head and throbbing of the eyes, crabs are said to be highly beneficial to females, given in astringent wine.

Castoreum, taken in honied wine, is useful as a promoter of menstruation: in cases of hysterical suffocation, it is given to the patient to smell at with pitch and vinegar, or else it is made up into tablets and used as a pessary. For the purpose also of bringing away the afterbirth it is found a useful plan to employ castoreum with panax, in four cyathi of wine; and in cases where the patient is suffering from cold, in doses of three oboli. If, however, a female in a state of pregnancy should happen to step over castoreum, or over the beaver itself, abortion, it is said, will be the sure result: so, too, if castoreum is only

held over a pregnant woman's head, there will be great danger of miscarriage.

There is a very marvellous fact, too, that I find stated in reference to the torpedo: if it is caught at the time that the moon is in Libra, and kept in the open air for three days, it will always facilitate parturition, as often as it is introduced into the apartment of a woman in labour. The sting, too, of the pastinaca, attached to the navel, is generally thought to have the property of facilitating delivery: it must be taken, however, from the fish while alive; which done, the fish must be returned to the sea. I find it stated by some authorities that there is a substance called "ostraceum," which is also spoken of as "onyx" by others; that, used as a fumigation, it is wonderfully beneficial for suffocations of the uterus; that in smell it resembles castoreum, and is still more efficacious, if burnt with this last substance; and that in a calcined state it has the property of healing inveterate ulcers, and cancerous sores of a malignant nature. As to carbuncles and carcinomatous sores upon the secret parts of females, there is nothing more efficacious, it is said, than a female crab beaten up, just after full moon, with flower of salt and applied with water.

Detailed table of contents

CHAP. 47.

METHODS OF REMOVING SUPERFLUOUS HAIR. DEPILATORIES.

Depilatories are prepared from the blood, gall, and liver of the tunny, either fresh or preserved; as also from pounded liver of the same fish, preserved with cedar resin in a leaden box; a re- cipe which we find given by the midwife Salpe for disguising the age of boys on sale for slaves. A similar property belongs to the pulmo marinus, to the blood and gall of the sea-hare, and to the sea-hare itself, stifled in oil. The same, too, with ashes of burnt crabs or sea scolopendræ, mixed with oil; sea-nettles, bruised in squill vinegar; and brains of the torpedo applied with alum on the sixteenth day of the moon. The thick matter emitted by the small frogs, which we have described when treating of eye-diseases, is a most efficient depilatory, if applied fresh: the same, too, with the frog itself, dried and pounded, and then boiled down to one-third in three heminæ of water, or else boiled in a copper vessel with oil in a like proportion. Others, again, prepare a depilatory from fifteen frogs, in manner already stated under the head of remedies for the eyes. Leeches, also, grilled in an earthen vessel, and applied with vinegar, have the same property as a depilatory; the very odour, too, which attaches to the persons who thus burn them is singularly efficacious for killing bugs. Cases are to be found, too, where persons have used castoreum with honey, for many days together, as a depilatory. In the case, however, of every depilatory, the hairs should always be removed before it is applied.

Detailed table of contents

CHAP. 48.

REMEDIES FOR THE DISEASES OF INFANTS.

Dentition in infants is promoted, and the gums greatly relieved, by rubbing them with ashes of a dolphin's teeth, mixed with honey, or else by touching the gums with the tooth itself of that fish. One of these teeth, worn as an amulet, is a preventive of sudden frights; the tooth of the dog-fish being also possessed of a similar property. As to ulcers which make their appearance in the ears, or in any other parts of the body, they may be cured by applying the liquor of river-crabs, with barley-meal. These crabs, too, bruised in oil and employed as a friction, are very useful for other kinds of maladies. A sponge moistened with cold water from time to time, or a frog applied, the back part to the head, is a most efficacious cure for siriasis in infants. When the frog is removed, it will be found quite dry, they say.

CHAP. 49.

METHODS OF PREVENTING INTOXICATION. THE FISH CALLED RUBELLIO: ONE REMEDY. THE EEL: ONE REMEDY. THE GRAPE-FISH: ONE REMEDY.

A surmullet stifled in wine; the fish called “rubellio;” or a couple of eels similarly treated; or a grapefish, left to putrefy in wine, all of them, produce an aversion to wine in those who drink thereof.

Detailed table of contents

CHAP. 50.

ANTAPHRODISIACS AND APHRODISIACS. THE HIPPOPOTAMUS: ONE REMEDY.
THE CROCODILE: ONE REMEDY.

In the number of antaphrodisiacs, we have the echeneïs; the skin from the left side of the forehead of the hippopotamus, attached to the body in lamb-skin; and the gall of a live torpedo, applied to the generative organs.

The following substances act as aphrodisiacs — the flesh of river-snails, preserved in salt and given to drink in wine; the erythinus taken as food; the liver of the frog called “diopetes” or “calamites” attached to the body in a small piece of crane’s skin; the eye-tooth of a crocodile, attached to the arm; the hippocampus; and the sinews of a bramble-frog, worn as an amulet upon the right arm. A bramble-frog, attached to the body in a piece of fresh sheep-skin, effectually puts an end to love.

Detailed table of contents

CHAP. 51.

REMEDIES FOR THE DISEASES OF ANIMALS.

A decoction of frogs in water, reduced to the form of a lini- ment, is curative of itch-scab in horses; indeed, it is said, that a horse, when once treated in this manner, will never again be attacked with the disease. Salpe says that if a live frog is given to dogs in their mess, they will lose the power of barking.

Detailed table of contents

CHAP. 52.

OTHER AQUATIC PRODUCTIONS. ADARCA OR CALAMOCHNOS: THREE
REMEDIES. REEDS: EIGHT REMEDIES. THE INK OF THE SÆPIA.

Among the aquatic productions ought also to be mentioned calamochnos, in Latin known as “adarea,” a substance which collects about small reeds, from a mixture of the foam of fresh and of sea water. It possesses certain caustic properties, and hence it is that it is so useful as an ingredient in “acopa” and as a remedy for cold shiverings; it is used too, for removing freckles upon the face of females. And now we are speaking of adarca, the reed ought equally to be mentioned. The root of that known as the “phragmites,” pounded fresh, is curative of sprains, and, applied topically with vinegar, removes pains in the spine. The calcined bark, too, of the Cyprian reed, known as the “donax,” is curative of alopecia and inveterate ulcers; and its leaves are good for the extraction of foreign bodies adhering to the flesh, and for the cure of erysipelas: should, however, the flower of the panicle happen to enter the ears, deafness is the consequence.

The ink of the sæpia is possessed of such remarkable potency, that if it is put into a lamp, Anaxilaüs tells us, the light will become entirely changed, and all present will look as black as Æthiopians. The bramble-frog, boiled in water, and given to swine with their drink, is curative of the maladies with which they are affected; an effect equally produced by the ashes of any other kind of frog. If wood is rubbed with the pulmo marinus, it will have all the appearance of being on fire; so much so, indeed, that a walking-stick, thus treated, will light the way like a torch.

Detailed table of contents

CHAP. 53. (11.)

THE NAMES OF ALL THE ANIMALS THAT EXIST IN THE SEA, ONE HUNDRED
AND SEVENTY-SIX IN NUMBER.

Having now completed our exposition of the properties which belong to the aquatic productions, it would appear by no means foreign to my purpose to give a list of the various animated beings which inhabit the seas; so many as these are in number, of such vast extent, and not only making their way into the interior of the land to a distance of so many miles, but also surrounding the exterior of it to an extent almost equal to that of the world itself. These animals, it is generally considered, embrace one hundred and seventy-six different species, and it will be my object to set them forth, each by its distinct name, a thing that cannot possibly be done in reference to the terrestrial animals and the birds.

For, in fact, we are by no means acquainted with all the wild beasts or all the birds that are to be found in India, Æthiopia, Scythia, or the desert regions of the earth; and even of man himself there are numerous varieties, which as yet we have been unable to make ourselves acquainted with. In addition, too, to the various countries above mentioned, we have Taprobane and other isles of the Ocean, about which so many fabulous stories are related. Surely then, every one must allow that it is quite impossible to comprise every species of animal in one general view for the information of mankind. And yet, by Hercules! in the sea and in the Ocean, vast as it is, there exists nothing that is unknown to us, and, a truly marvellous fact, it is with those things which Nature has concealed in the deep that we are the best acquainted!

To begin then with the monsters that are found in this element. We here find sea-trees, physeters, balænæ, pistrices, tritons, nereids, elephants, the creatures known as seamen, sea-wheels, oreæ, sea-rams, musculi, other fish too with the form of rams, dolphins, sea-calves, so celebrated by Homer, tortoises to minister to our luxury, and beavers, so extensively employed in medicine, to which class belongs the otter, an animal which we nowhere find frequenting the sea, it being only of the marine animals that we are speaking. There are dog-fish, also, drinones, cornutæ, swordfish, saw-fish, hippopotami and crocodiles, common to the sea, the land, and the rivers; tunnies also, thynnides, siluri, coracini, and perch, common to the sea only and to rivers.

To the sea only, belong also the acipenser, the dorade, the asellus, the acharne, the aphyæ, the alopex, the eel, the araneus, the boca, the batia, the bacchus, the batrachus, the belonæ, known to us as "aculeati," the balanus, the corvus, the citharus, the least esteemed of all the turbot, the chalcis, the cobio, the callarias, which would belong to the genus of the aselli were it not smaller; the colias, otherwise known as the fish of Parium or of Sexita, this last from a place of that name in Bætica its native region, the smallest, too, of the lacerti; the colias of the Mæotis, the next smallest of the lacerti; the

cybium, (the name given, when cut into pieces, to the pelamis which returns at the end of forty days from the Euxine to the Palus Mæotis); the cordyla — which is also a small pelamis, so called at the time when it enters the Euxine from the Palus Mæotis — the cantharus, the callionymus or uranoscopus, the cinædus, the only fish that is of a yellow colour; the cnide, known to us as the sea-nettle; the different kinds of crabs, the striated chemæ, the smooth chemæ, the chemæ belonging to the genus of pelorides, all differing in the variety of their colours and in the roundness of the shells; the chemæ glycymerides, still larger than the pelorides; the coluthia or coryphia; the various kinds of shellfish, among which we find the pearl oysters, the cochleæ, (belonging to which class are the pentadactyli,) the helices, by some known as actinophori, the spokes on whose shells are used for musical purposes; and, in addition to these, the round cochleæ, the shells of which are used in measuring oil, as also the seacucumber, the cynopos, the cammarus, and the cynosdextra.

Next to these we have the sea-dragon, a fish which, according to some, is altogether distinct from the dracunculus, and resembles the gerricula in appearance, it having on the gills a stickle which points towards the tail and inflicts a wound like that of the scorpion when the fish is handled — the erythinus, the echeneis, the sea-urchin, the sea-elephant, a black kind of crayfish, with four forked legs, in addition to two arms with double joints, and furnished, each of them, with a pair of claws, indented at the edge; the faber, also, or zæus, the glauciscus, the glanis, the gonger, the gerres, the galeos, the garos, the hippos, the hippuros, the hirundo, the halipleumon, the hippocampus, the hepar, the ictinus and the iulis. There are various kinds also of lacerti, the springing loligo, the crayfish, the lantern-fish, the lepas, the larinus, the sea-hare, and the sea-lion, with arms like those of the crab, and in the other parts of the body like the cray-fish.

We have the surmullet also, the sea black-bird, highly esteemed among the rock-fish; the mullet, the melanurus, the mæna, the mæotis, the muræna, the mys, the mitulus, the myiscus, the murex, the oculata, the ophidion, the oyster, the otia, the orcynus — the largest of all the pelamides and one that never returns to the Palus Mæotis, like the tritonus in appearance, and best when old — the orbis, the orthagoriscus, the phager, the phycis a rock-fish, the pelamis, (the largest kind of which is called “apolectum,” and is tougher than the tritonus) the sea-pig, the phthir, the sea-sparrow, the pastinaca, the several varieties of the polyp, the scallop, which is larger and more swarthy in summer than at other times, and the most esteemed of which are those of Mitylene, Tyndaris, Salonæ, Altinum, the island of Chios, and Alexandria in Egypt; the small scallop, the purple, the pegris, the pinna, the pinnotheres, the rhine or squalus of the Latins, the turbot, the scarus a fish which holds the first rank at the present day; the sole, the sargus, the squilla, the sarda — such being the name of an elongated pelamis which comes from the Ocean; the scomber, the salpa, the sorus, the scorpæna, the sea-scorpion, the solas, the sciæna, the sciadeus, the scolopendra, the smyrus, the sæpia, the strombus, the

solen, otherwise known as the aulos, donax, onyx or dactylus; the spondylus, the smaris, the starfish, and the sponges. There is the sea-thrush also, famous among the rock-fish, the thynnus, the thranus, by some writers known as the xiphias; the thrissa, the torpedo, the tethea, the tritonus, a large kind of pelamis, which admits of being cut into three cybia; the shells of Venus, the grapefish, and the xiphias.

CHAP. 54.

ADDITIONAL NAMES OF FISHES FOUND IN THE POEM OF OVID.

To the above enumeration we will add some names given in the poem of Ovid, which are not to be found in any other writer: species, however, which are probably peculiar to the Euxine, on the shores of which he commenced that work towards the close of his life. The fishes thus mentioned by him are the sea-ox, the cercyrus, that dwells among the rocks, the orphus, the red erythinus, the iulus, the tinted mormyr, the chrysophrys a fish of a golden colour, the parus, the tragus, the melanurus remarkable for the beauty of its tail, and the epodes, a flat fish.

In addition to these remarkable kinds of fishes, the same poet tells us that the channes conceives of itself, that the glaucus never makes its appearance in summer, that the pompilus always accompanies vessels in their course, and that the chromis makes its nest in the water. The helops, he says, is unknown to our waters; from which it would appear that those are in error who look upon it as identical with our acipenser. Many persons have given the preference to the helops before all other fish, in point of flavour.

There are several fishes also, which have been mentioned by no author; such, for instance, as the one called “sudis” by the Latins, and “sphyrene” by the Greeks, names which indicate the peculiar form of its muzzle. It is one of the very largest kinds, but rarely found, and by no means of inferior flavour. “Perna,” too, is the name given to a kind of shellfish, found in vast numbers in the vicinity of the islands of the Euxine. These fish are found firmly planted in the sand, resembling in appearance the long shank of a hog. Opening wide their shells, where there is sufficient space, they lie in wait for their prey; this opening being not less than a foot in breadth, and the edges of it garnished around with teeth closely set, much resembling the teeth of a comb in form. Within the shell, the meat consists of a vast lump of flesh. I once saw, too, a fish called the “hyæna,” which had been caught off the island of Ænaria.

In addition to these animals, there are certain excretions thrown up by the sea, which do not merit any further notice, and indeed ought to be reckoned among the sea-weeds, rather than looked upon as animated beings.

SUMMARY. — Remedies, narratives, and observations, nine hundred and ninety.

ROMAN AUTHORS QUOTED. — Licinius Macer, Trebius Niger, Sextius Niger who wrote in Greek, the Poet Ovid, Cassius Hemina, Mæcenas, Iacchus, Sornatius.

FOREIGN AUTHORS QUOTED. — Juba, Andreas, Salpe, Apion, Pelops, Apelles, Thrasyllus, Nicander.

BOOK XXXIII. THE NATURAL HISTORY OF METALS.

Detailed table of contents

CHAP. 1. (1.)

METALS.

WE are now about to speak of metals, of actual wealth, the standard of comparative value, objects for which we diligently search, within the earth, in numerous ways. In one place, for instance, we undermine it for the purpose of obtaining riches, to supply the exigencies of life, searching for either gold or silver, electrum or copper. In another place, to satisfy the requirements of luxury, our researches extend to gems and pigments, with which to adorn our fingers and the walls of our houses: while in a third place, we gratify our rash propensities by a search for iron, which, amid wars and carnage, is deemed more acceptable even than gold. We trace out all the veins of the earth, and yet, living upon it, undermined as it is beneath our feet, are astonished that it should occasionally cleave asunder or tremble: as though, forsooth, these signs could be any other than expressions of the indignation felt by our sacred parent! We penetrate into her entrails, and seek for treasures in the abodes even of the Manes, as though each spot we tread upon were not sufficiently bounteous and fertile for us!

And yet, amid all this, we are far from making remedies the object of our researches: and how few in thus delving into the earth have in view the promotion of medicinal knowledge! For it is upon her surface, in fact, that she has presented us with these substances, equally with the cereals, bounteous and ever ready, as she is, in supplying us with all things for our benefit! It is what is concealed from our view, what is sunk far beneath her surface, objects, in fact, of no rapid formation, that urge us to our ruin, that send us to the very depths of hell. As the mind ranges in vague speculation, let us only consider, proceeding through all ages, as these operations are, when will be the end of thus exhausting the earth, and to what point will avarice finally penetrate! How innocent, how happy, how truly delightful even would life be, if we were to desire nothing but what is to be found upon the face of the earth; in a word, nothing but what is provided ready to our hands!

[Detailed table of contents](#)

CHAP. 2.

GOLD.

Gold is dug out of the earth, and, in close proximity to it, chrysocola, a substance which, that it may appear all the more precious, still retains the name which it has borrowed from gold. It was not enough for us to have discovered one bane for the human race, but we must set a value too upon the very humours of gold. While avarice, too, was on the search for silver, it congratulated itself upon the discovery of minium, and devised a use to be made of this red earth.

Alas for the prodigal inventions of man! in how many ways have we augmented the value of things! In addition to the standard value of these metals, the art of painting lends its aid, and we have rendered gold and silver still more costly by the art of chasing them. Man has learned how to challenge both Nature and art to become the incitements to vice! His very cups he has delighted to engrave with libidinous subjects, and he takes pleasure in drinking from vessels of obscene form! But in lapse of time, the metals passed out of fashion, and men began to make no account of them; gold and silver, in fact, became too common. From this same earth we have extracted vessels of murrhine and vases of crystal, objects the very fragility of which is considered to enhance their value. In fact, it has come to be looked upon as a proof of opulence, and as quite the glory of luxury, to possess that which may be irremediably destroyed in an instant. Nor was even this enough; — we now drink from out of a mass of gems, and we set our goblets with smaragdi; we take delight in possessing the wealth of India, as the promoter of intoxication, and gold is now nothing more than a mere accessory.

CHAP. 3.

WHAT WAS THE FIRST RECOMMENDATION OF GOLD.

Would that gold could have been banished for ever from the earth, accursed by universal report, as some of the most celebrated writers have expressed themselves, reviled by the reproaches of the best of men, and looked upon as discovered only for the ruin of mankind. How much more happy the age when things themselves were bartered for one another; as was the case in the times of the Trojan war, if we are to believe what Homer says. For, in this way, in my opinion, was commerce then carried on for the supply of the necessities of life. Some, he tells us, would make their purchases by bartering ox-hides, and others by bartering iron or the spoil which they had taken from the enemy: and yet he himself, already an admirer of gold, was so far aware of the relative value of things, that Glaucus, he informs us, exchanged his arms of gold, valued at one hundred oxen, for those of Diomedes, which were worth but nine. Proceeding upon the same system of barter, many of the fines imposed by ancient laws, at Rome even, were levied in cattle, [and not in money].

CHAP. 4.

THE ORIGIN OF GOLD RINGS.

The worst crime against mankind was committed by him who was the first to put a ring upon his fingers: and yet we are not informed, by tradition, who it was that first did so. For as to all the stories told about Prometheus, I look upon them as utterly fabulous, although I am aware that the ancients used to represent him with a ring of iron: it was their intention, however, to signify a chain thereby, and not an ornament. As to the ring of Midas, which, upon the collet being turned inwards, conferred invisibility upon the wearer, who is there that must not admit, perforce, that this story is even still more fabulous? It was the hand, and a sinister hand, too, in every sense, that first brought gold into such high repute: not a Roman hand, however, for upon that it was the practice to wear a ring of iron only, and solely as an indication of warlike prowess.

As to the usage followed by the Roman kings, it is not easy to pronounce an opinion: the statue of Romulus in the Capitol wears no ring, nor does any other statue — not that of L. Brutus even — with the sole exception of those of Numa and Servius Tullius. I am surprised at this absence of the ring, in the case of the Tarquiniæ more particularly, seeing that they were originally from Greece, a country from which the use of gold rings was first introduced; though even at the present day the people of Lacedæmon are in the habit of wearing rings made of iron. Tarquinius Priscus, however, it is well known, was the first who presented his son with the golden bulla, on the occasion of his slaying an enemy before he had laid aside the prætexta; from which period the custom of wearing the bulla has been continued, a distinction confined to the children of those who have served in the cavalry, those of other persons simply wearing a leather thong. Such being the case, I am the more surprised that the statue of this Tarquinius should be without a ring.

And yet, with reference to the very name of the ring, I find that there has been considerable uncertainty. That given to it originally by the Greeks is derived from the finger; while our ancestors styled it “ungulus;” and in later times both Greeks and Latins have given it the name of “symbolum.” For a great length of time, it is quite clear, not even the Roman senators wore rings of gold: for rings were given, and at the public expense, to those only who were about to proceed on an embassy to foreign nations, the reason being, I suppose, because men of highest rank among foreign nations were perceived to be thus distinguished. Nor was it the practice for any person to wear these rings, except those who for this reason had received them at the public expense; and in most instances, it was without this distinction that the Roman generals celebrated their public triumphs. For whereas an Etruscan crown of gold was supported from behind over the head of the victor, he himself,

equally with the slave probably, who was so supporting the crown, had nothing but a ring of iron upon his finger. It was in this manner that C. Marius celebrated his triumph over Jugurtha; and he never assumed the golden ring, it is said, until the period of his third consulship. Those, too, who had received golden rings on the occasion of an embassy, only wore them when in public, resuming the ring of iron when in their houses. It is in pursuance of this custom that even at the present day, an iron ring is sent by way of present to a woman when betrothed, and that, too, without any stone in it.

For my own part, I do not find that any rings were used in the days of the Trojan War; at all events, Homer nowhere makes mention of them; for although he speaks of the practice of sending tablets by way of letter, of clothes and gold and silver plate being kept laid up in chests, still he gives us to understand that they were kept secure by the aid of a knot tied fast, and not under a seal impressed by a ring. He does not inform us too, that when the chiefs drew lots to ascertain which one of them should reply to the challenge of the enemy, they made any use of rings for the purpose; and when he enumerates the articles that were manufactured at the forge of the gods, he speaks of this as being the origin of fibulæ and other articles of female ornament, such as earrings for example, but does not make any mention of rings.

Whoever it was that first introduced the use of rings, he did so not without hesitation; for he placed this ornament on the left hand, the hand which is generally concealed, whereas, if he had been sure of its being an honourable distinction, it would have been made more conspicuous upon the right. And if any one should raise the objection that this would have acted as an impediment to the right hand, I can only say that the usage in more recent times fortifies my opinion, and that the inconvenience of wearing rings on the left hand would have been still greater, seeing that it is with the left hand that the shield is held. We find mention made too, in Homer, of men wearing gold plaited with the hair; and hence it is that I am at a loss to say whether the practice first originated with females.

Detailed table of contents

CHAP. 5.

THE QUANTITY OF GOLD POSSESSED BY THE ANCIENTS.

At Rome, for a long period of time, the quantity of gold was but very small. At all events, after the capture of the City by the Gauls, when peace was about to be purchased, not more than one thousand pounds' weight of gold could be collected. I am by no means unaware of the fact that in the third consulship of Pompeius there was lost from the throne of Jupiter Capitolinus two thousand pounds' weight of gold, originally placed there by Camillus; a circumstance which has led most persons to suppose, that two thousand pounds' weight was the quantity then collected. But in reality, this excess of one thousand pounds was contributed from the spoil taken from the Gauls, amplified as it was by the gold of which they had stripped the temples, in that part of the City which they had captured.

The story of Torquatus, too, is a proof that the Gauls were in the habit of wearing ornaments of gold when engaged in combat; from which it would appear that the sum taken from the Gauls themselves, and the amount of which they had pillaged the temples, were only equal to the amount of gold collected for the ransom, and no more; and this is what was really meant by the response given by the augurs, that Jupiter Capitolinus had rendered again the ransom twofold. As we were just now speaking on the subject of rings, it may be as well to add, by way of passing remark, that upon the officer in charge of the Temple of Jupiter Capitolinus being arrested, he broke the stone of his ring between his teeth, and expired upon the spot, thus putting an end to all possibility of discovering the perpetrator of the theft.

It appears, therefore, that in the year of the City 364, when Rome was captured by the Gauls, there was but two thousand pounds' weight of gold, at the very most; and this, too, at a period when, according to the returns of the census, there were already one hundred and fifty-two thousand five hundred and seventy-three free citizens in it. In this same city, too, three hundred and seven years later, the gold which C. Marius the younger conveyed to Præneste from the Temple of the Capitol when in flames, and all the other shrines, amounted to thirteen thousand pounds' weight, such being the sum that figured in the inscriptions at the triumph of Sylla; on which occasion it was displayed in the procession, as well as six thousand pounds' weight of silver. The same Sylla had, the day before, displayed in his triumph fifteen thousand pounds' weight of gold, and one hundred and fifteen thousand pounds' weight of silver, the fruit of all his other victories.

CHAP. 6.

THE RIGHT OF WEARING GOLD RINGS.

It does not appear that rings were in common use before the time of Cneius Flavius, the son of Annius. This Flavius was the first to publish a table of the days for pleading, which till then the populace had to ascertain each day from a few great personages. The son of a freedman only, and secretary to Appius Cæcus, (at whose request, by dint of natural shrewdness and continual observation, he had selected these days and made them public), he obtained such high favour with the people, that he was created *curule ædile*; in conjunction with Quintus Anicius Prænestinus, who a few years before had been an enemy to Rome, and to the exclusion of C. Pœtilius and Domitius, whose fathers respectively were of consular rank. The additional honour was also conferred on Flavius, of making him *tribune of the people* at the same time, a thing which occasioned such a degree of indignation, that, as we find stated in the more ancient Annals, “the rings were laid aside!”

Most persons, however, are mistaken in the supposition that on this occasion the members of the equestrian order did the same: for it is in consequence of these additional words, “the *phaleræ*, too, were laid aside as well,” that the name of the equestrian order was added. These rings, too, as the Annals tell us, were laid aside by the nobility, and not by the whole body of the senate. This event took place in the consulship of P. Sempronius and P. Sulpicius. Flavius made a vow that he would consecrate a temple to Concord, if he should succeed in reconciling the privileged orders with the plebeians: and as no part of the public funds could be voted for the purpose, he accordingly built a small shrine of brass in the *Græcostasis*, then situate above the *Comitium*, with the fines which had been exacted for usury. Here, too, he had an inscription engraved upon a tablet of brass, to the effect that the shrine was dedicated two hundred and three years after the consecration of the Capitol. Such were the events that happened four hundred and forty-nine years after the foundation of the City, this being the earliest period at which we find any traces of the common use of rings.

A second occasion, however, that of the Second Punic War, shows that rings must have been at that period in very general use; for if such had not been the case, it would have been impossible for Hannibal to send the three *modii* of rings, which we find so much spoken of, to Carthage. It was through a dispute, too, at an auction about the possession of a ring, that the feud first commenced between Cæpio and Drusus, a dispute which gave rise to the Social War, and the public disasters which thence ensued. Not even in those days, however, did all the senators possess gold rings, seeing that, in the memory of our grandsires, many personages who had even filled the *prætorship*, wore rings of iron to the end of their lives; Calpurnius, for

example, as Fenestella tells us, and Manilius, who had been legatus to Caius Marius in the Jugurthine War. Many historians also state the same of L. Fufidius, he to whom Scaurus dedicated the history of his life.

In the family of the Quintii, it is the usage for no one, not the females even, ever to wear a ring; and even at the present day, the greater part of the nations known to us, peoples who are living under the Roman sway, are not in the habit of wearing rings. Neither in the countries of the East, nor in Egypt, is any use made of seals, the people being content with simple writing only.

In this, as in every other case, luxury has introduced various fashions, either by adding to rings gems of exquisite brilliancy, and so loading the fingers with whole revenues, as we shall have further occasion to mention in our Book on Gems; or else by engraving them with various devices: so that it is in one instance the workmanship, in another the material, that constitutes the real value of the ring. Then again, in the case of other gems, luxury has deemed it no less than sacrilege to make a mark even upon them, and has caused them to be set whole, that no one may suppose that the ring was ever intended to be employed as a signet. In other instances, luxury has willed that certain stones, on the side even that is concealed by the finger, should not be closed in with gold, thus making gold of less account than thousands of tiny pebbles. On the other hand again, many persons will admit of no gems being set in their rings, but impress their seal with the gold itself, an invention which dates from the reign of Claudius Cæsar. At the present day, too, the very slaves even, incase their iron rings with gold (while other articles belonging to them, they decorate with pure gold), a licence which first originated in the Isle of Samothrace, as the name given to the invention clearly shows.

It was the custom at first to wear rings on a single finger only, the one, namely, that is next to the little finger; and this we see the case in the statues of Numa and Servius Tullius. In later times, it became the practice to put rings on the finger next to the thumb, even in the case of the statues of the gods; and more recently, again, it has been the fashion to wear them upon the little finger as well. Among the peoples of Gallia and Britannia, the middle finger, it is said, is used for this purpose. At the present day, however, among us, this is the only finger that is excepted, all the others being loaded with rings, smaller rings even being separately adapted for the smaller joints of the fingers. Some there are who heap several rings upon the little finger alone; while others, again, wear but one ring upon this finger, the ring that sets a seal upon the signetring itself, this last being kept carefully shut up as an object of rarity, too precious to be worn in common use, and only to be taken from the cabinet as from a sanctuary. And thus is the wearing of a single ring upon the little finger no more than an ostentatious advertisement that the owner has property of a more precious nature under seal at home!

Some, too, make a parade of the weight of their rings, while to others it is quite a labour to wear more than one at a time: some, in their solicitude for the safety of their gems, make the hoop of gold tinsel, and fill it with a lighter

material than gold, thinking thereby to diminish the risks of a fall. Others, again, are in the habit of inclosing poisons beneath the stones of their rings, and so wear them as instruments of death; Demosthenes, for instance, that greatest of the orators of Greece. And then, besides, how many of the crimes that are stimulated by cupidity, are committed through the instrumentality of rings! How happy the times, how truly innocent, in which no seal was ever put to anything! At the present day, on the contrary, our very food even and our drink have to be preserved from theft through the agency of the ring: a result owing to those legions of slaves, those throngs of foreigners which are introduced into our houses, multitudes so numerous that we require the services of a nomenclator even, to tell us the names of our own servants. Very different was it in the times of our forefathers, when each person possessed a single servant only, one of his master's own lineage, called Marcipor or Lucipor, from his master's name, as the case might be, and taking all his meals with him in common; when, too, there was no occasion for taking precautions at home by keeping a watch upon the domestics. But at the present day, we not only procure dainties which are sure to be pilfered, but hands to pilfer them as well; and so far is it from being sufficient to have the very keys sealed, that the signet-ring is often taken from off the owner's finger while he is overpowered with sleep or lying on his death-bed.

Indeed the most important transactions of life are now made to depend upon this instrument, though at what period this first began to be the case, I am at a loss to say. It would appear, however, so far as foreign nations are concerned, that we may admit the importance attached to it, from the days of Polycrates, the tyrant of Samos, whose favourite ring, after being thrown in the sea, was recovered from a fish that was caught; and this Polycrates, we know, was put to death about the year of our City, 230. The use of the ring must, of necessity, have become greatly extended with the increase of usury; one proof of which is, the usage still prevalent among the lower classes, of whipping off the ring the moment a simple contract is made; a practice which takes its date, no doubt, from a period when there was no more expeditious method of giving an earnest on closing a bargain. We may therefore very safely conclude, that though money was first introduced among us, the use of rings was introduced very shortly after. Of money, I shall shortly have occasion to speak further.

CHAP. 7.

THE DECURIES OF THE JUDGES.

Rings, as soon as they began to be commonly worn, distinguished the second order from the plebeians, in the same manner as the use of the tunic distinguished the senate from those who only wore the ring. Still, however, this last distinction was introduced at a later period only, and we find it stated by writers that the public heralds even were formerly in the habit of wearing the tunic with the purple laticlave; the father of Lucius Ælius Stilo, for instance, from whom his son received the cognomen of “Præconinus,” in consequence of his father’s occupation as a herald. But the use of rings, no doubt, was the distinguishing mark of a third and intermediate order, between the plebeians and the senators; and the title of “eques,” originally derived from the possession of a war-horse, is given at the present day as an indication of a certain amount of income. This, however, is of comparatively recent introduction; for when the late Emperor Augustus made his regulations for the decuries, the greater part of the members thereof were persons who wore iron rings, and these bore the name, not of “equites,” but of “judices,” the former name being reserved solely for the members of the squadrons furnished with war-horses at the public charge.

Of these judices, too, there were at first but four decuries only, and in each of these decuries there was hardly one thousand men to be found, the provinces not having been hitherto admitted to the office; an observance which is still in force at the present day, no one newly admitted to the rights of citizenship being allowed to perform the duties of judex as a member of the decuries.

(2.) These decuries, too, were themselves distinguished by several denominations—“tribunes of the treasury,” “selecti,” and “judices:” in addition to whom, there were the persons styled the “nine hundred,” chosen from all the decuries for the purpose of keeping the voting-boxes at the comitia. From the ambitious adoption, however, of some one of these names, great divisions ensued in this order, one person styling himself a member of the nine hundred, another one of the selecti, and a third a tribune of the treasury.

Detailed table of contents

CHAP. 8.

PARTICULARS CONNECTED WITH THE EQUESTRIAN ORDER.

At length, however, in the ninth year of the reign of the Emperor Tiberius, the equestrian order was united in a single body; and a decree was passed, establishing to whom belonged the right of wearing the ring, in the consulship of C. Asinius Pollio and C. Antistius Vetus, the year from the foundation of the City, 775. It is a matter for surprise, how almost futile, we may say, was the cause which led to this change. C. Sulpicius Galba, desirous in his youth to establish his credit with the Emperor by hunting out grounds for prosecuting the keepers of victualling-houses, made complaint in the senate that the proprietors of those places were in the habit of protecting themselves from the consequences of their guilt by their plea of wearing the golden ring. For this reason, an ordinance was made that no person whatsoever should have this right of wearing the ring, unless, freeborn himself as regarded his father and paternal grandfather, he should be assessed by the censors at four hundred thousand sesterces, and entitled, under the Julian Law, to sit in the fourteen tiers of seats at the theatre. In later times, however, people began to apply in whole crowds for this mark of rank; and in consequence of the diversities of opinion which were occasioned thereby, the Emperor Caius added a fifth decury to the number. Indeed to such a pitch has conceit now arisen, that whereas, under the late Emperor Augustus, the decuries could not be completed, at the present day they will not suffice to receive all the members of the equestrian order, and we see in every quarter persons even who have been but just liberated from slavery, making a leap all at once to the distinction of the golden ring: a thing that never used to happen in former days, as it was by the ring of iron that the equites and the judices were then to be recognized.

Indeed, so promiscuously was this privilege at last conferred, that Flavius Proculus, one of the equites, informed against four hundred persons on this ground, before the Emperor Claudius, who was then censor: and thus we see, an order, which was established as a mark of distinction from other private individuals of free birth, has been shared in common with slaves !

The Gracchi were the first to attach to this order the separate appellation of “judices,” their object being at the same moment a seditious popularity and the humiliation of the senate. After the fall of these men, in consequence of the varying results of seditious movements, the name and influence of the equestrian order were lost, and became merged in those of the publicani, who, for some time, were the men that constituted the third class in the state. At last, however, Marcus Cicero, during his consulship, and at the period of the Catilinarian troubles, re-established the equestrian name, it being his vaunt that he himself had sprung from that order, and he, by certain acts of

popularity peculiar to himself, having conciliated its support. Since that period, it is very clear that the equites have formed the third body in the state, and the name of the equestrian order has been added to the formula— “The Senate and People of Rome.” Hence it is, too, that at the present day even, the name of this order is written after that of the people, it being the one that was the last instituted.

Detailed table of contents

CHAP. 9.

HOW OFTEN THE NAME OF THE EQUESTRIAN ORDER HAS BEEN CHANGED.

Indeed, the name itself of the equites even, has been frequently changed, and that too, in the case of those who only owed their name to the fact of their service on horseback. Under Romulus and the other kings, the equites were known as “Celeres,” then again as “Flexuntēs,” and after that as “Trossuli,” from the fact of their having taken a certain town of Etruria, situate nine miles on this side of Volsinii, without any assistance from the infantry; a name too which survived till after the death of C. Gracchus.

At all events, in the writings left by Junius, who, from his affection for C. Gracchus, took the name of Gracchanus, we find the following words— “As regards the equestrian order, its members were formerly called ‘Trossuli,’ but at the present day they have the name of ‘Equites;’ because it is not understood what the appellation ‘Trossuli’ really means, and many feel ashamed at being called by that name.” — He then goes on to explain the reason, as above mentioned, and adds that, though much against their will, those persons are still called “Trossuli.”

CHAP. 10.

GIFTS FOR MILITARY SERVICES, IN GOLD AND SILVER.

There are also some other distinctions connected with gold, the mention of which ought not to be omitted. Our ancestors, for instance, presented tores of gold to the auxiliaries and foreign troops, while to Roman citizens they only granted silver ones: bracelets too, were given by them to citizens, but never to foreigners.

Detailed table of contents

CHAP. 11.

AT WHAT PERIOD THE FIRST CROWN OF GOLD WAS PRESENTED.

But, a thing that is more surprising still, crowns of gold were given to the citizens as well. As to the person who was first presented with one, so far as I have enquired, I have not been able to ascertain his name: L. Piso says, however, that the Dictator A. Posthumius was the first who conferred one: on taking the camp of the Latins at Lake Regillus, he gave a crown of gold, made from the spoil, to the soldier whose valour had mainly contributed to this success. L. Lentulus, also, when consul, presented one to Servius Cornelius Merenda, on taking a town of the Samnites; but in his case it was five pounds in weight. Piso Frugi, too, presented his son with a golden crown, at his own private expense, making it a specific legacy in his will.

CHAP. 12. (3.)

OTHER USES MADE OF GOLD, BY FEMALES.

To honour the gods at their sacrifices, no greater mark of honour has been thought of than to gild the horns of the animals sacrificed — that is, of the larger victims only. But in warfare, this species of luxury made such rapid advances, that in the Epistles of M. Brutus from the Plains of Philippi, we find expressions of indignation at the fibulæ of gold that were worn by the tribunes. Yes, so it is, by Hercules! and yet you, the same Brutus, have not said a word about women wearing gold upon their feet; while we, on the other hand, charge him with criminality who was the first to confer dignity upon gold by wearing the ring. Let men even, at the present day, wear gold upon the arms in form of bracelets — known as “dardania,” because the practice first originated in Dardania, and called “viriolæ” in the language of the Celts, “viriaë” in that of Celtiberia, let women wear gold upon their arms and all their fingers, their necks, their ears, the tresses of their hair; let chains of gold run meandering along their sides; and in the still hours of the night let sachets filled with pearls hang suspended from the necks of their mistresses, all bedizened with gold, so that in their very sleep even they may still retain the consciousness that they are the possessors of such gems: but are they to cover their feet as well with gold, and so, between the stola of the matrons and the garb of the plebeians, establish an intermediate or equestrian order of females? Much more becomingly do we accord this distinction to our pages, and the adorned beauty of these youths has quite changed the features of our public baths.

At the present day, too, a fashion has been introduced among the men even, of wearing effigies upon their fingers representing Harpocrates and other divinities of Egypt. In the reign of Claudius, also, there was introduced another unusual distinction, in the case of those to whom was granted the right of free admission, that, namely, of wearing the likeness of the emperor engraved in gold upon a ring: a circumstance that gave rise to vast numbers of informations, until the timely elevation of the Emperor Vespasianus rendered them impossible, by proclaiming that the right of admission to the emperor belonged equally to all. Let these particulars suffice on the subject of golden rings and the use of them.

CHAP. 13.

COINS OF GOLD. AT WHAT PERIODS COPPER, GOLD, AND SILVER WERE FIRST IMPRESSED. HOW COPPER WAS USED BEFORE GOLD AND SILVER WERE COINED. WHAT WAS THE LARGEST SUM OF MONEY POSSESSED BY ANY ONE AT THE TIME OF OUR FIRST CENSUS. HOW OFTEN, AND AT WHAT PERIODS, THE VALUE OF COPPER AND OF COINED MONEY HAS BEEN CHANGED.

The next crime committed against the welfare of mankind was on the part of him who was the first to coin a denarius of gold, a crime the author of which is equally unknown. The Roman people made no use of impressed silver even before the period of the defeat of King Pyrrhus. The “as” of copper weighed exactly one libra; and hence it is that we still use the terms “libella” and “dupondius.” Hence it is, too, that fines and penalties are inflicted under the name of “æs grave,” and that the words still used in keeping accounts are “expensa,” “impendia,” and “dependere.” Hence, too, the word “stipendium,” meaning the pay of the soldiers, which is nothing more than “stipis pondera;” and from the same source those other words, “dispensatores” and “libripendes.” It is also from this circumstance that in sales of slaves, at the present day even, the formality of using the balance is introduced.

King Servius was the first to make an impress upon copper. Before his time, according to Timæus, at Rome the raw metal only was used. The form of a sheep was the first figure impressed upon money, and to this fact it owes its name, “pecunia.” The highest figure at which one man’s property was assessed in the reign of that king was one hundred and twenty thousand asses, and consequently that amount of property was considered the standard of the first class.

Silver was not impressed with a mark until the year of the City 485, the year of the consulship of Q. Ogulnius and C. Fabius, five years before the First Punic War; at which time it was ordained that the value of the denarius should be ten libræ of copper, that of the quinarius five libræ, and that of the sestertius two libræ and a half. The weight, however, of the libra of copper was diminished during the First Punic War, the republic not having means to meet its expenditure: in consequence of which, an ordinance was made that the as should in future be struck of two ounces weight. By this contrivance a saving of five-sixths was effected, and the public debt was liquidated. The impression upon these copper coins was a two-faced Janus on one side, and the beak of a ship of war on the other: the triens, however, and the quadrans, bore the impression of a ship. The quadrans, too, had, previously to this, been called “teruncius,” as being three uncia in weight. At a later period again, when Hannibal was pressing hard upon Rome, in the dictatorship of Q. Fabius Maximus, asses of one ounce weight were struck, and it was ordained that the value of the denarius should be sixteen asses, that of the quinarius eight asses, and that of the sestertius four asses; by which last reduction of the weight of

the as the republic made a clear gain of one half. Still, however, so far as the pay of the soldiers is concerned, one denarius has always been given for every ten asses. The impressions upon the coins of silver were two-horse and four-horse chariots, and hence it is that they received the names of “bigati” and “quadrigati.”

Shortly after, in accordance with the Law of Papirius, asses were coined weighing half an ounce only. Livius Drusus, when tribune of the people, alloyed the silver with one-eighth part of copper. The coin that is known at the present day as the “victoriatus,” was first struck in accordance with the Clodian Law: before which period, a coin of this name was imported from Illyricum, but was only looked upon as an article of merchandize. The impression upon it is a figure of Victory, and hence its name.

The first golden coin was struck sixty-two years after that of silver, the scruple of gold being valued at twenty sesterces; a computation which gave, according to the value of the sesterce then in use, nine hundred sesterces to each libra of gold. In later times, again, an ordinance was made, that denarii of gold should be struck, at the rate of forty denarii to each libra of gold; after which period, the emperors gradually curtailed the weight of the golden denarius, until at last, in the reign of Nero, it was coined at the rate of forty-five to the libra.

CHAP. 14.

CONSIDERATIONS ON MAN'S CUPIDITY FOR GOLD.

But the invention of money opened a new field to human avarice, by giving rise to usury and the practice of lending money at interest, while the owner passes a life of idleness: and it was with no slow advances that, not mere avarice only, but a perfect hunger for gold became inflamed with a sort of rage for acquiring: to such a degree, in fact, that Septimuleius, the familiar friend of Caius Gracchus, not only cut off his head, upon which a price had been set of its weight in gold, but, before bringing it to Opimius, poured molten lead into the mouth, and so not only was guilty of the crime of parricide, but added to his criminality by cheating the state. Nor was it now any individual citizen, but the universal Roman name, that had been rendered infamous by avarice, when King Mithridates caused molten gold to be poured into the mouth of Aquilius the Roman general, whom he had taken prisoner: such were the results of cupidity.

One cannot but feel ashamed, on looking at those new-fangled names which are invented every now and then, from the Greek language, by which to designate vessels of silver filagreed or inlaid with gold, and the various other practices by which such articles of luxury, when only gilded, are made to sell at a higher price than they would have done if made of solid gold: and this, too, when we know that Spartacus forbade any one of his followers to introduce either gold or silver into the camp — so much more nobleness of mind was there in those days, even in our runaway slaves.

The orator Messala has informed us that Antonius the triumvir made use of golden vessels when satisfying the most humiliating wants of nature, a piece of criminality that would have reflected disgrace upon Cleopatra even! Till then, the most consummate instances of a similar licentiousness had been found among strangers only — that of King Philip, namely, who was in the habit of sleeping with a golden goblet placed beneath his pillows, and that of Hagnon of Teos, a commander under Alexander the Great, who used to fasten the soles of his sandals with nails of gold. It was reserved for Antonius to be the only one thus to impart a certain utility to gold, by putting an insult upon Nature. Oh how righteously would he himself have been proscribed! but then the proscription should have been made by Spartacus.

Detailed table of contents

CHAP. 15.

THE PERSONS WHO HAVE POSSESSED THE GREATEST QUANTITY OF GOLD AND SILVER.

For my own part, I am much surprised that the Roman people has always imposed upon conquered nations a tribute in silver, and not in gold; Carthage, for instance, from which, upon its conquest under Hannibal, a ransom was exacted in the shape of a yearly payment, for fifty years, of eight hundred thousand pounds' weight of silver, but no gold. And yet it does not appear that this could have arisen from there being so little gold then in use throughout the world. Midas and Cræsus, before this, had possessed gold to an endless amount: Cyrus, already, on his conquest of Asia, had found a booty consisting of twenty-four thousand pounds' weight of gold, in addition to vessels and other articles of wrought gold, as well as leaves of trees, a plane-tree, and a vine, all made of that metal.

It was through this conquest too, that he carried off five hundred thousand talents of silver, as well as the vase of Semiramis, the weight of which alone amounted to fifteen talents, the Egyptian talent being equal, according to Varro, to eighty of our pounds. Before this time too, Saulaces, the descendant of Æëtes, had reigned in Colchis, who, on finding a tract of virgin earth, in the country of the Suani, extracted from it a large amount of gold and silver, it is said, and whose kingdom besides, had been famed for the possession of the Golden Fleece. The golden arches, too, of his palace, we find spoken of, the silver supports and columns, and pilasters, all of which he had come into possession of on the conquest of Sesostris, king of Egypt; a monarch so haughty, that every year, it is said, it was his practice to select one of his vassal kings by lot, and yoking him to his car, celebrate his triumph afresh.

[Detailed table of contents](#)

CHAP. 16.

AT WHAT PERIOD SILVER FIRST MADE ITS APPEARANCE UPON THE ARENA AND UPON THE STAGE.

We, too, have done things that posterity may probably look upon as fabulous. Cæsar, who was afterwards dictator, but at that time ædile, was the first person, on the occasion of the funeral games in honour of his father, to employ all the apparatus of the arena in silver; and it was on the same occasion that for the first time criminals encountered wild beasts with implements of silver, a practice imitated at the present day in our municipal towns even.

At the games celebrated by C. Antonius the stage was made of silver; and the same was the case at those celebrated by L. Muræna. The Emperor Caius had a scaffold introduced into the Circus, upon which there were one hundred and twenty-four thousand pounds' weight of silver. His successor Claudius, on the occasion of his triumph over Britain, announced by the inscriptions that among the coronets of gold, there was one weighing seven thousand pounds' weight, contributed by Nearer Spain, and another of nine thousand pounds, presented by Gallia Comata. Nero, who succeeded him, covered the Theatre of Pompeius with gold for one day, the occasion on which he displayed it to Tiridates, king of Armenia. And yet how small was this theatre in comparison with that Golden Palace of his, with which he environed our city.

Detailed table of contents

CHAP. 17.

AT WHAT PERIODS THERE WAS THE GREATEST QUANTITY OF GOLD AND SILVER IN THE TREASURY OF THE ROMAN PEOPLE.

In the consulship of Sextus Julius and Lucius Aurelius, seven years before the commencement of the Third Punic War, there was in the treasury of the Roman people seventeen thousand four hundred and ten pounds' weight of uncoined gold, twenty-two thousand and seventy pounds' weight of silver, and in specie, six million one hundred and thirty-five thousand four hundred sesterces.

In the consulship of Sextus Julius and Lucius Marcius, that is to say, at the commencement of the Social War, there was in the public treasury one million six hundred and twenty thousand eight hundred and thirty-one pounds' weight of gold. Caius Cæsar, at his first entry into Rome, during the civil war which bears his name, withdrew from the treasury fifteen thousand pounds' weight in gold ingots, thirty thousand pounds' weight in uncoined silver, and in specie, three hundred thousand sesterces: indeed, at no period was the republic more wealthy. Æmilius Paulus, too, after the defeat of King Perseus, paid into the public treasury, from the spoil obtained in Macedonia, three hundred millions of sesterces, and from this period the Roman people ceased to pay tribute.

CHAP. 18.

AT WHAT PERIOD CEILINGS WERE FIRST GILDED.

The ceilings which, at the present day, in private houses even, we see covered with gold, were first gilded in the Capitol, after the destruction of Carthage, and during the censorship of Lucius Mummius. From the ceilings this luxuriousness has been since transferred to the arched roofs of buildings, and the party-walls even, which at the present day are gilded like so many articles of plate: very different from the times when Catulus was far from being unanimously approved of for having gilded the brazen tiles of the Capitol!

[Detailed table of contents](#)

CHAP. 19.

FOR WHAT REASONS THE HIGHEST VALUE IS SET UPON GOLD.

We have already stated, in the Seventh Book, who were the first discoverers of gold, as well as nearly all the other metals. The highest rank has been accorded to this substance, not, in my opinion, for its colour, (which in silver is clearer and more like the light of day, for which reason silver is preferred for our military ensigns, its brightness being seen at a greater distance); and those persons are manifestly in error who think that it is the resemblance of its colour to the stars that is so prized in gold, seeing that the various gems and other things of the same tint, are in no such particular request. Nor yet is it for its weight or malleability that gold has been preferred to other metals, it being inferior in both these respects to lead — but it is because gold is the only substance in nature that suffers no loss from the action of fire, and passes unscathed through conflagrations and the flames of the funeral pile. Nay, even more than this, the oftener gold is subjected to the action of fire, the more refined in quality it becomes; indeed, fire is one test of its goodness, as, when submitted to intense heat, gold ought to assume a similar colour, and turn red and igneous in appearance; a mode of testing which is known as “*obrussa*.”

The first great proof, however, of the goodness of gold, is its melting with the greatest difficulty: in addition to which, it is a fact truly marvellous, that though proof against the most intense fire, if made with wood charcoal, it will melt with the greatest readiness upon a fire made with chaff; and that, for the purpose of purifying it, it is fused with lead. There is another reason too, which still more tends to enhance its value, the fact that it wears the least of all metals by continual use: whereas with silver, copper, and lead, lines may be traced, and the hands become soiled with the substance that comes from off them. Nor is there any material more malleable than this, none that admits of a more extended division, seeing that a single ounce of it admits of being beaten out into seven hundred and fifty leaves, or more, four fingers in length by the same in breadth. The thickest kind of gold-leaf is known as “*leaf of Præncste*,” it still retaining that name from the excellence of the gilding upon the statue of Fortune there. The next in thickness is known as the “*quæstorian leaf*.” In Spain, small pieces of gold are known by the name of “*striges*.”

A thing that is not the case with any other metal, gold is found pure in masses or in the form of dust; and whereas all other metals, when found in the ore, require to be brought to perfection by the aid of fire, this gold that I am speaking of is gold the moment it is found, and has all its component parts already in a state of perfection. This, however, is only such gold as is found in the native state, the other kinds that we shall have to speak of, being refined by art. And then, more than anything else, gold is subject to no rust, no verdigris, no emanation whatever from it, either to alter its quality or to lessen

its weight. In addition to this, gold steadily resists the corrosive action of salt and vinegar, things which obtain the mastery over all other substances: it admits, too, beyond all other metals, of being spun out and woven like wool. Verrius tells us that Tarquinius Priscus celebrated a triumph, clad in a tunic of gold; and I myself have seen Agrippina, the wife of the Emperor Claudius, on the occasion of a naval combat which he exhibited, seated by him, attired in a military scarf made entirely of woven gold without any other material. For this long time past, gold has been interwoven in the Attalic textures, an invention of the kings of Asia.

Detailed table of contents

CHAP. 20.

THE METHOD OF GILDING.

On marble and other substances which do not admit of being brought to a white heat, gilt is laid with glair of egg, and on wood by the aid of a glutinous composition, known as “leucophoron:” what this last is, and how it is prepared, we shall state on the appropriate occasion. The most convenient method for gilding copper would be to employ quicksilver, or, at all events, hydrargyros; but with reference to these substances, as we shall have occasion to say when describing the nature of them, methods of adulteration have been devised. To effect this mode of gilding, the copper is first well hammered, after which it is subjected to the action of fire, and then cooled with a mixture of salt, vinegar, and alum. It is then cleansed of all extraneous substances, it being known by its brightness when it has been sufficiently purified. This done, it is again heated by fire, in order to enable it, when thus prepared, with the aid of an amalgam of pumice, alum, and quicksilver, to receive the gold leaf when applied. Alum has the same property of purifying copper, that we have already mentioned as belonging to lead with reference to gold.

Detailed table of contents

CHAP. 21. (4.)

HOW GOLD IS FOUND.

Gold is found in our own part of the world; not to mention the gold extracted from the earth in India by the ants, and in Scythia by the Griffins. Among us it is procured in three different ways; the first of which is, in the shape of dust, found in running streams, the Tagus in Spain, for instance, the Padus in Italy, the Hebrus in Thracia, the Pactolus in Asia, and the Ganges in India; indeed, there is no gold found in a more perfect state than this, thoroughly polished as it is by the continual attrition of the current.

A second mode of obtaining gold is by sinking shafts or seeking it among the debris of mountains; both of which methods it will be as well to describe. The persons in search of gold in the first place remove the “segutilum,” such being the name of the earth which gives indication of the presence of gold. This done, a bed is made, the sand of which is washed, and, according to the residue found after washing, a conjecture is formed as to the richness of the vein. Sometimes, indeed, gold is found at once in the surface earth, a success, however, but rarely experienced. Recently, for instance, in the reign of Nero, a vein was discovered in Dalmatia, which yielded daily as much as fifty pounds’ weight of gold. The gold that is thus found in the surface crust is known as “talutium,” in cases where there is auriferous earth beneath. The mountains of Spain, in other respects arid and sterile, and productive of nothing whatever, are thus constrained by man to be fertile, in supplying him with this precious commodity.

The gold that is extracted from shafts is known by some persons as “canalicium,” and by others as “canaliense;” it is found adhering to the gritty crust of marble, and, altogether different from the form in which it sparkles in the sapphirus of the East, and in the stone of Thebais and other gems, it is seen interlaced with the molecules of the marble. The channels of these veins are found running in various directions along the sides of the shafts, and hence the name of the gold they yield— “canalicium.” In these shafts, too, the superincumbent earth is kept from falling in by means of wooden pillars. The substance that is extracted is first broken up, and then washed; after which it is subjected to the action of fire, and ground to a fine powder. This powder is known as “apitascudes,” while the silver which becomes disengaged in the furnace has the name of “sudor” given to it. The impurities that escape by the chimney, as in the case of all other metals, are known by the name of “scoria.” In the case of gold, this scoria is broken up a second time, and melted over again. The crucibles used for this purpose are made of “tasconium,” a white earth similar to potter’s clay in appearance; there being no other substance capable of with-standing the strong current of air, the action of the fire, and the intense heat of the melted metal.

The third method of obtaining gold surpasses the labours of the Giants even: by the aid of galleries driven to a long distance, mountains are excavated by the light of torches, the duration of which forms the set times for work, the workmen never seeing the light of day for many months together. These mines are known as “arrugiæ;” and not unfrequently clefts are formed on a sudden, the earth sinks in, and the workmen are crushed beneath; so that it would really appear less rash to go in search of pearls and purples at the bottom of the sea, so much more dangerous to ourselves have we made the earth than the water! Hence it is, that in this kind of mining, arches are left at frequent intervals for the purpose of supporting the weight of the mountain above. In mining either by shaft or by gallery, barriers of silex are met with, which have to be driven asunder by the aid of fire and vinegar; or more frequently, as this method fills the galleries with suffocating vapours and smoke, to be broken to pieces with bruising- machines shod with pieces of iron weighing one hundred and fifty pounds: which done, the fragments are carried out on the workmen’s shoulders, night and day, each man passing them on to his neighbour in the dark, it being only those at the pit’s mouth that ever see the light. In cases where the bed of silex appears too thick to admit of being penetrated, the miner traces along the sides of it, and so turns it. And yet, after all, the labour entailed by this silex is looked upon as comparatively easy, there being an earth — a kind of potter’s clay mixed with gravel, “gangadia” by name, which it is almost impossible to overcome. This earth has to be attacked with iron wedges and hammers like those previously mentioned, and it is generally considered that there is nothing more stubborn in existence — except indeed the greed for gold, which is the most stubborn of all things.

When these operations are all completed, beginning at the last, they cut away the wooden pillars at the point where they support the roof: the coming downfall gives warning, which is instantly perceived by the sentinel, and by him only, who is set to watch upon a peak of the same mountain. By voice as well as by signals, he orders the workmen to be immediately summoned from their labours, and at the same moment takes to flight himself. The mountain, rent to pieces, is cleft asunder, hurling its debris to a distance with a crash which it is impossible for the human imagination to conceive; and from the midst of a cloud of dust, of a density quite incredible, the victorious miners gaze upon this downfall of Nature. Nor yet even then are they sure of gold, nor indeed were they by any means certain that there was any to be found when they first began to excavate, it being quite sufficient, as an inducement to undergo such perils and to incur such vast expense, to entertain the hope that they shall obtain what they so eagerly desire.

Another labour, too, quite equal to this, and one which entails even greater expense, is that of bringing rivers from the more elevated mountain heights, a distance in many instances of one hundred miles perhaps, for the purpose of washing these debris. The channels thus formed are called “corrugi,” from our

word “corrivatio,” I suppose; and even when these are once made, they entail a thousand fresh labours. The fall, for instance, must be steep, that the water may be precipitated, so to say, rather than flow; and it is in this manner that it is brought from the most elevated points. Then, too, vallies and crevasses have to be united by the aid of aqueducts, and in another place impassable rocks have to be hewn away, and forced to make room for hollowed troughs of wood; the person hewing them hanging suspended all the time with ropes, so that to a spectator who views the operations from a distance, the workmen have all the appearance, not so much of wild beasts, as of birds upon the wing. Hanging thus suspended in most instances, they take the levels, and trace with lines the course the water is to take; and thus, where there is no room even for man to plant a footstep, are rivers traced out by the hand of man. The water, too, is considered in an unfit state for washing, if the current of the river carries any mud along with it. The kind of earth that yields this mud is known as “urium;” and hence it is that in tracing out these channels, they carry the water over beds of silex or pebbles, and carefully avoid this urium. When they have reached the head of the fall, at the very brow of the mountain, reservoirs are hollowed out, a couple of hundred feet in length and breadth, and some ten feet in depth. In these reservoirs there are generally five sluices left, about three feet square; so that, the moment the reservoir is filled, the floodgates are struck away, and the torrent bursts forth with such a degree of violence as to roll onwards any fragments of rock which may obstruct its passage.

When they have reached the level ground, too, there is still another labour that awaits them. Trenches — known as “agogæ” — have to be dug for the passage of the water; and these, at regular intervals, have a layer of ulex placed at the bottom. This ulex is a plant like rosemary in appearance, rough and prickly, and well-adapted for arresting any pieces of gold that may be carried along. The sides, too, are closed in with planks, and are supported by arches when carried over steep and precipitous spots. The earth, carried onwards in the stream, arrives at the sea at last, and thus is the shattered mountain washed away; causes which have greatly tended to extend the shores of Spain by these encroachments upon the deep. It is also by the agency of canals of this description that the material, excavated at the cost of such immense labour by the process previously described, is washed and carried away; for otherwise the shafts would soon be choked up by it.

The gold found by excavating with galleries does not require to be melted, but is pure gold at once. In these excavations, too, it is found in lumps, as also in the shafts which are sunk, sometimes exceeding ten pounds even. The names given to these lumps are “palagæ,” and “palacurnæ,” while the gold found in small grains is known as “baluce.” The ulex that is used for the above purpose is dried and burnt, after which the ashes of it are washed upon a bed of grassy turf, in order that the gold may be deposited thereupon.

Asturia, Gallæcia, and Lusitania furnish in this manner, yearly, according to some authorities, twenty thousand pounds’ weight of gold, the produce of

Asturia forming the major part. Indeed, there is no part of the world that for centuries has maintained such a continuous fertility in gold. I have already mentioned that by an ancient decree of the senate, the soil of Italy has been protected from these researches; otherwise, there would be no land more fertile in metals. There is extant also a censorial law relative to the gold mines of Victumulæ, in the territory of Vercellæ, by which the farmers of the revenue were forbidden to employ more than five thousand men at the works.

Detailed table of contents

CHAP. 22.

ORPIMENT.

There is also one other method of procuring gold; by making it from orpiment, a mineral dug from the surface of the earth in Syria, and much used by painters. It is just the colour of gold, but brittle, like mirror-stone, in fact. This substance greatly excited the hopes of the Emperor Caius, a prince who was most greedy for gold. He accordingly had a large quantity of it melted, and really did obtain some excellent gold; but then the proportion was so extremely small, that he found himself a loser thereby. Such was the result of an experiment prompted solely by avarice: and this too, although the price of the orpiment itself was no more than four denarii per pound. Since his time, the experiment has never been repeated.

Detailed table of contents

CHAP. 23.

ELECTRUM.

In all gold ore there is some silver, in varying proportions; a tenth part in some instances, an eighth in others. In one mine, and that only, the one known as the mine of Albucrara, in Gallæcia, the proportion of silver is but one thirty-sixth: hence it is that the ore of this mine is so much more valuable than that of others. Whenever the proportion of silver is one-fifth, the ore is known also by the name of “electrum;” grains, too, of this metal are often found in the gold known as “canaliense.” An artificial electrum, too, is made, by mixing silver with gold. If the proportion of silver exceeds one-fifth, the metal offers no resistance on the anvil.

Electrum, too, was highly esteemed in ancient times, as we learn from the testimony of Homer, who represents the palace of Menelaüs as refulgent with gold and electrum, silver and ivory. At Lindos, in the island of Rhodes, there is a temple dedicated to Minerva, in which there is a goblet of electrum, consecrated by Helena: history states also that it was moulded after the proportions of her bosom. One peculiar advantage of electrum is, its superior brilliancy to silver by lamp-light. Native electrum has also the property of detecting poisons; for in such case, semicircles, resembling the rainbow in appearance, will form upon the surface of the goblet, and emit a crackling noise, like that of flame, thus giving a twofold indication of the presence of poison.

CHAP. 24.

THE FIRST STATUES OF GOLD.

The first statue of massive gold, without any hollowness within, and anterior to any of those statues of bronze even, which are known as “holosphyratæ,” is said to have been erected in the Temple of the goddess Anaitis. To what particular region this name belongs, we have already stated, it being that of a divinity held in the highest veneration by the nations in that part of the world. This statue was carried off during the wars of Antonius with the people of Parthia; and a witty saying is told, with reference to it, of one of the veterans of the Roman army, a native of Bononia. Entertaining on one occasion the late Emperor Augustus at dinner, he was asked by that prince whether he was aware that the person who was the first to commit this violence upon the statue, had been struck with blindness and paralysis, and then expired. To this he made answer, that at that very moment Augustus was making his dinner off of one of her legs, for that he himself was the very man, and to that bit of plunder he had been indebted for all his fortune.

As regards statues of human beings, Gorgias of Leontini was the first to erect a solid statue of gold, in the Temple at Delphi, in honour of himself, about the seventieth Olympiad: so great were the fortunes then made by teaching the art of oratory!

CHAP. 25.

EIGHT REMEDIES DERIVED FROM GOLD.

Gold is efficacious as a remedy in many ways, being applied to wounded persons and to infants, to render any malpractices of sorcery comparatively innocuous that may be directed against them. Gold, however, itself is mischievous in its effects if carried over the head, in the case of chickens and lambs more particularly. The proper remedy in such case is to wash the gold, and to sprinkle the water upon the objects which it is wished to preserve. Gold, too, is melted with twice its weight of salt, and three times its weight of misy; after which it is again melted with two parts of salt and one of the stone called “schistos.” Employed in this manner, it withdraws the natural acidity from the substances torrefied with it in the crucible, while at the same time it remains pure and incorrupt; the residue forming an ash which is preserved in an earthen vessel, and is applied with water for the cure of lichens on the face: the best method of washing it off is with bean-meal. These ashes have the property also of curing fistulas and the discharges known as “hæmorrhoides:” with the addition, too, of powdered pumice, they are a cure for putrid ulcers and sores which emit an offensive smell.

Gold, boiled in honey with melanthium and applied as a liniment to the navel, acts as a gentle purgative upon the bowels. M. Varro assures us that gold is a cure for warts.

CHAP. 26. (5.)

CHRYSOCOLLA.

Chrysocolle is a liquid which is found in the shafts already mentioned, flowing through the veins of gold; a kind of slime which becomes indurated by the cold of winter till it has attained the hardness even of pumice. The most esteemed kind of it, it has been ascertained, is found in copper-mines, the next best being the produce of silver-mines: it is found also in lead-mines, but that found in combination with gold ore is much inferior.

In all these mines, too, an artificial chrysocolle is manufactured; much inferior, however, to the native chrysocolle. The method of preparing it consists in introducing water gradually into a vein of metal, throughout the winter and until the month of June; after which, it is left to dry up during the months of June and July: so that, in fact, it is quite evident that chrysocolle is nothing else but the putrefaction of a metallic vein. Native chrysocolle, known as “uva,” differs from the other in its hardness more particularly; and yet, hard as it is, it admits of being coloured with the plant known as “lutum.” Like flax and wool, it is of a nature which imbibes liquids. For the purpose of dyeing it, it is first bruised in a mortar, after which, it is passed through a fine sieve. This done, it is ground, and then passed through a still finer sieve; all that refuses to pass being replaced in the mortar, and subjected once more to the mill. The finest part of the powder is from time to time measured out into a crucible, where it is macerated in vinegar, so that all the hard particles may be dissolved; after which, it is pounded again, and then rinsed in shell-shaped vessels, and left to dry. This done, the chrysocolle is dyed by the agency of schist alum and the plant above-mentioned; and thus is it painted itself before it serves to paint. It is of considerable importance, too, that it should be absorbent and readily take the dye: indeed, if it does not speedily take the colour, scytanum and turbistum are added to the dye; such being the name of two drugs which compel it to absorb the colouring matter.

Detailed table of contents

CHAP. 27.

THE USE MADE OF CHRYSOCOLLA IN PAINTING.

When chrysocolla has been thus dyed, painters call it “orobitis,” and distinguish two kinds of it, the cleansed orobitis, which is kept for making lomentum, and the liquid, the balls being dissolved for use by evaporation. Both these kinds are prepared in Cyprus, but the most esteemed is that made in Armenia, the next best being that of Macedonia: it is Spain, however, that produces the most. The great point of its excellence consists in its producing exactly the tint of corn when in a state of the freshest verdure. Before now, we have seen, at the spectacles exhibited by the Emperor Nero, the arena of the Circus entirely sanded with chrysocolla, when the prince himself, clad in a dress of the same colour, was about to exhibit as a charioteer.

The unlearned multitude of artisans distinguish three kinds of chrysocolla; the rough chrysocolla, which is valued at seven denarii per pound; the middling, worth five denarii; and the bruised, also known as the “herbaceous” chrysocolla, worth three denarii per pound. Before laying on the sanded chrysocolla, they underlay coats of atramentum and parætonium, substances which make it hold, and impart a softness to the colours. The parætonium, as it is naturally very unctuous, and, from its smoothness, extremely tenacious, is laid on first, and is then covered with a coat of atramentum, lest the parætonium, from its extreme whiteness, should impart a paleness to the chrysocolla. The kind known as “lutea,” derives its name, it is thought, from the plant called “lutum;” which itself is often pounded with cæruleum instead of real chrysocolla, and used for painting, making a very inferior kind of green and extremely deceptive.

Detailed table of contents

CHAP. 28.

SEVEN REMEDIES DERIVED FROM CHRYSOCOLLA.

Chrysocolla, too, is made use of in medicine. In combination with wax and oil, it is used as a detergent for wounds; and used by itself in the form of a powder, it acts as a desiccative, and heals them. In cases, too, of quinsy and hardness of breathing, chrysocolla is prescribed, in the form of an electuary, with honey. It acts as an emetic also, and is used as an ingredient in eye-salves, for the purpose of effacing cicatrizations upon the eyes. In green plasters too, it is used, for soothing pain and making scars disappear. This kind of chrysocolla is known by medical men as “acesis,” and is altogether different from orobitis.

Detailed table of contents

CHAP. 29.

THE CHRYSOCOLLA OF THE GOLDSMITHS, KNOWN ALSO AS SANTERNA.

The goldsmiths also employ a chrysocolloa of their own, for the purpose of soldering gold; and it is from this chrysocolloa, they say, that all the other substances, which present a similar green, have received their name. This preparation is made from verdigris of Cyprian copper, the urine of a youth who has not arrived at puberty, and a portion of nitre. It is then pounded with a pestle of Cyprian copper, in a copper mortar, and the name given to the mixture is “santerna.” It is in this way that the gold known as “silvery” gold is soldered; one sign of its being so alloyed being its additional brilliancy on the application of santerna. If, on the other hand, the gold is impregnated with copper, it will contract, on coming in contact with the santerna, become dull, and only be soldered with the greatest difficulty: indeed, for this last kind of gold, there is a peculiar solder employed, made of gold and one- seventh part of silver, in addition to the materials above-mentioned, the whole beaten up together.

Detailed table of contents

CHAP. 30.

THE MARVELLOUS OPERATIONS OF NATURE IN SOLDERING METALLIC SUBSTANCES, AND BRINGING THEM TO A STATE OF PERFECTION.

While speaking on this subject, it will be as well to annex the remaining particulars, that our admiration may here be drawn to all the marvels presented by Nature in connection therewith. The proper solder for gold is that above described; for iron, potter's clay; for copper, when in masses, cadmia, and in sheets, alum; for lead and marble, resin. Lead is also united by the aid of white lead; white lead with white lead, by the agency of oil; stannum, with copper file-dust; and silver, with stannum.

For smelting copper and iron, pine-wood is the best, Egyptian papyrus being also very good for the purpose. Gold is melted most easily with a fire made of chaff. Limestone and Thracian stone are ignited by the agency of water, this last being extinguished by the application of oil. Fire, however, is extinguished most readily by the application of vinegar, viscus, and unboiled eggs. Earth will under no circumstance ignite. When charcoal has been once quenched, and then again ignited, it gives out a greater heat than before.

Detailed table of contents

CHAP. 31. (6.)

SILVER.

After stating these facts, we come to speak of silver ore, the next folly of mankind. Silver is never found but in shafts sunk deep in the ground, there being no indications to raise hopes of its existence, no shining sparkles, as in the case of gold. The earth in which it is found is sometimes red, sometimes of an ashy hue. It is impossible, too, to melt it, except in combination with lead or with galena, this last being the name given to the vein of lead that is mostly found running near the veins of the silver ore. When submitted, too, to the action of fire, part of the ore precipitates itself in the form of lead, while the silver is left floating on the surface, like oil on water.

Silver is found in nearly all our provinces, but the finest of all is that of Spain; where it is found, like gold, in uncultivated soils, and in the mountains even. Wherever, too, one vein of silver has been met with, another is sure to be found not far off: a thing that has been remarked, in fact, in the case of nearly all the metals, which would appear from this circumstance to have derived their Greek name of “metalla.” It is a remarkable fact, that the shafts opened by Hannibal in the Spanish provinces are still worked, their names being derived from the persons who were the first to discover them. One of these mines, which at the present day is still called Bæbelo, furnished Hannibal with three hundred pounds’ weight of silver per day. The mountain is already excavated for a distance of fifteen hundred paces; and throughout the whole of this distance there are water-bearers standing night and day, baling out the water in turns, regulated by the light of torches, and so forming quite a river.

The vein of silver that is found nearest the surface is known by the name of “crudaria.” In ancient times, the excavations used to be abandoned the moment alum was met with, and no further search was made. Of late, however, the discovery of a vein of copper beneath alum, has withdrawn any such limits to man’s hopes. The exhalations from silver-mines are dangerous to all animals, but to dogs more particularly. The softer they are, the more beautiful gold and silver are considered. It is a matter of surprise with most persons, that lines traced with silver should be black.

[Detailed table of contents](#)

CHAP. 32.

QUICKSILVER.

There is a mineral also found in these veins of silver, which yields a humour that is always liquid, and is known as “quicksilver.” It acts as a poison upon everything, and pierces vessels even, making its way through them by the agency of its malignant properties. All substances float upon the surface of quicksilver, with the exception of gold, this being the only substance that it attracts to itself. Hence it is, that it is such an excellent refiner of gold; for, on being briskly shaken in an earthen vessel with gold, it rejects all the impurities that are mixed with it. When once it has thus expelled these superfluities, there is nothing to do but to separate it from the gold; to effect which, it is poured out upon skins that have been well tawed, and so, exuding through them like a sort of perspiration, it leaves the gold in a state of purity behind.

Hence it is, too, that when copper has to be gilded, a coat of quicksilver is laid beneath the gold leaf, which it retains in its place with the greatest tenacity: in cases, however, where the leaf is single, or very thin, the presence of the quicksilver is detected by the paleness of the colour. For this reason, persons, when meditating a piece of fraud, have been in the habit of substituting glair of egg for quicksilver, and then laying upon it a coat of hydrargyros, a substance of which we shall make further mention in the appropriate place. Generally speaking, quicksilver has not been found in any large quantities.

Detailed table of contents

CHAP. 33.

STIMMI, STIBI, ALABASTRUM, LARBASIS, OR PLATYOPHTHALMON.

In the same mines in which silver is found, there is also found a substance which, properly speaking, may be called a stone made of concrete froth. It is white and shining, without being transparent, and has the several names of stimmi, stibi, alabastrum, and larbasis. There are two kinds of it, the male and the female. The latter kind is the more approved of, the male stimmi being more uneven, rougher to the touch, less ponderous, not so radiant, and more gritty. The female kind, on the other hand, is bright and friable, and separates in laminæ, and not in globules.

[Detailed table of contents](#)

CHAP. 34.

SEVEN REMEDIES DERIVED FROM STIMMI.

Stimmi is possessed of certain astringent and refrigerative properties, its principal use, in medicine, being for the eyes. Hence it is that most persons call it “platyophthalmon,” it being extensively employed in the calliblepharie preparations of females, for the purpose of dilating the eyes. It acts also as a check upon fluxes of the eyes and ulcerations of those organs; being used, as a powder, with pounded frankincense and gum. It has the property, too, of arresting discharges of blood from the brain; and, sprinkled in the form of a powder, it is extremely efficacious for the cure of recent wounds and bites of dogs which have been some time inflicted. For the cure of burns it is remarkably good, mixed with grease, litharge, ceruse, and wax.

The method of preparing it, is to burn it, enclosed in a coat of cow-dung, in a furnace; which done, it is quenched with woman’s milk, and pounded with rain-water in a mortar. While this is doing, the thick and turbid part is poured off from time to time into a copper vessel, and purified with nitre. The lees of it, which are rejected, are recognized by their being full of lead and falling to the bottom. The vessel into which the turbid part has been poured off, is then covered with a linen cloth and left untouched for a night; the portion that lies upon the surface being poured off the following day, or else removed with a sponge. The part that has fallen to the bottom of the vessel is regarded as the choicest part, and is left, covered with a linen cloth, to dry in the sun, but not to become parched. This done, it is again pounded in a mortar, and then divided into tablets. But the main thing of all is, to observe such a degree of nicety in heating it, as not to let it become lead. Some persons, when preparing it on the fire, use grease instead of dung. Others, again, bruise it in water and then pass it through a triple strainer of linen cloth; after which, they reject the lees, and pour off the remainder of the liquid, collecting all that is deposited at the bottom, and using it as an ingredient in plasters and eye-salves.

[Detailed table of contents](#)

CHAP. 35.

THE SCORIA OF SILVER. SIX REMEDIES DERIVED FROM IT.

The scoria of silver is called by the Greeks “helcysma.” It has certain restraining and refrigerative effects upon bodies, and, like molybdæna, of which we shall make further mention when speaking of lead, is used as an ingredient in making plasters, those more particularly which are to promote the cicatrization of wounds. It is employed also for the cure of tenesmus and dysentery, being injected in the form of a clyster with myrtle-oil. It forms an ingredient, too, in the medicaments known as “liparæ,” for the removal of fleshy excrescences in sores, ulcerations arising from chafing, or running ulcers on the head.

The same mines also furnish us with the preparation known as “scum of silver.” There are three varieties of it; the best, known as “chrysitis;” the second best, the name of which is “argyritis;” and a third kind, which is called “molybditis.” In most instances, too, all these tints are to be found in the same cake.

The most approved kind is that of Attica; the next being that which comes from Spain. Chrysitis is the produce of the metallic vein, argyritis is obtained from the silver itself, and molybditis is the result of the smelting of lead, a work that is done at Puteoli; to which last circumstance, in fact, molybditis owes its name. All these substances are prepared in the following manner: the metal is first melted, and then allowed to flow from a more elevated receiver into a lower. From this last it is lifted by the aid of iron spits, and is then twirled round at the end of the spit in the midst of the flames, in order to make it all the lighter. Thus, as may be easily perceived from the name, it is in reality the scum of a substance in a state of fusion — of the future metal, in fact. It differs from scoria in the same way that the scum of a liquid differs from the lees, the one being an excretion thrown out by the metal while purifying itself, the other an excretion of the metal when purified.

Some persons distinguish two kinds of scum of silver, and give them the names of “scirerytis” and “peumene; a third variety being molybdæna, of which we shall have to make further mention when treating of lead. To make this scum fit for use, the cakes are again broken into pieces the size of a hazelnut, and then melted, the fire being briskly blown with the bellows. For the purpose of separating the charcoal and ashes from it, it is then rinsed with vinegar or with wine, and is so quenched. In the case of argyritis, it is recommended, in order to blanch it, to break it into pieces the size of a bean, and then to boil it with water in an earthen vessel, first putting with it, wrapped in linen cloths, some new wheat and barley, which are left there till they have lost the outer coat. This done, they bruise the whole in mortars for six consecutive days, taking care to rinse the mixture in cold water three times

a day, and after that, in an infusion of hot water and fossil salt, one obolus of the latter to every pound of scum: at the end of the six days it is put away for keeping in a vessel of lead.

Some persons boil it with white beans and a ptisan of barley, and then dry it in the sun; others, again, with white wool and beans, till such time as it imparts no darkness to the wool; after which, first adding fossil salt, they change the water from time to time, and then dry it during the forty hot- test days of summer. In some instances the practice is, to boil it in water in a swine's paunch, and then to take it out and rub it with nitre; after which, following the preceding method, they pound it in a mortar with salt. Some again never boil it, but pound it only with salt, and then rinse it with water.

Scum of silver is used as an ingredient in eye-salves, and, in the form of a liniment, by females, for the purpose of removing spots and blemishes caused by scars, as also in washes for the hair. Its properties are desiccative, emollient, refrigerative, temperative, and detergent. It fills up cavities in the flesh produced by ulceration, and reduces tumours. For all these purposes it is employed as an ingredient in plaster, and in the liparæ previously mentioned. In combination with rue, myrtle, and vinegar, it removes erysipelas: and, with myrtle and wax, it is a cure for chilblains.

[Detailed table of contents](#)

CHAP. 36. (7.)

MINIUM: FOR WHAT RELIGIOUS PURPOSES IT WAS USED BY THE ANCIENTS.

It is also in silver-mines that minium is found, a pigment held at the present day in very high estimation; and by the Romans in former times not only held in the highest estimation, but used for sacred purposes as well. Verrius enumerates certain authors, upon whose testimony we find it satisfactorily established that it was the custom upon festivals to colour the face of the statue of Jupiter even with minium, as well as the bodies of triumphant generals; and that it was in this guise that Camillus celebrated his triumph. We find, too, that it is through the same religious motives that it is employed at the present day for colouring the unguents used at triumphal banquets, and that it is the first duty of the censors to make a contract for painting the statue of Jupiter with this colour.

For my own part, I am quite at a loss for the origin of this usage; but it is a well-known fact, that at the present day even, minium is in great esteem with the nations of Æthiopia, their nobles being in the habit of staining the body all over with it, and this being the colour appropriated to the statues of their gods. I shall therefore use all the more diligence in enquiring into all the known facts respecting it.

Detailed table of contents

CHAP. 37.

THE DISCOVERY AND ORIGIN OF MINIMUM.

Theophrastus states that, ninety years before the magistracy of Praxibulus at Athens — a date which answers to the year of our City, 439 — minimum was discovered by Callias the Athenian, who was in hopes to extract gold, by submitting to the action of fire the red sand that was found in the silver-mines. This, he says, was the first discovery of minimum. He states, also, that in his own time, it was already found in Spain, but of a harsh and sandy nature; as also in Colchis, upon a certain inaccessible rock there, from which it was brought down by the agency of darts. This, however, he says, was only an adulterated kind of minimum, the best of all being that procured in the Cilbian Plains, above Ephesus, the sand of which has just the colour of the kermes berry. This sand, he informs us, is first ground to powder and then washed, the portion that settles at the bottom being subjected to a second washing. From this circumstance, he says, arises a difference in the article; some persons being in the habit of preparing their minimum with a single washing, while with others it is more diluted. The best kind, however, he says, is that which has undergone a second washing.

Detailed table of contents

CHAP. 38.

CINNABARIS.

I am not surprised that this colour should have been held in such high esteem; for already, in the days of the Trojan War, rubrica was highly valued, as appears from the testimony of Homer, who particularly notices the ships that were coloured with it, whereas, in reference to other colours and paintings, he but rarely notices them. The Greeks call this red earth “miltos,” and give to minium the name of “cinnabaris,” and hence the error caused by the two meanings of the same word; this being properly the name given to the thick matter which issues from the dragon when crushed beneath the weight of the dying elephant, mixed with the blood of either animal, as already described. Indeed this last is the only colour that in painting gives a proper representation of blood. This cinnabaris, too, is extremely useful as an ingredient in antidotes and various medicaments. But, by Hercules ! our physicians, because minium also has the name of “cinnabaris,” use it as a substitute for the other, and so employ a poison, as we shall shortly show it to be.

Detailed table of contents

CHAP. 39.

THE EMPLOYMENT OF CINNABARIS IN PAINTING.

The ancients used to paint with cinnabaris those pictures of one colour, which are still known among us as “ monochromata.” They painted also with the minium of Ephesus: but the use of this last has been abandoned, from the vast trouble which the proper keeping of the picture entailed. And then besides, both these colours were thought to be too harsh; the consequence of which is, that painters have now adopted the use of rubrica and of sinopis, substances of which I shall make further mention in the appropriate places.

Cinnabaris is adulterated by the agency of goats’ blood, or of bruised sorb-apples. The price of genuine cinnabaris is fifty sesterces per pound.

Detailed table of contents

CHAP. 40.

THE VARIOUS KINDS OF MINIUM. THE USE MADE OF IT IN PAINTING.

According to Juba minium is also a production of Carmania, and Timagenes says that it is found in Æthiopia. But from neither of those regions is it imported to Rome, nor, indeed, from hardly any other quarter but Spain ; that of most note coming from Sisapo, a territory of Bætica, the mine of minium there forming a part of the revennes of the Roman people. Indeed there is nothing guarded with a more constant circumspection; for it is not allowable to reduce and refine the ore upon the spot, it being brought to Rome in a crude state and under seal, to the amount of about two thousand pounds per annum. At Rome, the process of washing is performed, and, in the sale of it, the price is regulated by statute; it not being allowed to exceed seventy sesterces per pound. There are numerous ways, however, of adulterating it, a source of considerable plunder to the company.

For there is, in fact, another kind of minium, found in most silver-mines as well as lead-mines, and prepared by the calcination of certain stones that are found mixed with the metallic vein — not the minerals, however, to the fluid humours of which we have given the name of quicksilver; for if those are subjected to the action of fire they will yield silver — but another kind of stone that is found with them. These barren stones, too, may be recognized by their uniform leaden colour, and it is only when in the furnace that they turn red. After being duly calcined they are pulverized, and thus form a minium of second-rate quality, known to but very few, and far inferior to the produce of the native sand that we have mentioned. It is with this substance, then, as also with syricum, that the genuine minium is adulterated in the manufactories of the company. How syricum is prepared we shall describe in the appropriate place. One motive, however, for giving an under-coat of syricum to minium, is the evident saving of expense that results therefrom. Minium, too, in another way affords a very convenient opportunity to painters for pilfering, by washing their brushes, filled with the colouring matter, every now and then. The minium of course falls to the bottom, and is thus so much gained by the thief.

Genuine minium ought to have the brilliant colour of the kermes berry; but when that of inferior quality is used for walls, the brightness of it is sure to be tarnished by the moisture, and this too, although the substance itself is a sort of metallic mildew. In the mines of Sisapo, the veins are composed exclusively of the sandy particles of minium, without the intermixture of any silver whatever; the practice being to melt it like gold. Minium is assayed by the agency of gold in a state of incandescence: if it has been adulterated, it will turn black, but if genuine, it retains its colour. I find it stated also that minium is adulterated with line; the proper mode of detecting which, is

similarly to employ a sheet of red hot iron, if there should happen to be no gold at hand.

To objects painted with minium the action of the sun and moon is highly injurious. The proper method of avoiding this inconvenience, is to dry the wall, and then to apply, with a hair brush, hot Punic wax, melted with oil; after which, the varnish must be heated, with an application of gall-nuts, burnt to a red heat, till it quite perspires. This done, it must be smoothed down with rollers made of wax, and then polished with clean linen cloths, like marble, when made to shine. Persons employed in the manufactories in preparing minium protect the face with masks of loose bladder-skin, in order to avoid inhaling the dust, which is highly pernicious; the covering being at the same time sufficiently transparent to admit of being seen through.

Minium is employed also for writing in books; and the letters made with it being more distinct, even on gold or marble, it is used for the inscriptions upon tombs.

Detailed table of contents

CHAP. 41. (8.)

HYDRARGYROS. REMEDIES DERIVED FROM MINIMUM.

Human industry has also discovered a method of extracting hydrargyros from the inferior minium, a substitute for quick-silver, the further mention of which was deferred, a few pages before, to the present occasion. There are two methods of preparing this substance; either by pounding minium and vinegar with a brazen pestle and mortar, or else by putting minium into flat earthen pans, covered with a lid, and then enclosed in an iron seething-pot well luted with potter's clay. A fire is then lighted under the pans, and the flame kept continually burning by the aid of the bellows; which done, the steam is carefully removed, that is found adhering to the lid, being like silver in colour, and similar to water in its fluidity. This liquid, too, is easily made to separate in globules, which, from their fluid nature, readily unite.

As it is a fact generally admitted, that minium is a poison, I look upon all the recipes given as highly dangerous which recommend its employment for medicinal purposes; with the exception, perhaps, of those cases in which it is applied to the head or abdomen, for the purpose of arresting hæmorrhage, due care being taken that it is not allowed to penetrate to the viscera, or to touch any sore. Beyond such cases as these, for my own part, I should never recommend it to be used in medicine.

Detailed table of contents

CHAP. 42.

THE METHOD OF GILDING SILVER.

At the present day silver is gilded almost exclusively by the agency of hydrargyros; and a similar method should always be employed in laying gold leaf upon copper. But the same fraud which ever shows itself so extremely ingenious in all departments of human industry, has devised a plan of substituting an inferior material, as already mentioned.

Detailed table of contents

CHAP. 43.

TOUCHSTONES FOR TESTING GOLD.

A description of gold and silver is necessarily accompanied by that of the stone known as “coticula.” In former times, according to Theophrastus, this stone was nowhere to be found, except in the river Tmolus, but at the present day it is found in numerous places. By some persons it is known as the “Heraclian,” and by others as the “Lydian” stone. It is found in pieces of moderate size, and never exceeding four inches in length by two in breadth. The side that has lain facing the sun is superior to that which has lain next to the ground. Persons of experience in these matters, when they have scraped a particle off the ore with this stone, as with a file, can tell in a moment the proportion of gold there is in it, how much silver, or how much copper; and this to a scruple, their accuracy being so marvellous that they are never mistaken.

Detailed table of contents

CHAP. 44.

THE DIFFERENT KINDS OF SILVER, AND THE MODES OF TESTING IT.

There are two kinds of silver. On placing a piece of it upon an iron fire-shovel at a white heat, if the metal remains perfectly white, it is of the best quality: if again it turns of a reddish colour, it is inferior; but if it becomes black, it is worthless. Fraud, however, has devised means of stultifying this test even; for by keeping the shovel immersed in men's urine, the piece of silver absorbs it as it burns, and so displays a fictitious whiteness. There is also a kind of test with reference to polished silver: when the human breath comes in contact with it, it should immediately be covered with steam, the cloudiness disappearing at once.

Detailed table of contents

CHAP. 45. (9.)

MIRRORS.

It is generally supposed among us that it is only the very finest silver that admits of being laminated, and so converted into mirrors. Pure silver was formerly used for the purpose, but, at the present day, this too has been corrupted by the devices of fraud. But, really, it is a very marvellous property that this metal has, of reflecting objects; a property which, it is generally agreed, results from the repercussion of the air, thrown back as it is from the metal upon the eyes. The same too is the action that takes place when we use a mirror. If, again, a thick plate of this metal is highly polished, and is rendered slightly concave, the image or object reflected is enlarged to an immense extent; so vast is the difference between a surface receiving, and throwing back the air. Even more than this—drinking-cups are now made in such a manner, as to be filled inside with numerous concave facets, like so many mirrors; so that if but one person looks into the interior, he sees reflected a whole multitude of persons.

Mirrors, too, have been invented to reflect monstrous forms; those, for instance, which have been consecrated in the Temple at Smyrna. This, however, all results from the configuration given to the metal; and it makes all the difference whether the surface has a concave form like the section of a drinking cup, or whether it is [convex] like a Thracian buckler; whether it is depressed in the middle or elevated; whether the surface has a direction transversely or obliquely; or whether it runs horizontally or vertically; the peculiar configuration of the surface which receives the shadows, causing them to undergo corresponding distortions: for, in fact, the image is nothing else but the shadow of the object collected upon the bright surface of the metal.

However, to finish our description of mirrors on the present occasion — the best, in the times of our ancestors, were those of Brundisium, composed of a mixture of stannum and copper: at a later period, however, those made of silver were preferred, Pasiteles being the first who made them, in the time of Pompeius Magnus. More recently, a notion has arisen that the object is reflected with greater distinctness, by the application to the back of the mirror of a layer of gold.

CHAP. 46.

EGYPTIAN SILVER.

The people of Egypt stain their silver vessels, that they may see represented in them their god Anubis; and it is the custom with them to paint, and not to chase, their silver. This usage has now passed to our own triumphal statues even; and, a truly marvellous fact, the value of silver has been enhanced by deadening its brilliancy. The following is the method adopted: with the silver are mixed two-thirds of the very finest Cyprian copper, that known as “coronarium,” and a proportion of live sulphur equal to that of the silver. The whole of these are then melted in an earthen vessel well luted with potter’s clay, the operation being completed when the cover becomes detached from the vessel. Silver admits also of being blackened with the yolk of a hard-boiled egg; a tint, however, which is removed by the application of vinegar and chalk.

The Triumvir Antonius alloyed the silver denarius with iron: and in spurious coin there is an alloy of copper employed. Some, again, curtail the proper weight of our denarii, the legitimate proportion being eighty-four denarii to a pound of silver. It was in consequence of these frauds that a method was devised of assaying the denarius: the law ordaining which was so much to the taste of the plebeians, that in every quarter of the City there was a full-length statue erected in honour of Marius Gratidianus. It is truly marvellous, that in this art, and in this only, the various methods of falsification should be made a study: for the sample of the false denarius is now an object of careful examination, and people absolutely buy the counterfeit coin at the price of many genuine ones!

Detailed table of contents

CHAP. 47. (10.)

INSTANCES OF IMMENSE WEALTH. PERSONS WHO HAVE POSSESSED THE GREATEST SUMS OF MONEY.

The ancients had no number whereby to express a larger sum than one hundred thousand; and hence it is that, at the present day, we reckon by multiples of that number, as, for instance, ten times one hundred thousand, and so on. For these multiplications we are indebted to usury and the use of coined money; and hence, too, the expression “*æs alienum*,” or “another man’s money,” which we still use. In later times, again, the surname “Dives” was given to some: only be it known to all, that the man who first received this surname became a bankrupt and so bubbled his creditors. M. Crassus, a member of the same family, used to say that no man was rich, who could not maintain a legion upon his yearly income. He possessed in land two hundred millions of sesterces, being the richest Roman citizen next to Sylla. Nor was even this enough for him, but he must want to possess all the gold of the Parthians too! And yet, although he was the first to become memorable for his opulence — so pleasant is the task of stigmatizing this insatiate cupidity — we have known of many manumitted slaves, since his time, much more wealthy than he ever was; three for example, all at the same time, in the reign of the Emperor Claudius, Pallas, Callistus, and Narcissus.

But to omit all further mention of these men, as though they were still the rulers of the empire, let us turn to C. Cæcilius Claudius Isidorus, who, in the consulship of C. Asinius Gallus and C. Marcius Censorinus, upon the sixth day before the calends of February, declared by his will, that though he had suffered great losses through the civil wars, he was still able to leave behind him four thousand one hundred and sixteen slaves, three thousand six hundred pairs of oxen, and two hundred and fifty-seven thousand heads of other kind of cattle, besides, in ready money, sixty millions of sesterces. Upon his funeral, also, he ordered eleven hundred thousand sesterces to be expended.

And yet, supposing all these enormous riches to be added together, how small a proportion will they bear to the wealth of Ptolemæus; the person who, according to Varro, when Pompeius was on his expedition in the countries adjoining Judæa, entertained eight thousand horsemen at his own expense, and gave a repast to one thousand guests, setting before every one of them a drinking-cup of gold, and changing these vessels at every course! And then, again, how insignificant would his wealth have been by the side of that of Pythius the Bithynian — for I here make no mention of kings, be it remarked. He it was who gave the celebrated plane-tree and vine of gold to King Darius, and who entertained at a banquet the troops of Xerxes, seven hundred and eighty-eight thousand men in all; with a promise of pay and corn for the whole of them during the next five months, on condition that one at least of his five children, who had been drawn for service, should be left to him as the

solace of his old age. And yet, let any one compare the wealth of Pythius to that possessed by King Cræsus!

In the name of all that is unfortunate, what madness it is for human nature to centre its desires upon a thing that has either fallen to the lot of slaves, or else has reached no known limit in the aspirations even of kings!

CHAP. 48.

AT WHAT PERIOD THE ROMAN PEOPLE FIRST MADE VOLUNTARY CONTRIBUTIONS.

The Roman people first began to make voluntary contributions in the consulship of Spurius Posthumius and Quintus Marcius. So abundant was money at that period, that the people assessed themselves for a contribution to L. Scipio, to defray the expenses of the games which he celebrated. As to the contribution of the sixth part of an as, for the purpose of defraying the funeral expenses of Agrippa Menenius, I look upon that to have been a mark of respect paid to him, an honour, too, that was rendered necessary by his poverty, rather than in the light of a largess.

[Detailed table of contents](#)

CHAP. 49. (11.)

INSTANCES OF LUXURY IN SILVER PLATE.

The caprice of the human mind is marvellously exemplified in the varying fashions of silver plate; the work of no individual manufactory being for any long time in vogue. At one period, the Furnian plate, at another the Clodian, and at another the Gratian, is all the rage — for we borrow the shop even at our tables. — Now again, it is embossed plate that we are in search of, and silver deeply chiselled around the marginal lines of the figures painted upon it; and now we are building up on our sideboards fresh tiers of tables for supporting the various dishes. Other articles of plate we nicely pare away, it being an object that the file may remove as much of the metal as possible.

We find the orator Calvus complaining that the saucepans are made of silver; but it has been left for us to invent a plan of covering our very carriages with chased silver, and it was in our own age that Poppæa, the wife of the Emperor Nero, ordered her favourite mules to be shod even with gold!

Detailed table of contents

CHAP. 50.

INSTANCES OF THE FRUGALITY OF THE ANCIENTS IN REFERENCE TO SILVER PLATE.

The younger Scipio Africanus left to his heir thirty-two pounds' weight of silver; the same person who, on his triumph over the Carthaginians, displayed four thousand three hundred and seventy pounds' weight of that metal. Such was the sum total of the silver possessed by the whole of the inhabitants of Carthage, that rival of Rome for the empire of the world! How many a Roman since then has surpassed her in his display of plate for a single table! After the destruction of Numantia, the same Africanus gave to his soldiers, on the day of his triumph, a largess of seven denarii each — and right worthy were they of such a general, when satisfied with such a sum! His brother, Scipio Allobrogicus, was the very first who possessed one thousand pounds' weight of silver, but Drusus Livius, when he was tribune of the people, possessed ten thousand. As to the fact that an ancient warrior, a man, too, who had enjoyed a triumph, should have incurred the notice of the censor for being in possession of five pounds' weight of silver, it is a thing that would appear quite fabulous at the present day. The same, too, with the instance of Catus Ælius, who, when consul, after being found by the Ætolian ambassadors taking his morning meal off of common earthenware, refused to receive the silver vessels which they sent him; and, indeed, was never in possession, to the last day of his life, of any silver at all, with the exception of two drinking-cups, which had been presented to him as the reward of his valour, by L. Paulus, his father-in-law, on the conquest of King Perseus.

We read, too, that the Carthaginian ambassadors declared that no people lived on more amicable terms among themselves than the Romans, for that wherever they had dined they had always met with the same silver plate. And yet, by Hercules! to my own knowledge, Pompeius Paulinus, son of a Roman of equestrian rank at Arelate, a member, too, of a family, on the paternal side, that was graced with the fur, had with him, when serving with the army, and that, too, in a war against the most savage nations, a service of silver plate that weighed twelve thousand pounds!

Detailed table of contents

CHAP. 51.

AT WHAT PERIOD SILVER WAS FIRST USED AS AN ORNAMENT FOR COUCHES.

For this long time past, however, it has been the fashion to plate the couches of our women, as well as some of our ban- quetting-couches, entirely with silver. Carvilius Pollio, a Roman of equestrian rank, was the first, it is said, to adorn these last with silver; not, I mean, to plate them all over, nor yet to make them after the Delian pattern; the Punic fashion being the one he adopted. It was after this last pattern too, that he had them ornamented with gold as well: and it was not long after his time that silver couches came into fashion, in imitation of the couches of Delos. All this extravagance, however, was fully expiated by the civil wars of Sulla.

Detailed table of contents

CHAP. 52.

AT WHAT PERIOD SILVER CHARGERS OF ENORMOUS SIZE WERE FIRST MADE. WHEN SILVER WAS FIRST USED AS A MATERIAL FOR SIDEBOARDS. WHEN THE SIDEBOARDS CALLED TYMPANA WERE FIRST INTRODUCED.

In fact, it was but very shortly before that period that these couches were invented, as well as chargers of silver, one hundred pounds in weight: of which last, it is a well-known fact, that there were then upwards of one hundred and fifty in Rome, and that many persons were proscribed through the devices of others who were desirous to gain possession thereof. Well may our Annals be put to the blush for having to impute those civil wars to the existence of such vices as these!

Our own age, however, has waxed even stronger in this respect. In the reign of Claudius, his slave Drusillanus, surnamed Rotundus, who acted as his steward in Nearer Spain, possessed a silver charger weighing five hundred pounds, for the manufacture of which a workshop had had to be expressly built. This charger was accompanied also by eight other dishes, each two hundred and fifty pounds in weight. How many of his fellow-slaves, pray, would it have taken to introduce these dishes, or who were to be the guests served therefrom?

Cornelius Nepos says that before the victory gained by Sylla, there were but two banquetting couches adorned with silver at Rome, and that in his own recollection, silver was first used for adorning sideboards. Fenestella, who died at the end of the reign of Tiberius Cæsar, informs us that at that period sideboards, inlaid even with tortoiseshell, had come into fashion; whereas, a little before his time, they had been made of solid wood, of a round shape, and not much larger than our tables. He says, however, that when he was quite a boy, they had begun to make the sideboards square, and of different pieces of wood, or else veneered with maple or citrus: and that at a later period the fashion was introduced of overlaying the corners and the seams at the joinings with silver. The name given to them in his youth, he says, was “tympana;” and it was at this period, too, that the chargers which had been known as “magides” by the ancients, first received the name of “lances,” from their resemblance to the scales of a balance.

Detailed table of contents

CHAP. 53.

THE ENORMOUS PRICE OF SILVER PLATE.

It is not, however, only for vast quantities of plate that there is such a rage among mankind, but even more so, if possible, for the plate of peculiar artists: and this too, to the exculpation of our own age, has long been the case. C. Gracchus possessed some silver dolphins, for which he paid five thousand sesterces per pound. Lucius Crassus, the orator, paid for two goblets chased by the hand of the artist Mentor, one hundred thousand sesterces: but he confessed that for very shame he never dared use them, as also that he had other articles of plate in his possession, for which he had paid at the rate of six thousand sesterces per pound. It was the conquest of Asia that first introduced luxury into Italy; for we find that Lucius Scipio, in his triumphal procession, exhibited one thousand four hundred pounds' weight of chased silver, with golden vessels, the weight of which amounted to one thousand five hundred pounds. This took place in the year from the foundation of the City, 565. But that which inflicted a still more severe blow upon the Roman morals, was the legacy of Asia, which King Attalus left to the state at his decease, a legacy which was even more disadvantageous than the victory of Scipio, in its results. For, upon this occasion, all scruple was entirely removed, by the eagerness which existed at Rome, for making purchases at the auction of the king's effects. This took place in the year of the City, 622, the people having learned, during the fifty-seven years that had intervened, not only to admire, but to covet even, the opulence of foreign nations. The tastes of the Roman people had received, too, an immense impulse from the conquest of Achaia, which, during this interval, in the year of the City, 608, that nothing might be wanting, had introduced both statues and pictures. The same epoch, too, that saw the birth of luxury, witnessed the downfall of Carthage; so that, by a fatal coincidence, the Roman people, at the same moment, both acquired a taste for vice and obtained a license for gratifying it.

Some, too, of the ancients sought to recommend themselves by this love of excess; for Caius Marius, after his victory over the Cimbri, drank from a cantharus, it is said, in imitation of Father Liber; Marius, that ploughman of Arpinum, a general who had risen from the ranks.!

[Detailed table of contents](#)

CHAP. 54. (12.)

STATUES OF SILVER.

It is generally believed, but erroneously, that silver was first employed for making statues of the deified Emperor Augustus, at a period when adulation was all the fashion: for I find it stated, that in the triumph celebrated by Pompeius Magnus there was a silver statue exhibited of Pharnaces, the first king of Pontus, as also one of Mithridates Eupator, besides chariots of gold and silver.

Silver, too, has in some instances even supplanted gold; for the luxurious tastes of the female plebeians having gone so far as to adopt the use of shoe-buckles of gold, it is considered old-fashioned to wear them made of that metal. I myself, too, have seen Arellius Fuscus — the person whose name was erased from the equestrian order on a singularly calumnious charge, when his school was so thronged by our youth, attracted thither by his celebrity — wearing rings made of silver. But of what use is it to collect all these instances, when our very soldiers, holding ivory even in contempt, have the hilts of their swords made of chased silver? when, too, their scabbards are heard to jingle with their silver chains, and their belts with the plates of silver with which they are inlaid?

At the present day, too, the continence of our very pages is secured by the aid of silver: our women, when bathing, quite despise any sitting-bath that is not made of silver: while for serving up food at table, as well as for the most unseemly purposes, the same metal must be equally employed! Would that Fabricius could behold these instances of luxuriousness, the baths of our women — bathing as they do in company with the men — paved with silver to such an extent that there is not room left for the sole of the foot even! Fabricius, I say, who would allow of no general of an army having any other plate than a patera and a salt-cellar of silver. — Oh that he could see how that the rewards of valour in our day are either composed of these objects of luxury, or else are broken up to make them! Alas for the morals of our age! Fabricius puts us to the blush.

Detailed table of contents

CHAP. 55.

THE MOST REMARKABLE WORKS IN SILVER, AND THE NAMES OF THE MOST FAMOUS ARTISTS IN SILVER.

It is a remarkable fact that the art of chasing gold should have conferred no celebrity upon any person, while that of embossing silver has rendered many illustrious. The greatest renown, however, has been acquired by Mentor, of whom mention has been made already. Four pairs [of vases] were all that were ever made by him; and at the present day, not one of these, it is said, is any longer in existence, owing to the conflagrations of the Temple of Diana at Ephesus and of that in the Capitol. Varro informs us in his writings that he also was in possession of a bronze statue, the work of this artist. Next to Mentor, the most admired artists were Acragas, Boëthus, and Mys. Works of all these artists are still extant in the Isle of Rhodes; of Boëthus, in the Temple of Minerva, at Lindus; of Acragas, in the Temple of Father Liber, at Rhodes, consisting of cups engraved with figures in relief of Centaurs and Bacchantes; and of Mys, in the same temple, figures of Sileni and Cupids. Representations also of the chase by Acragas on drinking cups were held in high estimation.

Next to these in repute comes Calamis. Antipater too, it has been said, laid, rather than engraved, a Sleeping Satyr upon a drinking-bowl. Next to these come Stratonicus of Cyzicus, and Tauriscus: Ariston also, and Eunicus, of Mytilene are highly praised; Hecataeus also, and, about the age of Pompeius Magnus, Pasiteles, Posidonius of Ephesus, Hedystratides who engraved battle-scenes and armed warriors, and Zopyrus, who represented the Court of the Areopagus and the trial of Orestes, upon two cups valued at twelve thousand sesterces. There was Pytheas also, a work of whose sold at the rate of ten thousand denarii for two ounces: it was a drinking-bowl, the figures on which represented Ulysses and Diomedes stealing the Palladium. The same artist engraved also, upon some small drinking-vessels, kitchen scenes, known as “magiriscia;” of such remarkably fine workmanship and so liable to injury, that it was quite impossible to take copies of them. Teucer too, the inlayer, enjoyed a great reputation.

All at once, however, this art became so lost in point of excellence, that at the present day ancient specimens are the only ones at all valued; and only those pieces of plate are held in esteem the designs on which are so much worn that the figures cannot be distinguished.

Silver becomes tainted by the contact of mineral waters, and of the salt exhalations from them, as in the interior of Spain, for instance.

CHAP. 56.

SIL: THE PERSONS WHO FIRST USED IT IN PAINTING, AND THE METHOD THEY ADOPTED.

In the mines of gold and silver there are some other pigments also found, sil and cæruleum. Sil is, properly speaking, a sort of slime. The best kind is that known as Attic sil; the price of which is two denarii per pound. The next best kind is the marbled sil, the price of which is half that of the Attic kind. A third sort is the compressed sil, known to some persons as Scyric sil, it coming from the Isle of Scyros. Then, too, there is the sil of Achaia, which painters make use of for shadow-painting, and the price of which is two sesterces per pound. At a price of two asses less per pound, is sold the clear sil, which comes from Gaul. This last kind, as well as the Attic sil, is used for painting strong lights: but the marbled sil only is employed for colouring compartitions, the marble in it offering a resistance to the natural acidity of the lime. This last kind is extracted also from some mountains twenty miles distant from the City. When thus extracted, it is submitted to the action of fire; in which form it is adulterated by some, and sold for compressed sil. That it has been burnt, however, and adulterated, may be very easily detected by its acidity, and the fact that it very soon crumbles into dust.

Polygnotus and Micon were the first to employ sil in painting, but that of Attica solely. The succeeding age used this last kind for strong lights only, and employed the Scyric and Lydian kinds for shadow painting. The Lydian sil used to be bought at Sardes; but at the present day we hear nothing of it.

Detailed table of contents

CHAP. 57. (13.)

CÆRULEUM.

Cæruleum is a kind of sand. In former times there were three kinds of it; the Egyptian, which was the most esteemed of all; the Scythian, which is easily dissolved, and which produces four colours when pounded, one of a lighter blue and one of a darker blue, one of a thicker consistency and one comparatively thin; and the Cyprian, which is now preferred as a colour to the preceding. Since then, the kinds imported from Puteoli and Spain have been added to the list, this sand having of late been prepared there. Every kind, however, is submitted to a dyeing process, it being boiled with a plant used particularly for this purpose, and imbibing its juices. In other respects, the mode of preparing it is similar to that of chrysocolla. From cæruleum, too, is prepared the substance known as “lomentum,” it being washed and ground for the purpose. Lomentum is of a paler tint than cæruleum; the price of it is ten denarii per pound, and that of cæruleum but eight. Cæruleum is used upon a surface of clay, for upon lime it will not hold. A more recent invention is the Vestorian cæruleum, so called from the person who first manufactured it: it is prepared from the finer parts of Egyptian cæruleum, and the price of it is eleven denarii per pound. That of Puteoli is used in a similar manner, as also for windows: it is known as “cylon.”

It is not so long since that indicum was first imported to Rome, the price being seventeen denarii per pound. Painters make use of it for incisures, or in other words, the division of shadows from light. There is also a lomentum of very inferior quality, known to us as “ground” lomentum, and valued at only five asses per pound.

The mode of testing the genuineness of cæruleum, is to see whether it emits a flame, on being laid upon burning coals. One method of adulterating it is to boil dried violets in water, and then to strain the liquor through linen into Eretrian clay.

Detailed table of contents

CHAP. 58.

TWO REMEDIES DERIVED FROM CÆRULEUM.

Cæruleum has the medicinal property of acting as a detergent upon ulcers. Hence it is, that it is used as an ingredient in plasters, as also in cauteries. As to sil, it is pounded with the greatest difficulty: viewed as a medicament, it is slightly mordent and astringent, and fills up the cavities left by ulcers. To make it the more serviceable, it is burnt in earthen vessels.

The prices of things, which I have in different places annexed, vary, I am well aware, according to the locality, and experience a change almost every year: variations dependent upon the opportunities afforded for navigation, and the terms upon which the merchant may have purchased the article. It may so happen, too, that some wealthy dealer has engrossed the market, and so enhanced the price: for I am by no means forgetful of the case of Demetrius, who in the reign of the Emperor Nero was accused before the consuls by the whole community of the Seplasia. Still, however, I have thought it necessary to annex the usual price of each commodity at Rome, in order to give some idea of their relative values.

SUMMARY. — Remedies, narratives, and observations, one thousand one hundred and twenty-five.

ROMAN AUTHORS QUOTED. — Domitianus Cæsar, Junius Gracchanus, L. Piso, Verrius, M. Varro, Corvinus, Atticus Pomponius, Calvus Licinius, Cornelius Nepos, Mucianus, Bocchus, Fetialis, Fenestella, Valerius Maximus, Julius Bassus who wrote on Medicine in Greek, Sextius Niger who did the same.

FOREIGN AUTHORS QUOTED. — Theophrastus, Democritus, Juba, Timæus the historian, who wrote on Metallic Medicines, Heraclides, Andreas, Diagoras, Botrys, Archidemus, Dionysius, Aristogenes, Democles, Mnesides, Attalus the physician, Xenocrates the son of Zeno, Theomnestus, Nymphodorus, Iollas, Apollodorus, Pasiteles who wrote on Wonderful Works, Antigonus who wrote on the Toreutic art, Menæchmus who did the same, Xenocrates who did the same, Duris who did the same, Menander who wrote on Toreutics, Heliodorus who wrote on the Votive Offerings of the Athenians, Metrodorus of Scepsis.

BOOK XXXIV. THE NATURAL HISTORY OF METALS.

Detailed table of contents

CHAP. 1. (1.)

THE ORES OF BRASS.

WE must, in the next place, give an account of the ores of brass, a metal which, in respect of utility, is next in value; indeed the Corinthian brass comes before silver, not to say almost before gold itself. It is also, as I have stated above, the standard of monetary value; hence the terms “æra militum,” “tribuni ærarii,” “ærarium,” “obæрати,” and “ære diruti.” I have already mentioned for what length of time the Roman people employed no coin except brass; and there is another ancient fact which proves that the esteem in which it was held was of equal antiquity with that of the City itself, the circumstance that the third associated body which Numa established, was that of the braziers.

Detailed table of contents

CHAP. 2.

THE DIFFERENT KINDS OF COPPER.

The ore is extracted in the mode that has been described above, and is then purified by fusion. The metal is also obtained from a coppery stone called “cadmia.” The most highly esteemed copper is procured from beyond seas: it was formerly obtained in Campania also, and at present is found in the country of the Bergomates, at the extremity of Italy. It is said to have been lately discovered also in the province of Germany.

(2.) In Cyprus, where copper was first discovered, it is also procured from another stone, which is called “chalcitis.” This, however, was afterwards considered of little value, a better kind having been found in other regions, especially that called “aurichalcum,” which was long in high request, on account of its excellent quality; but none of it has been found for this long time, the earth having been quite exhausted. The kind which was next in value was the Sallustian, procured from the Alpine district of the Centrones; but this did not last long, and was succeeded by the Livian, in Gaul. They both took their names from the owners of the mines; the former a friend of the Emperor Augustus, the latter that emperor’s wife. They soon failed, however, and in the Livian even there is now found but a very small quantity of ore. That which is at present held in the highest estimation is the Marian, likewise known as the Corduban: next to the Livian, this kind most readily absorbs cadmia, and becomes almost as excellent as aurichalcum for making sesterces and double asses, the Cyprian copper being thought good enough for the as. Thus much concerning the natural qualities of this metal.

Detailed table of contents

CHAP. 3.

THE CORINTHIAN BRASS.

The other kinds are made artificially, all of which will be described in the appropriate places, the more celebrated kinds first coming under our notice. Formerly a mixture was made of copper fused with gold and silver, and the workmanship in this metal was considered even more valuable than the material itself; but, at the present day, it is difficult to say whether the workmanship in it, or the material, is the worst. Indeed, it is wonderful, that while the value of these works has so infinitely increased, the reputation of the art itself is nearly extinct. But it would appear, that in this, as in every thing else, what was formerly done for the sake of reputation, is now undertaken for the mere purpose of gain. For whereas this art was ascribed to the gods themselves, and men of rank in all countries endeavoured to acquire fame by the practice of it, we have now so entirely lost the method of making this valuable compound by fusion, that, for this long time past, not even chance itself has assumed, in this department, the privilege which formerly belonged to art.

Next after the above compound, so celebrated in antiquity, the Corinthian metal has been the most highly esteemed. This was a compound produced by accident, when Corinth was burnt at the time of its capture. There has been a wonderful mania with many for gaining possession of this metal. It is even said, that Verres, whom M. Cicero caused to be condemned, was proscribed by Antonius, along with Cicero, for no other reason than his refusal to give up some specimens of Corinthian metal, which were in his possession. But most of these people seem to me to make a pretence of their discernment in reference to this metal, rather for the purpose of distinguishing themselves from the multitude, than from any real knowledge which they possess; and this I will briefly show.

Corinth was captured in the third year of the 158th Olympiad, being the year of the City, 608, some ages after the period when those artists flourished, who produced all the specimens of what these persons now call Corinthian metal. It is in order, therefore, to refute this opinion, that I shall state the age when these different artists lived; for, if we reckon according to the above-mentioned era of the Olympiads, it will be easy to compare their dates with the corresponding years of our City. The only genuine Corinthian vessels, then, are those which these men of taste metamorphose, sometimes into dishes, sometimes into lamps, or even into washing-basins, without any regard to decency. They are of three kinds; the white variety, approaching very nearly to the splendour of silver, and in which that metal forms a large proportion of the compound; a second kind, in which the yellow colour of gold predominates; and a third, in which all the metals are mixed in equal

proportions. Besides these, there is another mixture, the composition of which it is impossible to describe, for although it has been formed into images and statues by the hand of man, it is chance that rules in the formation of the compound. This last is highly prized for its colour, which approaches to that of liver, and it is on this account that it is called “hepatizon:” it is far inferior to the Corinthian metal, but much superior to the Æginetan and Delian, which long held the first rank.

Detailed table of contents

CHAP. 4.

THE DELIAN BRASS.

The Delian brass was the first that became famous, all the world coming to Delos to purchase it; and hence the attention paid to the manufacture of it. It was in this island that brass first obtained celebrity for the manufacture of the feet and supports of dining-couches. After some time it came to be employed for the statues of the gods, and the effigies of men and other animated beings.

Detailed table of contents

CHAP. 5.

THE ÆGINETAN BRASS.

The next most esteemed brass was the Æginetan; the island itself being rendered famous for its brass — not indeed that the metal was produced there, but because the annealing of the Æginetan manufactories was so excellent. A brazen Ox, which was taken from this is and, now stands in the Forum Bearium at Rome. This is a specimen of the Æginetan metal, as the Jupiter in the Temple of Jupiter Tonans, in the Capitol, is of the Delian. Myron used the former metal and Polycletus the latter; they were contemporaries and fellow-pupils, but there was great rivalry between them as to their materials.

[Detailed table of contents](#)

CHAP. 6. (3.)

STANDS FOR LAMPS.

Ægina was particularly famous for the manufacture of sockets only for lamp-stands, as Tarentum was for that of the branches; the most complete articles were, therefore, produced by the union of the two. There are persons, too, who are not ashamed to give for one a sum equal to the salary of a military tribune, although, as its name indicates, its only use is to hold a lighted candle. On the sale of one of these lamp-stands, Theon the public crier announced, that the purchaser must also take, as part of the lot, one Clesippus, a fuller, who was hump-backed, and in other respects, of a hideous aspect. The purchase was made by a female named Gegania, for fifty thousand sesterces. Upon her exhibiting these purchases at an entertainment which she gave, the slave, for the amusement of her guests, was brought in naked. Conceiving an infamous passion for him, she first admitted him to her bed, and finally left him all her estate. Having thus become excessively rich, he adored the lamp-stand as much as any divinity, and the story became a sort of pendant to the celebrity of the Corinthian lamp-stands. Still, however, good morals were vindicated in the end, for he erected a splendid monument to her memory, and so kept alive the eternal remembrance of the misconduct of Gegania. But although it is well known that there are no lamp-stands in existence made of the Corinthian metal, yet this name is very generally attached to them, because, in consequence of the victory of Mummius, Corinth was destroyed: at the same time, however, it should be remembered that this victory dispersed a number of bronzes which originally came from many other cities of Achaia.

CHAP. 7.

ORNAMENTS OF THE TEMPLES MADE OF BRASS.

The ancients were in the habit of making the door-sills and even the doors of the temples of brass. I find it stated, also, that Cneius Octavius, who obtained a naval triumph over King Perseus, erected the double portico to the Flaminian Circus, which was called the “Corinthian” from the brazen capitals of the pillars. It is stated also, that an ordinance was made that the Temple of Vesta should be covered with a coating of Syracusan metal. The capitals, too, of the pillars, which were placed by M. Agrippa in the Pantheon, are made of similar metal. Even the opulence, too, of private individuals has been wrested to similar purposes. Spurius Carvilius, the quæstor, among the other charges which he brought against Camillus, accused him of having brazen doors in his house.

CHAP. 8.

COUCHES OF BRASS.

We learn from L. Piso, that Cneius Manlius was the first who introduced brazen banquetting-couches, buffets, and tables with single feet, when he entered the City in triumph, in the year of Rome 567, after his conquests in Asia. We also learn from Antias, that the heirs of L. Crassus, the orator, sold a number of banquetting-couches adorned with brass. The tripods, which were called Delphian, because they were devoted more particularly to receiving the offerings that were presented to the Delphian Apollo, were usually made of brass: also the pendant lamps, so much admired, which were placed in the temples, or gave their light in the form of trees loaded with fruit; such as the one, for instance, in the Temple of the Palatine Apollo, which Alexander the Great, at the sacking of Thebes, brought to Cyme, and dedicated to that god.

CHAP. 9. (4.)

WHICH WAS THE FIRST STATUE OF A GOD MADE OF BRASS AT ROME. THE
ORIGIN OF STATUES, AND THE RESPECT PAID TO THEM.

But after some time the artists everywhere applied themselves to representations of the gods. I find that the first brass image, which was made at Rome, was that of Ceres; and that the expenses were defrayed out of the property that belonged to Spurius Cassius, who was put to death by his own father, for aspiring to the regal office. The practice, however, soon passed from the gods to the statues and representations of men, and this in various forms. The ancients stained their statues with bitumen, which makes it the more remarkable that they were afterwards fond of covering them with gold. I do not know whether this was a Roman invention; but it certainly has the repute of being an ancient practice at Rome.

It was not the custom in former times to give the likeness of individuals, except of such as deserved to be held in lasting remembrance on account of some illustrious deed; in the first instance, for a victory at the sacred games, and more particularly the Olympic Games, where it was the usage for the victors always to have their statues consecrated. And if any one was so fortunate as to obtain the prize there three times, his statue was made with the exact resemblance of every individual limb; from which circumstance they were called “*iconicæ*.” I do not know whether the first public statues were not erected by the Athenians, and in honour of Harmodius and Aristogiton, who slew the tyrant; an event which took place in the same year in which the kings were expelled from Rome. This custom, from a most praiseworthy emulation, was afterwards adopted by all other nations; so that statues were erected as ornaments in the public places of municipal towns, and the memory of individuals was thus preserved, their various honours being inscribed on the pedestals, to be read there by posterity, and not on their tombs alone. After some time, a kind of forum or public place came to be made in private houses and in our halls, the clients adopting this method of doing honour to their patrons.

CHAP. 10. (5.)

THE DIFFERENT KINDS AND FORMS OF STATUES. STATUES AT ROME WITH CUIRASSES.

In former times the statues that were thus dedicated were clad in the toga. Naked statues also, brandishing a spear, after the manner of the youths at their gymnastic exercises, were much admired; these were called “Achillean.” The Greek practice is, not to cover any part of the body; while, on the contrary, the Roman and the military statues have the addition of a cuirass. Cæsar, the Dictator, permitted a statue with a cuirass to be erected in honour of him in his Forum. As to the statues which are made in the garb of the Luperci, they are of no older date than those which have been lately erected, covered with a cloak. Mancinus gave directions, that he should be represented in the dress which he wore when he was surrendered to the enemy. It has been remarked by some authors, that L. Attius, the poet, had a statue of himself erected in the Temple of the Muses, which was extremely large, although he himself was very short.

Equestrian statues are also held in esteem in Rome; but they are of Greek origin, no doubt. Among the Greeks, those persons only were honoured with equestrian statues who were victors on horseback in the sacred games; though afterwards the same distinction was bestowed on those who were successful in the races with chariots with two or four horses: hence the use of chariots with us in the statues of those who have triumphed. But this did not take place until a late period; and it was not until the time of the late Emperor Augustus, that we had chariots represented with six horses, as also with elephants.

CHAP. 11.

IN HONOUR OF WHOM PUBLIC STATUES WERE FIRST ERECTED: IN HONOUR OF WHOM THEY WERE FIRST PLACED ON PILLARS: WHEN THE ROSTRA WERE FIRST ERECTED.

The custom of erecting chariots with two horses in honour of those who had discharged the office of prætor, and had passed round the Circus in a chariot, is not of ancient date. That of placing statues on pillars is older, as it was done in honour of C. Mænius, who conquered the ancient Latins, to whom the Romans by treaty gave one third of the spoil which they had obtained. It was in the same consulship also, that the “rostra” or beaks of the ships, which had been taken from the Antiates when vanquished, were fixed to the tribunal; it being the year of the City, 416. The same thing was done also by Caius Duillius, who was the first to obtain a naval triumph over the Carthaginians: his column still remains in the Forum. I am not certain whether this honour was not first conferred by the people on L. Minutius, the præfect of the markets; whose statue was erected without the Trigeminian Gate, by means of a tax of the twelfth of an as per head: the same thing, however, had been previously done by the senate, and it would have been a more distinguished honour had it not had its origin on such frivolous occasions. The statue of Attus Navius, for example, was erected before the senate-house, the pedestal of which was consumed when the senate-house itself was burnt at the funeral of Publius Clodius. The statue of Hermodorus also, the Ephesian, the interpreter of the laws which were transcribed by the Decemvirs, was erected by the public in the Comitium.

It was for a very different, and more important reason, that the statue of Horatius Cocles was erected, he having singly prevented the enemy from passing the Sublician bridge; a statue which remains to this day. I am not at all surprized, too, that statues of the Sibyl should have been erected near the Rostra, even though three in number; one of which was repaired by Sextus Pacuvius Taurus, ædile of the people, and the other two by M. Messala. I should have considered these and that of Attus Navius to have been the oldest, as having been placed there in the time of Tarquinius Priscus, had there not been in the Capitol the statues of the preceding kings.

(6.) Among these we have the statues of Romullus and Tatius without the tunic; as also that of Camillus, near the Rostra. The equestrian statue of Marcius Tremulus, clad in the toga, stood before the Temple of the Castors; him who twice subdued the Samnites, and by the capture of Anagnia delivered the people from their tribute. Among the most ancient are those of Tullus Clælius, Lucius Roscius, Spurius Nautius, and C. Fulcinus, near the Rostra, all of whom were assassinated by the Fidenates, when on their mission as ambassadors. It was the custom with the republic to confer this honour on those who had been unjustly put to death; such as P. Junius, also, and Titus

Coruncanius, who were slain by Teuta, queen of the Illyrians. It would be wrong not to mention what is stated in the Annals, that their statues, erected in the Forum, were three feet in height; whence it would appear that such were the dimensions of these marks of honour in those times.

Nor must I forget to mention Cneius Octavius, on account of the language used by the senate. When King Antiochus said, that he would give him an answer at another time, Octavius drew a line round him with a stick, which he happened to have in his hand, and compelled him to give an answer before he allowed him to step beyond the circle. Octavius being slain while on this embassy, the senate ordered his statue to be placed in the most conspicuous spot; and that spot was the Rostra. A statue appears also to have been decreed to Taracia Caia, or Furetia, a Vestal Virgin, the same, too, to be placed wherever she might think fit; an additional honour, no less remarkable, it is thought, than the grant itself of a statue to a female. I will state her merits in the words of the Annals: “Because she had gratuitously presented to the public the field bordering on the Tiber.

CHAP. 12.

IN HONOUR OF WHAT FOREIGNERS PUBLIC STATUES WERE ERECTED AT ROME.

I find also, that statues were erected in honour of Pythagoras and of Alcibiades, in the corners of the Comitium; in obedience to the command of the Pythian Apollo, who, in the Samnite War, had directed that statues of the bravest and the wisest of the Greeks should be erected in some conspicuous spot: and here they remained until Sylla, the Dictator, built the senate-house on the site. It is wonderful that the senate should then have preferred Pythagoras to Socrates, who, in consequence of his wisdom, had been preferred to all other men by the god himself; as, also, that they should have preferred Alcibiades for valour to so many other heroes; or, indeed, any one to Themistocles, who so greatly excelled in both qualities. The reason of the statues being raised on columns, was, that the persons represented might be elevated above other mortals; the same thing being signified by the use of arches, a new invention which had its origin among the Greeks. I am of opinion that there is no one to whom more statues were erected than to Demetrius Phalereus at Athens: for there were three hundred and sixty erected in his honour, there being reckoned at that period no more days in the year: these, however, were soon broken to pieces. The different tribes erected statues, in all the quarters of Rome, in honour of Marius Gratidianus, as already stated; but they were all thrown down by Sylla, when he entered Rome.

CHAP. 13.

THE FIRST EQUESTRIAN STATUES PUBLICLY ERECTED AT ROME, AND IN HONOUR OF WHAT FEMALES STATUES WERE PUBLICLY ERECTED THERE.

Pedestrian statues have been, undoubtedly, for a long time in estimation at Rome: equestrian statues are, however, of considerable antiquity, and females even have participated in this honour; for the statue of Clælia is equestrian, as if it had not been thought sufficient to have her clad in the toga; and this, although statues were not decreed to Lucretia, or to Brutus, who had expelled the kings, and through both of whom Clælia had been given as a hostage. I should have thought that this statue, and that of Cocles, were the first that were erected at the public expense — for it is most likely that the statues of Attus and the Sibyl were erected by Tarquinius, and those of each of the other kings by themselves respectively — had not Piso stated that the statue of Clælia was erected by those who had been hostages with her, when they were given up by Porsena, as a mark of honour.

But Annius Fetialis states, on the other hand, that the equestrian statue, which stood opposite the Temple of Jupiter Stator, in the vestibule of the house of Tarquinius Superbus, was that of Valeria, the daughter of the consul Publicola; and that she was the only person that escaped and swam across the Tiber; the rest of the hostages that had been sent to Porsena having been destroyed by a stratagem of Tarquinius.

Detailed table of contents

CHAP. 14.

AT WHAT PERIOD ALL THE STATUES ERECTED BY PRIVATE INDIVIDUALS WERE REMOVED FROM THE PUBLIC PLACES.

We are informed by L. Piso, that when M. Æmilius and C. Popilius were consuls, for the second time, the censors, P. Cornelius Scipio and M. Popilius, caused all the statues erected round the Forum in honour of those who had borne the office of magistrates, to be removed; with the exception of those which had been placed there, either by order of the people or of the senate. The statue also which Spurius Cassius, who had aspired to the supreme authority, had erected in honour of himself, before the Temple of Tellus, was melted down by order of the censors; for even in this respect, the men of those days took precautions against ambition.

There are still extant some declamations by Cato, during his censorship, against the practice of erecting statues of women in the Roman provinces. However, he could not prevent these statues being erected at Rome even; to Cornelia, for instance, the mother of the Gracchi, and daughter of the elder Scipio Africanus. She is represented in a sitting posture, and the statue is remarkable for having no straps to the shoes. This statue, which was formerly in the public Portico of Metellus, is now in the Buildings of Octavia.

CHAP. 15.

THE FIRST STATUES PUBLICLY ERECTED BY FOREIGNERS.

The first statue that was erected at Rome at the expense of a foreigner was that of C. Ælius, the tribune of the people, who had introduced a law against Sthennius Statilius Lucanus, for having twice attacked Thurii: on which account the inhabitants of that place presented Ælius with a statue and a golden crown. At a later period, the same people erected a statue to Fabricius, who had delivered their city from a state of siege. From time to time various nations thus placed themselves under the protection of the Romans; and all distinctions were thereby so effectually removed, that statues of Hannibal even are to be seen in three different places in that city, within the walls of which, he alone of all its enemies, had hurled his spear.

CHAP. 16. (7.)

THAT THERE WERE STATUARIES IN ITALY ALSO AT AN EARLY PERIOD.

Various circumstances prove, that the art of making statues was commonly practised in Italy at an early period. The statue in the Cattle Market is said to have been consecrated to Hercules by Evander; it is called the triumphal Hercules, and, on the occasion of triumphal processions, is arrayed in triumphal vestments. And then besides, King Numa dedicated the statue of the two-faced Janus; a deity who is worshipped as presiding over both peace and war. The fingers, too, are so formed as to indicate three hundred and sixty-five days, or in other words, the year; thus denoting that he is the god of time and duration.

There are also Etruscan statues dispersed in various parts of the world, which beyond a doubt were originally made in Etruria. I should have supposed that these had been the statues only of divinities, had not Metrodorus of Scepsis, who had his surname from his hatred to the Roman name, reproached us with having pillaged the city of Volsinii for the sake of the two thousand statues which it contained. It appears to me a singular fact, that although the origin of statues was of such great antiquity in Italy, the images of the gods, which were consecrated to them in their temples, should have been formed either of wood or of earthenware, until the conquest of Asia, which introduced luxury among us. It will be the best plan to enlarge upon the origin of the art of expressing likenesses, when we come to speak of what the Greeks call “*plastice*,” for the art of modelling was prior to that of statuary. This last, however, has flourished to such an extraordinary degree, that an account of it would fill many volumes, if we were desirous of making an extensive acquaintance with the subject: but as to learning everything connected with it, who could do it?

Detailed table of contents

CHAP. 17.

THE IMMODERATE PRICES OF STATUES.

In the ædileship of M. Scaurus, there were three thousand statues erected on the stage of what was a temporary theatre only. Mummius, the conqueror of Achaia, filled the City with statues; he who at his death was destined not to leave a dowry to his daughter, for why not mention this as an apology for him? The Luculli also introduced many articles from abroad. Yet we learn from Mucianus, who was thrice consul, that there are still three thousand statues in Rhodes, and it is supposed that there are no fewer in existence at Athens, at Olympia, and at Delphi. What living mortal could enumerate them all? or of what utility would be such information? Still, however, I may, perhaps, afford amusement by giving some slight account of such of those works of art as are in any way remarkable, and stating the names of the more celebrated artists. Of each of these it would be impossible to enumerate all the productions, for Lysippus alone is said to have executed no less than fifteen hundred works of art, all of which were of such excellence that any one of them might have immortalized him. The number was ascertained by his heir, upon opening his coffers after his death, it having been his practice to lay up one golden denarius out of the sum which he had received as the price of each statue.

This art has arrived at incredible perfection, both in successfulness and in boldness of design. As a proof of successfulness, I will adduce one example, and that of a figure which represented neither god nor man. We have seen in our own time, in the Capitol, before it was last burnt by the party of Vitellius, in the shrine of Juno there, a bronze figure of a dog licking its wounds. Its miraculous excellence and its perfect truthfulness were not only proved by the circumstance of its having been consecrated there, but also by the novel kind of security that was taken for its safety; for, no sum appearing equal to its value, it was publicly enacted that the keepers of it should be answerable for its safety with their lives.

Detailed table of contents

CHAP. 18.

THE MOST CELEBRATED COLOSSAL STATUES IN THE CITY.

As to boldness of design, the examples are innumerable; for we see designed, statues of enormous bulk, known as colossal statues and equal to towers in size. Such, for instance, is the Apollo in the Capitol, which was brought by M. Lucullus from Apollonia, a city of Pontus, thirty cubits in height, and which cost five hundred talents: such, too, is the statue of Jupiter, in the Campus Martius, dedicated by the late Emperor Claudius, but which appears small in comparison from its vicinity to the Theatre of Pompeius: and such is that at Tarentum, forty cubits in height, and the work of Lysippus. It is a remarkable circumstance in this statue, that though, as it is stated, it is so nicely balanced as to be moveable by the hand, it has never been thrown down by a tempest. This indeed, the artist, it is said, has guarded against, by a column erected at a short distance from it, upon the side on which the violence of the wind required to be broken. On account, therefore, of its magnitude, and the great difficulty of moving it, Fabius Verrucosus did not touch it, when he transferred the Hercules from that place to the Capitol, where it now stands.

But that which is by far the most worthy of our admiration, is the colossal statue of the Sun, which stood formerly at Rhodes, and was the work of Chares the Lindian, a pupil of the above-named Lysippus; no less than seventy cubits in height. This statue fifty-six years after it was erected, was thrown down by an earthquake; but even as it lies, it excites our wonder and admiration. Few men can clasp the thumb in their arms, and its fingers are larger than most statues. Where the limbs are broken asunder, vast caverns are seen yawning in the interior. Within it, too, are to be seen large masses of rock, by the weight of which the artist steadied it while erecting it. It is said that it was twelve years before this statue was completed, and that three hundred talents were expended upon it; a sum raised from the engines of warfare which had been abandoned by King Demetrius, when tired of the long-protracted siege of Rhodes. In the same city there are other colossal statues, one hundred in number; but though smaller than the one already mentioned, wherever erected, they would, any one of them, have ennobled the place. In addition to these, there are five colossal statues of the gods, which were made by Bryaxis.

Colossal statues used also to be made in Italy. At all events, we see the Tuscan Apollo, in the library of the Temple of Augustus, fifty feet in height from the toe; and it is a question whether it is more remarkable for the quality of the metal, or for the beauty of the workmanship. Spurius Carvilius also erected the statue of Jupiter which is seen in the Capitol, after he had conquered the Samnites, who fought in obedience to a most solemn oath; it being formed out of their breast-plates, greaves, and helmets, and of such

large dimensions that it may be seen from the statue of Jupiter Latiaris. He made his own statue, which is at the feet of the other one, out of the filings of the metal. There are also, in the Capitol, two heads which are very much admired, and which were dedicated by the Consul P. Lentulus, one of them executed by the above-mentioned Chares, the other by Decius; but this last is so greatly excelled by the former, as to have all the appearance of being the work of one of the poorest of artists.

But all these gigantic statues of this kind have been surpassed in our own age by that of Mercury, made by Zenodotus for the city of the Arverni in Gaul, which was ten years in being completed, and the making of which cost four hundred thousand sesterces. Having given sufficient proof there of his artistic skill, he was sent for by Nero to Rome, where he made a colossal statue intended to represent that prince, one hundred and ten feet in height. In consequence, however, of the public detestation of Nero's crimes, this statue was consecrated to the Sun. We used to admire in his studio, not only the accurate likeness in the model of clay, but in the small sketches also, which served as the first foundation of the work. This statue proves that the art of fusing [precious] brass was then lost, for Nero was prepared to furnish the requisite gold and silver, and Zenodotus was inferior to none of the ancients, either as a designer or as an engraver. At the time that he was working at the statue for the Arverni, he copied for Dubius Avitus, the then governor of the province, two drinking-cups, chased by the hand of Calamis, which had been highly prized by Germanicus Cæsar, and had been given by him to his preceptor Cassius Silanus, the uncle of Avitus; and this with such exactness, that they could scarcely be distinguished from the originals. The greater, then, the superiority of Zenodotus, the more certainly it may be concluded that the secret of fusing [precious] brass is lost.

(8.) Persons who possess what are called Corinthian bronzes, are generally so much enamoured of them, as to carry them about with them from place to place; Hortensius, the orator, for instance, who possessed a Sphinx, which he had made Verres give him, when accused. It was to this figure that Cicero alluded, in an altercation which took place at the trial: when, upon Hortensius saying that he could not understand enigmas, Cicero made answer that he ought to understand them, as he had got a Sphinx at home. The Emperor Nero, also, used to carry about with him the figure of an Amazon, of which I shall speak further hereafter; and, shortly before this, C. Cestius, a person of consular rank, had possessed a figure, which he carried with him even in battle. The tent, too, of Alexander the Great was usually supported, it is said, by statues, two of which are consecrated before the Temple of Mars Ultor, and a similar number before the Palace.

CHAP. 19.

AN ACCOUNT OF THE MOST CELEBRATED WORKS IN BRASS, AND OF THE ARTISTS, 366 IN NUMBER.

An almost innumerable multitude of artists have been rendered famous by their statues and figures of smaller size. Before all others is Phidias, the Athenian, who executed the Jupiter at Olympia, in ivory and gold, but who also made figures in brass as well. He flourished in the eighty-third Olympiad, about the year of our City, 300. To the same age belong also his rivals Alcamenes, Critias, Nesiotes, and Hegias. Afterwards, in the eighty-seventh Olympiad, there were Agelades, Callon, and Gorgias the Laconian. In the ninetieth Olympiad there were Polycletus, Phradmon, Myron, Pythagoras, Scopas, and Perellus. Of these, Polycletus had for pupils, Argius, Asopodorus, Alexis, Aristides, Phrynon, Dinon, Athenodorus, and Demeas the Clitorian: Lycius, too, was the pupil of Myron. In the ninety-fifth Olympiad flourished Naucsydes, Dinomenes, Canachus, and Patroclus. In the hundred and second Olympiad there were Polycles, Cephisodotus, Learches, and Hypatodorus. In the hundred and fourth Olympiad, flourished Praxiteles and Euphranor; in the hundred and seventh, Aëtion and Therimachus; in the hundred and thirteenth, Lysippus, who was the contemporary of Alexander the Great, his brother Lysistratus, Sthennis, Euphron, Eucles, Sostratus, Ion, and Silanion, who was remarkable for having acquired great celebrity without any instructor: Zeuxis was his pupil. In the hundred and twenty-first Olympiad were Eutychides, Euthycrates, Laëppus, Cephisodotus, Timarchus, and Pyromachus.

The practice of this art then ceased for some time, but revived in the hundred and fifty-sixth Olympiad, when there were some artists, who, though far inferior to those already mentioned, were still highly esteemed; Antæus, Callistratus, Polycles, Athenæus, Callixenus, Pythocles, Pythias, and Timocles.

The ages of the most celebrated artists being thus distinguished, I shall cursorily review the more eminent of them, the greater part being mentioned in a desultory manner. The most celebrated of these artists, though born at different epochs, have joined in a trial of skill in the Amazons which they have respectively made. When these statues were dedicated in the Temple of Diana at Ephesus, it was agreed, in order to ascertain which was the best, that it should be left to the judgment of the artists themselves who were then present: upon which, it was evident that that was the best, which all the artists agreed in considering as the next best to his own. Accordingly, the first rank was assigned to Polycletus, the second to Phidias, the third to Cresilas, the fourth to Cydon, and the fifth to Phradmon.

Phidias, besides the Olympian Jupiter, which no one has ever equalled, also executed in ivory the erect statue of Minerva, which is in the Parthenon at Athens. He also made in brass, beside the Amazon above mentioned, a

Minerva, of such exquisite beauty, that it received its name from its fine proportions. He also made the Cliduchus, and another Minerva, which Paulus Æmilius dedicated at Rome in the Temple of Fortune of the passing day. Also the two statues, draped with the pallium, which Catulus erected in the same temple; and a nude colossal statue. Phidias is deservedly considered to have discovered and developed the toreutic art.

Polycletus of Sicyon, the pupil of Agelades, executed the Diadumenos, the statue of an effeminate youth, and remarkable for having cost one hundred talents; as also the statue of a youth full of manly vigour, and called the Doryphoros. He also made what the artists have called the Model statue, and from which, as from a sort of standard, they study the lineaments: so that he, of all men, is thought in one work of art to have exhausted all the resources of art. He also made statues of a man using the body-scraper, and of a naked man challenging to play at dice; as also of two naked boys playing at dice, and known as the Astragalizontes; they are now in the atrium of the Emperor Titus, and it is generally considered, that there can be no work more perfect than this. He also executed a Mercury, which was formerly at Lysimachia; a Hercules Ageter, seizing his arms, which is now at Rome; and an Artemon, which has received the name of Periphoretos. Polycletus is generally considered as having attained the highest excellence in statuary, and as having perfected the toreutic art, which Phidias invented. A discovery which was entirely his own, was the art of placing statues on one leg. It is remarked, however, by Varro, that his statues are all square-built, and made very much after the same model.

Myron of Eleutheræ, who was also the pupil of Agelades, was rendered more particularly famous by his statue of a heifer, celebrated in many well-known lines: so true is it, that most men owe their renown more to the genius of others, than to their own. He also made the figure of a dog, a Discobolus, a Perseus, the Pristæ, a Satyr admiring a flute, and a Minerva, the Delphic Pentathletes, the Pancratiastæ, and a Hercules, which is at the Circus Maximus, in the house of Pompeius Magnus. Erinna, in her poems, makes allusion to a monument which he erected to a cricket and a locust. He also executed the Apollo, which, after being taken from the Ephesians by the Triumvir Antonius, was restored by the Emperor Augustus, he having been admonished to do so in a dream. Myron appears to have been the first to give a varied development to the art, having made a greater number of designs than Polycletus, and shewn more attention to symmetry. And yet, though he was very accurate in the proportions of his figures, he has neglected to give expression; besides which, he has not treated the hair and the pubes with any greater attention than is observed in the rude figures of more ancient times.

Pythagoras of Rhegium, in Italy, excelled him in the figure of the Pancratiast which is now at Delphi, and in which he also surpassed Leontiscus. Pythagoras also executed the statue of Astylos, the runner, which is exhibited at Olympia; that of a Libyan boy holding a tablet, also in the same

place; and a nude male figure holding fruit. There is at Syracuse a figure of a lame man by him: persons, when looking at it, seem to feel the very pain of his wound. He also made an Apollo, with the serpent pierced by his arrows; and a Player on the Lyre, known as the Dicæus, from the fact that, when Thebes was taken by Alexander the Great, a fugitive successfully concealed in its bosom a sum of gold. He was the first artist who gave expression to the sinews and the veins, and paid more attention to the hair.

There was also another Pythagoras, a Samian, who was originally a painter, seven of whose nude figures, in the Temple of Fortune of the passing day, and one of an aged man, are very much admired. He is said to have resembled the last-mentioned artist so much in his features, that they could not be distinguished. Sostratus, it is said, was the pupil of Pythagoras of Rhegium, and his sister's son.

According to Duris, Lysippus the Sicyonian was not the pupil of any one, but was originally a worker in brass, and was first prompted to venture upon statuary by an answer that was given by Eupompus the painter; who, upon being asked which of his predecessors he proposed to take for his model, pointed to a crowd of men, and replied that it was Nature herself, and no artist, that he proposed to imitate. As already mentioned, Lysippus was most prolific in his works, and made more statues than any other artist. Among these, is the Man using the Body-scraper, which Marcus Agrippa had erected in front of his Warm Baths, and which wonderfully pleased the Emperor Tiberius. This prince, although in the beginning of his reign he imposed some restraint upon himself, could not resist the temptation, and had this statue removed to his bed-chamber, having substituted another for it at the baths: the people, however, were so resolutely opposed to this, that at the theatre they clamorously demanded the Apoxyomenos to be replaced; and the prince, notwithstanding his attachment to it, was obliged to restore it.

Lysippus is also celebrated for his statue of the intoxicated Female Flute-player, his dogs and huntsmen, and, more particularly, for his Chariot with the Sun, as represented by the Rhodians. He also executed a numerous series of statues of Alexander the Great, commencing from his childhood. The Emperor Nero was so delighted with his statue of the infant Alexander, that he had it gilt: this addition, however, to its value, so detracted from its artistic beauty that the gold was removed, and in this state it was looked upon as still more precious, though disfigured by the scratches and seams which remained upon it, and in which the gold was still to be seen. He also made the statue of Hephæstion, the friend of Alexander the Great, which some persons attribute to Polycletus, whereas that artist lived nearly a century before his time. Also, the statue of Alexander at the chase, now consecrated at Delphi, the figure of a Satyr, now at Athens, and the Squadron of Alexander, all of whom he represented with the greatest accuracy. This last work of art, after his conquest of Macedonia, Metellus conveyed to Rome. Lysippus also executed chariots of various kinds. He is considered to have contributed very greatly to the art

of statuary by expressing the details of the hair, and by making the head smaller than had been done by the ancients, and the body more graceful and less bulky, a method by which his statues were made to appear taller. The Latin language has no appropriate name for that "symmetry," which he so attentively observed in his new and hitherto untried method of modifying the squareness observable in the ancient statues. Indeed, it was a common saying of his, that other artists made men as they actually were, while he made them as they appeared to be. One peculiar characteristic of his work, is the finish and minuteness which are observed in even the smallest details. Lysippus left three sons, who were also his pupils, and became celebrated as artists, Laippus, Bœdas, and, more particularly, Euthyrates; though this last-named artist rivalled his father in precision rather than in elegance, and preferred scrupulous correctness to gracefulness. Nothing can be more expressive than his Hercules at Delphi, his Alexander, his Hunter at Thespiæ, and his Equestrian Combat. Equally good, too, are his statue of Trophonius, erected in the oracular cave of that divinity, his numerous chariots, his Horse with the Panniers, and his hounds.

Tisicrates, also a native of Sicyon, was a pupil of Euthyrates, but more nearly approaching the style of Lysippus; so much so, that several of his statues can scarcely be distinguished from those of Lysippus; his aged Theban, for example, his King Demetrius, and his Peucestes, who saved the life of Alexander the Great, and so rendered himself deserving of this honour.

Artists, who have transmitted these details in their works, bestow wonderful encomiums upon Telephanes, the Phocæan, a statuary but little known, they say, because he lived in Thessaly, where his works remained concealed; according to their account, however, he is quite equal to Polycletus, Myron, and Pythagoras. They more particularly commend his Larissa, his Spintharus, the pentathlete, and his Apollo. Others, however, assign another reason for his being so little known; it being owing, they think, to his having devoted himself to the studios established by Kings Xerxes and Darius.

Praxiteles, who excelled more particularly in marble, and thence acquired his chief celebrity, also executed some very beautiful works in brass, the Rape of Proserpine, the Catagusa, a Father Liber, a figure of Drunkenness, and the celebrated Satyr, to the Greeks known as "Periboetos." He also executed the statues, which were formerly before the Temple of Good Fortune, and the Venus, which was destroyed by fire, with the Temple of that goddess, in the reign of Claudius, and was considered equal to his marble statue of Venus, so celebrated throughout the world. He also executed a Stephanusa, a Spilumene, an Cœnophorus, and two figures of Harmodius and Aristogiton, who slew the tyrants; which last, having been taken away from Greece by Xerxes, were restored to the Athenians on the conquest of Persia by Alexander the Great. He also made the youthful Apollo, known as the "Sauroctonos," because he is aiming an arrow at a lizard which is stealing towards him. There are greatly

admired, also, two statues of his, expressive of contrary emotions — a Matron in tears, and a Courtesan full of gaiety: this last is supposed to be a likeness of Phryne, and it is said that we can detect in her figure the love of the artist, and in the countenance of the courtesan the promised reward.

His kindness of heart, too, is witnessed by another figure; for in a chariot and horses which had been executed by Calamis, he himself made the charioteer, in order that the artist, who excelled in the representation of horses, might not be considered deficient in the human figure. This last-mentioned artist has executed other chariots also, some with four horses, and some with two; and in his horses he is always unrivalled. But that it may not be supposed that he was so greatly inferior in his human figures, it is as well to remark that his Alcmena is equal to any that was ever produced.

Alcámenes, who was a pupil of Phidias, worked in marble and executed a Pentathlete in brass, known as the “Encrinomenos.” Aristides, too, who was the scholar of Polycletus, executed chariots in metal with four and two horses. The Leæna of Amphiçrates is highly commended. The courtesan Leæna, who was a skilful performer on the lyre, and had so become acquainted with Harmodius and Aristogiton, submitted to be tortured till she expired, rather than betray their plot for the extermination of the tyrants. The Athenians, being desirous of honouring her memory, without at the same time rendering homage to a courtesan, had her represented under the figure of the animal whose name she bore; and, in order to indicate the cause of the honour thus paid her, ordered the artist to represent the animal without a tongue.

Bryaxis executed in brass statues of Æsculapius and Seleucus; Bœdas a figure in adoration; Baton, an Apollo and a Juno, which are in the Temple of Concord at Rome.

Ctesilaüs executed a statue of a man fainting from his wounds, in the expression of which may be seen how little life remains; as also the Olympian Pericles, well worthy of its title: indeed, it is one of the marvellous adjuncts of this art, that it renders men who are already celebrated even more so.

Cephisodotus is the artist of an admirable Minerva, now erected in the port of Athens; as also of the altar before the Temple of Jupiter Servator, at the same place, to which, indeed, few works are comparable.

Canachus executed a nude Apollo, which is known as the “Philesian:” it is at Didymi, and is composed of bronze that was fused at Ægina. He also made a stag with it, so nicely poised on its hoofs, as to admit of a thread being passed beneath. One fore-foot, too, and the alternate hind-foot are so made as firmly to grip the base, the socket being so indented on either side, as to admit of the figure being thrown at pleasure upon alternate feet. Another work of his was the boys known as the “Celetizontes.”

Chæreas made statues of Alexander the Great and of his father Philip. Desilaüs made a Doryphoros and a wounded Amazon; and Demetrius a statue of Lysimache, who was priestess of Minerva sixty-four years. This statuary also made the Minerva, which has the name of Musica, and so called because

the dragons on its Gorgon's head vibrate at the sound of the lyre; also an equestrian statue of Simon, the first writer on the art of equitation. Dædalus, who is highly esteemed as a modeller in clay, made two brazen figures of youths using the body-scraper; and Dinomenes executed figures of Protesilaüs and Pythodemus the wrestler.

The statue of Alexander Paris is the work of Euphranor: it is much admired, because we recognize in it, at the same moment, all these characteristics; we see him as the umpire between the goddesses, the paramour of Helen, and yet the slayer of Achilles. We have a Minerva, too, by Euphranor, at Rome, known as the "Catulina," and dedicated below the Capitol, by Q. Lutatius; also a figure of Good Success, holding in the right hand a patera, and in the left an ear of corn and a poppy. There is also a Latona by him, in the Temple of Concord, with the new-born infants Apollo and Diana in her arms. He also executed some brazen chariots with four and two horses, and a Cliduchus of beautiful proportions; as also two colossal statues, one representing Virtue, the other Greece; and a figure of a female lost in wonder and adoration: with statues of Alexander and Philip in chariots with four horses. Eutychides executed an emblematic figure of the Eurotas, of which it has been frequently remarked, that the work of the artist appears more flowing than the waters even of the river.

Hegias is celebrated for his Minerva and his King Pyrrhus, his youthful Celetizontes, and his statues of Castor and Pollux, before the Temple of Jupiter Tonans: Hegesias, for his Hercules, which is at our colony of Parium. Of Isidotus we have the Buthytes.

Lycius was the pupil of Myron: he made a figure representing a boy blowing a nearly extinguished fire, well worthy of his master, as also figures of the Argonauts. Leochares made a bronze representing the eagle carrying off Ganymede: the eagle has all the appearance of being sensible of the importance of his burden, and for whom he is carrying it, being careful not to injure the youth with his talons, even through the garments. He executed a figure, also, of Autolycus, who had been victorious in the contests of the Pancratium, and for whom Xenophon wrote his Symposium; the figure, also, of Jupiter Tonans in the Capitol, the most admired of all his works; and a statue of Apollo crowned with a diadem. He executed, also, a figure of Lyciscus, and one of the boy Lagon, full of the archness and low-bred cunning of the slave. Lycius also made a figure of a boy burning perfumes.

We have a young bull by Menæchmus, pressed down beneath a man's knee, with its neck bent back: this Menæch- mus has also written a treatise on his art. Naucydes is admired for a Mercury, a Discobolus, and a Man sacrificing a Ram. Naucerus made a figure of a wrestler panting for breath; Niceratus, an Æsculapius and Hygeia, which are in the Temple of Concord at Rome. Pyromachus represented Alcibiades, managing a chariot with four horses: Polycles made a splendid statue of Hermaphroditus; Pyrrhus, statues of Hygeia and Minerva; and Phanis, who was a pupil of Lysippus, an

Epithyusa.

Stypax of Cyprus acquired his celebrity by a single work, the statue of the Splanchnoptes; which represents a slave of the Olympian Pericles, roasting entrails and kindling the fire with his breath. Silanion made a statue in metal of Apollodorus, who was himself a modeller, and not only the most diligent of all in the study of this art, but a most severe criticizer of his own works, frequently breaking his statues to pieces when he had finished them, and never able to satisfy his intense passion for the art — a circumstance which procured him the surname of “the Madman.” Indeed, it is this expression which he has given to his works, which represent in metal embodied anger rather than the lineaments of a human being. The Achilles, also, of Silanion is very excellent, and his Epistates exercising the Athletes. Strongylion made a figure of an Amazon, which, from the beauty of the legs, was known as the “Eucnemos,” and which Nero used to have carried about with him in his travels. Strongylion was the artist, also, of a youthful figure, which was so much admired by Brutus of Philippi, that it received from him its surname.

Theodorus of Samos, who constructed the Labyrinth, cast his own statue in brass; which was greatly admired, not only for its resemblance, but for the extreme delicacy of the work. In the right hand he holds a file, and with three fingers of the left, a little model of a four-horse chariot, which has since been transferred to Præneste: it is so extremely minute, that the whole piece, both chariot and charioteer, may be covered by the wings of a fly, which he also made with it.

Xenocrates was the pupil of Tigrates, or, as some say, of Euthykrates: he surpassed them both, however, in the number of his statues, and was the author of some treatises on his art.

Several artists have represented the battles fought by Attalus and Eumenes with the Galli; Isigonus, for instance, Pyromachus, Stratonicus, and Antigonus, who also wrote some works in reference to his art. Boëthus, although more celebrated for his works in silver, has executed a beautiful figure of a child strangling a goose. The most celebrated of all the works, of which I have here spoken, have been dedicated, for some time past, by the Emperor Vespasianus in the Temple of Peace, and other public buildings of his. They had before been forcibly carried off by Nero, and brought to Rome, and arranged by him in the reception-rooms of his Golden Palace.

In addition to these, there are several other artists, of about equal celebrity, but none of whom have produced any first-rate works; Ariston, who was principally employed in chasing silver, Callides, Ctesias, Cantharus of Sicyon, Diodorus, a pupil of Critias, Deliades, Euphorion, Eunicus, and Hecatæus, all of them chasers in silver; Lesbocles, also, Prodorus, Pythodicus, and Polygnotus, one of the most celebrated painters; also two other chasers in silver, Stratonicus, and Scymnus, a pupil of Critias.

I shall now enumerate those artists who have executed works of the same class: — Apollodorus, for example, Antrobulus, Asclepiodorus, and Aleuas,

who have executed statues of philosophers. Apellas has left us some figures of females in the act of adoration; Antignotus, a Perixyomenos, and figures of the Tyrannicides, already mentioned. Antimachus and Athenodorus made some statues of females of noble birth; Aristodemus executed figures of wrestlers, two-horse chariots with the charioteers, philosophers, aged women, and a statue of King Seleucus: his Doryphoros, too, possesses his characteristic gracefulness.

There were two artists of the name of Cephisodotus: the earlier of them made a figure of Mercury nursing Father Liber when an infant; also of a man haranguing, with the hand elevated, the original of which is now unknown. The younger Cephisodotus executed statues of philosophers. Colotes, who assisted Phidias in the Olympian Jupiter, also executed statues of philosophers; the same, too, with Cleon, Cenchramis, Callicles, and Cepis. Chalcosthenes made statues of comedians and athletes. Daëppus executed a Perixyomenos. Daëphron, Democritus, and Dæmon made statues of philosophers.

Epigonus, who has attempted nearly all the above-named classes of works, has distinguished himself more particularly by his Trumpeter, and his Child in Tears, caressing its murdered mother. The Woman in Admiration, of Eubulus, is highly praised; and so is the Man, by Eubulides, reckoning on his Fingers. Micon is admired for his athletes; Menogenes, for his four-horse chariots. Niceratus, too, who attempted every kind of work that had been executed by any other artist, made statues of Aleibiades and of his mother Demarate, who is represented sacrificing by the light of torches.

Tisicrates executed a two-horse chariot in brass, in which Piston afterwards placed the figure of a female. Piston also made the statues of Mars and Mercury, which are in the Temple of Concord at Rome. No one can commend Perillus; more cruel even than the tyrant Phalaris himself, he made for him a brazen bull, asserting that when a man was enclosed in it, and fire applied beneath, the cries of the man would resemble the roaring of a bull: however, with a cruelty in this instance marked by justice, the experiment of this torture was first tried upon himself. To such a degree did this man degrade the art of representing gods and men, an art more adapted than any other to refine the feelings! Surely so many persons had not toiled to perfect it in order to make it an instrument of torture! Hence it is that the works of Perillus are only preserved, in order that whoever sees them, may detest the hands that made them.

Sthennis made the statues of Ceres, Jupiter, and Minerva, which are now in the Temple of Concord; also figures of matrons weeping, adoring, and offering sacrifice; Simon executed figures of a dog and an archer. Stratonicus, the chaser in silver, made some figures of philosophers; and so did both of the artists named Scopas.

The following artists have made statues of athletes, armed men, hunters, and sacrificers — Baton, Euchir, Glaucides, Heliodorus, Hicanus, Leophon,

Lyson, Leon, Menodorus, Myagrus, Polycrates, Polyidus, Pythocritus, Protogenes, a famous painter, whom we shall have occasion to mention hereafter; Patrocles, Pollis, Posidonius the Ephesian, who was also a celebrated chaser in silver; Periclymenus, Philon, Symenus, Timotheus, Theomnestus, Timarchides, Timon, Tisias, and Thrason.

But of all these, Callimachus is the most remarkable, on account of his surname. Being always dissatisfied with himself, and continually correcting his works, he obtained the name of “Catatexitechnos;” thus affording a memorable example of the necessity of observing moderation even in carefulness. His Laconian Female Dancers, for instance, is a most correct performance, but one in which, by extreme correctness, he has effaced all gracefulness. It has been said, too, that Callimachus was a painter also. Cato, in his expedition against Cyprus, sold all the statues that he found there, with the exception of one of Zeno; in which case he was influenced, neither by the value of the metal nor by its excellence as a work of art, but by the fact that it was the statue of a philosopher. I only mention this circumstance casually, that an example so little followed, may be known.

While speaking of statues, there is one other that should not be omitted, although its author is unknown, that of Hercules clothed in a tunic, the only one represented in that costume in Rome: it stands near the Rostra, and the countenance is stern and expressive of his last agonies, caused by that dress. There are three inscriptions on it; the first of which states that it had formed part of the spoil obtained by L. Lucullus the general; the second, that his son, while still a minor, dedicated in accordance with a decree of the Senate; the third, that T. Septimius Sabinus, the curule ædile, had it restored to the public from the hands of a private individual. So vast has been the rivalry caused by this statue, and so high the value set upon it.

CHAP. 20.

THE DIFFERENT KINDS OF COPPER AND ITS COMBINATIONS. PYROPUS. CAMPANIAN COPPER.

We will now return to the different kinds of copper, and its several combinations. In Cyprian copper we have the kind known as “coronarium,” and that called “regulare,” both of them ductile. The former is made into thin leaves, and, after being coloured with ox-gall, is used for what has all the appearance of gilding on the coronets worn upon the stage. The same substance, if mixed with gold, in the proportion of six scruples of gold to the ounce, and reduced into thin plates, acquires a fiery red colour, and is termed “pyropus.” In other mines again, they prepare the kind known as “regulare,” as also that which is called “caldarium.” These differ from each other in this respect, that, in the latter, the metal is only fused, and breaks when struck with the hammer, whereas the “regulare” is malleable, or ductile, as some call it, a property which belongs naturally to all the copper of Cyprus. In the case, however, of all the other mines, this difference between bar copper and cast brass is produced by artificial means. All the ores, in fact, will produce bar or malleable copper when sufficiently melted and purified by heat. Among the other kinds of copper, the palm of excellence is awarded to that of Campania, which is the most esteemed for vessels and utensils. This last is prepared several ways. At Capua it is melted upon fires made with wood, and not coals, after which it is sprinkled with cold water and cleansed through a sieve made of oak. After being thus smelted a number of times, Spanish silver-lead is added to it, in the proportion of ten pounds of lead to one hundred pounds of copper; a method by which it is rendered pliable, and made to assume that agreeable colour which is imparted to other kinds of copper by the application of oil and the action of the sun. Many parts, however, of Italy, and the provinces, produce a similar kind of metal; but there they add only eight pounds of lead, and, in consequence of the scarcity of wood, melt it several times over upon coals. It is in Gaul more particularly, where the ore is melted between red-hot stones, that the difference is to be seen that is produced by these variations in the method of smelting. Indeed, this last method scorches the metal, and renders it black and friable. Besides, they only melt it twice; whereas, the oftener this operation is repeated, the better in quality it becomes.

(9.) It is also as well to remark that all copper fuses best when the weather is intensely cold. The proper combination for making statues and tablets is as follows: the ore is first melted; after which there is added to the molten metal one third part of second-hand copper, or in other words, copper that has been in use and bought up for the purpose. For it is a peculiarity of this metal that when it has been some time in use, and has been subject to long-continued friction, it becomes seasoned, and subdued, as it were, to a high polish.

Twelve pounds and a half of silver-lead are then added to every hundred pounds of the fused metal. There is also a combination of copper, of a most delicate nature, “mould-copper,” as it is called; there being added to the metal one tenth part of lead and one twentieth of silver-lead, this combination being the best adapted for taking the colour known as “Græcanicus.” The last kind is that known as “ollaria,” from the vessels that are made of it: in this combination three or four pounds of silver-lead are added to every hundred pounds of copper. By the addition of lead to Cyprian copper, the purple tint is produced that we see upon the drapery of statues.

CHAP. 21.

THE METHOD OF PRESERVING COPPER.

Copper becomes covered with verdigris more quickly when cleaned than when neglected, unless it is well rubbed with oil. It is said that the best method of preserving it is with a coating of tar. The custom of making use of copper for monuments, which are intended to be perpetuated, is of very ancient date: it is upon tablets of brass that our public enactments are engraved.

CHAP. 22. (10.)

CADMIA.

The ores of copper furnish a number of resources that are employed in medicine; indeed, all kinds of ulcers are healed thereby with great rapidity. Of these, however, the most useful is cadmia. This substance is formed artificially, beyond a doubt, in the furnaces, also, where they smelt silver, but it is whiter and not so heavy, and by no means to be compared with that from copper. There are several kinds of it. For, as the mineral itself, from which it is prepared artificially, so necessary in fusing copper ore, and so useful in medicine, has the name of "cadmia," so also is it found in the smelting-furnaces, where it receives other names, according to the way in which it is formed. By the action of the flame and the blast, the more attenuated parts of the metal are separated, and become attached, in proportion to their lightness, to the arched top and sides of the furnace. These flakes are the thinnest near the exterior opening of the furnace, where the flame finds a vent, the substance being called "capnitis;" from its burnt appearance and its extreme lightness it resembles white ashes. The best is that which is found in the interior, hanging from the arches of the chimney, and from its form and position named "botryitis." It is heavier than the first-mentioned kind, but lighter than those which follow. It is of two different colours: the least valuable is ash-coloured, the better kind being red, friable, and extremely useful as a remedy for affections of the eyes.

A third kind of cadmia is that found on the sides of the furnace, and which, in consequence of its weight, could not reach the arched vaults of the chimney. This species is called "placitis," in reference to its solid appearance, it presenting a plane surface more like a solid crust than pumice, and mottled within. Its great use is, for the cure of itch-scab, and for making wounds cicatrize. Of this last there are two varieties, the "onychitis," which is almost entirely blue on the exterior, and spotted like an onyx within; and the "ostracitis," which is quite black and more dirty than the others, but particularly useful for healing wounds. All the species of cadmia are of the best quality from the furnaces of Cyprus. When used in medicine it is heated a second time upon a fire of pure charcoal, and when duly incinerated, is quenched in Aminean wine, if required for making plasters, but in vinegar, if wanted for the cure of itch-scab. Some persons first pound it, and then burn it in earthen pots; which done, they wash it in mortars and then dry it.

Nymphodorus recommends that the most heavy and dense pieces of mineral cadmia that can be procured, should be burnt upon hot coals and quenched in Chian wine; after which, it must be pounded and then sifted through a linen cloth. It is then pulverized in a mortar and macerated in rain water, the sediment being again pounded until it is reduced to the consistency

of ceruse, and presents no grittiness to the teeth. Iollas recommends the same process; except that he selects the purest specimens of native cadmia.

Detailed table of contents

CHAP. 23.

FIFTEEN REMEDIES DERIVED FROM CADMIA. TEN MEDICINAL EFFECTS OF CALCINED COPPER.

Cadmia acts as a desiccative, heals wounds, arrests discharges, acts detergently upon webs and foul incrustations of the eyes, removes eruptions, and produces, in fact, all the good effects which we shall have occasion to mention when speaking of lead. Copper too, itself, when calcined, is employed for all these purposes; in addition to which it is used for white spots and cicatrizations upon the eyes. Mixed with milk, it is curative also of ulcers upon the eyes; for which purpose, the people in Egypt make a kind of eye-salve by grinding it upon whet stones. Taken with honey, it acts as an emetic. For these purposes, Cyprian copper is calcined in unbaked earthen pots, with an equal quantity of sulphur; the apertures of the vessel being well luted, and it being left in the furnace until the vessel itself has become completely hardened. Some persons add salt, and others substitute alum for sulphur; others, again, add nothing, but merely sprinkle the copper with vinegar. When calcined, it is pounded in a mortar of Thebaic stone, after which it is washed with rain water, and then pounded with a large quantity of water, and left to settle. This process is repeated until the deposit has gained the appearance of minium; after which it is dried in the sun, and put by for keeping in a box made of copper.

Detailed table of contents

CHAP. 24. (11.)

THE SCORIA OF COPPER.

The scoria, too, of copper is washed in the same manner; but the action of it is less efficacious than that of copper itself. The flower, too, of copper is also used in medicine; a substance which is procured by fusing copper, and then removing it into another furnace, where the repeated action of the bellows makes the metal separate into small scales, like the husks of millet, and known as “flower of copper.” These scales are also separated, when the cakes of metal are plunged into water: they become red, too, like the scales of copper known as “lepis,” by means of which the genuine flower of copper is adulterated, it being also sold under that name. This last is made by hammering nails that are forged from the cakes of metal. All these processes are principally carried on in the furnaces of Cyprus; the great difference between these substances being, that this lepis is detached from the cakes by hammering, whereas the flower falls off spontaneously.

Detailed table of contents

CHAP. 25.

STOMOMA OF COPPER; FORTY-SEVEN REMEDIES.

There is another finer kind of scale which is detached from the surface of the metal, like a very fine down, and known as “stomoma.” But of all these substances, and even of their names, the physicians, if I may venture so to say, are quite ignorant, as appears by the names they give them; so unacquainted are they with the preparation of medicaments, a thing that was formerly considered the most essential part of their profession. At the present day, whenever they happen to find a book of recipes, if they wish to make any composition from these substances, or, in other words, to make trial of the prescription at the expense of their unhappy patients, they trust entirely to the druggists, who spoil everything by their fraudulent adulterations. For this long time past, they have even purchased their plasters and eye-salves ready made, and the consequence is, that the spoiled or adulterated wares in the druggists’ shops are thus got rid of.

Both lepis and flower of copper are calcined in shallow earthen or brazen pans; after which they are washed, as described above, and employed for the same purposes; in addition to which, they are used for excrescences in the nostrils and in the anus, as also for dullness of the hearing, being forcibly blown into the ears through a tube. Incorporated with meal, they are applied to swellings of the uvula, and, with honey, to swellings of the tonsils. The scales prepared from white copper are much less efficacious than those from Cyprian copper. Sometimes they first macerate the nails and cakes of copper in a boy’s urine; and in some instances, they pound the scales, when detached, and wash them in rain water. They are then given to dropsical patients, in doses of two drachmæ, with one semisextarius of honied wine: they are also made into a liniment with fine flour.

Detailed table of contents

CHAP. 26.

VERDIGRIS; EIGHTEEN REMEDIES.

Verdigris is also applied to many purposes, and is prepared in numerous ways. Sometimes it is detached already formed, from the mineral from which copper is smelted: and sometimes it is made by piercing holes in white copper, and suspending it over strong vinegar in casks, which are closed with covers; it being much superior if scales of copper are used for the purpose. Some persons plunge vessels themselves, made of white copper, into earthen pots filled with vinegar, and scrape them at the end of ten days. Others, again, cover the vessels with husks of grapes, and scrape them in the same way, at the end of ten days. Others sprinkle vinegar upon copper filings, and stir them frequently with a spatula in the course of the day, until they are completely dissolved. Others prefer triturating these filings with vinegar in a brazen mortar: but the most expeditious method of all is to add to the vinegar shavings of coronet copper. Rhodian verdigris, more particularly, is adulterated with pounded marble; some persons use pumice-stone or gum.

The adulteration, however, which is the most difficult to detect, is made with copperas; the other sophistications being detected by the crackling of the substance when bitten with the teeth. The best mode of testing it is by using an iron fire-shovel; for when thus subjected to the fire, if pure, the verdigris retains its colour, but if mixed with copperas, it becomes red. The fraud may also be detected by using a leaf of papyrus, which has been steeped in an infusion of nut-galls; for it becomes black immediately upon the genuine verdigris being applied. It may also be detected by the eye; the green colour being unpleasant to the sight. But whether it is pure or adulterated, the best method is first to wash and dry it, and then to burn it in a new earthen vessel, turning it over until it is reduced to an ash; after which it is pounded and put by for use. Some persons calcine it in raw earthen vessels, until the earthenware becomes thoroughly baked: others again add to it male frankincense. Verdigris is washed, too, in the same manner as cadmia.

It affords a most useful ingredient for eye-salves, and from its mordent action is highly beneficial for watery humours of the eyes. It is necessary, however, to wash the part with warm water, applied with a fine sponge, until its mordency is no longer felt.

Detailed table of contents

CHAP. 27.

HIERACIUM.

“Hieracium” is the name given to an eye-salve, which is essentially composed of the following ingredients; four ounces of sal ammoniac, two of Cyprian verdigris, the same quantity of the kind of copperas which is called “chalcanthum,” one ounce of misy and six of saffron; all these substances being pounded together with Thasian vinegar and made up into pills. It is an excellent remedy for incipient glaucoma and cataract, as also for films upon the eyes, eruptions, albugo, and diseases of the eye-lids. Verdigris, in a crude state, is also used as an ingredient in plasters for wounds. In combination with oil, it is wonderfully efficacious for ulcerations of the mouth and gums, and for sore lips. Used in the form of a cerate, it acts detergently upon ulcers, and promotes their cicatrization. Verdigris also consumes the callosities of fistulas and excrescences about the anus, either used by itself, applied with sal ammoniac, or inserted in the fistula in the form of a salve. The same substance, kneaded with one third part of resin of turpentine, removes leprosy.

[Detailed table of contents](#)

CHAP. 28. (12.)

SCOLEX OF COPPER; EIGHTEEN REMEDIES.

There is another kind of verdigris also, which is called “scolex.” It is prepared by tritulating in a mortar of Cyprian copper, alum and salt, or an equal quantity of nitre, with the very strongest white vinegar. This preparation is only made during the hottest days of the year, about the rising of the Dog-star. The whole is trituated until it becomes green, and assumes the appearance of small worms, to which it owes its name. This repulsive form is corrected by mixing the urine of a young child, with twice the quantity of vinegar. Scolex is used for the same medicinal purposes as santerna, which we have described as being used for soldering gold, and they have, both of them, the same properties as verdigris. Native scolex is also procured by scraping the copper ore of which we are about to speak.

CHAP. 29.

CHALCITIS: SEVEN REMEDIES.

Chalcitis is the name of a mineral, from which, as well as cadmia, copper is extracted by heat. It differs from cadmia in this respect, that this last is procured from beds below the surface, while chalcitis is detached from rocks that are exposed to the air. Chalcitis also becomes immediately friable, being naturally so soft as to have the appearance of a compressed mass of down. There is also this other distinction between them, that chalcitis is a composition of three other substances, copper, misy, and sory, of which last we shall speak in their appropriate places. The veins of copper which it contains are oblong. The most approved kind is of the colour of honey; it is streaked with fine sinuous veins, and is friable and not stony. It is generally thought to be most valuable when fresh, as, when old, it becomes converted into sory. It is highly useful for removing fleshy excrescences in ulcers, for arresting hæmorrhage, and, in the form of a powder, for acting as- tringently upon the gums, the uvula, and the tonsillary glands. It is applied in wool, as a pessary, for affections of the uterus; and with leek juice it is formed into plasters for diseases of the genitals. This substance is macerated for forty days in vinegar, in an earthen vessel luted with dung; after which it acquires a saffron colour. When this composition is mixed with an equal proportion of cadmia, it forms the medicament known as “psoricon.” If two parts of chalcitis are combined with one of cadmia, the medicament becomes more active; and it is rendered still more powerful if vinegar is used instead of wine. For all these purposes, calcined chalcitis is the most efficacious.

Detailed table of contents

CHAP. 30.

SORY: THREE REMEDIES.

The sory of Egypt is the most esteemed, being considered much superior to that of Cyprus, Spain, and Africa; although some prefer the sory from Cyprus for affections of the eyes. But from whatever place it comes, the best is that which has the strongest odour, and which, when trituated, becomes greasy, black, and spongy. It is a substance so unpleasant to the stomach, that some persons are made sick merely by its smell. This is the case more particularly with the sory from Egypt. That from other countries, by trituration, acquires the lustre of misy, and is of a more gritty consistency. Held in the mouth, and used as a collutory, it is good for toothache. It is also useful for malignant ulcers of a serpiginous nature. It is calcined upon charcoal, like chalcitis.

Detailed table of contents

CHAP. 3

MISY: THIRTEEN REMEDIES.

Some persons have stated, that misy is formed by the calcination of the mineral, in trenches; its fine yellow powder becoming mixed with the ashes of the burnt fire-wood. The fact is, however, that though obtained from the mineral, it is already formed, and in compact masses, which require force to detach them. The best is that which comes from the manufactories of Cyprus, its characteristics being, that when broken, it sparkles like gold, and when triturated, it presents a sandy or earthy appearance, like chalcitis. Misy is used in the process of refining gold. Mixed with oil of roses, it is used as an injection for suppurations of the ears, and, in combination with wool, it is applied to ulcers of the head. It also removes inveterate granulations of the eye-lids, and is particularly useful for affections of the tonsils, quinsy, and suppurations. For these maladies, sixteen drachmæ should be mixed with one semisextarius of vinegar, and boiled with the addition of some honey, until it becomes of a viscous consistency; in which state it is applicable to the different purposes above mentioned. When its action is wanted to be modified, a sprinkling of honey is added. A fomentation of misy and vinegar removes the callosities of fistulous ulcers; it also enters into the composition of eye-salves. It arrests hæmorrhage, prevents the spreading of serpiginous and putrid ulcers, and consumes fleshy excrescences. It is particularly useful for diseases of the male generative organs, and acts as a check upon menstruation.

Detailed table of contents

CHAP. 32.

CHALCANTHUM, OR SHOEMAKERS' BLACK: SIXTEEN REMEDIES.

The Greeks, by the name which they have given to it, have indicated the relation between shoemakers' black and copper; for they call it "chalcanthum." Indeed there is no substance so singular in its nature. It is prepared in Spain, from the water of wells or pits which contain it in dissolution. This water is boiled with an equal quantity of pure water, and is then poured into large wooden reservoirs. Across these reservoirs there are a number of immovable beams, to which cords are fastened, and then sunk into the water beneath by means of stones; upon which, a slimy sediment attaches itself to the cords, in drops of a vitreous appearance, somewhat resembling a bunch of grapes. Upon being removed, it is dried for thirty days. It is of an azure colour, and of a brilliant lustre, and is often taken for glass. When dissolved, it forms the black dye that is used for colouring leather.

Chalcanthum is also prepared in various other ways: the earth which contains it being sometimes excavated into trenches, from the sides of which globules exude, which become concrete when exposed to the action of the winter frosts. This kind is called "stalagmia," and there is none more pure. When its colour is nearly white, with a slight tinge of violet, it is called "lonchoton." It is also prepared in pans hollowed out in the rocks; the rain water carrying the slime into them, where it settles and becomes hardened. It is also formed in the same way in which we prepare salt; the intense heat of the sun separating the fresh water from it. Hence it is that some distinguish two kinds of chalcanthum, the fossil and the artificial; the latter being paler than the former, and as much inferior to it in quality as it is in colour.

The chalcitis which comes from Cyprus is the most highly esteemed for the purposes of medicine, being taken in doses of one drachma with honey, as an expellent of intestinal worms. Diluted and injected into the nostrils, it acts detergently upon the brain, and, taken with honey or with hydromel, it acts as a purgative upon the stomach. It removes granulations upon the eye-lids, and is good for pains and films upon the eyes; it is curative also of ulcerations of the mouth. It arrests bleeding at the nostrils, and hæmorrhoidal discharges. In combination with seed of hyoscyamus, it brings away splinters of broken bones. Applied to the forehead with a sponge, it acts as a check upon defluxions of the eyes. Made up into plasters, it is very efficacious as a detergent for sores and fleshy excrescences in ulcers. The decoction of it, by the contact solely, is curative of swellings of the uvula. It is laid with linseed upon plasters which are used for relieving pains. The whitish kind is preferred to the violet in one instance only, for the purpose of being blown into the ears, through a tube, to relieve deafness. Applied topically by itself, it heals wounds; but it leaves a discoloration upon the scars. It has been lately

discovered, that if it is sprinkled upon the mouths of bears and lions in the arena, its astringent action is so powerful as to deprive the animals of the power of biting.

Detailed table of contents

CHAP. 33. (13.)

POMPHOLYX.

The substances called pompholyx and spodos are also found in the furnaces of copper-smelting works; the difference between them being, that pompholyx is disengaged by washing, while spodos is not washed. Some persons have called the part which is white and very light “pompholyx,” and say that it is the ashes of copper and cadmia; whereas spodos is darker and heavier, being a substance scraped from the walls of the furnace, mixed with extinguished sparks from the metal, and sometimes with the residue of coals. When vinegar is combined with it, pompholyx emits a coppery smell, and if it is touched with the tongue, the taste is most abominable. It is useful as an ingredient in ophthalmic preparations for all diseases of the eyes, as also for all the purposes for which spodos is used; this last only differing from it in its action being less powerful. It is also used for plasters, when required to be gently cooling and desiccative. For all these purposes it is more efficacious when it has been moistened with wine

[Detailed table of contents](#)

CHAP. 34.

SPODOS; FIVE REMEDIES.

The Cyprian spodos is the best. It is formed by fusing cadmia with copper ore. This substance, which is the lightest part of the metal disengaged by fusion, escapes from the furnace, and adheres to the roof, being distinguished from the soot by the whiteness of its colour. Such parts of it as are less white are indicative of incomplete combustion, and it is this which some persons call “pompholyx.” Such portions of it as are of a more reddish colour are possessed of a more energetic power, and are found to be so corrosive, that if it touches the eyes, while being washed, it will cause blindness. There is also a spodos of a honey colour, an indication that it contains a large proportion of copper. All the different kinds, however, are improved by washing; it being first skimmed with a feather, and afterwards submitted to a more substantial washing, the harder grains being removed with the finger. That, too, which has been washed with wine is more modified in its effects; there being also some difference according to the kind of wine that is used. When it has been washed with weak wine the spodos is considered not so beneficial as an ingredient in medicaments for the eyes; but the same kind of preparation is more efficacious for running sores, and for ulcers of the mouth attended with a discharge of matter, as well as in all those remedies which are used for gangrene.

There is also a kind of spodos, called “lauriotis,” which is made in the furnaces where silver is smelted. The kind, however, that is best for the eyes, it is said, is that produced in the furnaces for smelting gold. Indeed there is no department of art in which the ingenuity of man is more to be admired; for it has discovered among the very commonest objects, a substance that is in every way possessed of similar properties.

Detailed table of contents

CHAP. 35.

FIFTEEN VARIETIES OF ANTISPODOS.

The substance called “antispodos” is produced from the ashes of the fig-tree or wild fig, or of leaves of myrtle, together with the more tender shoots of the branches. The leaves, too, of the wild olive furnish it, the cultivated olive, the quince-tree, and the lentisk; unripe mulberries also, before they have changed their colour, dried in the sun; and the foliage of the box, pseudo-cypirus, bramble, terebinth and œnanthe. The same virtues have also been found in the ashes of bull-glue and of linen cloth. All these substances are burnt in a pot of raw earth, which is heated in a furnace, until the earthenware is thoroughly baked.

Detailed table of contents

CHAP. 36.

SMEGMA.

In the copper forges also smegma is prepared. When the metal is liquefied and thoroughly smelted, charcoal is added to it and gradually kindled; after which, upon it being suddenly acted upon by a powerful pair of bellows, a substance is disengaged like a sort of copper chaff. The floor on which it is received ought to be prepared with a stratum of coal-dust.

Detailed table of contents

CHAP. 37.

DIPHRYX.

There is another product of these furnaces, which is easily distinguished from smegma, and which the Greeks call “diphryx,” from its being twice calcined. This substance is prepared from three different sources. It is prepared, they say, from a mineral pyrites, which is heated in the furnace until it is converted by calcination into a red earth. It is also made in Cyprus, from a slimy substance extracted from a certain cavern there, which is first dried and then gradually heated, by a fire made of twigs. A third way of making it, is from the residue in the copper-furnaces that falls to the bottom. The difference between the component parts of the ore is this; the copper itself runs into the receivers, the scoriæ make their escape from the furnace, the flower becomes sublimated, and the diphryx remains behind.

Some say that there are certain globules in the ore, while being smelted, which become soldered together; and that the rest of the metal is fused around it, the mass itself not becoming liquefied, unless it is transferred to another furnace, and forming a sort of knot, as it were, in the metal. That which remains after the fusion, they say, is called “diphryx.” Its use in medicine is similar to that of the substances mentioned above; it is desiccative, removes morbid excrescences, and acts as a detergent. It is tested by placing it on the tongue, which ought to be instantly parched by it, a coppery flavour being perceptible.

Detailed table of contents

CHAP. 38.

PARTICULARS RELATIVE TO THE SERVILIAN TRIENS.

We must not neglect to mention one other very remarkable fact relative to copper. The Servilian family, so illustrious in our annals, nourishes with gold and silver a copper triens, which devours them both. The origin and nature of this coin is to me incomprehensible; but I will quote the very words of the story, as given by old Messala himself— “The family of the Servilii is in possession of a sacred triens, to which they offer every year a sacrifice, with the greatest care and magnificence; the triens itself, they say, appears sometimes to increase in size and sometimes to diminish; changes which indicate the coming advancement or decadence of the family.”

Detailed table of contents

CHAP. 39. (14).

IRON ORES.

Next to copper we must give an account of the metal known as iron, at the same time the most useful and the most fatal instrument in the hand of mankind. For by the aid of iron we lay open the ground, we plant trees, we prepare our vineyard-trees, and we force our vines each year to resume their youthful state, by cutting away their decayed branches. It is by the aid of iron that we construct houses, cleave rocks, and perform so many other useful offices of life. But it is with iron also that wars, murders, and robberies are effected, and this, not only hand to hand, but from a distance even, by the aid of missiles and winged weapons, now launched from engines, now hurled by the human arm, and now furnished with feathery wings. This last I regard as the most criminal artifice that has been devised by the human mind; for, as if to bring death upon man with still greater rapidity, we have given wings to iron and taught it to fly. Let us therefore acquit Nature of a charge that here belongs to man himself.

Indeed there have been some instances in which it has been proved that iron might be solely used for innocent purposes. In the treaty which Porsena granted to the Roman people, after the expulsion of the kings, we find it expressly stipulated, that iron shall be only employed for the cultivation of the fields; and our oldest authors inform us, that in those days it was considered unsafe to write with an iron pen. There is an edict extant, published in the third consulship of Pompeius Magnus, during the tumults that ensued upon the death of Clodius, prohibiting any weapon from being retained in the City.

Detailed table of contents

CHAP. 40.

STATUES OF IRON; CHASED WORKS IN IRON.

Still, however, human industry has not failed to employ iron for perpetuating the honours of more civilized life. The artist Aristonidas, wishing to express the fury of Athamas subsiding into repentance, after he had thrown his son Learchus from the rock, blended copper and iron, in order that the blush of shame might be more exactly expressed, by the rust of the iron making its appearance through the shining substance of the copper; a statue which still exists at Rhodes. There is also, in the same city, a Hercules of iron, executed by Alcon, the endurance displayed in his labours by the god having suggested the idea. We see too, at Rome, cups of iron consecrated in the Temple of Mars the Avenger, Nature, in conformity with her usual benevolence, has limited the power of iron, by inflicting upon it the punishment of rust; and has thus displayed her usual foresight in rendering nothing in existence more perishable, than the substance which brings the greatest dangers upon perishable mortality.

Detailed table of contents

CHAP. 41.

THE DIFFERENT KINDS OF IRON, AND THE MODE OF TEMPERING IT.

Iron ores are to be found almost everywhere; for they exist even in the Italian island of Ilva, being easily distinguished by the ferruginous colour of the earth. The method of working the ore is the same as that employed in the case of copper. In Cappadocia, however, it is peculiarly questionable whether this metal is a present due to the water or to the earth; because, when the latter has been saturated with the water of a certain river, it yields, and then only, an iron that may be obtained by smelting.

There are numerous varieties of iron ore; the chief causes of which arise from differences in the soil and in the climate. Some earths produce a metal that is soft, and nearly akin to lead; others an iron that is brittle and coppery, the use of which must be particularly avoided in making wheels or nails, the former kind being better for these purposes. There is another kind, again, which is only esteemed when cut into short lengths, and is used for making hobnails; and another which is more particularly liable to rust. All these varieties are known by the name of "strictura," an appellation which is not used with reference to the other metals, and is derived from the steel that is used for giving an edge. There is a great difference, too, in the smelting; some kinds producing knurrs of metal, which are especially adapted for hardening into steel, or else, prepared in another manner, for making thick anvils or heads of hammers. But the main difference results from the quality of the water into which the red-hot metal is plunged from time to time. The water, which is in some places better for this purpose than in others, has quite ennobled some localities for the excellence of their iron, Bilbilis, for example, and Turiasso in Spain, and Comum in Italy; and this, although there are no iron mines in these spots.

But of all the different kinds of iron, the palm of excellence is awarded to that which is made by the Seres, who send it to us with their tissues and skins; next to which, in quality, is the Parthian iron. Indeed, none of the other kinds of iron are made of the pure hard metal, a softer alloy being welded with them all. In our part of the world, a vein of ore is occasionally found to yield a metal of this high quality, as in Noricum for instance; but, in other cases, it derives its value from the mode of working it, as at Sulmo, for example, a result owing to the nature of its water, as already stated. It is to be observed also, that in giving an edge to iron, there is a great difference between oil-whetstones and water-whetstones, the use of oil producing a much finer edge. It is a remarkable fact, that when the ore is fused, the metal becomes liquefied like water, and afterwards acquires a spongy, brittle texture. It is the practice to quench smaller articles made of iron with oil, lest by being hardened in water they should be rendered brittle. Human blood revenges itself upon iron;

for if the metal has been once touched by this blood it is much more apt to become rusty.

Detailed table of contents

CHAP. 42.

THE METAL CALLED LIVE IRON.

We shall speak of the loadstone in its proper place, and of the sympathy which it has with iron. This is the only metal that acquires the properties of that stone, retaining them for a length of time, and attracting other iron, so that we may sometimes see a whole chain formed of these rings. The lower classes, in their ignorance, call this “live iron,” and the wounds that are made by it are much more severe. This mineral is also found in Cantabria, not in continuous strata, like the genuine loadstone, but in scattered fragments, which they call “bullationes.” I do not know whether this species of ore is proper also for the fusion of glass, as no one has hitherto tried it; but it certainly imparts the same property as the magnet to iron. The architect Timochares began to erect a vaulted roof of loadstone, in the Temple of Arsinoë, at Alexandria, in order that the iron statue of that princess might have the appearance of hanging suspended in the air: his death, however, and that of King Ptolemæus, who had ordered this monument to be erected in honour of his sister, prevented the completion of the project.

[Detailed table of contents](#)

CHAP. 43. (15.)

METHODS OF PREVENTING RUST.

Of all metals, the ores of iron are found in the greatest abundance. In the maritime parts of Cantabria which are washed by the Ocean, there is a steep and lofty mountain, which, however incredible it may appear, is entirely composed of this metal, as already stated in our description of the parts bordering upon the Ocean

Iron which has been acted upon by fire is spoiled, unless it is forged with the hammer. It is not in a fit state for being hammered when it is red-hot, nor, indeed, until it has begun to assume a white heat. By sprinkling vinegar or alum upon it, it acquires the appearance of copper. It is protected from rust by an application of ceruse, gypsum, and tar; a property of iron known by the Greeks as “antipathia.” Some pretend, too, that this may be ensured by the performance of certain religious ceremonies, and that there is in existence at the city of Zeugma, upon the Euphrates, an iron chain, by means of which Alexander the Great constructed a bridge across the river; the links of which that have been replaced are attacked with rust, while the original links are totally exempt from it.

Detailed table of contents

CHAP. 44.

SEVEN REMEDIES DERIVED FROM IRON.

Iron is employed in medicine for other purposes besides that of making incisions. For if a circle is traced with iron, or a pointed weapon is carried three times round them, it will preserve both infant and adult from all noxious influences: if nails, too, that have been extracted from a tomb, are driven into the threshold of a door, they will prevent night-mare. A slight puncture with the point of a weapon, with which a man has been wounded, will relieve sudden pains, attended with stitches in the sides or chest. Some affections are cured by cauterization with red-hot iron, the bite of the mad dog more particularly; for even if the malady has been fully developed, and hydrophobia has made its appearance, the patient is instantly relieved on the wound being cauterized. Water in which iron has been plunged at a white heat, is useful, as a potion, in many diseases, dysentery more particularly.

[Detailed table of contents](#)

CHAP. 45.

FOURTEEN REMEDIES DERIVED FROM RUST.

Rust itself, too, is classed among the remedial substances; for it was by means of it that Achilles cured Telephus, it is said, whether it was an iron weapon or a brazen one that he used for the purpose. So it is, however, that he is represented in paintings detaching the rust with his sword. The rust of iron is usually obtained for these purposes by scraping old nails with a piece of moistened iron. It has the effect of uniting wounds, and is possessed of certain desiccative and astringent properties. Applied in the form of a liniment, it is curative of alopecia. Mixed with wax and myrtle-oil, it is applied to granulations of the eyelids, and pustules in all parts of the body, with vinegar it is used for the cure of erysipelas; and, applied with lint, it is curative of itch, whitlows on the fingers, and hang-nails. Used as a pessary with wool, it arrests female discharges. Diluted in wine, and kneaded with myrrh, it is applied to recent wounds, and, with vinegar, to condylomatous⁶ swellings. Employed in the form of a liniment, it alleviates gout.

[Detailed table of contents](#)

CHAP. 46.

SEVENTEEN REMEDIES DERIVED FROM THE SCALES OF IRON. HYGREMPLASTRUM.

The scales of iron, which are procured from a fine point or a sharp edge, are also made use of, being very similar in effect to rust, but more active; for which reason they are employed for defluxions of the eyes. They arrest bleeding, also, more particularly from wounds inflicted with iron; and they act as a check upon female discharges. They are applied, too, for diseases of the spleen, and they arrest hæmorrhoidal swellings and serpiginous ulcers. They are useful also for affections of the eyelids, gradually applied in the form of a fine powder. But their chief recommendation is, their great utility in the form of a hygreemplastrum or wet plaster, for cleansing wounds and fistulous sores, consuming all kinds of callosities, and making new flesh on bones that are denuded. The following are the ingredients: of pitch, six oboli, of Cimolian chalk, six drachmæ, two drachmæ of pounded copper, the same quantity of scales of iron, six drachmæ of wax, and one sextarius of oil. To these is added some cerate, when it is wanted to cleanse or fill up wounds.

[Detailed table of contents](#)

CHAP. 47. (16.)

THE ORES OF LEAD.

The nature of lead next comes to be considered. There are two kinds of it, the black and the white. The white is the most valuable: it was called by the Greeks “cassiteros,” and there is a fabulous story told of their going in quest of it to the islands of the Atlantic, and of its being brought in barks made of osiers, covered with hides. It is now known that it is a production of Lusitania and Gallæcia. It is a sand found on the surface of the earth, and of a black colour, and is only to be detected by its weight. It is mingled with small pebbles, particularly in the dried beds of rivers. The miners wash this sand, and calcine the deposit in the furnace. It is also found in the gold mines that are known as “alutiæ,” the stream of water which is passed through them detaching certain black pebbles, mottled with small white spots and of the same weight as gold. Hence it is that they remain with the gold in the baskets in which it is collected; and being separated in the furnace, are then melted, and become converted into white lead.

Black lead is not procured in Gallæcia, although it is so greatly abundant in the neighbouring province of Cantabria; nor is silver procured from white lead, although it is from black. Pieces of black lead cannot be soldered without the intervention of white lead, nor can this be done without employing oil; nor can white lead, on the other hand, be united without the aid of black lead. White lead was held in estimation in the days even of the Trojan War, a fact that is attested by Homer, who calls it “cassiteros.” There are two different sources of black lead: it being procured either from its own native ore, where it is produced without the intermixture of any other substance, or else from an ore which contains it in common with silver, the two metals being fused together. The metal which first becomes liquid in the furnace, is called “stannum;” the next that melts is silver; and the metal that remains behind is galena, the third constituent part of the mineral. On this last being again submitted to fusion black lead is produced, with a deduction of two-ninths.

Detailed table of contents

CHAP. 48. (17.)

STANNUM. ARGENTARIUM.

When copper vessels are coated with stannum, they produce a less disagreeable flavour, and the formation of verdigris is prevented; it is also remarkable, that the weight of the vessel is not increased. As already mentioned, the finest mirrors were formerly prepared from it at Brundisium, until everybody, our maid-servants even, began to use silver ones. At the present day a counterfeit stannum is made, by adding one-third of white copper to two-thirds of white lead. It is also counterfeited in another way, by mixing together equal parts of white lead and black lead; this last being what is called “argentarium.” There is also a composition called “tertiarium,” a mixture of two parts of black lead and one of white: its price is twenty denarii per pound, and it is used for soldering pipes. Persons still more dishonest mix together equal parts of tertiaryum and white lead, and, calling the compound “argentarium,” coat articles with it melted. This last sells at sixty denarii per ten pounds, the price of the pure unmixed white lead being eighty denarii, and of the black seven.

White lead is naturally more dry; while the black, on the contrary, is always moist; consequently the white, without being mixed with another metal, is of no use for anything. Silver too, cannot be soldered with it, because the silver becomes fused before the white lead. It is confidently stated, also, that if too small a proportion of black lead is mixed with the white, this last will corrode the silver. It was in the Gallic provinces that the method was discovered of coating articles of copper with white lead, so as to be scarcely distinguishable from silver: articles thus plated are known as “incocilia.” At a later period, the people of the town of Alesia began to use a similar process for plating articles with silver, more particularly ornaments for horses, beasts of burden, and yokes of oxen: the merit, however, of this invention belongs to the Bituriges. After this, they began to ornament their esseda, colisata, and petorita in a similar manner; and luxury has at last arrived at such a pitch, that not only are their decorations made of silver, but of gold even, and what was formerly a marvel to behold on a cup, is now subjected to the wear and tear of a carriage, and this in obedience to what they call fashion!

White lead is tested, by pouring it, melted, upon paper, which ought to have the appearance of being torn rather by the weight than by the heat of the metal. India has neither copper nor lead, but she procures them in exchange for her precious stones and pearls.

CHAP. 49.

BLACK LEAD.

Black lead is used in the form of pipes and sheets: it is extracted with great labour in Spain, and throughout all the Gallic provinces; but in Britannia it is found in the upper stratum of the earth, in such abundance, that a law has been spontaneously made, prohibiting any one from working more than a certain quantity of it. The various kinds of black lead are known by the following names — the Ovetanian, the Caprariensian, and the Oleastrensian. There is no difference whatever in them, when the scoria has been carefully removed by calcination. It is a marvellous fact, that these mines, and these only, when they have been abandoned for some time, become replenished, and are more prolific than before. This would appear to be effected by the air, infusing itself at liberty through the open orifices, just as some women become more prolific after abortion. This was lately found to be the case with the Santarensian mine in Bætica; which, after being farmed at an annual rental of two hundred thousand denarii, and then abandoned, is now rented at two hundred and fifty-five thousand per annum. In the same manner, the Antonian mine in the same province has had the rent raised to four hundred thousand sesterces per annum.

It is a remarkable fact, that if we pour water into a vessel of lead, it will not melt; but that if we throw into the water a pebble or a copper quadrans, the vessel will be penetrated by the fire.

Detailed table of contents

CHAP. 50. (18.)

FIFTEEN REMEDIES DERIVED FROM LEAD.

Lead is used in medicine, without any addition, for the removal of scars; if it is applied, too, in plates, to the region of the loins and kidneys, in consequence of its cold nature it will restrain the venereal passions, and put an end to libidinous dreams at night, attended with spontaneous emissions, and assuming all the form of a disease. The orator Calvus, it is said, effected a cure for himself by means of these plates, and so preserved his bodily energies for labour and study. The Emperor Nero — for so the gods willed it — could never sing to the full pitch of his voice, unless he had a plate of lead upon his chest; thus showing us one method of preserving the voice. For medicinal purposes the lead is melted in earthen vessels; a layer of finely powdered sulphur being placed beneath, very thin plates of lead are laid upon it, and are then covered with a mixture of sulphur and iron. While it is being melted, all the apertures in the vessel should be closed, otherwise a noxious vapour is discharged from the furnace, of a deadly nature, to dogs in particular. Indeed, the vapours from all metals destroy flies and gnats; and hence it is that in mines there are none of those annoyances. Some persons, during the process, mix lead-filings with the sulphur, while others substitute ceruse for sulphur. By washing, a preparation is made from lead, that is much employed in medicine: for this purpose, a leaden mortar, containing rain water, is beaten with a pestle of lead, until the water has assumed a thick consistency; which done, the water that floats on the surface is removed with a sponge, and the thicker part of the sediment is left to dry, and is then divided into tablets. Some persons triturate lead-filings in this way, and some mix with it lead ore, or else vinegar, wine, grease, or rose-leaves. Others, again, prefer triturating the lead in a stone mortar, one of Thebaic stone more particularly, with a pestle of lead; by which process a whiter preparation is obtained.

As to calcined lead, it is washed, like stibi and cadmia. Its action is astringent and repressive, and it is promotive of cicatrization. The same substance is also employed in preparations for the eyes, cases of proci-dence of those organs more particularly; also for filling up the cavities left by ulcers, and for removing excrescences and fissures of the anus, as well as hæmorrhoidal and condylomatous tumours. For all these purposes the lotion of lead is particularly useful; but for serpiginous or sordid ulcers it is the ashes of calcined lead that are used, these producing the same advantageous effects as ashes of burnt papyrus.

The lead is calcined in thin plates, laid with sulphur in shallow vessels, the mixture being stirred with iron rods or stalks of fennel-giant, until the melted metal becomes calcined; when cold, it is pulverized. Some persons calcine lead-filings in a vessel of raw earth, which they leave in the furnace, until the

earthenware is completely baked. Others, again, mix with it an equal quantity of ceruse or of barley, and triturate it in the way mentioned for raw lead; indeed, the lead which has been prepared this way is preferred to the spodium of Cyprus.

Detailed table of contents

CHAP. 51.

FIFTEEN REMEDIES DERIVED FROM THE SCORIA OF LEAD.

The scoria of lead is also made use of; the best kind being that which approaches nearest to a yellow colour, without any vestiges of lead, or which has the appearance of sulphur without any terreous particles. It is broken into small pieces and washed in a mortar, until the mortar assumes a yellow colour; after which, it is poured off into a clean vessel, the process being repeated until it deposits a sediment, which is a substance of the greatest utility. It possesses the same properties as lead, but of a more active nature. How truly wonderful is the knowledge which we gain by experiment, when even the very dregs and foul residues of substances have in so many ways been tested by mankind!

Detailed table of contents

CHAP. 52.

SPODIUM OF LEAD.

A spodium of lead is also prepared in the same manner as that extracted from Cyprian copper. It is washed with rain water, in linen of a loose texture, and the earthy parts are separated by pouring it off; after which it is sifted, and then pounded. Some prefer removing the fine powder with a feather, and then tritulating it with aromatic wine.

[Detailed table of contents](#)

CHAP. 53.

MOLYBDÆNA: FIFTEEN REMEDIES.

Molybdæna, which in another place I have called “galena,” is a mineral compounded of silver and lead. It is considered better in quality the nearer it approaches to a golden colour and the less lead it contains; it is also friable, and of moderate weight. When it is melted with oil, it acquires the colour of liver. It is found adhering also to the furnaces in which gold and silver have been smelted; and in this case it is called “metallic.” The most esteemed kind is that prepared at Zephyrium. Those kinds, too, are considered the best that are the least earthy and the least stony. It is used in preparing liparæ, as also for soothing or cooling ulcers, and as an ingredient in plasters, which are applied without ligatures, but are used only as a liniment for producing cicatrization on the bodies of delicate persons and the more tender parts. The composition is made of three pounds of molybdæna, one pound of wax, and three heminæ of oil; to which are added lees of olives, in the case of aged persons. Combined with scum of silver and scoria of lead, it is employed warm in fomentations for dysentery and tenesmus.

[Detailed table of contents](#)

CHAP. 54.

PSIMITHIUM, OR CERUSE; SIX REMEDIES.

Psimithium, which is also known as ceruse, is another production of the lead-works. The most esteemed comes from Rhodes. It is made from very fine shavings of lead, placed over a vessel filled with the strongest vinegar; by which means the shavings become dissolved. That which falls into the vinegar is first dried, and then pounded and sifted, after which it is again mixed with vinegar, and is then divided into tablets and dried in the sun, during summer. It is also made in another way; the lead is thrown into jars filled with vinegar, which are kept closed for ten days; the sort of mould that forms upon the surface is then scraped off, and the lead is again put into the vinegar, until the whole of the metal is consumed. The part that has been scraped off is triturated and sifted, and then melted in shallow vessels, being stirred with ladles, until the substance becomes red, and assumes the appearance of sandarach. It is then washed with fresh water, until all the cloudy impurities have disappeared, after which it is dried as before, and divided into tablets.

Its properties are the same as those of the substances above mentioned. It is, however, the mildest of all the preparations of lead; in addition to which, it is also used by females to whiten the complexion. It is, however, like scum of silver, a deadly poison. Melted a second time, ceruse becomes red.

Detailed table of contents

CHAP. 55.

SANDARACH; ELEVEN REMEDIES.

We have already mentioned nearly all the properties of sandarach. It is found both in gold-mines and in silver-mines. The redder it is, the more pure and friable, and the more powerful its odour, the better it is in quality. It is detergent, astringent, heating, and corrosive, but is most remarkable for its septic properties. Applied topically with vinegar, it is curative of alopecia. It is also employed as an ingredient in ophthalmic preparations. Used with honey, it cleanses the fauces and makes the voice more clear and harmonious. Taken with the food, in combination with turpentine, it is a pleasant cure for cough and asthma. In the form of a fumigation also, with cedar, it has a remedial effect upon those complaints.

Detailed table of contents

CHAP. 56.

ARRHENICUM.

Arrhenicum, too, is procured from the same sources. The best in quality is of the colour of the finest gold; that which is of a paler hue, or resembling sandarach, being less esteemed. There is a third kind also, the colour of which is a mixture of that of gold and of sandarach. The last two kinds are both of them scaly, but the other is dry and pure, and divides into delicate long veins. This substance has the same virtues as the one last mentioned, but is more active in its effects. Hence it is that it enters into the composition of cauteries and depilatory preparations. It is also used for the removal of hangnails, polypi of the nostrils, condylomatous tumours, and other kinds of excrescences. For the purpose of increasing its energies, it is heated in a new earthen vessel, until it changes its colour.

SUMMARY. — Remedies, one hundred and fifty-eight, Facts, narratives, and observations, nine hundred and fifteen.

ROMAN AUTHORS QUOTED. — L. Piso, Antias, Verrius, M. Varro, Cornelius Nepos, Messala, Rufus, the Poet Marsus, Bocchus, Julius Bassus who wrote in Greek on Medicine, Sextus Niger who did the same, Fabius Vestalis.

FOREIGN AUTHORS QUOTED. — Democritus, Metrodorus of Scepsis, Menæchmus who wrote on the Toreutic art, Xenocrates who did the same, Antigonus who did the same, Duris who did the same, Heliodorus who wrote on the Votive Offerings of the Athenians, Pasiteles who wrote on Wonderful Works, Timæus who wrote on the Medicines derived from Metals, Nymphodorus, Iollas, Apollodorus, Andreas, Heraclides, Diagoras, Botrys, Archidemus, Dionysius, Aristogenes, Democles, Mnesides, Xenocrates the son of Zeno, Theomnestus.

BOOK XXXV. AN ACCOUNT OF PAINTINGS AND COLOURS.

Detailed table of contents

CHAP. 1. (1.)

THE HONOUR ATTACHED TO PAINTING.

I HAVE now given at considerable length an account of the nature of metals, which constitute our wealth, and of the substances that are derived from them; so connecting my various subjects, as, at the same time, to describe an immense number of medicinal compositions which they furnish, the mysteries thrown upon them by the druggists, and the tedious minutiae of the arts of chasing, and statuary, and of dyeing. It remains for me to describe the various kinds of earths and stones; a still more extensive series of subjects, each of which has been treated of, by the Greeks more particularly, in a great number of volumes. For my own part, I propose to employ a due degree of brevity, at the same time omitting nothing that is necessary or that is a product of Nature.

I shall begin then with what still remains to be said with reference to painting, an art which was formerly illustrious, when it was held in esteem both by kings and peoples, and ennobling those whom it deigned to transmit to posterity. But at the present day, it is completely banished in favour of marble, and even gold. For not only are whole walls now covered with marble, but the marble itself is carved out or else marqueted so as to represent objects and animals of various kinds. No longer now are we satisfied with formal compartitions of marble, or with slabs extended like so many mountains in our chambers, but we must begin to paint the very stone itself! This art was invented in the reign of Claudius, but it was in the time of Nero that we discovered the method of inserting in marble spots that do not belong to it, and so varying its uniformity; and this, for the purpose of representing the marble of Numidia variegated with ovals, and that of Synnada veined with purple; just, in fact, as luxury might have willed that Nature should produce them. Such are our resources when the quarries fail us, and luxury ceases not to busy itself, in order that as much as possible may be lost whenever a conflagration happens.

Detailed table of contents

CHAP. 2. (2.)

THE HONOUR ATTACHED TO PORTRAITS.

Correct portraits of individuals were formerly transmitted to future ages by painting; but this has now completely fallen into desuetude. Brazen shields are now set up, and silver faces, with only some obscure traces of the countenance: the very heads, too, of statues are changed, a thing that has given rise before now to many a current sarcastic line; so true it is that people prefer showing off the valuable material, to having a faithful likeness. And yet, at the same time, we tapestry the walls of our galleries with old pictures, and we prize the portraits of strangers; while as to those made in honour of ourselves, we esteem them only for the value of the material, for some heir to break up and melt, and so forestall the noose and slip-knot of the thief. Thus it is that we possess the portraits of no living individuals, and leave behind us the pictures of our wealth, not of our persons.

And yet the very same persons adorn the palæstra and the anointing-room with portraits of athletes, and both hang up in their chamber and carry about them a likeness of Epicurus. On the twentieth day of each moon they celebrate his birthday by a sacrifice, and keep his festival. known as the "Icas," every month: and these too, people who wish to live without being known! So it is, most assuredly, our indolence has lost sight of the arts, and since our minds are destitute of any characteristic features, those of our bodies are neglected also.

But on the contrary, in the days of our ancestors, it was these that were to be seen in their halls, and not statues made by foreign artists, or works in bronze or marble: portraits modelled in wax were arranged, each in its separate niche, to be always in readiness to accompany the funeral processions of the family; occasions on which every member of the family that had ever existed was always present. The pedigree, too, of the individual was traced in lines upon each of these coloured portraits. Their muniment-rooms, too, were filled with archives and memoirs, stating what each had done when holding the magistracy. On the outside, again, of their houses, and around the thresholds of their doors, were placed other statues of those mighty spirits, in the spoils of the enemy there affixed, memorials which a purchaser even was not allowed to displace; so that the very house continued to triumph even after it had changed its master. A powerful stimulus to emulation this, when the walls each day reproached an unwarlike owner for having thus intruded upon the triumphs of another! There is still extant an address by the orator Messala, full of indignation, in which he forbids that there should be inserted among the images of his family any of those of the stranger race of the Lævini. It was the same feeling, too, that extorted from old Messala those compilations of his "On the Families of Rome;" when, upon passing through

the hall of Scipio Pomponianus, he observed that, in consequence of a testamentary adoption, the Salvittos — for that had been their surname — to the disgrace of the Africani, had surreptitiously contrived to assume the name of the Scipios. But the Messalas must pardon me if I remark, that to lay a claim, though an untruthful one, to the statues of illustrious men, shows some love for their virtues, and is much more honourable than to have such a character as to merit that no one should wish to claim them.

There is a new invention too, which we must not omit to notice. Not only do we consecrate in our libraries, in gold or silver, or at all events, in bronze, those whose immortal spirits hold converse with us in those places, but we even go so far as to reproduce the ideal of features, all remembrance of which has ceased to exist; and our regrets give existence to likenesses that have not been transmitted to us, as in the case of Homer, for example. And indeed, it is my opinion, that nothing can be a greater proof of having achieved success in life, than a lasting desire on the part of one's fellow-men, to know what one's features were. This practice of grouping portraits was first introduced at Rome by Asinius Pollio, who was also the first to establish a public library, and so make the works of genius the property of the public. Whether the kings of Alexandria and of Pergamus, who had so energetically rivalled each other in forming libraries, had previously introduced this practice, I cannot so easily say.

That a strong passion for portraits formerly existed, is attested both by Atticus, the friend of Cicero, who wrote a work on this subject, and by M. Varro, who conceived the very liberal idea of inserting, by some means or other, in his numerous volumes, the portraits of seven hundred individuals; as he could not bear the idea that all traces of their features should be lost, or that the lapse of centuries should get the better of mankind. Thus was he the inventor of a benefit to his fellow-men, that might have been envied by the gods themselves; for not only did he confer upon them immortality, but he transmitted them, too, to all parts of the earth; so that everywhere it might be possible for them to be present, and for each to occupy his niche. This service, too, Varro conferred upon persons who were no members of his own family.

CHAP. 3. (3.)

WHEN SHIELDS WERE FIRST INVENTED WITH PORTRAITS UPON THEM; AND
WHEN THEY WERE FIRST ERECTED IN PUBLIC.

So far as I can learn, Appius Claudius, who was consul with P. Servilius, in the year of the City, 259, was the first to dedicate shields in honour of his own family in a sacred or public place. For he placed representations of his ancestors in the Temple of Bellona, and desired that they might be erected in an elevated spot, so as to be seen, and the inscriptions reciting their honours read. A truly graceful device; more particularly when a multitude of children, represented by so many tiny figures, displays those germs, as it were, which are destined to continue the line: shields such as these, no one can look at without a feeling of pleasure and lively interest.

Detailed table of contents

CHAP. 4.

WHEN THESE SHIELDS WERE FIRST PLACED IN PRIVATE HOUSES.

More recently, M. Æmilius, who was consul with Quintus Lutatius, not only erected these shields in the Æmilian Basilica, but in his own house as well; in doing which he followed a truly warlike example. For, in fact, these portraits were represented on bucklers, similar to those used in the Trojan War; and hence it is that these shields received their present name of “clypei,” and not, as the perverse subtleties of the grammarians will have it, from the word “cluo.” It was an abundant motive for valour, when upon each shield was represented the features of him who had borne it. The Carthaginians used to make both their bucklers and their portraits of gold, and to carry them with them in the camp: at all events, Marcius, the avenger of the Scipios in Spain, found one of this kind on capturing the camp of Hasdrubal, and it was this same buckler that remained suspended over the gate of the Capitoline Temple until the time when it was first burnt. Indeed, in the days of our ancestors, so assured was the safety of these shields, that it has been a subject of remark, that in the consulship of L. Manlius and Q. Fulvius, in the year of the City, 575, M. Aufidius, who had given security for the safety of the Capitol, informed the senate that the bucklers there which for some lustra had been assessed as copper, were in reality made of silver.

CHAP. 5.

THE COMMENCEMENT OF THE ART OF PAINTING. MO- NOCHROME PAINTINGS. THE EARLIEST PAINTERS.

We have no certain knowledge as to the commencement of the art of painting, nor does this enquiry fall under our consideration. The Egyptians assert that it was invented among themselves, six thousand years before it passed into Greece; a vain boast, it is very evident. As to the Greeks, some say that it was invented at Sicyon, others at Corinth; but they all agree that it originated in tracing lines round the human shadow. The first stage of the art, they say, was this, the second stage being the employment of single colours; a process known as “monochromaton,” after it had become more complicated, and which is still in use at the present day. The invention of line-drawing has been assigned to Philocles, the Egyptian, or to Cleanthes of Corinth. The first who practised this line-drawing were Aridices, the Corinthian, and Telephanes, the Sicyonian, artists who, without making use of any colours, shaded the interior of the outline by drawing lines; hence, it was the custom with them to add to the picture the name of the person represented. Ecphantus, the Corinthian, was the first to employ colours upon these pictures, made, it is said, of broken earthenware, reduced to powder. We shall show on a future occasion, that it was a different artist of the same name, who, according to Cornelius Nepos, came to Italy with Demaratus, the father of the Roman king, Tarquinius Priscus, on his flight from Corinth to escape the violence of the tyrant Cypselus.

Detailed table of contents

CHAP. 6.

THE ANTIQUITY OF PAINTING IN ITALY.

But already, in fact, had the art of painting been perfectly developed in Italy. At all events, there are extant in the temples at Ardea, at this day, paintings of greater antiquity than Rome itself; in which, in my opinion, nothing is more marvellous, than that they should have remained so long unprotected by a roof, and yet preserving their freshness. At Lanuvium, too, it is the same, where we see an Atalanta and a Helena, without drapery, close together, and painted by the same artist. They are both of the greatest beauty, the former being evidently the figure of a virgin, and they still remain uninjured, though the temple is in ruins. The Emperor Caius, inflamed with lustfulness, attempted to have them removed, but the nature of the plaster would not admit of it. There are in existence at Cære, some paintings of a still higher antiquity. Whoever carefully examines them, will be forced to admit that no art has arrived more speedily at perfection, seeing that it evidently was not in existence at the time of the Trojan War.

Detailed table of contents

CHAP. 7. (4.)

ROMAN PAINTERS.

Among the Romans, too, this art very soon rose into esteem, for it was from it that the Fabii, a most illustrious family, derived their surname of “Pictor;” indeed the first of the family who bore it, himself painted the Temple of Salus, in the year of the City, 450; a work which lasted to our own times, but was destroyed when the temple was burnt, in the reign of Claudius. Next in celebrity were the paintings of the poet Pacuvius, in the Temple of Hercules, situate in the Cattle Market: he was a son of the sister of Ennius, and the fame of the art was enhanced at Rome by the success of the artist on the stage. After this period, the art was no longer practised by men of rank; unless, indeed, we would make reference to Turpilius, in our own times, a native of Venetia, and of equestrian rank, several of whose beautiful works are still in existence at Verona. He painted, too, with his left hand, a thing never known to have been done by any one before.

Titidius Labeo, a person of prætorian rank, who had been formerly proconsul of the province of Gallia Narbonensis, and who lately died at a very advanced age, used to pride himself upon the little pictures which he executed, but it only caused him to be ridiculed and sneered at. I must not omit, too, to mention a celebrated consultation upon the subject of painting, which was held by some persons of the highest rank.

Q. Pedius, who had been honoured with the consulship and a triumph, and who had been named by the Dictator Cæsar as co-heir with Augustus, had a grandson, who being dumb from his birth, the orator Messala, to whose family his grandmother belonged, recommended that he should be brought up as a painter, a proposal which was also approved of by the late Emperor Augustus. He died, however, in his youth, after having made great progress in the art. But the high estimation in which painting came to be held at Rome, was principally due, in my opinion, to M. Valerius Maximus Messala, who, in the year of the City, 490, was the first to exhibit a painting to the public; a picture, namely, of the battle in which he had defeated the Carthaginians and Hiero in Sicily, upon one side of the Curia Hostilia. The same thing was done, too, by L. Scipio, who placed in the Capitol a painting of the victory which he had gained in Asia; but his brother Africanus, it is said, was offended at it, and not without reason, for his son had been taken prisoner in the battle. Lucius Hostilius Mancinus, too, who had been the first to enter Carthage at the final attack, gave a very similar offence to Æmilianus, by exposing in the Forum a painting of that city and the attack upon it, he himself standing near the picture, and describing to the spectators the various details of the siege; a piece of complaisance which secured him the consulship at the ensuing Comitia.

The stage, too, which was erected for the games celebrated by Claudius Pulcher, brought the art of painting into great admiration, it being observed that the ravens were so deceived by the resemblance, as to light upon the decorations which were painted in imitation of tiles.

Detailed table of contents

CHAP. 8.

AT WHAT PERIOD FOREIGN PAINTINGS WERE FIRST INTRODUCED AT ROME.

The high estimation in which the paintings of foreigners were held at Rome commenced with Lucius Mummius, who, from his victories, acquired the surname of “Achaicus.” For upon the sale of the spoil on that occasion, King Attalus having purchased, at the price of six thousand denarii, a painting of Father Liber by Aristides, Mummius, feeling surprised at the price, and suspecting that there might be some merit in it of which he himself was unaware, in spite of the complaints of Attalus, broke off the bargain, and had the picture placed in the Temple of Ceres; the first instance, I conceive, of a foreign painting being publicly exhibited at Rome.

After this, I find, it became a common practice to exhibit foreign pictures in the Forum; for it was to this circumstance that we are indebted for a joke of the orator Crassus. While pleading below the Old Shops, he was interrupted by a witness who had been summoned, with the question, “Tell me then, Crassus, what do you take me to be?” “Very much like him,” answered he, pointing to the figure of a Gaul in a picture, thrusting out his tongue in a very unbecoming manner. It was in the Forum, too, that was placed the picture of the Old Shepherd leaning on his staff; respecting which, when the envoy of the Teutones was asked what he thought was the value of it, he made answer that he would rather not have the original even, at a gift.

Detailed table of contents

CHAP. 9.

AT WHAT PERIOD PAINTING WAS FIRST HELD IN HIGH ESTEEM AT ROME, AND
FROM WHAT CAUSES.

But it was the Dictator Cæsar that first brought the public exhibition of pictures into such high estimation, by consecrating an Ajax and a Medea before the Temple of Venus Genetrix. After him there was M. Agrippa, a man who was naturally more attached to rustic simplicity than to refinement. Still, however, we have a magnificent oration of his, and one well worthy of the greatest of our citizens, on the advantage of exhibiting in public all pictures and statues; a practice which would have been far preferable to sending them into banishment at our country-houses. Severe as he was in his tastes, he paid the people of Cyzicus twelve hundred thousand sesterces for two paintings, an Ajax and a Venus. He also ordered small paintings to be set in marble in the very hottest part of his Warm Baths; where they remained until they were removed a short time since, when the building was repaired.

Detailed table of contents

CHAP. 10.

WHAT PICTURES THE EMPERORS HAVE EXHIBITED IN PUBLIC.

The late Emperor Augustus did more than all the others; for he placed in the most conspicuous part of his Forum, two pictures, representing War and Triumph. He also placed in the Temple of his father, Cæsar, a picture of the Castors, and one of Victory, in addition to those which we shall mention in our account of the works of the different artists. He also inserted two pictures in the wall of the Curia which he consecrated in the Comitium; one of which was a Nemea seated upon a lion, and bearing a palm in her hand. Close to her is an Old Man, standing with a staff, and above his head hangs the picture of a chariot with two horses. Nicias has written upon this picture that he “inburned” it, such being the word he has employed.

In the second picture the thing to be chiefly admired, is the resemblance that the youth bears to the old man his father, allowing, of course, for the difference in age; above them soars an eagle, which grasps a dragon in its talons. Philochares attests that he is the author of this work, an instance, if we only consider it, of the mighty power wielded by the pictorial art; for here, thanks to Philochares, the senate of the Roman people, age after age, has before its eyes Glaucion and his son Aristippus, persons who would otherwise have been altogether unknown. The Emperor Tiberius, too, a prince who was by no means very gracious, has exhibited in the temple dedicated by him, in his turn, to Augustus, several pictures which we shall describe hereafter.

Detailed table of contents

CHAP. 11. (5.)

THE ART OF PAINTING.

Thus much then with reference to the dignity of this now expiring art. We have already stated with what single colours the earlier artists painted, when speaking of these pigments under the head of metals. The new modes of painting which were afterwards discovered, and are known as “neogrammatea,” the names of the artists, their different inventions, and the periods at which these inventions were adopted, will all be described when we come to enumerate the painters: for the present, however, the proposed plan of this work requires, that I should enlarge upon the nature of the several colours that are employed.

The art of painting at last became developed, in the invention of light and shade, the alternating contrast of the colours serving to heighten the effect of each. At a later period, again, lustre was added, a thing altogether different from light. The gradation between lustre and light on the one hand and shade on the other, was called “tonos;” while the blending of the various tints, and their passing into one another, was known as “harmoge.”

Detailed table of contents

CHAP. 12. (6.)

PIGMENTS OTHER THAN THOSE OF A METALLIC ORIGIN. ARTIFICIAL COLOURS.

Colours are either sombre or florid, these qualities arising either from the nature of the substances or their mode of combination. The florid colours are those which the employer supplies to the painter at his own expense; minium, namely, armenium, cinnabaris, chrysocolla, indicum, and purpurisum. The others are the sombre colours. Taking both kinds together, some are native colours, and others are artificial. Sinopis, rubrica, parætonium, melinum, cretria and orpiment, are native colours. The others are artificial, more particularly those described by us when speaking of metals; in addition to which there are, among the more common colours, ochra, usta or burnt ceruse, sandarach, sandyx, syricum, and atramentum.

Detailed table of contents

CHAP. 13.

SINOPIS: ELEVEN REMEDIES.

Sinopis was discovered in Pontus; and hence its name, from the city of Sinope there. It is produced also in Egypt, the Balearic islands, and Africa; but the best is found in Lemnos and Cappadocia, being extracted from quarries there. That part is considered the best which has been found adhering to the rock. In the native mass, it has its own proper colour within, but is spotted on the exterior; the ancients made use of it for tone.

There are three kinds of sinopis, the red, the pale red, and the intermediate. The price of the best is twelve denarii per pound; it is used both for painting with the brush, and for colouring wood. The kind which comes from Africa sells at eight asses per pound; the name given to it is “cicerculum.” That which is of the deepest red is the most in use for colouring compartitions. The sinopis known as the dull kind, being of a very tawny complexion, sells also at the price of eight asses per pound; it is used principally for the lower parts of compartitions.

Used medicinally, sinopis is of a soothing nature, and is employed as an ingredient in plasters and emollient poultices. It admits of being easily used, whether in the form of a dry or of a liquid composition, for the cure of ulcers situate in the humid parts of the body, the mouth and the rectum, for instance. Used as an injection, it arrests looseness of the bowels, and, taken in doses of one denarius, it acts as a check upon female discharges. Applied in a burnt state, with wine in particular, it has a desiccative effect upon granulations of the eyelids.

Detailed table of contents

CHAP. 14.

RUBRICA; LEMNIAN EARTH: FOUR REMEDIES.

Some persons have wished to make out that sinopis is nothing else but a kind of rubrica of second-rate quality, looking upon earth of Lemnos as a rubrica of the highest quality. This last approaches very nearly to minium, and was as highly esteemed among the ancients as the island that produces it: it was never sold except in sealed packages, a circumstance to which it was indebted for its additional name of “sphragis.” It is with this material that they give the undercoating to minium, in the adulteration of which it is also extensively employed.

In medicine it is very highly esteemed. Applied to the eyes in the form of a liniment, it allays defluxions and pains in those organs, and arrests the discharges from lachrymal fistulas. To persons vomiting blood, it is administered with vinegar to drink. It is taken also internally for affections of the spleen and kidneys; and by females for the purpose of arresting flooding. It is employed too, to counteract the effects of poisons, and of stings inflicted by sea or land serpents; hence it is that it is so commonly used as an ingredient in antidotes.

Detailed table of contents

CHAP. 15.

EGYPTIAN EARTH.

Of the other kinds of rubrica, those of Egypt and Africa are of the greatest utility to workers in wood, from the fact of their being absorbed with the greatest rapidity. They are used also for painting, and are found in a native state in iron-mines.

Detailed table of contents

CHAP. 16.

OCHRA: REMEDIES DERIVED FROM RUBRICA.

It is from rubrica also, that ochra is prepared, the rubrica being burnt in new earthen pots well luted with clay. The more highly it is calcined in the furnace, the better the colour is. All kinds of rubrica are of a desiccative nature, and hence it is that they are so useful for plasters, and as an application even for erysipelas.

[Detailed table of contents](#)

CHAP. 17.

LEUCOPHORON.

Half a pound of Pontic sinopis, ten pounds of bright sil, and two pounds of Greek melinum, well mixed and triturated together for twelve successive days, produce “leucophoron,” a cement used for applying gold-leaf to wood.

Detailed table of contents

CHAP. 18.

PARÆTONIUM.

Parætonium is so called from the place of that name in Egypt. It is sea-foam, they say, solidified with slime, and hence it is that minute shells are often found in it. It is prepared also in the Isle of Crete, and at Cyrenæ. At Rome, it is adulterated with Cimolian earth, boiled and thickened. The price of that of the highest quality is fifty denarii per six pounds. This is the most unctuous of all the white colours, and the most tenacious as a coating for plaster, the result of its smoothness.

[Detailed table of contents](#)

CHAP. 19.

MELINUM: SIX REMEDIES. CERUSE.

Melinum, too, is a white colour, the best being the produce of the Isle of Melos. It is found also in Samos; but this last kind is never used by painters, in consequence of its being too unctuous. The persons employed in extracting it, lie at full length upon the ground, and search for the veins among the rocks. In medicine it is employed for much the same purposes as eretria; in addition to which, it dries the tongue, acts as a depilatory, and has a soothing effect. The price of it is one sestertius per pound.

The third of the white pigments is ceruse, the nature of which we have already explained when speaking of the ores of lead; there was also a native ceruse, formerly found on the lands of Theodotus at Smyrna, which the ancients made use of for painting ships. At the present day, all ceruse is prepared artificially, from lead and viuegar, as already stated.

CHAP. 20.

USTA.

Usta was accidentally discovered at a fire in the Piræus, some ceruse having been burnt in the jars there. Nicias, the artist above-mentioned, was the first to use it. At the present day, that of Asia, known also as “purpurea,” is considered the best. The price of it is six denarii per pound. It is prepared also at Rome by calcining marbled sil, and quenching it with vinegar. Without the use of usta shadows cannot be made.

CHAP. 21.

ERETRIA.

Eretria takes its name from the territory which produces it. Nicomachus and Parrhasius made use of it. In a medicinal point of view, it is cooling and emollient. In a calcined state, it promotes the cicatrization of wounds, is very useful as a desiccative, and is particularly good for pains in the head, and for the detection of internal suppurations. If the earth, when applied with water, does not dry with rapidity, the presence of purulent matter is apprehended.

CHAP. 22.

SANDARACH.

According to Juba, sandarach and ochra are both of them productions of the island of Topazus, in the Red Sea; but neither of them are imported to us from that place. The mode of preparing sandarach we have described already: there is a spurious kind also, prepared by calcining ceruse in the furnace. This substance, to be good, ought to be of a flame colour; the price of it is five asses per pound.

Detailed table of contents

CHAP. 23.

SANDYX.

Calcined with an equal proportion of rubrica, sandarach forms sandyx; although I perceive that Virgil, in the following line, has taken sandyx to be a plant —

“Sandyx itself shall clothe the feeding lambs.”

The price of sandyx is one half that of sandarach; these two colours being the heaviest of all in weight.

[Detailed table of contents](#)

CHAP. 24.

SYRICUM.

Among the artificial colours, too, is syricum, which is used as an under-coating for minium, as already stated. It is prepared from a combination of sinopis with sandyx.

[Detailed table of contents](#)

CHAP. 25.

ATRAMENTUM.

Atramentum, too, must be reckoned among the artificial colours, although it is also derived in two ways from the earth. For sometimes it is found exuding from the earth like the brine of salt-pits, while at other times an earth itself of a sulphurous colour is sought for the purpose. Painters, too, have been known to go so far as to dig up half-charred bones from the sepulchres for this purpose.

All these plans, however, are new-fangled and troublesome; for this substance may be prepared, in numerous ways, from the soot that is yielded by the combustion of resin or pitch; so much so, indeed, that manufactories have been built on the principle of not allowing an escape for the smoke evolved by the process. The most esteemed black, however, that is made in this way, is prepared from the wood of the torch-pine.

It is adulterated by mixing it with the ordinary soot from furnaces and baths, a substance which is also employed for the purpose of writing. Others, again, calcine dried wine-lees, and assure us that if the wine was originally of good quality from which the colour is made, it will bear comparison with that of indicum. Polygnotus and Micon, the most celebrated painters of Athens, made their black from grape-husks, and called it “tryginon.” Apelles invented a method of preparing it from burnt ivory, the name given to it being “elephantinon.”

We have indicum also, a substance imported from India, the composition of which is at present unknown to me. Dyers, too, prepare an atramentum from the black inflorescence which adheres to the brazen dye-pans. It is made also from logs of torch-pine, burnt to charcoal and pounded in a mortar. The *sæpia*, too, has a wonderful property of secreting a black liquid; but from this liquid no colour is prepared. The preparation of every kind of atramentum is completed by exposure to the sun; the black, for writing, having an admixture of gum, and that for coating walls, an admixture of glue. Black pigment that has been dissolved in vinegar is not easily effaced by washing.

CHAP. 26.

PURPURISSUM.

Among the remaining colours which, as already stated, owing to their dearness are furnished by the employer, purpurissum holds the highest rank. For the purpose of preparing it, argentaria or silver chalk is dyed along with purple cloth, it imbibing the colour more speedily than the wool. The best of all is that which, being thrown the very first into the boiling cauldron, becomes saturated with the dye in its primitive state. The next best in quality is that which has been put into the same liquor, after the first has been removed. Each time that this is done, the quality becomes proportionally deteriorated, owing, of course, to the comparative thinness of the liquid. The reason that the purpurissum of Puteoli is more highly esteemed than that of Tyre, Gætulia, or Laconia, places which produce the most precious kinds of purple, is the fact that it combines more readily with hysginum, and that it is made to absorb the colouring liquid of madder. The worst purpurissum is that of Lanuvium.

The price of purpurissum is from one to thirty denarii per pound. Persons who use it in painting, place a coat of sandyx beneath; a layer on which of purpurissum with glair of egg, produces all the brilliant tints of minium. If, on the other hand, it is their object to make a purple, they lay a coat of cæruleum beneath, and purpurissum, with egg, upon it.

Detailed table of contents

CHAP. 27.

INDICUM.

Next in esteem to this is indicum, a production of India, being a slime which adheres to the scum upon the reeds there. When powdered, it is black in appearance, but when diluted in water it yields a marvellous combination of purple and cæruleum. There is another kind, also, which floats upon the surface of the pans in the purple dye-houses, being the scum which rises upon the purple dye. Persons who adulterate it, stain pigeons' dung with genuine indicum, or else colour Selinusian earth, or anularian chalk with woad.

The proper way of testing indicum is by laying it on hot coals, that which is genuine producing a fine purple flame, and emitting a smell like that of sea-water while it smokes: hence it is that some are of opinion that it is gathered from the rocks on the sea-shore. The price of indicum is twenty denarii per pound. Used medicinally, it alleviates cold shiverings and defluxions, and acts as a desiccative upon sores.

CHAP. 28.

ARMENIUM; ONE REMEDY.

Armenia sends us the colouring substance which is known to us by its name. This also is a mineral, which admits of being dyed, like chrysocolla, and is best when it most closely resembles that substance, the colour being pretty much that of cæruleum. In former times it was sold at thirty sesterces per pound; but there has been found of late in the Spanish provinces a sand which admits of a similar preparation, and consequently armenium has come to be sold so low as at six denarii per pound. It differs from cæruleum in a certain degree of whiteness, which causes the colour it yields to be thinner in comparison. The only use made of it in medicine is for the purpose of giving nourishment to the hair, that of the eyelids in particular.

Detailed table of contents

CHAP. 29.

APPIANUM.

There are also two colours of very inferior quality, which have been recently discovered. One of these is the green known as “appianum,” a fair imitation of chrysocolla; just as though we had not had to mention sufficient of these counterfeits already. This colour, too, is prepared from a green chalk, the usual price of it being one sesterce per pound.

[Detailed table of contents](#)

CHAP. 30.

ANULARIAN WHITE.

The other colour is that known as “anularian white;” being used for giving a brilliant whiteness to the figures of females. This, too, is prepared from a kind of chalk, combined with the glassy paste which the lower classes wear in their rings: hence it is, that it has the name “anulare.”

CHAP. 31. (7.)

WHICH COLOURS DO NOT ADMIT OF BEING LAID ON A WET COATING.

Those among the colours which require a dry, cretaceous, coating, and refuse to adhere to a wet surface, are purpurissum, indicum, cæruleum, melinum, orpiment, appianum, and ceruse. Wax, too, is stained with all these colouring substances for encaustic painting; a process which does not admit of being applied to walls, but is in common use by way of ornament for ships of war, and, indeed, merchant-ships at the present day. As we go so far as to paint these vehicles of danger, no one can be surprised if we paint our funeral piles as well, or if we have our gladiators conveyed in handsome carriages to the scene of death, or, at all events, of carnage. When we only contemplate this extensive variety of colours, we cannot but admire the ingenuity displayed by the men of former days.

Detailed table of contents

CHAP. 32.

WHAT COLOURS WERE USED BY THE ANCIENTS IN PAINTING.

It was with four colours only, that Apelles, Echion, Melanthius, and Nicomachus, those most illustrious painters, executed their immortal works; melinum for the white, Attic sil for the yellow, Pontic sinopis for the red, and atramentum for the black; and yet a single picture of theirs has sold before now for the treasures of whole cities. But at the present day, when purple is employed for colouring walls even, and when India sends to us the slime of her rivers, and the corrupt blood of her dragons and her elephants, there is no such thing as a picture of high quality produced. Everything, in fact, was superior at a time when the resources of art were so much fewer than they now are. Yes, so it is; and the reason is, as we have already stated, that it is the material, and not the efforts of genius, that is now the object of research.

Detailed table of contents

CHAP. 33.

AT WHAT TIME COMBATS OF GLADIATORS WERE FIRST PAINTED AND PUBLICLY EXHIBITED.

One folly, too, of this age of ours, in reference to painting, I must not omit. The Emperor Nero ordered a painting of himself to be executed upon canvass, of colossal proportions, one hundred and twenty feet in height; a thing till then unknown. This picture was just completed when it was burnt by lightning, with the greater part of the gardens of Maius, in which it was exhibited.

A freedman of the same prince, on the occasion of his exhibiting a show of gladiators at Antium, had the public porticos hung, as everybody knows, with paintings, in which were represented genuine portraits of the gladiators and all the other assistants. Indeed, at this place, there has been a very prevailing taste for paintings for many ages past. C. Terentius Lucanus was the first who had combats of gladiators painted for public exhibition: in honour of his grandfather, who had adopted him, he provided thirty pairs of gladiators in the Forum, for three consecutive days, and exhibited a painting of their combats in the Grove of Diana.

CHAP. 34. (8.)

THE AGE OF PAINTING; WITH THE NAMES OF THE MORE CELEBRATED WORKS
AND ARTISTS, FOUR HUNDRED AND FIVE IN NUMBER.

I shall now proceed to enumerate, as briefly as possible, the more eminent among the painters; it not being consistent with the plan of this work to go into any great lengths of detail. It must suffice therefore, in some cases, to name the artist in a cursory manner only, and with reference to the account given of others; with the exception, of course, of the more famous productions of the pictorial art, whether still in existence or now lost, all of which it will be only right to take some notice of. In this department, the ordinary exactness of the Greeks has been somewhat inconsistent, in placing the painters so many Olympiads after the statuaries and toreutic artists, and the very first of them so late as the ninetieth Olympiad; seeing that Phidias himself is said to have been originally a painter, and that there was a shield at Athens which had been painted by him: in addition to which, it is universally agreed that in the eighty-third Olympiad, his brother Panæus painted, at Elis, the interior of the shield of Minerva, which had been executed by Colotes, a disciple of Phidias and his assistant in the statue of the Olympian Jupiter. And then besides, is it not equally admitted that Candaules, the last Lydian king of the race of the Heraclidæ, very generally known also by the name of Myrsilus, paid its weight in gold for a picture by the painter Bularchus, which represented the battle fought by him with the Magnetes? so great was the estimation in which the art was already held. This circumstance must of necessity have happened about the period of our Romulus; for it was in the eighteenth Olympiad that Candaules perished, or, as some writers say, in the same year as the death of Romulus: a thing which clearly demonstrates that even at that early period the art had already become famous, and had arrived at a state of great perfection.

If, then, we are bound to admit this conclusion, it must be equally evident that the commencement of the art is of much earlier date, and that those artists who painted in monochrome, and whose dates have not been handed down to us, must have flourished at even an anterior period; Hygiænon, namely, Dinias, Charmadas, Eumarus, of Athens, the first who distinguished the sexes in painting, and attempted to imitate every kind of figure; and Cimon of Cleonæ, who improved upon the inventions of Eumarus.

It was this Cimon, too, who first invented foreshortenings, or in other words, oblique views of the figure, and who first learned to vary the features by representing them in the various attitudes of looking backwards, upwards, or downwards. It was he, too, who first marked the articulations of the limbs, indicated the veins, and gave the natural folds and sinuosities to drapery. Panæus, too, the brother of Phidias, even executed a painting of the battle fought by the Athenians with the Persians at Marathon: so common, indeed,

had the employment of colours become, and to such a state of perfection had the art arrived, that he was able to represent, it is said, the portraits of the various generals who commanded at that battle, Miltiades, Callimachus, and Cynægirus, on the side of the Athenians, and, on that of the barbarians, Datis and Artaphernes.

CHAP. 35. (9.)

THE FIRST CONTEST FOR EXCELLENCE IN THE PICTORIAL ART.

And not only this, but, during the time that Panæus flourished, there were contests in the pictorial art instituted at Corinth and Delphi. On the first occasion, Panæus himself entered the lists, at the Pythian Games, with Timagoras of Chalcis, by whom he was defeated; a circumstance which is recorded in some ancient lines by Timagoras himself, and an undoubted proof that the chroniclers are in error as to the date of the origin of painting. After these, and yet before the ninetieth Olympiad, there were other celebrated painters, Polygnotus of Thasos, for instance, who was the first to paint females in transparent drapery, and to represent the head covered with a parti-coloured head-dress. He, too, was the first to contribute many other improvements to the art of painting, opening the mouth, for example, showing the teeth, and throwing expression into the countenance, in place of the ancient rigidity of the features.

There is a picture by this artist in the Portico of Pompeius, before the Curia that was built by him; with reference to which, there is some doubt whether the man represented with a shield is in the act of ascending or descending. He also embellished the Temple at Delphi, and at Athens the Portico known as the Pœcile; at which last he worked gratuitously, in conjunction with Micon, who received pay for his labours. Indeed Polygnotus was held in the higher esteem of the two; for the Amphictyons, who form the general Council of Greece, decreed that he should have his lodging furnished him at the public expense.

There was also another Micon, distinguished from the first Micon by the surname of “the younger,” and whose daughter Timarete also practised the art of painting.

CHAP. 36.

ARTISTS WHO PAINTED WITH THE PENCIL.

In the ninetieth Olympiad lived Aglaophon, Cephisodorus, Erillus, and Evenor, the father of Parrhasius, one of the greatest of painters, and of whom we shall have to speak when we come to the period at which he flourished. All these were artists of note, but not sufficiently so to detain us by any further details, in our haste to arrive at the luminaries of the art; first among whom shone Apollodorus of Athens, in the ninety-third Olympiad. He was the first to paint objects as they really appeared; the first too, we may justly say, to confer glory by the aid of the pencil. Of this artist there is a Priest in Adoration, and an Ajax struck by Lightning, a work to be seen at Pergamus at the present day: before him, there is no painting of any artist now to be seen which has the power of rivetting the eye.

The gates of art being now thrown open by Apollodorus, Zeuxis of Heraclea entered upon the scene, in the fourth year of the ninety-fifth Olympiad, destined to lead the pencil — for it is of the pencil that we are still speaking — a pencil for which there was nothing too arduous, to a very high pitch of glory. By some writers he is erroneously placed in the eighty-ninth Olympiad, a date that must of necessity be reserved for Demophilus of Himera and Neseus of Thasos, of one of whom, it is uncertain which, Zeuxis was the pupil. It was in reference to him that Apollodorus, above-mentioned, wrote a verse to the effect, that Zeuxis had stolen the art from others and had taken it all to himself. Zeuxis also acquired such a vast amount of wealth, that, in a spirit of ostentation, he went so far as to parade himself at Olympia with his name embroidered on the checked pattern of his garments in letters of gold. At a later period, he came to the determination to give away his works, there being no price high enough to pay for them, he said. Thus, for instance, he gave an Alcmena to the people of Agrigentum, and a Pan to Archelaüs. He also painted a Penelope, in which the peculiar character of that matron appears to be delineated to the very life; and a figure of an athlete, with which he was so highly pleased, that he wrote beneath it the line which has since become so famous, to the effect that it would be easier to find fault with him than to imitate him. His Jupiter seated on the throne, with the other Deities standing around him, is a magnificent production: the same, too, with his Infant Hercules strangling the Dragons, in presence of Amphitryon and his mother Alcmena, who is struck with horror. Still, however, Zeuxis is generally censured for making the heads and articulations of his figures out of proportion. And yet, so scrupulously careful was he, that on one occasion, when he was about to execute a painting for the people of Agrigentum, to be consecrated in the Temple of the Lacinian Juno there, he had the young maidens of the place stripped for examination, and selected five of them, in

order to adopt in his picture the most commendable points in the form of each. He also painted some monochromes in white.

The contemporaries and rivals of Zeuxis were Timanthes, Androcydes, Eupompus, and Parrhasius. (10.) This last, it is said, entered into a pictorial contest with Zeuxis, who represented some grapes, painted so naturally that the birds flew towards the spot where the picture was exhibited. Parrhasius, on the other hand, exhibited a curtain, drawn with such singular truthfulness, that Zeuxis, elated with the judgment which had been passed upon his work by the birds, haughtily demanded that the curtain should be drawn aside to let the picture be seen. Upon finding his mistake, with a great degree of ingenuous candour he admitted that he had been surpassed, for that whereas he himself had only deceived the birds, Parrhasius had deceived him, an artist.

There is a story, too, that at a later period, Zeuxis having painted a child carrying grapes, the birds came to peck at them; upon which, with a similar degree of candour, he expressed himself vexed with his work, and exclaimed —" I have surely painted the grapes better than the child, for if I had fully succeeded in the last, the birds would have been in fear of it." Zeuxis executed some figures also in clay, the only works of art that were left behind at Ambracia, when Fulvius Nobilior transported the Muses from that city to Rome. There is at Rome a Helena by Zeuxis, in the Porticos of Philippus, and a Marsyas Bound, in the Temple of Concord there.

Parrhasius of Ephesus also contributed greatly to the progress of painting, being the first to give symmetry to his figures, the first to give play and expression to the features, elegance to the hair, and gracefulness to the mouth: indeed, for contour, it is universally admitted by artists that he bore away the palm. This, in painting, is the very highest point of skill. To paint substantial bodies and the interior of objects is a great thing, no doubt, but at the same time it is a point in which many have excelled: but to make the extreme outline of the figure, to give the finishing touches to the painting in rounding off the contour, this is a point of success in the art which is but rarely attained. For the extreme outline, to be properly executed, requires to be nicely rounded, and so to terminate as to prove the existence of something more behind it, and thereby disclose that which it also serves to hide.

Such is the merit conceded to Parrhasius by Antigonus and Xenocrates, who have written on the art of painting; and in this as well as in other points, not only do they admit his excellence, but enlarge upon it in terms of the highest commendation. There are many pen sketches by him still in existence, both upon panel and on parchment, from the study of which, even artists, it is said, may greatly profit.

Notwithstanding these points of excellence, however, Parrhasius seems comparatively inferior to himself in giving the proper expression to the middle of the body. In his allegorical picture of the People of Athens, he has displayed singular ingenuity in the treatment of his subject; for in representing it, he had to depict it as at once fickle, choleric, unjust, and versatile; while,

again, he had equally to show its attributes of implacability and clemency, compassionateness and pride, loftiness and humility, fierceness and timidity — and all these at once. He painted a Theseus also, which was formerly in the Capitol at Rome, a Naval Commander wearing a cuirass, and, in one picture, now at Rhodes, figures of Meleager, Hercules, and Perseus. This last painting, though it has been thrice struck by lightning, has escaped being effaced, a circumstance which tends to augment the admiration which it naturally excites. He painted an Archigallus also, a picture which the Emperor Tiberius greatly admired. According to Deculo, that prince had it shut up in his chamber, the price at which it was valued being six hundred thousand sesterces.

Parrhasius also painted a Thracian Nurse, with an Infant in her arms, a Philiscus, a Father Liber attended by Virtue, Two Children, in which we see portrayed the careless simplicity of childhood, and a Priest attended by a Boy, with a censer and chaplet. There are also two most noble pictures by him; one of which represents a Runner contending for the prize, completely armed, so naturally depicted that he has all the appearance of sweating. In the other we see the Runner taking off his armour, and can fancy that we hear him panting aloud for breath. His Æneas, Castor, and Pollux, all represented in the same picture, are highly praised; his Telephus also, and his Achilles, Agamemnon, and Ulysses.

Parrhasius was a most prolific artist, but at the same time there was no one who enjoyed the glory conferred upon him by his talent with greater insolence and arrogance. It was in this spirit, that he went so far as to assume certain surnames, and to call himself “Habrodiætus;” while in some other verses he declared himself to be the “prince of painters,” and asserted that in him the art had arrived at perfection. But above all things, it was a boast with him that he had sprung from the lineage of Apollo, and that he had painted his Hercules, a picture now at Lindos, just as he had often seen him in his sleep. It was in this spirit, too, that upon being defeated by Timanthes, at Samos, by a great majority of votes, the subject of the picture being Ajax and the Award of the Arms, he declared, in the name of his hero, that he felt himself quite disgraced on thus seeing himself a second time defeated by an unworthy opponent. He painted also some smaller pictures of an immodest nature, indulging his leisure in such prurient fancies as these.

As to Timanthes, he was an artist highly gifted with genius, and loud have some of the orators been in their commendations of his Iphigenia, represented as she stands at the altar awaiting her doom. Upon the countenance of all present, that of her uncle in particular, grief was depicted; but having already exhausted all the characteristic features of sorrow, the artist adopted the device of veiling the features of the victim’s father, finding himself unable adequately to give expression to his feelings. There are also some other proofs of his genius, a Sleeping Cyclops, for instance, which he has painted upon a small panel; but, being desirous to convey an idea of his gigantic stature, he

has painted some Satyrs near him measuring his thumb with a thyrsus. Indeed, Timanthes is the only one among the artists in whose works there is always something more implied by the pencil than is expressed, and whose execution, though of the very highest quality, is always surpassed by the inventiveness of his genius. He has also painted the figure of a Hero, a master-piece of skill, in which he has carried the art to the very highest pitch of perfection, in the delineation of the warrior: this last-mentioned work is now at Rome, in the Temple of Peace.

It was at this period, too, that Euxinidas had for his pupil Aristides, who became a most illustrious artist; and that Eupompus instructed Pamphilus, who afterwards became the instructor of Apelles. There is by Eupompus, a Victor in a gymnastic contest, holding a palm. So high was the reputation of this artist, that he established a school of painting, and so divided the art into three styles; whereas till then there had been but two, known respectively as the Helladic and the Asiatic. In honour of him, a native of Sicyon by birth, the Helladic school was divided into two, and from this period there were three distinct styles recognized, the Ionic, the Sicyonian, and the Attic.

We have, by Pamphilus, a picture representing the Alliance and the Battle that was fought at Phlius; the Victory also that was gained by the Athenians, and a representation of Ulysses in his ship. He was a Macedonian by birth, but was the first painter who was also skilled in all the other sciences, arithmetic and geometry more particularly, without the aid of which he maintained that the pictorial art could not attain perfection. He gave instruction to no one for a smaller sum than one talent, at the rate of five hundred denarii per annum, and this fee both Apelles and Melanthius paid. It was through his influence that, first at Sicyon, and then throughout the whole of Greece, all children of free birth were taught the graphic art, or in other words, the art of depicting upon boxwood, before all others; in consequence of which this came to be looked upon as the first step in the liberal arts. It is the fact, however, that this art has always been held in high estimation, and cultivated by persons of free birth, and that, at a more recent period, men of rank even began to pursue it; it having always been forbidden that slaves should receive instruction in it. Hence it is, that neither in painting nor in the toreutic art has there been any celebrated work executed by a slave.

In the hundred and seventh Olympiad, flourished Aëtion and Therimachus. By the former we have some fine pictures; a Father Liber, Tragedy and Comedy, Semiramis from the rank of a slave elevated to the throne, an Old Woman bearing torches, and a New-made Bride, remarkable for the air of modesty with which she is portrayed.

But it was Apelles of Cos, in the hundred and twelfth Olympiad, who surpassed all the other painters who either preceded or succeeded him. Single-handed, he contributed more to painting than all the others together, and even went so far as to publish some treatises on the principles of the art. The great point of artistic merit with him was his singular charm of gracefulness, and

this too, though the greatest of painters were his contemporaries. In admiring their works and bestowing high eulogiums upon them, he used to say that there was still wanting in them that ideal of beauty so peculiar to himself, and known to the Greeks as "Charis;" others, he said, had acquired all the other requisites of perfection, but in this one point he himself had no equal. He also asserted his claim to another great point of merit: admiring a picture by Protogenes, which bore evident marks of unbounded laboriousness and the most minute finish, he remarked that in every respect Protogenes was fully his equal, or perhaps his superior, except in this, that he himself knew when to take his hand off a picture — a memorable lesson, which teaches us that over-carefulness may be productive of bad results. His candour too, was equal to his talent; he acknowledged the superiority of Melanthius in his grouping, and of Asclepiodorus in the niceness of his measurements, or, in other words, the distances that ought to be left between the objects represented.

A circumstance that happened to him in connection with Protogenes is worthy of notice. The latter was living at Rhodes, when Apelles disembarked there, desirous of seeing the works of a man whom he had hitherto only known by reputation. Accordingly, he repaired at once to the studio; Protogenes was not at home, but there happened to be a large panel upon the easel ready for painting, with an old woman who was left in charge. To his enquiries she made answer, that Protogenes was not at home, and then asked whom she should name as the visitor. "Here he is," was the reply of Apelles, and seizing a brush, he traced with colour upon the panel an outline of a singularly minute fineness. Upon his return, the old woman mentioned to Protogenes what had happened. The artist, it is said, upon remarking the delicacy of the touch, instantly exclaimed that Apelles must have been the visitor, for that no other person was capable of executing anything so exquisitely perfect. So saying, he traced within the same outline a still finer outline, but with another colour, and then took his departure, with instructions to the woman to show it to the stranger, if he returned, and to let him know that this was the person whom he had come to see. It happened as he anticipated; Apelles returned, and vexed at finding himself thus surpassed, he took up another colour and split both of the outlines, leaving no possibility of anything finer being executed. Upon seeing this, Protogenes admitted that he was defeated, and at once flew to the harbour to look for his guest. He thought proper, too, to transmit the panel to posterity, just as it was, and it always continued to be held in the highest admiration by all, artists in particular. I am told that it was burnt in the first fire which took place at Cæsar's palace on the Palatine Hill; but in former times I have often stopped to admire it. Upon its vast surface it contained nothing whatever except the three outlines, so remarkably fine as to escape the sight: among the most elaborate works of numerous other artists it had all the appearance of a blank space; and yet by that very fact it attracted the notice of every one, and was held in higher estimation than any other painting there.

It was a custom with Apelles, to which he most tenaciously adhered, never to let any day pass, however busy he might be, without exercising himself by tracing some outline or other; a practice which has now passed into a proverb. It was also a practice with him, when he had completed a work, to exhibit it to the view of the passers-by in some exposed place; while he himself, concealed behind the picture, would listen to the criticisms that were passed upon it; it being his opinion that the judgment of the public was preferable to his own, as being the more discerning of the two. It was under these circumstances, they say, that he was censured by a shoemaker for having represented the shoes with one shoe-string too little. The next day, the shoemaker, quite proud at seeing the former error corrected, thanks to his advice, began to criticize the leg; upon which Apelles, full of indignation, popped his head out, and reminded him that a shoemaker should give no opinion beyond the shoes, a piece of advice which has equally passed into a proverbial saying. In fact, Apelles was a person of great amenity of manners, a circumstance which rendered him particularly agreeable to Alexander the Great, who would often come to his studio. He had forbidden himself, by public edict, as already stated, to be represented by any other artist. On one occasion, however, when the prince was in his studio, talking a great deal about painting without knowing anything about it, Apelles quietly begged that he would quit the subject, telling him that he would get laughed at by the boys who were there grinding the colours: so great was the influence which he rightfully possessed over a monarch, who was otherwise of an irascible temperament. And yet, irascible as he was, Alexander conferred upon him a very signal mark of the high estimation in which he held him; for having, in his admiration of her extraordinary beauty, engaged Apelles to paint Pancaste undraped, the most beloved of all his concubines, the artist while so engaged, fell in love with her; upon which, Alexander, perceiving this to be the case, made him a present of her, thus showing himself, though a great king in courage, a still greater one in self-command, this action redounding no less to his honour than any of his victories. For in thus conquering himself, not only did he sacrifice his passions in favour of the artist, but even his affections as well; uninfluenced, too, by the feelings which must have possessed his favourite in thus passing at once from the arms of a monarch to those of a painter. Some persons are of opinion that Pancaste was the model of Apelles in his painting of Venus Anadyomene.

It was Apelles too, who, courteous even to his rivals, first established the reputation of Protogenes at Rhodes. Held as he was in little estimation by his own fellow-countrymen, a thing that generally is the case, Apelles enquired of him what price he set upon certain finished works of his, which he had on hand. Upon Protogenes mentioning some very trifling sum or other, Apelles made him an offer of fifty talents, and then circulated a report that he was buying these works in order to sell them as his own. By this contrivance, he aroused the Rhodians to a better appreciation of the merits of their artist, and

only consented to leave the pictures with them upon their offering a still larger price.

He painted portraits, too, so exactly to the life, that a fact with which we are made acquainted by the writings of Apion the grammarian seems altogether incredible. One of those persons, he says, who divine events by the traits of the features, and are known as "metoposcopi," was enabled, by an examination of his portraits, to tell the year of their death, whether past or future, of each person represented. Apelles had been on bad terms with Ptolemæus in former times, when they formed part of the suite of Alexander. After Ptolemæus had become king of Egypt, it so happened that Apolles was driven by the violence of a tempest to Alexandria. Upon this, some of his rivals fraudulently suborned a jester, who was attached to the court, to carry him an invitation to dine with the king. Accordingly, Apelles attended; upon which Ptolemæus was highly indignant, and, summoning before him his stewards of the household, requested that the artist would point out the one that had given him the invitation. Thus challenged, Apelles seized a piece of quenched charcoal that lay in the fire-place, and traced a likeness upon the wall, with such exactness, that the king, the moment he began it, recognized the features as those of the jester. He also painted a portrait of King Antigonus; and as that monarch was blind of one eye, he invented a method of concealing the defect. With this object, he painted him in profile, in order that what in reality was wanting to the person might have the semblance of being wanting to the picture rather, he making it his care to show that side of the face only which he could show without any defect. Among his works, too, there are some figures representing persons at the point of death; but it is not easy to say which of his productions are of the highest order of excellence.

His Venus Rising from the Sea, known as the Venus Anadyomene, was consecrated by the late Emperor Augustus in the Temple of his father Cæsar; a work which has been celebrated in certain Greek lines, which, though they have out-lived it, have perpetuated its fame. The lower part of the picture having become damaged, no one could be found to repair it; and thus did the very injury which the picture had sustained, redound to the glory of the artist. Time, however, and damp at last effaced the painting, and Nero, in his reign, had it replaced by a copy, painted by the hand of Dorotheus. Apelles also commenced another Venus for the people of Cos, which would have outshone even the former one; but death invidiously prevented its completion, nor could any one be found to complete the work in conformity with the sketches of the outline. He painted also, in the Temple of Diana at Ephesus, Alexander the Great wielding the Thunderbolts, a picture for which he received twenty talents of gold. The fingers have all the appearance of projecting from the surface, and the lightning seems to be darting from the picture. And then, too, let the reader bear in mind that all these works were executed by the aid of four colours only. The price paid in golden coin for this picture was ascertained by weight, there being no specific sum agreed upon.

He also painted a Procession of the Megabyzus, the priest of Diana at Ephesus; and a Clitus on Horseback, hastening to the combat, his Armour-bearer handing him his helmet at his command. How many times he painted Alexander and Philip, it would be quite superfluous to attempt to enumerate. At Samos, there is a Habron by him, that is greatly admired; at Rhodes a Menander, king of Caria, and an Ancæus; at Alexandria, a Gorgosthenes, the Tragedian; and at Rome, a Castor and Pollux, with figures of Victory and Alexander the Great, and an emblematical figure of War with her hands tied behind her, and Alexander seated in a triumphal car; both of which pictures the late Emperor Augustus, with a great degree of moderation and good taste, consecrated in the most frequented parts of his Forum: the Emperor Claudius, however, thought it advisable to efface the head of Alexander in both pictures, and substitute likenesses of his predecessor Augustus. It is by his hand too, it is generally supposed, that the Hercules, with the face averted, now in the Temple of Anna, was painted; a picture in which, one of the greatest difficulties in the art, the face, though hidden, may be said to be seen rather than left to the imagination. He also painted a figure of a naked Hero, a picture in which he has challenged Nature herself.

There exists too, or did exist, a Horse that was painted by him for a pictorial contest; as to the merits of which, Apelles appealed from the judgment of his fellow-men to that of the dumb quadrupeds. For, finding that by their intrigues his rivals were likely to get the better of him, he had some horses brought, and the picture of each artist successively shown to them. Accordingly, it was only at the sight of the horse painted by Apelles that they began to neigh; a thing that has always been the case since, whenever this test of his artistic skill has been employed. He also painted a Neoptolemus on horse-back, fighting with the Persians; an Archeläus, with his Wife and Daughter; and an Antigonus on foot, with a cuirass on, and his horse led by his side. Connoisseurs in the art give the preference, before all other works of his, to his paintings of King Archeläus on horseback, and of Diana in the midst of a throng of Virgins performing a sacrifice; a work in which he would appear to have surpassed the lines of Homer descriptive of the same subject. He also portrayed some things, which in reality do not admit of being portrayed — thunder, lightning, and thunderbolts, in pictures which are known by the respective names of Bronte, Astrape, and Ceraunobolia.

His inventions, too, in the art of painting, have been highly serviceable to others; but one thing there was in which no one could imitate him. When his works were finished, he used to cover them with a black varnish, of such remarkable thinness, that while by the reflection it gave more vivacity to the colours, and preserved them from the contact of dust and dirt, its existence could only be detected by a person when close enough to touch it. In addition to this, there was also this other great advantage attending it: the brightness of the colours was softened thereby, and harmonized to the sight, looking as though they had been viewed from a distance, and through a medium of

specular-stone; the contrivance, by some indescribable means, giving a sombreness to colours which would otherwise have been too florid.

One of the contemporaries of Apelles was Aristides of Thebes; the first of all the painters to give full expression to the mind and passions of man, known to the Greeks as ἤθη, as well as to the mental perturbations which we experience: he was somewhat harsh, however, in his colours. There is a picture by him of a Captured City, in which is represented an infant crawling toward the breast of its wounded mother, who, though at the point of death, has all the appearance of being aware of it, and of being in dread lest the child should suck blood in place of milk from her exhausted breast: this picture Alexander the Great ordered to be transferred to Pella, his native place. Aristides also painted a Battle with the Persians, a picture which contained one hundred figures, for each of which he was paid at the rate of ten minæ by Mnason, the tyrant of Elatea. He also painted Chariots with four horses in full career; a Suppliant, which almost speaks, Huntsmen with game; Leontion, the mistress of Epicurus; the Anapauomenc, a damsel pining to death from love for her brother; a Father Liber also, and an Artamene, two fine pictures now to be seen in the Temple of Ceres at Rome; a Tragedian and a Child, in the Temple of Apollo, a picture which has lost its beauty, owing to the unskilfulness of the painter to whom M. Junius, the prætor, entrusted the cleaning of it, about the period of the Apollinarian Games. There was also to be seen, in the Temple of Faith, in the Capitol, a picture of his, representing an Aged Man giving instructions to a Child on the lyre. He executed also a painting of an Invalid, upon which endless encomiums have been lavished. Indeed, so great was the excellence of this artist, that King Attalus, it is said, purchased one picture of his at the price of one hundred talents.

At the same period flourished Protogenes, as already stated. He was a native of Caunus, a place held in subjection by the Rhodians. Great poverty in his early days, and extreme application to his art, were the causes of his comparative unproductiveness. It is not known with certainty from whom he received his instruction in the art: indeed some say that he was only a ship-decorator down to his fiftieth year; a proof of which, it is asserted, is the fact, that in decorating the Propylæum of the Temple of Minerva, situate in one of the most celebrated spots in Athens, where he has painted the fine picture of Paralus and Hammonias, known by some as the Nausicaa, he has added in the side pieces of the picture, by painters called "parerga," several small ships of war; wishing thereby to show in what department that skill had first manifested itself which had thus reached the citadel of Athens, the scene of his glory. Of all his compositions, however, the palm has been awarded to his Ialysus, now at Rome, consecrated in the Temple of Peace there. So long as he was at work upon it, he lived, it is said, upon nothing but soaked lupines; by which means he at once appeased both hunger and thirst, and avoided all risk of blunting his perception by too delicate a diet. In order to protect this picture against the effects of ill-usage and old age, he painted it over four

times, so that when an upper coat might fail, there would be an under one to succeed it. There is in this picture the figure of a dog, which was completed in a very remarkable manner, inasmuch as accident had an equal share with design in the execution of it. The painter was of opinion that he had not given the proper expression to the foam at the mouth of the animal, panting for breath, as it was represented; while, with all other parts of the picture, a thing extremely difficult with him, he was perfectly satisfied. The thing that displeased him was, the evident traces of art in the execution of it, touches which did not admit of any diminution, and yet had all the appearance of being too laboured, the effect produced being far removed from his conception of the reality: the foam, in fact, bore the marks of being painted, and not of being the natural secretion of the animal's mouth. Vexed and tormented by this dilemma, it being his wish to depict truth itself, and not something that only bore a semblance of truth, he effaced it again and again, changed his pencil for another, and yet by no possibility could satisfy himself. At last, quite out of temper with an art, which, in spite of him, would still obtrude itself, he dashed his sponge against the vexatious spot; when behold: the sponge replaced the colours that it had just removed, exactly in accordance with his utmost wishes, and thus did chance represent Nature in a painting.

Following his example, Nealces, it is said, succeeded in representing the foam at a horse's mouth; for on one occasion, when engaged in painting a man holding in a pair of horses and soothing them with his voice, he also dashed his sponge against the picture, with the view of producing a like effect.

It was on account of this Ialysus, which he was apprehensive of destroying, that King Demetrius forbore to set fire to the only side of the city of Rhodes by which it was capable of being taken; and thus, in his anxiety to spare a picture, did he lose his only opportunity of gaining a victory. The dwelling of Protogenes at this period was situate in a little garden in the suburbs, or in other words, in the midst of the camp of Demetrius. The combats that were taking place made no difference whatever to the artist, and in no way interrupted his proceeding with the works which he had commenced; until at last he was summoned before the king, who enquired how he could have the assurance thus to remain without the walls. "Because I know," was his answer, "that you are waging war with the Rhodians, and not with the arts." Upon this, the king, delighted at having the opportunity of protecting the hand which he had thus spared, ordered a guard to be placed at his disposal for the especial purpose of his protection. In order, too, that he might not distract the artist's attention by sending for him too often, he would often go, an enemy albeit, to pay him a visit, and, abandoning his aspirations for victory, in the midst of arms and the battering down of walls, would attentively examine the compositions of the painter. Even to this day, the story is still attached to the picture which he was then engaged upon, to the effect, that Protogenes painted it beneath the sword. It is his Satyr, known as the "Anapauomenos;" in whose

hand, to mark the sense of security that he felt, the painter has placed a pair of pipes.

Protogenes executed also, a Cydippe; a Tlepolemus; a portrait of Philiscus, the tragic poet, in an attitude of meditation; an Athlete; a portrait of King Antigonus, and one of the mother of Aristotle. It was this philosopher too, who advised him to paint the exploits of Alexander the Great, as being certain to be held in everlasting remembrance. The impulse, however, of his natural disposition, combined with a certain artistic caprice, led him in preference to adopt the various subjects which have just been mentioned. His last works were representations of Alexander and the god Pan. He also executed some figures in bronze, as already stated.

At the same period also, lived Asclepiodorus, who was greatly admired by Apelles for his proportions. The tyrant Mnason paid him, for his picture of the Twelve Gods, at the rate of thirty minæ for each divinity. This same Mnason also paid Theomnestus twenty minæ for each of his Heroes.

In addition to these, it is only proper to mention Nicomachus, the son and disciple of Aristiæus. He painted a Rape of Proserpina, a picture that was formerly in the Temple of Minerva in the Capitol, above the shrine of Juventas. Another picture of his was to be seen also in the Capitol, placed there by the Roman general Plancus, a Victory soaring aloft in a chariot: he was the first painter who represented Ulysses wearing the pileus. He painted also an Apollo and Diana; the Mother of the Gods seated on a Lion; the fine picture of the Bacchantes, with Satyrs moving stealthily towards them; and a Scylla, now at Rome in the Temple of Peace. No painter ever worked with greater rapidity than Nicomachus; indeed it is said, that on one occasion having entered into an engagement with Aristratus, the tyrant of Sicyon, to paint within a given time the monument which he was raising to the memory of the poet Telestis, the artist only arrived a few days before the expiration of the term; upon which, the tyrant was so angry that he threatened to punish him: however, in the few days that were left, Nicomachus, to the admiration of all, completed the work, with equal promptitude and success. Among his pupils, were his brother Ariston, his son Aristides, and Philoxenus of Eretria, who painted for King Cassander a picture representing one of the battles between Alexander and Darius, a work which may bear comparison with any. He also painted a picture in grotesque, representing Three Sileni at their revels. Imitating the celerity of execution displayed by his master, he introduced a more sketchy style of painting, executed in a comparatively off-hand manner.

To these artists Nicophanes has also been added, an elegant and finished painter, to whom for gracefulness few can be compared, but for a severe and tragic style far inferior to Zeuxis or Apelles. Perseus also belongs to this period, a pupil of Apelles, who dedicated to him his work on painting. Aristides of Thebes had for pupils his sons Niceros and Ariston. By the latter of these artists, there is a Satyr crowned with a chaplet and holding a goblet:

two of his pupils were Antorides and Euphranor, of the latter of whom we shall have to make mention again.

CHAP. 37.

VARIOUS OTHER KINDS OF PAINTING.

We must now, however, make some mention of those artists who acquired fame by the pencil in an inferior style of painting. Among these was Piræicus, inferior to few of the painters in skill. I am not sure that he did not do injustice to himself by the choice of his subjects, seeing that, although he adopted an humble walk, he still attained in that walk the highest reputation. His subjects were barbers' shops, cobblers' stalls, jackasses, eatables, and the like, and to these he was indebted for his epithet of "Ithyparographos." His paintings, however, are exquisitely pleasing, and have sold at higher prices than the very largest works of many masters.

On the other hand again, as Varro tells us, a single picture by Serapio covered the whole space of the balustrades, beneath the Old Shops, where it was exhibited. This artist was very successful in painting stage-scenery, but was unable to depict the human form. Dionysius, on the contrary, painted nothing but men, and hence it was that he had the surname of "Anthropographos." Callicles also painted some small pictures, and Calates executed some small works in the comic style. Both of these styles were adopted by Antiphilus; who painted a very fine Hesione, and a Philip and Alexander with Minerva, now in the School of the Porticos of Octavia. In the Portico of Philippus, also, there is a Father Liber by him; an Alexander when a child; and an Hippolytus alarmed at the Bull, which is rushing upon him: and in the Portico of Pompeius we have his Cadmus and Europa. On the other hand, again, he painted a figure in a ridiculous costume, known jocosely as the Gryllus; and hence it is that pictures of this class are generally known as "Grylli." Antiphilus was a native of Egypt, and received instruction in the art from Ctesidemus.

It would not be right to pass in silence the painter of the Temple at Ardea, the more particularly as he was honoured with the citizenship at that place, and with the following inscription in verse upon one of the paintings which he executed there:

"These paintings, worthy of this worthy place,
Temple of Juno, queen, and wife of Jove,
Plautius Marcus, from Alalia, made.
May Ardea now and ever praise him for his skill."

These lines are written in ancient Latin characters.

Ludius too, who lived in the time of the late Emperor Augustus, must not be allowed to pass without some notice; for he was the first to introduce the fashion of covering the walls of our houses with most pleasing landscapes, representing villas, porticos, ornamental gardening, woods, groves, hills,

fishponds, canals, rivers, sea-shores, and anything else one could desire; varied with figures of persons walking, sailing, or proceeding to their villas, on asses or in carriages. Then, too, there are others to be seen fishing, fowling, or gathering in the vintage. In some of his decorations there are fine villas to be seen, and roads to them across the marshes, with women making bargains to be carried across on men's shoulders, who move along slipping at every step and tottering beneath their load; with numberless other subjects of a similar nature, redolent of mirth and of the most amusing ingenuity. It was this artist, too, who first decorated our uncovered edifices with representations of maritime cities, a subject which produces a most pleasing effect, and at a very trifling expense.

But as for fame, that has been reserved solely for the artists who have painted pictures; a thing that gives us all the more reason to venerate the prudence displayed by the men of ancient times. For with them, it was not the practice to decorate the walls of houses, for the gratification of the owners only; nor did they lavish all their resources upon a dwelling which must of necessity always remain a fixture in one spot, and admits of no removal in case of conflagration. Protogenes was content with a cottage in his little garden; Apelles had no paintings on the plaster of his walls; it not being the fashion in their day to colour the party-walls of houses from top to bottom. With all those artists, art was ever watchful for the benefit of whole cities only, and in those times a painter was regarded as the common property of all.

Shortly before the time of the late Emperor Augustus, Arellius was in high esteem at Rome; and with fair reason, had he not profaned the art by a disgraceful piece of profanity; for, being always in love with some woman or other, it was his practice, in painting goddesses, to give them the features of his mistresses; hence it is, that there were always some figures of prostitutes to be seen in his pictures. More recently, lived Amulius, a grave and serious personage, but a painter in the florid style. By this artist there was a Minerva, which had the appearance of always looking at the spectators, from whatever point it was viewed. He only painted a few hours each day, and then with the greatest gravity, for he always kept the toga on, even when in the midst of his implements. The Golden Palace of Nero was the prison-house of this artist's productions, and hence it is that there are so few of them to be seen elsewhere.

Next in repute to him were Cornelius Pinus and Attius Priscus, who painted the Temple of Honour and that of Virtue, on their restoration by the Emperor Vespasianus Augustus. Priscus approaches more closely to the ancient masters.

CHAP. 38. (11.)

AN EFFECTUAL WAY OF PUTTING A STOP TO THE SINGING OF BIRDS.

I must not omit here, in reference to painting, a celebrated story that is told about Lepidus. During the Triumvirate, when he was entertained by the magistrates of a certain place, he had lodgings given him in a house that was wholly surrounded with trees. The next day, he complained to them in a threatening tone, that he had been unable to sleep for the singing of the birds there. Accordingly, they had a dragon painted, on pieces of parchment of the greatest length that could possibly be obtained, and surrounded the grove with it; a thing that so terrified the birds, it is said, that they became silent at once; and hence it was that it first became known how this object could be attained.

CHAP. 39.

ARTISTS WHO HAVE PAINTED IN ENCAUSTICS OR WAX, WITH EITHER THE
CESTRUM OR THE PENCIL.

It is not agreed who was the inventor of the art of painting in wax and in encaustic. Some think that it was a discovery of the painter Aristides, and that it was afterwards brought to perfection by Praxiteles: but there are encaustic paintings in existence, of a somewhat prior date to them, those by Polygnotus, for example, and by Nicanor and Arcesilaüs, natives of Paros. Elasippus too, has inscribed upon a picture of his at Ægina, the word ἐνέχαιεν; a thing that he certainly could not have done, if the art of encaustic painting had not been then invented.

CHAP. 40.

THE FIRST INVENTORS OF VARIOUS KINDS OF PAINTING. THE GREATEST DIFFICULTIES IN THE ART OF PAINTING. THE SEVERAL VARIETIES OF PAINTING. THE FIRST ARTIST THAT PAINTED CEILINGS. WHEN ARCHED ROOFS WERE FIRST PAINTED. THE MARVELLOUS PRICE OF SOME PICTURES.

It is said, too, that Pamphilus, the instructor of Apelles, not only painted in encaustic, but also instructed Pausias of Sicyon in the art, the first who rendered himself distinguished in this branch. Pausias was the son of Bryetes, by whom he was originally instructed in the art of painting. He retouched also with the pencil some walls at Thespiaë, then undergoing repair, which had formerly been painted by Polygnotus. Upon instituting a comparison, however, it was considered that he was greatly inferior, this kind of painting not being in his line. It was he, too, who first thought of painting ceilings; nor had it been the practice before his day to use this kind of decoration for arched roofs. He painted many small pictures also, miniatures of children more particularly; a thing which, according to the interpretation put upon it by his rivals, was owing to the peculiarly slow process of encaustic painting. The consequence was, that being determined to give a memorable proof of his celerity of execution, he completed a picture in the space of a single day, which was thence called the "Hemeresios," representing the portrait of a child.

In his youth, he was enamoured of Glycera, his fellow-townswoman, the first inventor of chaplets; and in his rivalry of the skill shown by her, he achieved so much success in the encaustic art, as to reproduce the almost numberless tints displayed by flowers. At a later period, he painted her, seated, with a chaplet on, and thus produced one of the very finest of his pictures; known as the "Stephaneplocos" by some, and as the "Stephanopolis" by others; from the circumstance that Glycera had supported herself in her poverty by selling these chaplets. A copy of this picture, usually known as an "apographon," was purchased by L. Lucullus at Athens, during the festival of the Dionysia, at the price of two talents.

Pausias also painted some large pictures, a Sacrifice of Oxen, for instance, which used to be seen in the Portico of Pompeius. In this painting he invented several improvements, which many artists have since imitated, but none with the same success. Although in the picture it was particularly his desire to give an impression of the length of the ox, he painted it with a front view and not sideways, and still has caused the large dimensions of the animal to be fully understood. And then too, whereas all other painters colour in white such parts as they wish to have the appearance of being prominent, and in black such portions as are intended to remain in the back-ground, he has painted the whole of the ox of a black colour, and has shown the dimensions of the body which throws the shadow by the medium of the shadow itself;

thus evincing a wonderful degree of skill in showing relief upon a coat painted with a single colour, and conveying an impression of uniform solidity upon a broken ground. It was at Sicyon also that Pausias passed his life, a city which for a long time continued to be the native place of painting. Ultimately, all the paintings belonging to that place were sold by public auction for the discharge of the debts owing by the city, and were transferred to Rome in the ædileship of Scaurus.

Next to him, in the hundred and fourth Olympiad, Euphranor, the Isthmian, distinguished himself far beyond all others, an artist who has been already mentioned in our account of the statuaries. He executed some colossal figures also, and some statues in marble, and he chased some drinking-vessels; being studious and laborious in the highest degree, excellent in every branch, and at all times equal to himself. This artist seems to have been the first to represent heroes with becoming dignity, and to have paid particular attention to symmetry. Still, however, in the generality of instances, he has made the body slight in proportion to the head and limbs. He composed some treatises also upon symmetry and colours. His works are, an Equestrian Combat; the Twelve Gods; and a Theseus; with reference to which he remarked that the Theseus of Parrhasius had been fed upon roses, but his own upon beef. There are also at Ephesus some famous pictures by him; an Ulysses, in his feigned madness, yoking together an ox and a horse; Men, in an attitude of meditation, wearing the pallium; and a Warrior, sheathing his sword.

At the same time, also, flourished Cydias; for whose picture of the Argonautæ the orator Hortensius paid one hundred and forty-four thousand sesterces, and had a shrine constructed expressly for its reception on his estate at Tusculum. There was also Antidotus, a pupil of Euphranor, by whom there is, at Athens, a Combatant armed with a shield; a Wrestler, also; and a Trumpeter, a work which has been considered a most exquisite production.

Antidotus, as a painter, was more careful in his works than prolific, and his colouring was of a severe style. His principal glory was his having been the instructor of Nicias of Athens; who was a most careful painter of female portraits, and a strict observer of light and shade, making it his especial care that the figures in his pictures should appear in the boldest relief. His works are, a Nemea, which was brought from Asia to Rome by Silanus, and was placed in the Curia, as already stated; a Father Liber, in the Temple of Concord; a Hyacinthus, which the Emperor Augustus was so delighted with, that he took it away with him after the capture of Alexandria; for which reason also it was consecrated in the Temple of Augustus by the Emperor Tiberius; and a Danaë. At Ephesus, there is a tomb by him of a megabyzus, or priest of the Ephesian Diana; and at Athens a representation of the Necyomantea of Homer; which last he declined to sell to King Attalus for sixty talents, and in preference, so rich was he, made a present of it to his own native place. He also executed some large pictures, among which there are a Calypso, an Io, an Andromeda, a very fine Alexander, in the Porticos of

Pompeius, and a Calypso, seated. To this painter also there are some pictures of cattle attributed, and in his dogs he has been remarkably successful. It was this Nicias, with reference to whom, Praxiteles, when asked with which of all his works in marble he was the best pleased, made answer, "Those to which Nicias has set his hand," so highly did he esteem the colouring of that artist. It has not been satisfactorily ascertained whether it is this artist or another of the same name that some writers have placed in the hundred and twelfth Olympiad.

With Nicias has been compared, and indeed sometimes preferred to him, Athenion of Maronea, a pupil of Glaucion of Corinth. In his colouring he is more sombre than Nicias, and yet, with all his sombreness, more pleasing; so much so indeed, that in his paintings shines forth the extensive knowledge which he possessed of the art. He painted, in the Temple at Eleusis, a Phylarchus; and at Athens, a family group, which has been known as the "Syngenicon;" an Achilles also, concealed in a female dress, and Ulysses detecting him; a group of six whole-length figures, in one picture; and, a work which has contributed to his fame more than any other, a Groom leading a Horse. Indeed, if he had not died young, there would have been no one comparable to Athenion in painting.

Heraclides, too, of Macedon, had some repute as an artist. At first he was a painter of ships, but afterwards, on the capture of King Perseus, he removed to Athens; where at the same period was also Metrodorus, who was both a painter and a philosopher, and of considerable celebrity in both branches. Hence it was, that when L. Paulus Æmilius, after the conquest of Perseus, requested the Athenians to send him the most esteemed philosopher for the education of his children, and a painter to represent his triumph, they made choice of Metrodorus, declaring that he was eminently suited for either purpose; a thing which Paulus admitted to be the case.

Timomachus of Byzantium, in the time of the Dictator Cæsar, painted an Ajax and a Medea, which were placed by Cæsar in the Temple of Venus Genetrix, having been purchased at the price of eighty talents; the value of the Attic talent being, according to M. Varro, equivalent to six thousand denarii. An Orestes, also by Timomachus, an Iphigenia in Tauris, and a Lecythion, a teacher of gymnastics, are equally praised; a Noble Family also; and Two Men clothed in the pallium, and about to enter into conversation, the one standing, the other in a sitting posture. It is in his picture, however of the Gorgon, that the art appears to have favoured him most highly.

Aristolaüs, the son and pupil of Pausias, was one of the painters in a more severe style: there are by him an Epaminondas, a Pericles, a Medea, a Theseus, an emblematical picture of the Athenian People, and a Sacrifice of Oxen. Some persons, too, are pleased with the careful style of Nicophanes, who was also a pupil of Pausias; a carefulness, however, which only artists can appreciate, as in other respects he was harsh in his colours, and too lavish of sil; as in his picture, for example, of Æsculapius with his daughters, Hygia,

Ægle, and Panacea, his Jason, and his Sluggard, known as the "Ocnos," a man twisting a rope at one end as an ass gnaws it at the other. As to Socrates, his pictures are, with good reason, universally esteemed.

Having now mentioned the principal painters in either branch, I must not pass in silence those who occupy the next rank. Aristoclides decorated the Temple of Apollo at Delphi. Antiphilus is highly praised for his picture of a Boy blowing a Fire, which illumines an apartment handsomely furnished, and throws a light upon the features of the youth; a Spinning-room, with women plying their respective tasks; and a King Ptolemæus hunting. But his most famous picture is his Satyr, clad in a panther's skin, and known as the "Aposcopeuon." Aristophon has painted an Ancæus wounded by the Boar, with Astypale, the sharer of his grief; and a picture with numerous figures, representing Priam, Helena, Credulity, Ulysses, Dphobus, and Guile. Androbius has painted a Scyllus cutting away the anchors of the Persian fleet: and Artemon a Danaë, with Robbers in admiration; a Queen Stratonice; and a Hercules and Deianira. But the finest of all this artist's works are those now in the buildings of Octavia; a Hercules ascending to heaven, with the sanction of the gods, from his funeral pile upon Mount Cæta in Doris; and the story of Laomedon and his bargain with Hercules and Neptune. Alcimachus has painted Dioxippus, who was victorious in the pancratium at Olympia, without raising the dust; a victory known to the Greeks as being gained "aconiti." Cœnus painted pedigrees.

Ctesilochus, a pupil of Apelles, was famous for a burlesque picture of his representing Jupiter in labour with Bacchus, with a mitra on his head, and crying like a woman in the midst of the goddesses, who are acting as midwives. Cleon distinguished himself by his Cadmus; and Ctesidemus, by his Capture of Eechalia and his Laodamia.

Ctesicles became notorious for the insult which he offered to Queen Stratonice; for, upon failing to meet with an honourable reception from her, he painted her, romping with a fisherman, for whom, according to common report, she had conceived an ardent affection. After exhibiting this picture in the harbour at Ephesus, he at once set sail and escaped: the queen, however, would not allow of its removal, the likenesses of the two figures being so admirably expressed. Cratinus, the comic writer, painted at Athens, in the Pompeion there.

Of Eutychides, there is a Victory guiding a chariot drawn by two horses. Eudorus is famous for his dramatic scenery; he executed some statues in bronze also. By Hippys there is a Neptune and Victory. Habron painted a picture of Friendship and Concord, and several figures of divinities; Leontiscus, an Aratus with the trophies of victory, and a Singing-girl; Leon, a portrait of Sappho; and Nearchus, a Venus attended by Cupids and Graces, and a Hercules, sorrowing and repentant at the sad results of his madness. Nealces, a remarkably ingenious and inventive artist, painted a Venus. On one occasion, when he had to represent a naval engagement between the Persians

and Egyptians, wishing it to be understood that it took place on the river Nilus, the waters of which are similar in appearance to those of the sea, he employed an emblem to disclose that which would not admit of expression by art; for he painted an ass drinking on the shore, and a crocodile lying in wait for him.

Enias has painted a Family Group; Philiscus, a Painter's Studio, with a boy blowing the fire; Phalerion, a Scylla; Simonides, an Agatharchus and a Mnemosyne; Simus, a youth reposing, a Fuller's Shop, a person celebrating the Quinquatria, and a Nemesis of great merit. By Theorus there is a Man Anointing himself; a picture of the Murder of Ægisthus and Clytæmnestra by Orestes; and a representation of the Trojan War, in a series of paintings, now at Rome, in the Porticos of Philippus: a Cassandra also, in the Temple of Concord; a Leontium, the mistress of Epicurus, in an attitude of meditation; and a King Demetrius. Theon has painted the Frenzy of Orestes, and a Thamyras playing on the lyre; Tauriscus, a Discobolus, a Clytæmnestra, a Pan in miniature, a Polynices claiming the sovereignty, and a Capaneus.

In speaking of these artists, I must not omit to mention one memorable circumstance: Erigonus, who was colour-grinder to the painter Nealces, himself made such progress in the art as to leave a very celebrated pupil, Pasius, the brother of Ægineta, the modeller. It is also a very singular fact, and one well deserving of remark, that the last works of these artists, their unfinished paintings, in fact, are held in greater admiration than their completed works; the Iris of Aristides, for instance, the Tyndaridæ of Nicomachus, the Medea of Timomachus, and the Venus of Apelles, already mentioned. For in such works as these, we not only see the outline depicted, and the very thoughts of the artist expressed, but have the composition additionally commended to our notice by the regrets which we must necessarily feel on finding the hand that commenced it arrested by death.

There are still some other artists, who, though by no means without reputation, can only be noticed here in a summary manner: Aristocydes; Anaxander; Aristobulus of Syria; Arcesilas, son of Tisicrates; Coræbos, a pupil of Nicomachus; Charmantides, a pupil of Euphranor; Dionysodorus of Colophon; Dicæogenes, a contemporary of King Demetrius; Euthymides; Heraclides of Macedon; Milo of Soli, a pupil of the statuary Pyromachus; Mnasitheus of Sicyon; Mnasitimus, the son and pupil of Aristonidas; Nessus, son of Habron; Polemon of Alexandria; Theodorus of Samos, and Stadiæus, pupils of Nicosthenes; and Xeno of Sicyon, a pupil of Neocles.

There have been some female painters also. Timarete, the daughter of Micon, painted a Diana at Ephesus, one of the very oldest panel-paintings known. Irene, daughter and pupil of the artist Cratinus, painted a figure of a girl, now at Eleusis, a Calypso, an Aged Man, the juggler Theodorus, and Alcisthenes the dancer. Aristarete, daughter and pupil of Nearchus, painted an Æsculapius. Iaia of Cyzicus, who always remained single, painted at Rome, in the youth of M. Varro, both with the brush, and with the graver, upon ivory,

her subjects being female portraits mostly. At Naples, there is a large picture by her, the portrait of an Old Woman; as also a portrait of herself, taken by the aid of a mirror. There was no painter superior to her for expedition; while at the same time her artistic skill was such, that her works sold at much higher prices than those of the most celebrated portrait-painters of her day, Sopolis namely, and Dionysius, with whose pictures our galleries are filled. One Olympias painted also, but nothing is known relative to her, except that she had Autobulus for a pupil.

CHAP. 41.

ENCAUSTIC PAINTING.

In ancient times there were but two methods of encaustic painting, in wax and on ivory, with the cestrum or pointed graver. When, however, this art came to be applied to the painting of ships of war, a third method was adopted, that of melting the wax colours and laying them on with a brush, while hot. Painting of this nature, applied to vessels, will never spoil from the action of the sun, winds, or salt water.

CHAP. 42.

THE COLOURING OF TISSUES.

In Egypt, too, they employ a very remarkable process for the colouring of tissues. After pressing the material, which is white at first, they saturate it, not with colours, but with mordents that are calculated to absorb colour. This done, the tissues, still unchanged in appearance, are plunged into a cauldron of boiling dye, and are removed the next moment fully coloured. It is a singular fact, too, that although the dye in the pan is of one uniform colour, the material when taken out of it is of various colours, according to the nature of the mordents that have been respectively applied to it: these colours, too, will never wash out. Thus the dye-pan, which under ordinary circumstances, no doubt, would have made but one colour of several, if coloured tissues had been put into it, is here made to yield several colours from a single dye. At the same moment that it dyes the tissues, it boils in the colour; and it is the fact, that material which has been thus submitted to the action of fire becomes stouter and more serviceable for wear, than it would have been if it had not been subjected to the process

CHAP. 43. (12.)

THE INVENTORS OF THE ART OF MODELLING.

On painting we have now said enough, and more than enough; but it will be only proper to append some accounts of the plastic art. Butades, a potter of Sicyon, was the first who invented, at Corinth, the art of modelling portraits in the earth which he used in his trade. It was through his daughter that he made the discovery; who, being deeply in love with a young man about to depart on a long journey, traced the profile of his face, as thrown upon the wall by the light of the lamp. Upon seeing this, her father filled in the outline, by compressing clay upon the surface, and so made a face in relief, which he then hardened by fire along with other articles of pottery. This model, it is said, was preserved in the Nymphæum at Corinth, until the destruction of that city by Mummius. Others, again, assert that the first inventors of the plastic art were Rhœcus and Theodorus, at Samos, a considerable period before the expulsion of the Bacchiadæ from Corinth: and that Damaratus, on taking to flight from that place and settling in Etruria, where he became father of Tarquinius, who was ultimately king of the Roman people, was accompanied thither by the modellers Euchir, Diopus, and Eugrammus, by whose agency the art was first introduced into Italy.

Butades first invented the method of colouring plastic compositions, by adding red earth to the material, or else modelling them in red chalk: he, too, was the first to make masks on the outer edges of gutter-tiles upon the roofs of buildings; in low relief, and known as “prostypa” at first, but afterwards in high relief, or “ectypa.” It was in these designs, too, that the ornaments on the pediments of temples originated; and from this invention modellers first had their name of “plastæ.”

Detailed table of contents

CHAP. 44.

WHO WAS THE FIRST TO MOULD FIGURES IN IMITATION OF THE FEATURES OF LIVING PERSONS, OR OF STATUES.

The first person who expressed the human features by fitting a mould of plaster upon the face, and then improving it by pouring melted wax into the cast, was Lysistratus of Sicyon, brother of Lysippus, already mentioned. It was he, in fact, who first made it his study to give a faithful likeness; for before his time, artists only thought how to make their portraits as handsome as possible. The same artist, too, was the first who thought of making models for his statues; a method which afterwards became so universally adopted, that there could be neither figure nor statue made without its model in clay. Hence it would appear, that the art of modelling in clay is more ancient than that of moulding in bronze.

CHAP. 45.

THE MOST FAMOUS MODELLERS.

The most celebrated modellers were Damophilus and Gorgasus, who were painters as well. These artists adorned with their works, in both kinds, the Temple of Ceres, in the Circus Maximus at Rome; with an inscription in Greek, which stated that the decorations on the right-hand were the workmanship of Damophilus, and those on the left, of Gorgasus. Varro says that, before the construction of this temple, everything was Tuscan in the temples; and that, when the temple was afterwards repaired, the painted coatings of the walls were cut away in tablets and enclosed in frames, but that the figures on the pediments were dispersed. Chalcosthenes, too, executed at Athens some works in unbaked earth, on the spot which, from his manufactory, has since obtained the name of "Cericus."

M. Varro states that he knew an artist at Rome, Possis by name, who executed fruit, grapes, and fish, with such exactness, that it was quite impossible, by only looking at them, to distinguish them from the reality. He speaks very highly also of Arcesilaüs, who was on terms of intimacy with Lucius Lucullus, and whose models in plaster used to sell at a higher rate, among artists themselves, than the works of others. He informs us, also, that it was by this modeller that the Venus Genetrix in the Forum of Cæsar was executed, it having been erected before completion, in the great haste that there was to consecrate it; that the same artist had made an agreement with Lucullus to execute a figure of Felicity, at the price of sixty thousand sesterces, the completion of which was prevented by their death; and that Octavius, a Roman of equestrian rank, being desirous of a model for a mixing-bowl, Arcesilaüs made him one in plaster, at the price of one talent.

Varro praises Pasiteles also, who used to say, that the plastic art was the mother of chasing, statuary, and sculpture, and who, excellent as he was in each of these branches, never executed any work without first modelling it. In addition to these particulars, he states that the art of modelling was anciently cultivated in Italy, Etruria in particular; and that Volcanius was summoned from Veii, and entrusted by Tarquinius Priscus with making the figure of Jupiter, which he intended to consecrate in the Capitol; that this Jupiter was made of clay, and that hence arose the custom of painting it with minium; and that the four-horse chariot, so often mentioned, upon the pediment of the temple, was made of clay as well. We learn also from him, that it was by the same artist that the Hercules was executed, which, even to this day, is named at Rome from the material of which it is composed. Such, in those times, were the most esteemed statues of the gods; and small reason have we to complain of our forefathers for worshipping such divinities as these; for in their day there was no working of gold and silver — no, not even in the service of the

gods.

CHAP. 46.

WORKS IN POTTERY.

Statues of this nature are still in existence at various places. At Rome, in fact, and in our municipal towns, we still see many such pediments of temples; wonderful too, for their workmanship, and, from their artistic merit and long duration, more deserving of our respect than gold, and certainly far less baneful. At the present day even, in the midst of such wealth as we possess, we make our first libation at the sacrifice, not from murrhine vases or vessels of crystal, but from ladles made of earthenware.

Bounteous beyond expression is the earth, if we only consider in detail her various gifts. To omit all mention of the cereals, wine, fruits, herbs, shrubs, medicaments, and metals, bounties which she has lavished upon us, and which have already passed under our notice, her productions in the shape of pottery alone, would more than suffice, in their variety, to satisfy our domestic wants; what with gutter-tiles of earthenware, vats for receiving wine, pipes for conveying water, conduits for supplying baths, baked tiles for roofs, bricks for foundations, the productions, too, of the potter's wheel; results, all of them, of an art, which induced King Numa to establish, as a seventh company, that of the makers of earthenware.

Even more than this, many persons have chosen to be buried in coffins made of earthenware; M. Varro, for instance, who was interred, in true Pythagorean style, in the midst of leaves of myrtle, olive, and black poplar; indeed, the greater part of mankind make use of earthen vases for this purpose. For the service of the table, the Samian pottery is even yet held in high esteem; that, too, of Arretium in Italy, still maintains its high character; while for their cups, and for those only, the manufactories of Surrentum, Asta, Pollentia, Saguntum in Spain, and Pergamus in Asia, are greatly esteemed.

The city of Tralles, too, in Asia, and that of Mutina in Italy, have their respective manufactures of earthenware, and even by this branch of art are localities rendered famous; their productions, by the aid of the potter's wheel, becoming known to all countries, and conveyed by sea and by land to every quarter of the earth. At Erythræ, there are still shown, in a temple there, two amphoræ, that were consecrated in consequence of the singular thinness of the material: they originated in a contest between a master and his pupil, which of the two could make earthenware of the greatest thinness. The vessels of Cos are the most highly celebrated for their beauty, but those of Adria are considered the most substantial.

In relation to these productions of art, there are some instances of severity mentioned: Q. Coponius, we find, was condemned for bribery, because he made present of an amphora of wine to a person who had the right of voting. To make luxury, too, conduce in some degree to enhance our estimation of

earthenware, “tripatinium,” as we learn from Fenestella, was the name given to the most exquisite course of dishes that was served up at the Roman banquets. It consisted of one dish of murænæ, one of lupi, and a third of a mixture of fish. It is clear that the public manners were then already on the decline; though we still have a right to hold them preferable to those of the philosophers even of Greece, seeing that the representatives of Aristotle, it is said, sold, at the auction of his goods, as many as seventy dishes of earthenware. It has been already stated by us, when on the subject of birds, that a single dish cost the tragic actor Æsopus one hundred thousand sesterces; much to the reader’s indignation, no doubt; but, by Hercules! Vitellius, when emperor, ordered a dish to be made, which was to cost a million of sesterces, and for the preparation of which a furnace had to be erected out in the fields! luxury having thus arrived at such a pitch of excess as to make earthenware even sell at higher prices than murrhine vessels. It was in reference to this circumstance, that Mucianus, in his second consulship, when pronouncing one of his perorations, reproached the memory of Vitellius with his dishes as broad as the Pomptine Marsh; not less deserving to be execrated than the poisoned dish of Asprenas, which, according to the accusation brought against him by Cassius Severus, caused the death of one hundred and thirty guests.

These works of artistic merit have conferred celebrity on some cities even, Rhegium for example, and Cumæ. The priests of the Mother of the gods, known as the Galli, deprive themselves of their virility with a piece of Samian pottery, the only means, if we believe M. Cælius, of avoiding dangerous results. He it was, too, who recommended, when inveighing against certain abominable practices, that the person guilty of them should have his tongue cut out, in a similar manner; a reproach which would appear to have been levelled by anticipation against this same Vitellius.

What is there that human industry will not devise? Even broken pottery has been utilized; it being found that, beaten to powder, and tempered with lime, it becomes more solid and durable than other substances of a similar nature; forming the cement known as the “Signine” composition, so extensively employed for even making the pavements of houses.

Detailed table of contents

CHAP. 47. (13.)

VARIOUS KINDS OF EARTH. THE PUTEOLAN DUST, AND OTHER EARTHS OF WHICH CEMENTS LIKE STONE ARE MADE.

But there are other resources also, which are derived immediately from the earth. Who, indeed, cannot but be surprised at finding the most inferior constituent parts of it, known as “dust” only, on the hills about Puteoli, forming a barrier against the waves of the sea, becoming changed into stone the moment of its immersion, and increasing in hardness from day to day — more particularly when mixed with the cement of Cumæ? There is an earth too, of a similar nature found in the districts about Cyzicus; but there, it is not a dust, but a solid earth, which is cut away in blocks of all sizes, and which, after being immersed in the sea, is taken out transformed into stone. The same thing may be seen also, it is said, in the vicinity of Cassandra; and at Cnidos, there is a spring of fresh water which has the property of causing earth to petrify within the space of eight months. Between Oropus and Aulis, every portion of the land upon which the sea encroaches becomes transformed into solid rock.

The finer portion of the sand of the river Nilus is not very different in its properties from the dust of Puteoli; not, indeed, that it is used for breaking the force of the sea and withstanding the waves, but only for the purpose, forsooth, of subduing the body for the exercises of the palestra! At all events, it was for this purpose that it used to be brought over for Patrobius, a freedman of the Emperor Nero. I find it stated also, that Craterus, Leonnatus, and Meleager, generals of Alexander the Great, had this sand transported along with their munitions of war. But I forbear to enlarge any further upon this subject; or indeed, by Hercules! upon those preparations of earth and wax of which the ceromata are made, so much employed by our youth in their exercises of the body, at the cost of all vigour of the mind.

Detailed table of contents

CHAP. 48. (14.)

FORMACEAN WALLS.

And then, besides, have we not in Africa and in Spain walls of earth, known as “formaceoan” walls? from the fact that they are moulded, rather than built, by enclosing earth within a frame of boards, constructed on either side. These walls will last for centuries, are proof against rain, wind, and fire, and are superior in solidity to any cement. Even at this day, Spain still beholds watch-towers that were erected by Hannibal, and turrets of earth placed on the very summits of her mountains. It is from the same source, too, that we derive the substantial materials so well adapted for forming the earth-works of our camps and embankments against the impetuous violence of rivers. What person, too, is unacquainted with the fact, that partitions are made of hurdles coated with clay, and that walls are constructed of unbaked bricks?

Detailed table of contents

CHAP. 49.

WALLS OF BRICK. THE METHOD OF MAKING BRICKS.

Earth for making bricks should never be extracted from a sandy or gravelly soil, and still less from one that is stony; but from a stratum that is white and cretaceous, or else impregnated with red earth. If a sandy soil must be employed for the purpose, it should at least be male sand, and no other. The spring is the best season for making bricks, as at midsummer they are very apt to crack. For building, bricks two years old are the only ones that are approved of; and the wrought material of them should be well macerated before they are made.

There are three different kinds of bricks; the Lydian, which is in use with us, a foot-and-a-half in length by a foot in breadth; the tetradoron; and the pentadoron; the word “doron” being used by the ancient Greeks to signify the palm — hence, too, their word “doron” meaning a gift, because it is the hand that gives. — These last two kinds, therefore, are named respectively from their being four and five palms in length, the breadth being the same. The smaller kind is used in Greece for private buildings, the larger for the construction of public edifices. At Pitane, in Asia, and in the cities of Maxilua and Calentum in Farther Spain, there are bricks made, which float in water, when dry; the material being a sort of pumice-earth, extremely good for the purpose when it can be made to unite. The Greeks have always preferred walls of brick, except in those cases where they could find silicious stone for the purposes of building: for walls of this nature will last for ever, if they are only built on the perpendicular. Hence it is, that the Greeks have built their public edifices and the palaces of their kings of brick; the wall at Athens, for example, which faces Mount Hymettus; the Temples of Jupiter and Hercules at Patræ, although the columns and architraves in the interior are of stone; the palace of King Attalus at Tralles; the palace of Cræsus at Sardes, now converted into an asylum for aged persons; and that of King Mausolus at Halicarnassus; edifices, all of them, still in existence.

Muræna and Varro, in their ædileship, had a fine fresco painting, on the plaster of a wall at Lacedæmon, cut away from the bricks, and transported in wooden frames to Rome, for the purpose of adorning the Comitium. Admirable as the work was of itself, it was still more admired after being thus transferred. In Italy also there are walls of brick, at Arretium and Mevania. At Rome, there are no buildings of this description, because a wall only a foot-and-a-half in thickness would not support more than a single story; and by public ordinance it has been enacted that no partition should exceed that thickness; nor, indeed, does the peculiar construction of our party-walls admit of it.

CHAP. 50. (15.)

SULPHUR, AND THE SEVERAL VARIETIES OF IT: FOURTEEN REMEDIES.

Let thus much be deemed sufficient on the subject of bricks. Among the other kinds of earth, the one of the most singular nature, perhaps, is sulphur, an agent of great power upon other substances. Sulphur is found in the Æolian Islands, between Sicily and Italy, which are volcanic, as already stated. But the finest sulphur of all, is that which comes from the Isle of Melos. It is obtained also in Italy, upon the range of hills in the territories of Neapolis and Campania, known as the Leucogæi: when extracted from the mines there, it is purified by the agency of fire.

There are four kinds of sulphur; the first of which is “live” sulphur, known as “apryon” by the Greeks, and found in solid masses, or in other words, in blocks. This, too, is the only sulphur that is extracted in its native state, the others being found in a state of liquescence, and requiring to be purified by being boiled in oil. This kind is green and transparent, and is the only sulphur that is used for medicinal purposes. A second kind is known as the “glebaceous” sulphur, and is solely employed in the workshops of the fullers. The third kind, also, is only used for a single purpose, that of fumigating wool, a process which contributes very greatly to making the wool white and soft; “egula” is the name given to it. The fourth kind is used in the preparation of matches more particularly.

In addition to these several uses, sulphur is of such remarkable virtue, that if it is thrown upon the fire it will at once detect, by the smell, whether or not a person is subject to epilepsy. Anaxilaüs used to employ this substance by way of pastime: putting sulphur in a cup of wine, with some hot coals beneath, he would hand it round to the guests, the light given by it, while burning, throwing a ghastly paleness like that of death upon the face of each. Its properties are calorific and maturative, in addition to which, it disperses abscesses on the body: hence it is that it is used as an ingredient in plasters and emollient poultices. Applied to the loins and kidneys, with grease, when there are pains in those parts, it is marvellously effectual as a remedy. In combination with turpentine, it removes lichens on the face, and leprosy, the preparation being known as “harpax,” from the celerity with which it acts upon the skin; for which reason it ought to be removed every now and then. Employed as an electuary, it is good for asthma, purulent expectorations, and stings inflicted by scorpions. Live sulphur, mixed with nitre, and then bruised with vinegar and applied, causes morpew to disappear, and destroys nits in the hair; in combination, too, with sandarach and vinegar, it is good for diseases of the eyelids.

Sulphur has its place among our religious ceremonies, being used as a fumigation for purifying houses. Its virtues are also to be perceived in certain

hot mineral waters; and there is no substance that ignites more readily, a proof that there is in it a great affinity to fire. Lightning and thunder are attended with a strong smell of sulphur, and the light produced by them is of a sulphureous complexion.

Detailed table of contents

CHAP. 51.

BITUMEN, AND THE SEVERAL VARIETIES OF IT; TWENTY-SEVEN REMEDIES.

Nearly approaching to the nature of sulphur is that of bitumen, which in some places assumes the form of a slime, and in others that of an earth; a slime, thrown up, as already stated, by a certain lake in Judæa, and an earth, found in the vicinity of Sidon, a maritime town of Syria. In both these states, it admits of being thickened and condensed. There is also a liquid bitumen, that of Zacynthus, for example, and the bitumen that is imported from Babylon; which last kind is also white: the bitumen, too, of Apollonia is liquid. All these kinds, in Greek, have the one general name of “pissasphaltos,” from their strong resemblance to a compound of pitch and bitumen. There is also found an unctuous liquid bitumen, resembling oil, in a spring at Agrigentum, in Sicily, the waters of which are tainted by it. The inhabitants of the spot collect it on the panicles of reeds, to which it very readily adheres, and make use of it for burning in lamps, as a substitute for oil, as also for the cure of itch-scab in beasts of burden.

Some authorities include among the bitumens, naphtha, a substance which we have already mentioned in the Second Book; but the burning properties which it possesses, and its susceptibility of igniting, render it quite unfit for use. Bitumen, to be of good quality, should be extremely brilliant, heavy, and massive; it should also be moderately smooth, it being very much the practice to adulterate it with pitch. Its medicinal properties are similar to those of sulphur, it being naturally astringent, dispersive, contractive, and agglutinating: ignited, it drives away serpents by the smell. Babylonian bitumen is very efficacious, it is said, for the cure of cataract and albugo, as also of leprosy, lichens, and pruriginous affections. Bitumen is employed, too, in the form of a liniment, for gout; and every variety of it is useful for making bandolines for eyelashes that are refractory and impede the sight. Applied topically with nitre, it is curative of tooth-ache, and, taken internally, with wine, it alleviates chronic coughs and difficulty of respiration. It is administered in a similar manner for dysentery, and is very good for arresting looseness of the bowels. Taken internally with vinegar, it dissolves and brings away coagulated blood. It modifies pains also in the loins and joints, and, applied with barley-meal, it forms a peculiar kind of plaster, to which it has given its name. It stanches blood also, heals wounds, and unites the sinews when severed. Bitumen is administered for quartan fevers, in doses of one drachma to an equal quantity of hedyosmos, the whole kneaded up with one obolus of myrrh. The smell of burnt bitumen detects a tendency to epilepsy, and, applied to the nostrils with wine and castoreum, it dispels suffocations of the uterus. Employed as a fumigation, it acts as a check upon procidence of the uterus, and, taken internally with wine, it has the effect of an

emmenagogue.

Another use that is made of it, is for coating the inside of copper vessels, it rendering them proof against the action of fire. It has been already stated that bitumen was formerly employed for staining copper and coating statues. It has been used, too, as a substitute for lime; the walls of Babylon, for instance, which are cemented with it. In the smithies they are in the habit of varnishing iron and heads of nails with it, and of using it for many other purposes as well.

[Detailed table of contents](#)

CHAP. 52.

ALUMEN, AND THE SEVERAL VARIETIES OF IT; THIRTY-EIGHT REMEDIES.

Not less important, or indeed very dissimilar, are the uses that are made of alumen; by which name is understood a sort of brine which exudes from the earth. Of this, too, there are several kinds. In Cyprus there is a white alumen, and another kind of a darker colour. The difference, however, in their colour is but trifling in reality, though the uses made of them are very dissimilar; the white liquid alumen being employed for dyeing wool of bright colours, and the black, on the other hand, for giving wool a tawny or a sombre tint. Gold, too, is purified by the agency of black alumen. Every kind of alumen is a compound of slime and water, or in other words, is a liquid product exuding from the earth; the concretion of it commencing in winter, and being completed by the action of the summer sun. That portion of it which is the first matured, is the whitest in appearance.

The countries which produce this substance, are Spain, Ægypt, Armenia, Macedonia, Pontus, Africa, and the islands of Sardinia, Melos, Lipara, and Strongyle: the most esteemed, however, is that of Egypt, the next best being the produce of Melos. Of this last kind there are also two varieties, the liquid alumen, and the solid. Liquid alumen, to be good, should be of a limpid, milky, appearance: when rubbed between the fingers it should be free from grit, and productive of a slight sensation of heat. The name given to it is “phorimon.” The mode of detecting whether or not it has been adulterated, is by the application of pomegranate-juice; for if genuine, it will turn black on combining with the juice. The other, or solid alumen, is pale and rough in appearance, and turns black on the application of nut-galls; for which reason it is known by the name of “paraphoron.”

Liquid alumen is naturally astringent, indurative, and corrosive: used in combination with honey, it heals ulcerations of the mouth, pimples, and pruriginous eruptions. The remedy, when thus used, is employed in the bath, the proportions being two parts of honey to one of alumen. It has the effect, also, of checking and dispersing perspiration, and of neutralizing offensive odours of the arm-pits. It is taken too, in the form of pills, for affections of the spleen, and for the purpose of carrying off blood by the urine: incorporated with nitre and melanthium, it is curative of itch-scab.

There is one kind of solid alumen, known to the Greeks as “schiston,” which splits into filaments of a whitish colour; for which reason some have preferred giving it the name of “trichitis.” It is produced from the mineral ore known to us as “chalcitis,” from which copper is also produced, it being a sort of exudation from that mineral, coagulated into the form of scum. This kind of alumen is less desiccative than the others, and is not so useful as a check upon bad humours of the body. Used, however, either in the form of a liniment or

of an injection, it is highly beneficial to the ears; as also for ulcerations of the mouth, and for tooth-ache, if retained with the saliva in the mouth. It is employed also as a serviceable ingredient in compositions for the eyes, and for the generative organs in either sex. The mode of preparing it is to roast it in crucibles, until it has quite lost its liquid form.

There is another variety of alumen also, of a less active nature, and known as “strongyle;” which is again subdivided into two kinds; the fungous, which easily dissolves in any liquid, and is looked upon as altogether worthless; and the porous, which is full of small holes like a sponge, and in pieces of a globular form, more nearly approaching white alumen in appearance. It has a certain degree, too, of unctuousness, is free from grit, friable, and not apt to blacken the fingers. This last kind is calcined by itself upon hot coals, unmixed with any other substance, until it is entirely reduced to ashes.

The best kind of all, however, is that called “melinum,” as coming from the Isle of Melos, as already mentioned; none being more effectual for acting as an astringent, staining black, and indurating, and none assuming a closer consistency. It removes granulations of the eye-lids, and, in a calcined state, is still more efficacious for checking defluxions of the eyes: in this last form, too, it is employed for the cure of pruriginous eruptions on the body. Whether taken internally, or employed externally, it arrests discharges of blood; and if it is applied with vinegar to a part from which the hair has been first removed, it will change into a soft down the hair which replaces it. The leading property of every kind of alumen is its remarkable astringency, to which, in fact, it is indebted for its name with the Greeks. It is for this property that the various kinds are, all of them, so remarkably good for the eyes. In combination with grease, they arrest discharges of blood; and they are employed in a similar manner for checking the spread of putrid ulcers, and for removing sores upon the bodies of infants.

Alumen has a desiccative effect upon dropsical eruptions; and, in combination with pomegranate juice, it removes diseases of the ears, malformed nails, indurations resulting from cicatrization, hangnails, and chilblains. Calcined, with vinegar or nut-galls, in equal proportions, it is curative of phagedænic ulcers; and, in combination with extracted juice of cabbage, of leprosy. Used in the proportion of one part of alumen to two of salt, it arrests the progress of serpiginous eruptions; and an infusion of it in water destroys lice and other parasitical insects that infest the hair. Employed in a similar manner, it is good for burns; and, in combination with the serous part of pitch, for furfuraceous eruptions on the body. It is used also as an injection for dysentery, and, employed in the form of a gargle, it braces the uvula and tonsillary glands. For all those maladies which we have mentioned as being treated with the other kinds of alumen, that imported from Melos, be it understood, is still more efficacious. As to the other uses that are made of it for industrial purposes, such as preparing hides and wool, for example, they have been mentioned already.

SAMIAN EARTH: THREE REMEDIES.

In succession to these, we shall now have to speak of various other kinds of earth which are made use of in medicine.

Of Samian earth there are two varieties; one known as “collyrium,” the other by the name of “aster.” To be in perfection, the first kind should be fresh, remarkably smooth, and glutinous to the tongue; the second being of a more solid consistency, and white. They are both prepared for use by being calcined and then rinsed in water, some persons giving the preference to the first. They are both of them useful for discharges of blood from the mouth, and are employed as an ingredient in plasters of a desiccative nature. They are used also in the preparation of ophthalmic compositions.

Detailed table of contents

CHAP. 54.

THE VARIOUS KINDS OF ERETRIA.

Of eretria, or Eretrian earth, there are also the same number of varieties; one white, and the other of an ashy colour, this last being preferred in medicine. To be good, this earth should be of a soft consistency, and when rubbed upon copper it should leave a violet tint. The virtues of cretria in a medicinal point of view, and the methods of using it, have been already mentioned in our description of the pigments.

CHAP. 55.

THE METHOD OF WASHING EARTHS FOR MEDICINAL PURPOSES.

All these earths — for we will take the present opportunity of mentioning it — are well washed in water, and then dried in the sun; after which, they are again triturated in water, and left to settle: this done, they are divided into tablets. They are usually boiled in earthen vessels, which are well shaken every now and then.

Detailed table of contents

CHAP. 56.

CHIAN EARTH; THREE REMEDIES. SELINUSIAN EARTH; THREE REMEDIES.
PNIGITIS; NINE REMEDIES. AMPELITIS; FOUR REMEDIES.

Among the medicinal substances, there is the white earth of Chios also, the properties of which are the same as those of Samian earth. It is used more particularly as a cosmetic for the skin of females; the Selinusian earth being also employed for a similar purpose. This last is of a milk-white colour, and melts very rapidly in water: dissolved in milk, it is employed for whitening the plaster coats on walls. Pnigitis is very similar to Eretrian earth, only that it is found in larger masses, and is of a glutinous consistency. Its effects are similar to those produced by Cimolian earth, but are not so energetic.

Ampelitis is an earth which bears a strong resemblance to bitumen. The test of its goodness is its dissolving in oil, like wax, and preserving its black colour when submitted to the action of fire. Its properties are emollient and repercussive; for which reason, it is used in medicinal compositions, those known as “calliblephara,” more particularly, and in preparations for dyeing the hair.

CHAP. 57. (17.)

CRETACEOUS EARTHS USED FOR SCOURING CLOTH. CIMOLIAN EARTH; NINE REMEDIES. SARDINIAN EARTH. UMBRIAN EARTH. SAXUM.

Of cretaceous earths there are several varieties; and among them, two kinds of Cimolian earth, employed in medicine, the one white and the other inclining to the tint of purpurisum. Both kinds, moistened with vinegar, have the effect of dispersing tumours and arresting defluxions. They are curative also of inflammatory swellings and imposthumes of the parotid glands; and, applied topically, they are good for affections of the spleen and pustules on the body. With the addition of aphronitrum, oil of cypros, and vinegar, they reduce swellings of the feet, care being taken to apply the lotion in the sun, and at the end of six hours to wash it off with salt and water. In combination with wax and oil of cypros, Cimolian earth is good for swellings of the testes.

Cretaceous earths, too, are of a cooling tendency, and, applied to the body in the form of a liniment, they act as a check upon excessive perspiration: taken with wine, in the bath, they remove pimples on the body. The most esteemed of all these earths is that of Thessaly: it is found also in the vicinity of Bubon in Lycia.

Cimolian earth is used also for another purpose, that of scouring cloth. As to the kind which is brought from Sardinia, and is known as “sarda,” it is used for white tissues only, and is never employed for coloured cloths. Indeed, this last is held in the lowest estimation of all the Cimolian earths; whereas, that of Umbria is more highly esteemed, as also the kind generally known as “saxum.” It is a property of this last to increase in weight by maceration, and it is by weight that it is usually sold, Sardinian earth being sold by measure. Umbrian earth is only used for giving lustre to cloths.

It will not be deemed out of place to give some further account here of this process, there being still in existence the Metilian Law, relative to fullers; an enactment which C. Flaminius and L. Æmilius, in their censorship, had passed by the people, so attentive to everything were our ancestors. The following then is the method employed in preparing cloth: it is first washed in an infusion of Sardinian earth, and is then exposed to a fumigation with sulphur. This done, it is scoured with Cimolian earth, when the cloth has been found to be of a genuine colour; it being very soon detected when it has been coloured with spurious materials, by its turning black and the colours becoming dispersed by the action of the sulphur. Where the colours are genuine and rich, they are softened by the application of Cimolian earth; which brightens and freshens them also when they have been rendered sombre by the action of the sulphur. Saxum is better for white tissues, after the application of sulphur, but to coloured cloths it is highly injurious. In Greece they use Tymphæan gypsum in place of Cimolian earth.

CHAP. 58.

ARGENTARIA. NAMES OF FREEDMEN WHO HAVE EITHER RISEN TO POWER THEMSELVES, OR HAVE BELONGED TO MEN OF INFLUENCE.

There is another cretaceous earth, known as “argentaria,” from the brightness which it imparts to silver. There is also the most inferior kind of chalk; which was used by the ancients for tracing the line of victory in the Circus, and for marking the feet of slaves on sale, that were brought from beyond sea. Such, for instance, were Publilius Lochius, the founder of our mimic scenes; his cousin, Manilius Antiochus, the first cultivator of astronomy; and Staberius Eros, our first grammarian; all three of whom our ancestors saw brought over in the same ship

(18.) But why mention these names, recommended as they are by the literary honours which they acquired? Other instances too, Rome has beheld of persons rising to high positions from the slave-market; Chrysogonus, for example, the freedman of Sylla; Amphion, the freedman of Q. Catulus; the man who was the keeper of Lucullus; Demetrius, the freedman of Pompeius, and Auge, the freedwoman of Demetrius, or else of Pompeius himself, as some have supposed; Hipparchus, the freedman of M. Antonius; as also, Menas and Menecrates, freedmen of Sextus Pompeius, and many others as well, whom it would be superfluous to enumerate, and who have enriched themselves at the cost of Roman blood, and the licence that results from proscription.

Such is the mark that is set upon those droves of slaves which we see on sale, such the opprobrium thrown upon them by a capricious fortune ! And yet, some of these very men have we beheld in the enjoyment of such power and influence, that the senate itself has decreed them — at the command of Agrippina, wife of the Emperor Claudius — the decorations even of the prætorship: all but honoured with the fasces and their laurels, in fact, and sent back in state to the very place from which they originally came, with their feet whitened with the slave-dealer’s chalk!

CHAP. 59. (19.)

THE EARTH OF GALATA; OF CLYPEA; OF THE BALEARES; AND OF EBUSUS.

In addition to these, there are various other kinds of earth, endowed with peculiar properties of their own, and which have been already mentioned on former occasions. We may, however, take the present opportunity of again remarking the following properties. The earth of the island of Galata and of the vicinity of Clypea, in Africa, is fatal to scorpions; and that of the Balearic Islands and of Ebusus kills serpents.

SUMMARY. — Remedies, narratives, and observations, nine hundred and fifty-six.

ROMAN AUTHORS QUOTED. — Messala the Orator, the Elder Messala, Fenestella, Atticus, M. Varro, Verrius, Cornelius Nepos, Deculo, Mucianus, Melissus, Vitruvius, Cassius Severus Longulanus, Fabius Vestalis, who wrote on Painting.

FOREIGN AUTHORS QUOTED. — Pasiteles, Apelles, Melanthius Asclepiodorus, Euphranor, Heliodorus, who wrote on the Votive Offerings of the Athenians, Metrodorus, who wrote on Architecture, Democritus, Theophrastus, Apion the grammarian, who wrote on the Medicines derived from Metals, Nymphodorus, Iollas, Apollodorus, Andreas, Heraclides, Diagoras, Botrys, Archidemus, Dionysius, Aristogenes, Democles, Mnesides, Xenocrates the son of Zeno, Theomnestus.

BOOK XXXVI. THE NATURAL HISTORY OF STONES.

Detailed table of contents

CHAP. 1. (1.)

LUXURY DISPLAYED IN THE USE OF VARIOUS KINDS OF MARBLE.

IT now remains for us to speak of stones, or, in other words, the leading folly of the day; to say nothing at all of our taste for gems and amber, crystal and murrhine vases. For everything of which we have previously treated, down to the present Book, may, by some possibility or other, have the appearance of having been created for the sake of man: but as to the mountains, Nature has made those for herself, as a kind of bulwark for keeping together the bowels of the earth; as also for the purpose of curbing the violence of the rivers, of breaking the waves of the sea, and so, by opposing to them the very hardest of her materials, putting a check upon those elements which are never at rest. And yet we must hew down these mountains, forsooth, and carry them off; and this, for no other reason than to gratify our luxurious inclinations: heights which in former days it was reckoned a miracle even to have crossed!

Our forefathers regarded as a prodigy the passage of the Alps, first by Hannibal, and, more recently, by the Cimbri: but at the present day, these very mountains are cut asunder to yield us a thousand different marbles, promontories are thrown open to the sea, and the face of Nature is being everywhere reduced to a level. We now carry away the barriers that were destined for the separation of one nation from another; we construct ships for the transport of our marbles; and, amid the waves, the most boisterous element of Nature, we convey the summits of the mountains to and fro: a thing, however, that is even less unpardonable than to go on the search amid the regions of the clouds for vessels with which to cool our draughts, and to excavate rocks, towering to the very heavens, in order that we may have the satisfaction of drinking from ice! Let each reflect, when he hears of the high prices set upon these things, when he sees these ponderous masses carted and carried away, how many there are whose life is passed far more happily without them. For what utility or for what so-called pleasure do mortals make themselves the agents, or, more truly speaking, the victims of such undertakings, except in order that others may take their repose in the midst of variegated stones? Just as though too, the shades of night, which occupy one half of each man's existence, would forbear to curtail these imaginary delights.

Detailed table of contents

CHAP. 2.

WHO WAS THE FIRST TO EMPLOY MARBLE IN PUBLIC BUILDINGS.

Indeed, while making these reflections, one cannot but feel ashamed of the men of ancient times even. There are still in existence censorial laws, which forbid the kernels in the neck of swine to be served at table, dormice too, and other things too trifling to mention: and yet there has been no law passed, forbidding marble to be imported, or the seas to be traversed in search of it!

(2.) It may possibly be observed, that this was, because marble was not then introduced. Such, however, is not the fact; for in the ædileship of M. Scaurus, three hundred and sixty columns were to be seen imported; for the decorations of a temporary theatre, too, one that was destined to be in use for barely a single month. And yet the laws were silent thereon; in a spirit of indulgence for the amusements of the public, no doubt. But then, why such indulgence? or how do vices more insidiously steal upon us than under the plea of serving the public? By what other way, in fact, did ivory, gold, and precious stones, first come into use with private individuals?

Can we say that there is now anything that we have reserved for the exclusive use of the gods? However, be it so, let us admit of this indulgence for the amusements of the public; but still, why did the laws maintain their silence when the largest of these columns, pillars of Lucullan marble, as much as eight-and-thirty feet in height, were erected in the atrium of Scaurus? a thing, too, that was not done privately or in secret; for the contractor for the public sewers compelled him to give security for the possible damage that might be done in the carriage of them to the Palatium. When so bad an example as this was set, would it not have been advisable to take some precautions for the preservation of the public morals? And yet the laws still preserved their silence, when such enormous masses as these were being carried past the earthenware pediments of the temples of the gods, to the house of a private individual!

Detailed table of contents

CHAP. 3. (3.)

WHO WAS THE FIRST TO ERECT COLUMNS OF FOREIGN MARBLE AT ROME.

And yet it cannot be said that Scaurus, by way of a first essay in vice, took the City by surprise, in a state of ignorance and totally unguarded against such evils as these. Already had L. Crassus, the orator, he who was the first to possess pillars of foreign marble, and in this same Palatium too, received from M. Brutus, on the occasion of a dispute, the nickname of the “Palatine Venus,” for his indulgence in this kind of luxury. The material, I should remark, was Hymettian marble, and the pillars were but six in number, and not exceeding some twelve feet in height. Our forefathers were guilty of this omission, no doubt, because morals were universally contaminated; and, seeing that things which had been interdicted had been forbidden in vain, they preferred the absence of laws to laws that were no better than a dead letter. These particulars and others in the sequel will show that we are so far improved; for who is there at the present day that has, in his atrium, any such massive columns as these of Scaurus?

But before proceeding to treat of the several varieties of this material, it will be as well to mention the various artists, and the degrees of estimation in which they are held, who have worked in marble. We will, therefore, proceed to review the sculptors who have flourished at different periods.

Detailed table of contents

CHAP. 4. (4.)

THE FIRST ARTISTS WHO EXCELLED IN THE SCULPTURE OF MARBLE, AND THE VARIOUS PERIODS AT WHICH THEY FLOURISHED. THE MAUSOLEUM IN CARIA. THE MOST CELEBRATED SCULPTORS AND WORKS IN MARBLE, TWO HUNDRED AND TWENTY-FIVE IN NUMBER.

The first artists who distinguished themselves in the sculpture of marble, were Dipœnus and Scyllis, natives of the Isle of Crete. At this period the Medians were still in power, and Cyrus had not begun to reign in Persia; their date being about the fiftieth Olympiad. They afterwards repaired to Sicyon, a state which for a length of time was the adopted country of all such pursuits as these. The people of Sicyon had made a contract with them for the execution of certain statues of the gods; but, before completing the work, the artists complained of some injustice being done them, and retired to Ætolia. Immediately upon this, the state was afflicted with sterility and famine, and dreadful consternation was the result. Upon enquiry being made as to a remedy for these evils, the Pythian Apollo made answer, that Dipœnus and Scyllis must complete the statues of the gods; an object which was attained at the cost of great concessions and considerable sums of money. The statues were those of Apollo, Diana, Hercules, and Minerva; the last of which was afterwards struck by lightning.

(5.) Before these artists were in existence, there had already appeared Melas, a sculptor of the Isle of Chios; and, in succession to him, his son Micciades, and his grandson Archermus; whose sons, Bupalus and Athenis, afterwards attained the highest eminence in the art. These last were contemporaries of the poet Hipponax, who, it is well known, lived in the sixtieth Olympiad. Now, if a person only reckons, going upwards from their time to that of their great-grandfather, he will find that the art of sculpture must have necessarily originated about the commencement of the era of the Olympiads. Hipponax being a man notorious for his ugliness, the two artists, by way of joke, exhibited a statue of him for the ridicule of the public. Indignant at this, the poet emptied upon them all the bitterness of his verses; to such an extent indeed, that, as some believe, they were driven to hang themselves in despair. This, however, is not the fact; for, at a later period, these artists executed a number of statues in the neighbouring islands; at Delos for example, with an inscription subjoined to the effect, that Chios was rendered famous not only by its vines but by the works of the sons of Archermus as well. The people of Lasos still show a Diana that was made by them; and we find mention also made of a Diana at Chios, the work of their hands: it is erected on an elevated spot, and the features appear stern to a person as he enters, and joyous as he departs. At Rome, there are some statues by these artists on the summit of the Temple of the Palatine Apollo, and, indeed, in most of the buildings that were erected by the late Emperor

Augustus. At Delos and in the Isle of Lesbos there were formerly some sculptures by their father to be seen. Ambracia too, Argos, and Cleonæ, were filled with productions of the sculptor Dipœnus.

All these artists, however, used nothing but the white marble of the Isle of Paros, a stone which was known as “lychnites” at first, because, according to Varro, it was cut in the quarries by lamplight. Since their time, many other whiter marbles have been discovered, and very recently that of the quarries of Luna. With reference to the marble of Paros, there is one very marvellous circumstance related; in a single block that was split with wedges, a figure of Silenus made its appearance.

We must not omit to remark, that the art of sculpture is of much more ancient date than those of painting and of statuary in bronze; both of which commenced with Phidias, in the eighty-third Olympiad, or in other words, about three hundred and thirty-two years later. Indeed, it is said, that Phidias himself worked in marble, and that there is a Venus of his at Rome, a work of extraordinary beauty, in the buildings of Octavia. A thing, however, that is universally admitted, is the fact that he was the instructor of Alcamenes, the Athenian, one of the most famous among the sculptors. By this last artist, there are numerous statues in the temples at Athens; as also, without the walls there, the celebrated Venus, known as the Aphrodite ἐν χήποις, a work to which Phidias himself, it is said, put the finishing hand. Another disciple also of Phidias was Agoracritus of Paros, a great favourite with his master, on account of his extremely youthful age; and for which reason, it is said, Phidias gave his own name to many of that artist’s works. The two pupils entering into a contest as to the superior execution of a statue of Venus, Alcamenes was successful; not that his work was superior, but because his fellow-citizens chose to give their suffrages in his favour in preference to a stranger. It was for this reason, it is said, that Agoracritus sold his statue, on the express condition that it should never be taken to Athens, and changed its name to that of Nemesis. It was accordingly erected at Rhamnus, a borough of Attica, and M. Varro has considered it superior to every other statue. There is also to be seen in the Temple of the Great Mother, in the same city, another work by Agoracritus.

Among all nations which the fame of the Olympian Jupiter has reached, Phidias is looked upon, beyond all doubt, as the most famous of artists: but to let those who have never even seen his works, know how deservedly he is esteemed, we will take this opportunity of adducing a few slight proofs of the genius which he displayed. In doing this, we shall not appeal to the beauty of his Olympian Jupiter, nor yet to the vast proportions of his Athenian Minerva, six and twenty cubits in height, and composed of ivory and gold; but it is to the shield of this last statue that we shall draw attention; upon the convex face of which he has chased a combat of the Amazons, while, upon the concave side of it, he has represented the battle between the Gods and the Giants. Upon the sandals again, we see the wars of the Lapithæ and Centaurs, so

careful has he been to fill every smallest portion of his work with some proof or other of his artistic skill. To the story chased upon the pedestal of the statue, the name of the "Birth of Pandora" has been given; and the figures of new-born gods to be seen upon it are no less than twenty in number. The figure of Victory, in particular, is most admirable, and connoisseurs are greatly struck with the serpent and the sphinx in bronze lying beneath the point of the spear. Let thus much be said incidentally in reference to an artist who can never be sufficiently praised; if only to let it be understood that the richness of his genius was always equal to itself, even in the very smallest details.

When speaking of the statuaries, we have already given the period at which Praxiteles flourished; an artist, who, in the glory which he acquired by his works in marble, surpassed even himself. There are some works of his in the Ceramicus at Athens; but, superior to all the statues, not only of Praxiteles, but of any other artist that ever existed, is his Cnidian Venus; for the inspection of which, many persons before now have purposely undertaken a voyage to Cnidos. The artist made two statues of the goddess, and offered them both for sale: one of them was represented with drapery, and for this reason was preferred by the people of Cos, who had the choice; the second was offered them at the same price, but, on the grounds of propriety and modesty, they thought fit to choose the other. Upon this, the Cnidians purchased the rejected statue, and immensely superior has it always been held in general estimation. At a later period, King Nicomedes wished to purchase this statue of the Cnidians, and made them an offer to pay off the whole of their public debt, which was very large. They preferred, however, to submit to any extremity rather than part with it; and with good reason, for by this statue Praxiteles has perpetuated the glory of Cnidos. The little temple in which it is placed is open on all sides, so that the beauties of the statue admit of being seen from every point of view; an arrangement which was favoured by the goddess herself, it is generally believed. Indeed, from whatever point it is viewed, its execution is equally worthy of admiration. A certain individual, it is said, became enamoured of this statue, and, concealing himself in the temple during the night, gratified his lustful passion upon it, traces of which are to be seen in a stain left upon the marble.

There are also at Cnidos some other statues in marble, the productions of illustrious artists; a Father Liber by Bryaxis, another by Scopas, and a Minerva by the same hand: indeed, there is no greater proof of the supreme excellence of the Venus of Praxiteles than the fact that, amid such productions as these, it is the only one that we generally find noticed. By Praxiteles, too, there is a Cupid, a statue which occasioned one of the charges brought by Cicero against Verres, and for the sake of seeing which persons used to visit Thespiae: at the present day, it is to be seen in the Schools of Octavia. By the same artist there is also another Cupid, without drapery, at Parium, a colony of the Propontis; equal to the Cnidian Venus in the fineness of its execution,

and said to have been the object of a similar outrage. For one Alcetas, a Rhodian, becoming deeply enamoured of it, left upon the marble similar traces of the violence of his passion.

At Rome there are, by Praxiteles, a Flora, a Triptolemus, and a Ceres, in the Gardens of Servilius; statues of Good Success and Good Fortune, in the Capitol; as also some Mænades, and figures known as Thyiades and Caryatides; some Sileni, to be seen in the memorial buildings of Asinius Pollio, and statues of Apollo and Neptune.

Cephisodotus, the son of Praxiteles, inherited his father's talent. There is, by him, at Pergamus, a splendid Group of Wrestlers, a work that has been highly praised, and in which the fingers have all the appearance of being impressed upon real flesh rather than upon marble. At Rome there are by him, a Latona, in the Temple of the Palatium; a Venus, in the buildings that are memorials of Asinius Pollio; and an Æsculapius, and a Diana, in the Temple of Juno situate within the Porticos of Octavia.

Scopas rivals these artists in fame: there are by him, a Venus and a Pothos, statues which are venerated at Samothrace with the most august ceremonials. He was also the sculptor of the Palatine Apollo; a Vesta seated, in the Gardens of Servilius, and represented with two Bends around her, a work that has been highly praised; two similar Bends, to be seen upon the buildings of Asinius Pollio; and some figures of Canephoræ in the same place. But the most highly esteemed of all his works, are those in the Temple erected by Cneius Domitius, in the Flaminian Circus; a figure of Neptune himself, a Thetis and Achilles, Nereids seated upon dolphins, cetaceous fishes, and sea-horses, Tritons, the train of Phorcus, whales, and numerous other sea-monsters, all by the same hand; an admirable piece of workmanship, even if it had taken a whole life to complete it. In addition to the works by him already mentioned, and others of the existence of which we are ignorant, there is still to be seen a colossal Mars of his, seated, in the Temple erected by Brutus Callæus, also in the Flaminian Circus; as also, a naked Venus, of anterior date to that by Praxiteles, and a production that would be quite sufficient to establish the renown of any other place.

At Rome, it is true, it is quite lost sight of amid such a vast multitude of similar works of art: and then besides, the inattention to these matters that is induced by such vast numbers of duties and so many items of business, quite precludes the generality of persons from devoting their thoughts to the subject. For, in fact, the admiration that is due to this art, not only demands an abundance of leisure, but requires that profound silence should reign upon the spot. Hence it is, that the artist is now forgotten, who executed the statue of Venus that was dedicated by the Emperor Vespasianus in his Temple of Peace, a work well worthy of the high repute of ancient times. With reference, too, to the Dying Children of Niobe, in the Temple of the Sosian Apollo, there is an equal degree of uncertainty, whether it is the work of Scopas or of Praxiteles. So, too, as to the Father Janus, a work that was brought from Egypt

and dedicated in his Temple by Augustus, it is a question by which of these two artists it was made: at the present day, however, it is quite hidden from us by the quantity of gold that covers it. The same question, too, arises with reference to the Cupid brandishing a Thunderbolt, now to be seen in the Curia of Octavia: the only thing, in fact, that is affirmed with any degree of certainty respecting it, is, that it is a likeness of Alcibiades, who was the handsomest man of his day. There are, too, in the Schools of Octavia, many other highly attractive works, the authors of which are now unknown: four Satyrs, for example, one of which carries in his arms a Father Liber, robed in the palla; another similarly supports the Goddess Libera; a third is pacifying a child who is crying; and a fourth is giving a child some water to drink, from a cup; two Zephyrs also, who agitate their flowing drapery with their breath. No less is the uncertainty that prevails as to the authors of the statues now to be seen in the Septa; an Olympus and Pan, and a Charon and Achilles; and yet their high reputation has caused them to be deemed valuable enough for their keepers to be made answerable for their safety at the cost of their lives.

Scopas had for rivals and contemporaries, Bryaxis, Timotheus, and Leochares, artists whom we are bound to mention together, from the fact that they worked together at the Mausoleum; such being the name of the tomb that was erected by his wife Artemisia in honour of Mausolus, a petty king of Caria, who died in the second year of the hundred and seventh Olympiad. It was through the exertions of these artists more particularly, that this work came to be reckoned one of the Seven Wonders of the World. The circumference of this building is, in all, four hundred and forty feet, and the breadth from north to south sixty-three, the two fronts being not so wide in extent. It is twenty-five cubits in height, and is surrounded with six-and-thirty columns, the outer circumference being known as the "Pteron." The east side was sculptured by Scopas, the north by Bryaxis, the south by Timotheus, and the west by Leochares; but, before their task was completed, Queen Artemisia died. They did not leave their work, however, until it was finished, considering that it was at once a memorial of their own fame and of the sculptor's art: and, to this day even, it is undecided which of them has excelled. A fifth artist also took part in the work; for above the Pteron there is a pyramid erected, equal in height to the building below, and formed of four and twenty steps, which gradually taper upwards towards the summit; a platform, crowned with a representation of a four-horse chariot by Pythis. This addition makes the total height of the work one hundred and forty feet.

There is at Rome, by Timotheus, a Diana, in the Temple of Apollo in the Palatium, the head of which has been replaced by Avianus Evander. A Hercules, too, by Menestratus, is greatly admired; and there is a Hecate of his at Ephesus, in the Temple of Diana there, behind the sanctuary. The keepers of the temple recommend persons, when viewing it, to be careful of their eyes, so remarkably radiant is the marble. No less esteemed, too, are the statues of the Graces, in the Propylæum at Athens; the workmanship of Socrates the

sculptor, a different person from the painter of that name, though identical with him in the opinion of some. As to Myron, who is so highly praised for his works in bronze, there is by him at Smyrna, *An Old Woman Intoxicated*, a work that is held in high estimation.

Asinius Pollio, a man of a warm and ardent temperament, was determined that the buildings which he erected as memorials of himself should be made as attractive as possible; for here we see groups representing, Nymphs carried off by Centaurs, a work of Arcesilas: the Thespiades, by Cleomenes: Oceanus and Jupiter, by Heniochus: the Appiades, by Stephanus: Hermerotes, by Tauriscus, not the chaser in silver, already mentioned, but a native of Tralles: a Jupiter Hospitalis by Papyllus, a pupil of Praxiteles: Zethus and Amphion, with Dirce, the Bull, and the halter, all sculptured from a single block of marble, the work of Apollonius and Tauriscus, and brought to Rome from Rhodes. These two artists made it a sort of rivalry as to their parentage, for they declared that, although Apollodorus was their natural progenitor, Menecrates would appear to have been their father. In the same place, too, there is a *Father Liber*, by Eutychides, highly praised. Near the Portico of Octavia, there is an Apollo, by Philiscus of Rhodes, placed in the Temple of that God; a *Latona and Diana* also; the *Nine Muses*; and another Apollo, without drapery. The Apollo holding the Lyre, in the same temple, was executed by Timarchides. In the Temple of Juno, within the Porticos of Octavia, there is a figure of that goddess, executed by Dionysius, and another by Polycles, as also other statues by Praxiteles. This Polycles, too, in conjunction with Dionysius, the son of Timarchides, made the statue of Jupiter, which is to be seen in the adjoining temple. The figures of Pan and Olympus Wrestling, in the same place, are by Heliodorus; and they are considered to be the next finest group of this nature in all the world. The same artist also executed a *Venus at the Bath*, and Polycharmus another *Venus*, in an erect posture.

By the honourable place which the work of Lysias occupies, we may see in what high esteem it was held by the late Emperor Augustus, who consecrated it in honour of his father Octavius, in the Palatium, placing it on an arch within a small temple, adorned with columns: it is the figure of a four-horse chariot, with an Apollo and Diana, all sculptured from a single block. I find it stated, also, that the Apollo by Calamis, the chaser already mentioned, the *Pugilists* by Dercylides, and the statue of Callisthenes the historian, by Amphistratus, all of them now in the Gardens of Servilius, are works highly esteemed.

Beyond these, there are not many sculptors of high repute; for, in the case of several works of very great excellence, the number of artists that have been engaged upon them has proved a considerable obstacle to the fame of each, no individual being able to engross the whole of the credit, and it being impossible to award it in due proportion to the names of the several artists combined. Such is the case with the *Laocoön*, for example, in the palace of

the Emperor Titus, a work that may be looked upon as preferable to any other production of the art of painting or of statuary. It is sculptured from a single block, both the main figure as well as the children, and the serpents with their marvellous folds. This group was made in concert by three most eminent artists, Agesander, Polydorus, and Athenodorus, natives of Rhodes. In similar manner also, the palaces of the Cæsars, in the Palatium, have been filled with most splendid statuary, the work of Craterus, in conjunction with Pythodorus, of Polydeuces with Hermoläus, and of another Pythodorus with Artemon; some of the statues, also, are by Aphrodisius of Tralles, who worked alone. The Pantheon of Agrippa has been decorated by Diogenes of Athens, and the Caryatides, by him, which form the columns of that temple, are looked upon as master-pieces of excellence: the same, too, with the statues that are placed upon the roof, though, in consequence of the height, they have not had an opportunity of being so well appreciated.

Without glory, and excluded from every temple, is the statue of Hercules, in honour of whom the Carthaginians were accustomed to sacrifice human victims every year: it stands upon the ground before the entrance of the Portico of the Nations. There were erected, too, near the Temple of Felicity, the statues of the Thespian Muses; of one of which, according to Varro, Junius Pisciculus, a Roman of equestrian rank, became enamoured. Pasiteles, too, speaks in terms of high admiration of them, the artist who wrote five Books on the most celebrated works throughout the world. Born upon the Grecian shores of Italy, and presented with the Roman citizenship granted to the cities of those parts, Pasiteles constructed the ivory statue of Jupiter which is now in the Temple of Metellus, on the road to the Campus Martius. It so happened, that being one day at the Docks, where there were some wild beasts from Africa, while he was viewing through the bars of a cage a lion which he was engaged in drawing, a panther made its escape from another cage, to the no small danger of this most careful artist. He executed many other works, it is said, but we do not find the names of them specifically mentioned.

Arcesilaüs, also, is an artist highly extolled by Varro; who states that he had in his possession a Lioness in marble of his, and Winged Cupids playing with it, some holding it with cords, and others making it drink from a horn, the whole sculptured from a single block: he says, also, that the fourteen figures around the Theatre of Pompeius, representing different Nations, are the work of Coponius.

I find it stated that Canachus, an artist highly praised among the statuaries in bronze, executed some works also in marble. Saurus, too, and Batrachus must not be forgotten, Lacedæmonians by birth, who built the temples enclosed by the Porticos of Octavia. Some are of opinion that these artists were very wealthy men, and that they erected these buildings at their own expense, expecting to be allowed to inscribe their names thereon; but that, this indulgence being refused them, they adopted another method of attaining their object. At all events, there are still to be seen, at the present day, on the spirals

of the columns, the figures of a lizard and a frog, emblematical of their names. In the Temple of Jupiter by the same artists, the paintings, as well as all the other ornaments, bear reference to the worship of a goddess. The fact is, that when the temple of Juno was completed, the porters, as it is said, who were entrusted with the carriage of the statues, made an exchange of them; and, on religious grounds, the mistake was left uncorrected, from an impression that it had been by the intervention of the divinities themselves, that this seat of worship had been thus shared between them. Hence it is that we see in the Temple of Juno, also, the ornaments which properly pertain to the worship of Jupiter.

Some minute works in marble have also gained reputation for their artists: by Myrmecides, there was a four-horse chariot, so small that it could be covered, driver and all, by the wings of a fly; and by Callicrates, some ants, in marble, the feet and other limbs of which were so fine as to escape the sight.

CHAP. 5. (6.)

AT WHAT PERIOD MARBLE WAS FIRST USED IN BUILDINGS.

This must suffice for the sculptors in marble, and the works that have gained the highest repute; with reference to which subject it occurs to me to remark, that spotted marbles were not then in fashion. In making their statues, these artists used the marble of Thasos also, one of the Cyclades, and of Lesbos, this last being rather more livid than the other. The poet Menander, in fact, who was a very careful enquirer into all matters of luxury, is the first who has spoken, and that but rarely, of variegated marbles, and, indeed, of the employment of marble in general. Columns of this material were at first employed in temples, not on grounds of superior elegance, (for that was not thought of, as yet), but because no material could be found of a more substantial nature. It was under these circumstances, that the Temple of the Olympian Jupiter was commenced at Athens, the columns of which were brought by Sylla to Rome, for the buildings in the Capitol.

Still, however, there had been a distinction drawn between ordinary stone and marble, in the days of Homer even. The poet speaks in one passage of a person being struck down with a huge mass of marble; but that is all; and when he describes the abodes of royalty adorned with every elegance, besides brass, gold, electrum, and silver, he only mentions ivory. Variegated marbles, in my opinion, were first discovered in the quarries of Chios, when the inhabitants were building the walls of their city; a circumstance which gave rise to a facetious repartee on the part of M. Cicero. It being the practice with them to show these walls to everybody, as something magnificent; "I should admire them much more," said he, "if you had built them of the stone used at Tibur." And, by Hercules! the art of painting never would have been held in such esteem, or, indeed, in any esteem at all, if variegated marbles had been held in admiration.

CHAP. 6.

WHO WERE THE FIRST TO CUT MARBLE INTO SLABS, AND AT WHAT PERIOD.

I am not sure whether the art of cutting marble into slabs, is not an invention for which we are indebted to the people of Caria. The most ancient instance of this practice, so far as I know of, is found in the palace of Mausolus, at Halicarnassus, the walls of which, in brick, are covered with marble of Proconnesus. Mausolus died in the second year of the hundred and seventh Olympiad, being the year of Rome, 403.

Detailed table of contents

CHAP. 7.

WHO WAS THE FIRST TO ENCRUST THE WALLS OF HOUSES AT ROME WITH MARBLE.

The first person at Rome who covered the whole of the walls of his house with marble, according to Cornelius Nepos, was Mamurra, who dwelt upon the Cælian Hill, a member of the equestrian order, and a native of Formiæ, who had been præfect of the engineers under C. Cæsar in Gaul. Such was the individual, that nothing may be wanting to the indignity of the example, who first adopted this practice; the same Mamurra, in fact, who has been so torn to pieces in the verses of Catullus of Verona. Indeed, his own house proclaimed more loudly than Catullus could proclaim it, that he had come into possession of all that Gallia Comata had had to possess. For Nepos adds, as well, that he was the first to have all the columns of his house made of nothing but solid marble, and that, too, marble of Carystus or of Luna.

[Detailed table of contents](#)

CHAP. 8.

AT WHAT PERIOD THE VARIOUS KINDS OF MARBLE CAME INTO USE AT ROME.

M. Lepidus, who was consul with Q. Catulus, was the first to have the lintels of his house made of Numidian marble, a thing for which he was greatly censured: he was consul in the year of Rome, 676. This is the earliest instance that I can find of the introduction of Numidian marble; not in the form of pillars, however, or of slabs, as was the case with the marble of Carystus, above-mentioned, but in blocks, and that too, for the comparatively ignoble purpose of making the thresholds of doors. Four years after this Lepidus, L. Lucullus was consul; the same person who gave its name, it is very evident, to the Lucullan marble; for, taking a great fancy to it, he introduced it at Rome. While other kinds of marble are valued for their spots or their colours, this marble is entirely black. It is found in the island of Melos, and is pretty nearly the only marble that has taken its name from the person who first introduced it. Among these personages, Scaurus, in my opinion, was the first to build a theatre with walls of marble: but whether they were only coated with slabs of marble or were made of solid blocks highly polished, such as we now see in the Temple of Jupiter Tonans, in the Capitol, I cannot exactly say: for, up to this period, I cannot find any vestiges of the use of marble slabs in Italy.

CHAP. 9.

THE METHOD OF CUTTING MARBLE INTO SLABS. THE SAND USED IN CUTTING MARBLE.

But whoever it was that first invented the art of thus cutting marble, and so multiplying the appliances of luxury, he displayed considerable ingenuity, though to little purpose. This division, though apparently effected by the aid of iron, is in reality effected by sand; the saw acting only by pressing upon the sand within a very fine cleft in the stone, as it is moved to and fro.

The sand of Æthiopia is the most highly esteemed for this purpose; for, to add to the trouble that is entailed, we have to send to Æthiopia for the purpose of preparing our marble — aye, and as far as India even; whereas in former times, the severity of the Roman manners thought it beneath them to repair thither in search of such costly things even as pearls! This Indian sand is held in the next highest degree of estimation, the Æthiopian being of a softer nature, and better adapted for dividing the stone without leaving any roughness on the surface; whereas the sand from India does not leave so smooth a face upon it. Still, however, for polishing marble, we find it recommended to rub it with Indian sand calcined. The sand of Naxos has the same defect; as also that from Coptos, generally known as “Egyptian” sand.

The above were the several varieties of sand used by the ancients in dividing marble. More recently, a sand has been discovered that is equally approved of for this purpose; in a certain creek of the Adriatic Sea, which is left dry at low water only; a thing that renders it not very easy to be found. At the present day, however, the fraudulent tendencies of our workers in marble have emboldened them to use any kind of river-sand for the purpose; a mischief which very few employers rightly appreciate. For, the coarser the sand, the wider is the division made in the stone, the greater the quantity of material consumed, and the more extensive the labour required for polishing the rough surface that is left; a result of which is that the slabs lose so much more in thickness. For giving the last polish to marble, Thebaic stone is considered well adapted, as also porous stone, or pumice, powdered fine.

CHAP. 10. (7.)

STONE OF NAXOS. STONE OF ARMENIA.

For polishing marble statues, as also for cutting and giving a polish to precious stones, the preference was long given to the stone of Naxos, such being the name of a kind of touchstone that is found in the Isle of Cyprus. More recently, however, the stones imported from Armenia for this purpose have displaced those of Naxos.

CHAP. 11.

THE MARBLES OF ALEXANDRIA.

The marbles are too well known to make it necessary for me to enumerate their several colours and varieties; and, indeed, so numerous are they, that it would be no easy task to do so. For what place is there, in fact, that has not a marble of its own? In addition to which, in our description of the earth and its various peoples, we have already made it our care to mention the more celebrated kinds of marble. Still, however, they are not all of them produced from quarries, but in many instances lie scattered just beneath the surface of the earth; some of them the most precious even, the green Lace-dæmonian marble, for example, more brilliant in colour than any other; the Augustan also; and, more recently, the Tiberian; which were first discovered, in the reigns respectively of Augustus and Tiberius, in Egypt. These two marbles differ from ophites in the circumstance that the latter is marked with streaks which resemble serpents in appearance, whence its name. There is also this difference between the two marbles themselves, in the arrangement of their spots: the Augustan marble has them undulated and curling to a point; whereas in the Tiberian the streaks are white, not involved, but lying wide asunder.

Of ophites, there are only some very small pillars known to have been made. There are two varieties of it, one white and soft, the other inclining to black, and hard. Both kinds, it is said, worn as an amulet, are a cure for headache, and for wounds inflicted by serpents. Some, too, recommend the white ophites as an amulet for phrenitis and lethargy. As a counter-poison to serpents, some persons speak more particularly in praise of the ophites that is known as “tephrias,” from its ashy colour. There is also a marble known as “memphites,” from the place where it is found, and of a nature somewhat analogous to the precious stones. For medicinal purposes, it is trituated and applied in the form of a liniment, with vinegar, to such parts of the body as require cauterizing or incision; the flesh becoming quite benumbed, and thereby rendered insensible to pain.

Porphyrites, which is another production of Egypt, is of a red colour: the kind that is mottled with white blotches is known as “leptospsephos.” The quarries there are able to furnish blocks of any dimensions, however large. Vitrasius Pollio, who was steward in Egypt for the Emperor Claudius, brought to Rome from Egypt some statues made of this stone; a novelty which was not very highly approved of, as no one has since followed his example. The Egyptians, too, have discovered in Æthiopia the stone known as “basanites;” which in colour and hardness resembles iron, whence the name that has been given to it. A larger block of it has never been known than the one forming the group which has been dedicated by the Emperor Vespasianus Augustus in

the Temple of Peace. It represents the river Nilus with sixteen children sporting around it, symbolical of the sixteen cubits, the extreme height to which, in the most favourable seasons, that river should rise. It is stated, too, that in the Temple of Serapis at Thebes, there is a block not unlike it, which forms the statue of Memnon there; remarkable, it is said, for emitting a sound each morning when first touched by the rays of the rising sun.

CHAP. 12.

ONYX AND ALABASTRITES; SIX REMEDIES.

Our forefathers imagined that onyx was only to be found in the mountains of Arabia, and nowhere else; but Sudines was aware that it is also found in Carmania. Drinking-vessels were made of it at first, and then the feet of beds and chairs. Cornelius Nepos relates that great was the astonishment, when P. Lentulus Spinther exhibited amphoræ made of this material, as large as Chian wine-vessels in size; “and yet, five years after,” says he, “I saw columns of this material, no less than two-and-thirty feet in height.” At a more recent period again, some change took place with reference to this stone; for four small pillars of it were erected by Cornelius Balbus in his Theatre as something quite marvellous: and I myself have seen thirty columns, of larger size, in the banquetting-room which Callistus erected, the freedman of Claudius, so well known for the influence which he possessed.

(8.) This stone is called “alabastrites” by some, and is hollowed out into vessels for holding unguents, it having the reputation of preserving them from corruption better than anything else. In a calcined state, it is a good ingredient for plaisters. It is found in the vicinity of Thebes in Egypt and of Damascus in Syria, that of Damascus being whiter than the others. The most esteemed kind, however, is that of Carmania, the next being the produce of India, and then, those of Syria and Asia. The worst in quality is that of Cappadocia, it being utterly destitute of lustre. That which is of a honey colour is the most esteemed, covered with spots curling in whirls, and not transparent. Alabastrites is considered defective, when it is of a white or horn colour, or approaching to glass in appearance.

Detailed table of contents

CHAP. 13.

LYGDINUS; CORALLITIC STONE; STONE OF ALABANDA; STONE OF THEBAIS;
STONE OF SYENE.

Little inferior to it for the preservation of unguents, in the opinion of many, is the stone, called “lygdinus,” that is found in Paros, and never of a larger size than to admit of a dish or goblet being made of it. In former times, it was only imported from Arabia, being remarkable for its extreme whiteness.

Great value is placed also upon two other kinds of stone, of quite a contrary nature; corallitic stone, found in Asia, in blocks not more than two cubits in thickness, and of a white some-what approaching that of ivory, and in some degree resembling it; and Alabandic stone, which, on the other hand, is black, and is so called from the district which produces it: though it is also to be found at Miletus, where, however, it verges somewhat more upon the purple. It admits of being melted by the action of fire, and is fused for the preparation of glass.

Thebaic stone, which is sprinkled all over with spots like gold, is found in Africa, on the side of it which lies adjacent to Egypt; the small hones which it supplies being peculiarly adapted, from their natural properties, for grinding the ingredients used in preparations for the eyes. In the neighbourhood of Syene, too, in Thebais, there is a stone found that is now known as “syenites,” but was formerly called “pyrrhopæcilon.”

CHAP. 14.

OBELISKS.

Monarchs, too, have entered into a sort of rivalry with one another in forming elongated blocks of this stone, known as "obelisks," and consecrated to the divinity of the Sun. The blocks had this form given to them in resemblance to the rays of that luminary, which are so called in the Egyptian language.

Mesphres, who reigned in the City of the Sun, was the first who erected one of these obelisks, being warned to do so in a dream: indeed, there is an inscription upon the obelisk to this effect; for the sculptures and figures which we still see engraved thereon are no other than Egyptian letters.

At a later period other kings had these obelisks hewn. Sesosthes erected four of them in the above-named city, forty-eight cubits in height. Rhamsesis, too, who was reigning at the time of the capture of Troy, erected one, a hundred and forty cubits high. Having quitted the spot where the palace of Mnevis stood, this monarch erected another obelisk, one hundred and twenty cubits in height, but of prodigious thickness, the sides being no less than eleven cubits in breadth. (9.) It is said that one hundred and twenty thousand men were employed upon this work; and that the king, when it was on the point of being elevated, being apprehensive that the machinery employed might not prove strong enough for the weight, with the view of increasing the peril that might be entailed by due want of precaution on the part of the workmen, had his own son fastened to the summit; in order that the safety of the prince might at the same time ensure the safety of the mass of stone. It was in his admiration of this work, that, when King Cambyzes took the city by storm, and the conflagration had already reached the very foot of the obelisk, he ordered the fire to be extinguished; he entertaining a respect for this stupendous erection which he had not entertained for the city itself.

There are also two other obelisks, one of them erected by Zmarres, and the other by Phius; both of them without inscriptions, and forty-eight cubits in height. Ptolemæus Philadelphus had one erected at Alexandria, eighty cubits high, which had been prepared by order of King Necthebis: it was without any inscription, and cost far more trouble in its carriage and elevation, than had been originally expended in quarrying it. Some writers inform us that it was conveyed on a raft, under the inspection of the architect Satyrus; but Callixenus gives the name of Phœnix. For this purpose, a canal was dug from the river Nilus to the spot where the obelisk lay; and two broad vessels, laden with blocks of similar stone a foot square, the cargo of each amounting to double the size, and consequently double the weight, of the obelisk, were brought beneath it; the extremities of the obelisk remaining supported by the opposite sides of the canal. The blocks of stone were then removed, and the vessels, being thus gradually lightened, received their burden. It was erected

upon a basis of six square blocks, quarried from the same mountain, and the artist was rewarded with the sum of fifty talents. This obelisk was placed by the king abovementioned in the Arsinoœum, in testimony of his affection for his wife and sister Arsinoë. At a later period, as it was found to be an inconvenience to the docks, Maximus, the then præfect of Egypt, had it transferred to the Forum there, after removing the summit for the purpose of substituting a gilded point; an intention which was ultimately abandoned.

There are two other obelisks, which were in Cæsar's Temple at Alexandria, near the harbour there, forty-two cubits in height, and originally hewn by order of King Mesphres. But the most difficult enterprise of all, was the carriage of these obelisks by sea to Rome, in vessels which excited the greatest admiration. Indeed, the late Emperor Augustus consecrated the one which brought over the first obelisk, as a lasting memorial of this marvellous undertaking, in the docks at Puteoli; but it was destroyed by fire. As to the one in which, by order of the Emperor Caius, the other obelisk had been transported to Rome, after having been preserved for some years and looked upon as the most wonderful construction ever beheld upon the seas, it was brought to Ostia, by order of the late Emperor Claudius; and towers of Puteolan earth being first erected upon it, it was sunk for the construction of the harbour which he was making there. And then, besides, there was the necessity of constructing other vessels to carry these obelisks up the Tiber; by which it became practically ascertained, that the depth of water in that river is not less than that of the river Nilus.

The obelisk that was erected by the late Emperor Augustus in the Great Circus, was originally quarried by order of King Semempserteus, in whose reign it was that Pythagoras visited Egypt. It is eighty-five feet and three quarters in height, exclusive of the base, which is a part of the same stone. The one that he erected in the Campus Martius, is nine feet less in height, and was originally made by order of Sesothis. They are both of them covered with inscriptions, which interpret the operations of Nature according to the philosophy of the Egyptians.

Detailed table of contents

CHAP. 15. (10.)

THE OBELISK WHICH SERVES AS A DIAL IN THE CAMPUS MARTIUS.

The one that has been erected in the Campus Martius has been applied to a singular purpose by the late Emperor Augustus; that of marking the shadows projected by the sun, and so measuring the length of the days and nights. With this object, a stone pavement was laid, the extreme length of which corresponded exactly with the length of the shadow thrown by the obelisk at the sixth hour on the day of the winter solstice. After this period, the shadow would go on, day by day, gradually decreasing, and then again would as gradually increase, correspondingly with certain lines of brass that were inserted in the stone; a device well deserving to be known, and due to the ingenuity of Facundus Novus, the mathematician. Upon the apex of the obelisk he placed a gilded ball in order that the shadow of the summit might be condensed and agglomerated, and so prevent the shadow of the apex itself from running to a fine point of enormous extent; the plan being first suggested to him, it is said, by the shadow that is projected by the human head. For nearly the last thirty years, however, the observations derived from this dial have been found not to agree: whether it is that the sun itself has changed its course in consequence of some derangement of the heavenly system; or whether that the whole earth has been in some degree displaced from its centre, a thing that, I have heard say, has been remarked in other places as well; or whether that some earthquake, confined to this city only, has wrenched the dial from its original position; or whether it is that in consequence of the inundations of the Tiber, the foundations of the mass have subsided, in spite of the general assertion that they are sunk as deep into the earth as the obelisk erected upon them is high.

(11.) The third obelisk at Rome is in the Vaticanian Circus, which was constructed by the Emperors Caius and Nero; this being the only one of them all that has been broken in the carriage. Nuncoreus, the son of Sesoses, made it: and there remains another by him, one hundred cubits in height, which, by order of an oracle, he consecrated to the Sun, after having lost his sight and recovered it.

Detailed table of contents

CHAP. 16. (12.)

MARVELLOUS WORKS IN EGYPT. THE PYRAMIDS.

We must make some mention, too, however cursorily, of the Pyramids of Egypt, so many idle and frivolous pieces of ostentation of their resources, on the part of the monarchs of that country. Indeed, it is asserted by most persons, that the only motive for constructing them, was either a determination not to leave their treasures to their successors or to rivals that might be plotting to supplant them, or to prevent the lower classes from remaining unoccupied. There was great vanity displayed by these men in constructions of this description, and there are still the remains of many of them in an unfinished state. There is one to be seen in the Nome of Arsinoïtes; two in that of Memphites, not far from the Labyrinth, of which we shall shortly have to speak; and two in the place where Lake Mœris was excavated, an immense artificial piece of water, cited by the Egyptians among their wondrous and memorable works: the summits of the pyramids, it is said, are to be seen above the water.

The other three pyramids, the renown of which has filled the whole earth, and which are conspicuous from every quarter to persons navigating the river, are situate on the African side of it, upon a rocky sterile elevation. They lie between the city of Memphis and what we have mentioned as the Delta, within four miles of the river, and seven miles and a-half from Memphis, near a village known as Busiris, the people of which are in the habit of ascending them.

Detailed table of contents

CHAP. 17.

THE EGYPTIAN SPHINX.

In front of these pyramids is the Sphinx, a still more wondrous object of art, but one upon which silence has been observed, as it is looked upon as a divinity by the people of the neighbourhood. It is their belief that King Harmaïs was buried in it, and they will have it that it was brought there from a distance. The truth is, however, that it was hewn from the solid rock; and, from a feeling of veneration, the face of the monster is coloured red. The circumference of the head, measured round the forehead, is one hundred and two feet, the length of the feet being one hundred and forty-three, and the height, from the belly to the summit of the asp on the head, sixty-two.

The largest Pyramid is built of stone quarried in Arabia: three hundred and sixty thousand men, it is said, were employed upon it twenty years, and the three were completed in seventy-eight years and four months. They are described by the following writers: Herodotus, Euhemerus, Duris of Samos, Aristagoras, Dionysius, Artemidorus, Alexander Polyhistor, Butoridas, Antisthenes, Demetrius, Demoteles, and Apion. These authors, however, are disagreed as to the persons by whom they were constructed; accident having, with very considerable justice, consigned to oblivion the names of those who erected such stupendous memorials of their vanity. Some of these writers inform us that fifteen hundred talents were expended upon radishes, garlic, and onions alone.

The largest Pyramid occupies seven jugera of ground, and the four angles are equidistant, the face of each side being eight hundred and thirty-three feet in length. The total height from the ground to the summit is seven hundred and twenty-five feet, and the platform on the summit is sixteen feet and a-half in circuit. Of the second Pyramid, the faces of the four sides are each seven hundred and fifty-seven feet and a-half in length. The third is smaller than the others, but far more prepossessing in appearance: it is built of Æthiopian stone, and the face between the four corners is three hundred and sixty-three feet in extent. In the vicinity of these erections, there are no vestiges of any buildings left. Far and wide there is nothing but sand to be seen, of a grain somewhat like a lentil in appearance, similar to that of the greater part of Africa, in fact.

The most difficult problem is, to know how the materials for construction could possibly be carried to so vast a height. According to some authorities, as the building gradually advanced, they heaped up against it vast mounds of nitre and salt; which piles were melted after its completion, by introducing beneath them the waters of the river. Others, again, maintain, that bridges were constructed, of bricks of clay, and that, when the pyramid was completed, these bricks were distributed for erecting the houses of private

individuals. For the level of the river, they say, being so much lower, water could never by any possibility have been brought there by the medium of canals. In the interior of the largest Pyramid there is a well, eighty-six cubits deep, which communicates with the river, it is thought. The method of ascertaining the height of the Pyramids and all similar edifices was discovered by Thales of Miletus; he measuring the shadow at the hour of the day at which it is equal in length to the body projecting it.

Such are the marvellous Pyramids; but the crowning marvel of all is, that the smallest, but most admired of them — that we may feel no surprise at the opulence of the kings — was built by Rhodopis, a courtesan! This woman was once the fellow-slave of Æsopus the philosopher and fabulist, and the sharer of his bed; but what is much more surprising is, that a courtesan should have been enabled, by her vocation, to amass such enormous wealth.

CHAP. 18.

THE PHAROS.

There is another building, too, that is highly celebrated; the tower that was built by a king of Egypt, on the island of Pharos, at the entrance to the harbour of Alexandria. The cost of its erection was eight hundred talents, they say; and, not to omit the magnanimity that was shown by King Ptolemæus on this occasion, he gave permission to the architect, Sostratus of Cnidos, to inscribe his name upon the edifice itself. The object of it is, by the light of its fires at night, to give warning to ships, of the neighbouring shoals, and to point out to them the entrance of the harbour. At the present day, there are similar fires lighted up in numerous places, Ostia and Ravenna, for example. The only danger is, that when these fires are thus kept burning without intermission, they may be mistaken for stars, the flames having very much that appearance at a distance. This architect 'is the first person that built a promenade upon arches; at Cnidos, it is said.

CHAP. 19. (13.)

LABYRINTHS.

We must speak also of the Labyrinths, the most stupendous works, perhaps, on which mankind has expended its labours; and not for chimerical purposes, merely, as might possibly be supposed.

There is still in Egypt, in the Nome of Heracleopolites, a labyrinth, which was the first constructed, three thousand six hundred years ago, they say, by King Petesuchis or Tithöes: although, according to Herodotus, the entire work was the production of no less than twelve kings, the last of whom was Psammetichus. As to the purpose for which it was built, there are various opinions: Demoteles says that it was the palace of King Moteris, and Lyceas that it was the tomb of Mœris, while many others assert that it was a building consecrated to the Sun, an opinion which mostly prevails.

That Dædalus took this for the model of the Labyrinth which he constructed in Crete, there can be no doubt; though he only reproduced the hundredth part of it, that portion, namely, which encloses circuitous passages, windings, and inextricable galleries which lead to and fro. We must not, comparing this last to what we see delineated on our mosaic pavements, or to the mazes formed in the fields for the amusement of children, suppose it to be a narrow promenade along which we may walk for many miles together; but we must picture to ourselves a building filled with numerous doors, and galleries which continually mislead the visitor, bringing him back, after all his wanderings, to the spot from which he first set out. This Labyrinth is the second, that of Egypt being the first. There is a third in the Isle of Lemnos, and a fourth in Italy.

They are all of them covered with arched roofs of polished stone; at the entrance, too, of the Egyptian Labyrinth, a thing that surprises me, the building is constructed of Parian marble, while throughout the other parts of it the columns are of syenites. With such solidity is this huge mass constructed, that the lapse of ages has been totally unable to destroy it, seconded as it has been by the people of Heracleopolites, who have marvellously ravaged a work which they have always held in abhorrence. To detail the position of this work and the various portions of it is quite impossible, it being sub-divided into regions and præfectures, which are styled nomes, thirty in number, with a vast palace assigned to each. In addition to these, it should contain temples of all the gods of Egypt, and forty statues of Nemesis in as many sacred shrines; besides numerous pyramids, forty ells in height, and covering six aruræ at the base. Fatigued with wandering to and fro, the visitor is sure to arrive at some inextricable crossing or other of the galleries. And then, too, there are banquetting rooms situate at the summit of steep ascents; porticos from which we descend by flights of ninety steps; columns in the interior, made of

porphyrites; figures of gods; statues of kings; and effigies of hideous monsters. Some of the palaces are so peculiarly constructed, that the moment the doors are opened a dreadful sound like that of thunder reverberates within: the greater part, too, of these edifices have to be traversed in total darkness. Then again, without the walls of the Labyrinth, there rises another mass of buildings known as the “Pteron;” beneath which there are passages excavated leading to other subterranean palaces. One person, and only one, has made some slight repairs to the Labyrinth; Chæremon, an eunuch of King Necthebis, who lived five hundred years before the time of Alexander the Great. It is asserted, also, that while the arched roofs of squared stone were being raised, he had them supported by beams of thorn boiled in oil.

As for the Cretan Labyrinth, what I have already stated must suffice for that. The Labyrinth of Lemnos is similar to it, only that it is rendered more imposing by its hundred and fifty columns; the shafts of which, when in the stone-yard, were so nicely balanced, that a child was able to manage the wheel of the lathe in turning them. The architects were, Smilis, Rhæcus, and Theodorus, natives of the island, and there are still in existence some remains of it; whereas of the Cretan Labyrinth and of that in Italy not a vestige is left.

As to this last, which Porsena, King of Etruria, erected as his intended sepulchre, it is only proper that I should make some mention of it, if only to show that the vanity displayed by foreign monarchs, great as it is, has been surpassed. But as the fabulousness of the story connected with it quite exceeds all bounds, I shall employ the words given by M. Varro himself in his account of it:— “Porsena was buried,” says he, “beneath the city of Clusium; in the spot where he had had constructed a square monument, built of squared stone. Each side of this monument was three hundred feet in length and fifty in height, and beneath the base, which was also square, there was an inextricable labyrinth, into which if any one entered without a clew of thread, he could never find his way out. Above this square building there stand five pyramids, one at each corner, and one in the middle, seventy-five feet broad at the base, and one hundred and fifty feet in height. These pyramids are so tapering in their form, that upon the summit of all of them united there rests a brazen globe, and upon that a petasus; from which there hang, suspended by chains, bells, which make a tinkling when agitated by the wind, like what was done at Dodona in former times. Upon this globe there are four other pyramids, each one hundred feet in height; and above them is a single platform, on which there are five more pyramids,” — the height of which Varro has evidently felt ashamed to add; but, according to the Etruscan fables, it was equal to that of the rest of the building. What downright madness this, to attempt to seek glory at an outlay which can never be of utility to any one; to say nothing of exhausting the resources of the kingdom, and after all, that the artist may reap the greater share of the praise!

CHAP. 20.

HANGING GARDENS. A HANGING CITY.

We read, too, of hanging gardens, and what is even more than this, a hanging city, Thebes in Egypt: it being the practice for the kings to lead forth their armies from beneath, while the inhabitants were totally unconscious of it. This, too, is even less surprising than the fact that a river flows through the middle of the city. If, however, all this had really been the case, there is no doubt that Homer would have mentioned it, he who has celebrated the hundred gates of Thebes.

[Detailed table of contents](#)

CHAP. 21. (14.)

THE TEMPLE OF DIANA AT EPHEBUS.

The most wonderful monument of Græcian magnificence, and one that merits our genuine admiration, is the Temple of Diana at Ephesus, which took one hundred and twenty years in building, a work in which all Asia joined. A marshy soil was selected for its site, in order that it might not suffer from earthquakes, or the chasms which they produce. On the other hand, again, that the foundations of so vast a pile might not have to rest upon a loose and shifting bed, layers of trodden charcoal were placed beneath, with fleeces covered with wool upon the top of them. The entire length of the temple is four hundred and twenty-five feet, and the breadth two hundred and twenty-five. The columns are one hundred and twenty-seven in number, and sixty feet in height, each of them presented by a different king. Thirty-six of these columns are carved, and one of them by the hand of Scopas. Chersiphron was the architect who presided over the work.

The great marvel in this building is, how such ponderous Architraves could possibly have been raised to so great a height. This, however, the architect effected by means of bags filled with sand, which he piled up upon an inclined plane until they reached beyond the capitals of the columns; then, as he gradually emptied the lower bags, the architraves insensibly settled in the places assigned them. But the greatest difficulty of all was found, in laying the lintel which he placed over the entrance-doors. It was an enormous mass of stone, and by no possibility could it be brought to lie level upon the jambs which formed its bed; in consequence of which, the architect was driven to such a state of anxiety and desperation as to contemplate suicide. Wearied and quite worn out by such thoughts as these, during the night, they say, he beheld in a dream the goddess in honour of whom the temple was being erected; who exhorted him to live on, for that she herself had placed the stone in its proper position. And such, in fact, next morning, was found to be the case, the stone apparently having come to the proper level by dint of its own weight. The other decorations of this work would suffice to fill many volumes, but they do not tend in any way to illustrate the works of Nature.

CHAP. 22. (15.)

MARVELS CONNECTED WITH OTHER TEMPLES.

There still exists, too, at Cyzicus, a temple of polished stone, between all the joints of which the artist has inserted a thread of gold; it being his intention to erect an ivory statue of Jupiter within, with Apollo in marble crowning him. The result is, that the interstices quite glisten with their fine, hair-like threads; and the reflection of the gold, obscured as it is, gently falling upon the statues, besides proclaiming the genius of the artist, heightens their effect, and so teaches us to appreciate the costliness of the work.

Detailed table of contents

CHAP. 23.

THE FUGITIVE STONE. THE SEVEN-FOLD ECHO. BUILDINGS ERECTED WITHOUT THE USE OF NAILS.

In the same city also, there is a stone, known as the “Fugitive Stone;” the Argonautæ, who used it for the purposes of an anchor, having left it there. This stone having repeatedly taken flight from the Prytanæum, the place so called where it is kept, it has been fastened down with lead. In this city also, near the gate which is known as the “Trachia,” there are seven towers, which repeat a number of times all sounds that are uttered in them. This phenomenon, to which the name of “Echo,” has been given by the Greeks, depends upon the peculiar conformation of localities, and is produced in valleys more particularly. At Cyzicus, however, it is the effect of accident only; while at Olympia, it is produced by artificial means, and in a very marvellous manner; in a portico there, which is known as the “Heptaphonon,” from the circumstance that it returns the sound of the voice seven times.

At Cyzicus, also, is the Buleuterium, a vast edifice, constructed without a nail of iron; the raftering being so contrived as to admit of the beams being removed and replaced without the use of stays. A similar thing, too, is the case with the Sublician Bridge at Rome; and this by enactment, on religious grounds, there having been such difficulty experienced in breaking it down when Horatius Cocles defended it.

Detailed table of contents

CHAP. 24.

MARVELLOUS BUILDINGS AT ROME, EIGHTEEN IN NUMBER.

But it is now time to pass on to the marvels in building displayed by our own City, and to make some enquiry into the resources and experience that we have gained in the lapse of eight hundred years; and so prove that here, as well, the rest of the world has been outdone by us: a thing which will appear, in fact, to have occurred almost as many times as the marvels are in number which I shall have to enumerate. If, indeed, all the buildings of our City are considered in the aggregate, and supposing them, so to say, all thrown together in one vast mass, the united grandeur of them would lead one to suppose that we were describing another world, accumulated in a single spot.

Not to mention among our great works, the Circus Maximus, that was constructed by the Dictator Cæsar, one stadium in width and three in length, and occupying, with the adjacent buildings, no less than four jugera, with room for two hundred and sixty thousand spectators seated; am I not to include in the number of our magnificent constructions, the Basilica of Paulus, with its admirable Phrygian columns; the Forum of the late Emperor Augustus; the Temple of Peace, erected by the Emperor Vespasianus Augustus — some of the finest works that the world has ever beheld — the roofing, too, of the Vote-Office, that was built by Agrippa? not to forget that, before his time, Valerius of Ostia, the architect, had covered in a theatre at Rome, at the time of the public Games celebrated by Libo?

We behold with admiration pyramids that were built by kings, when the very ground alone, that was purchased by the Dictator Cæsar, for the construction of his Forum, cost one hundred millions of sesterces! If, too, an enormous expenditure has its attractions for any one whose mind is influenced by monetary considerations, be it known to him that the house in which Clodius dwelt, who was slain by Milo, was purchased by him at the price of fourteen million eight hundred thousand sesterces! a thing that, for my part, I look upon as no less astounding than the monstrous follies that have been displayed by kings. And then, as to Milo himself, the sums in which he was indebted, amounted to no less than seventy millions of sesterces; a state of things, to be considered, in my opinion, as one of the most portentous phenomena in the history of the human mind. But it was in those days, too, that old men still spoke in admiration of the vast proportions of the Agger, and of the enormous foundations of the Capitol; of the public sewers, too, a work more stupendous than any; as mountains had to be pierced for their construction, and, like the hanging city which we recently mentioned, navigation had to be carried on beneath Rome; an event which happened in the ædileship of M. Agrippa, after he had filled the office of consul.

For this purpose, there are seven rivers, made, by artificial channels, to

flow beneath the city. Rushing onward, like so many impetuous torrents, they are compelled to carry off and sweep away all the sewerage; and swollen as they are by the vast accession of the pluvial waters, they reverberate against the sides and bottom of their channels. Occasionally, too, the Tiber, overflowing, is thrown backward in its course, and discharges itself by these outlets: obstinate is the contest that ensues within between the meeting tides, but so firm and solid is the masonry, that it is enabled to offer an effectual resistance. Enormous as are the accumulations that are carried along above, the work of the channels never gives way. Houses falling spontaneously to ruins, or levelled with the ground by conflagrations, are continually battering against them; the ground, too, is shaken by earthquakes every now and then; and yet, built as they were in the days of Tarquinius Priscus, seven hundred years ago, these constructions have survived, all but unharmed. We must not omit, too, to mention one remarkable circumstance, and all the more remarkable from the fact, that the most celebrated historians have omitted to mention it. Tarquinius Priscus having commenced the sewers, and set the lower classes to work upon them, the laboriousness and prolonged duration of the employment became equally an object of dread to them; and the consequence was, that suicide was a thing of common occurrence, the citizens adopting this method of escaping their troubles. For this evil, however, the king devised a singular remedy, and one that has never been resorted to either before that time or since: for he ordered the bodies of all who had been thus guilty of self-destruction, to be fastened to a cross, and left there as a spectacle to their fellow - citizens and a prey to birds and wild beasts. The result was, that that sense of propriety which so peculiarly attaches itself to the Roman name, and which more than once has gained a victory when the battle was all but lost, came to the rescue on this occasion as well; though for this once, the Romans were in reality its dupes, as they forgot that, though they felt shocked at the thoughts of such ignominy while alive, they would be quite insensible to any such disgrace when dead. It is said that Tarquinius made these sewers of dimensions sufficiently large to admit of a waggon laden with hay passing along them.

All that we have just described, however, is but trifling when placed in comparison with one marvellous fact, which I must not omit to mention before I pass on to other subjects. In the consulship of M. Lepidus and Q. Catulus, there was not at Rome, as we learn from the most trustworthy authors, a finer house than the one which belonged to Lepidus himself: and yet, by Hercules! within five-and-thirty years from that period, the very same house did not hold the hundredth rank even in the City! Let a person, if he will, in taking this fact into consideration, only calculate the vast masses of marble, the productions of painters, the regal treasures that must have been expended, in bringing these hundred mansions to vie with one that had been in its day the most sumptuous and the most celebrated in all the City; and then let him reflect how that, since that period, and down to the present time, these

houses have all of them been surpassed by others without number. There can be no doubt that conflagrations are a punishment inflicted upon us for our luxury; but such are our habits, that in spite of such warnings as these, we cannot be made to understand that there are things in existence more perishable even than man himself.

But there are still two other mansions by which all these edifices have been eclipsed. Twice have we seen the whole City environed by the palaces of the Emperors Caius and Nero; that of the last, that nothing might be wanting to its magnificence, being coated with gold. Surely such palaces as these must have been intended for the abode of those who created this mighty empire, and who left the plough or their native hearth to go forth to conquer nations, and to return laden with triumphs! men, in fact, whose very fields even occupied less space than the audience-chambers of these palaces.

Indeed, one cannot but help reflecting how trifling a portion of these palaces was equal to the sites which the republic granted to its invincible generals, for the erection of their dwellings. The supreme honour, too, attendant upon these grants — as in the case of P. Valerius Publicola, the first consul with L. Brutus, for his many meritorious services; and of his brother, who twice in one consulship defeated the Sabines — was the permission granted, by the terms of the decree, to have the doors of their houses opening from without, and the gates thrown back upon the public street. Such was the most distinguished privilege accorded in those days to triumphal mansions even!

I will not permit, however, these two Caiuses, or two Neros, to enjoy this glory even, such as it is; for I will prove that these extravagant follies of theirs have been surpassed, in the use that was made of his wealth by M. Scaurus, a private citizen. Indeed, I am by no means certain that it was not the ædileship of this personage that inflicted the first great blow upon the public manners, and that Sylla was not guilty of a greater crime in giving such unlimited power to his stepson, than in the proscription of so many thousands. During his ædileship, and only for the temporary purposes of a few days, Scaurus executed the greatest work that has ever been made by the hands of man, even when intended to be of everlasting duration; his Theatre, I mean. This building consisted of three storeys, supported upon three hundred and sixty columns; and this, too, in a city which had not allowed without some censure one of its greatest citizens to erect six pillars of Hymettian marble. The ground-storey was of marble, the second of glass, a species of luxury which ever since that time has been quite unheard of, and the highest of gilded wood. The lowermost columns, as previously stated, were eight-and-thirty feet in height; and, placed between these columns, as already mentioned, were brazen statues, three thousand in number. The area of this theatre afforded accommodation for eighty thousand spectators; and yet the Theatre of Pompeius, after the City had so greatly increased, and the inhabitants had become so vastly more numerous, was considered abundantly large, with its

sittings for forty thousand only. The rest of the fittings of it, what with Attalic vestments, pictures, and the other stage-properties, were of such enormous value that, after Scaurus had had conveyed to his Tusculan villa such parts thereof as were not required for the enjoyment of his daily luxuries, the loss was no less than three hundred millions of sesterces, when the villa was burnt by his servants in a spirit of revenge.

The consideration of such prodigality as this quite distracts my attention, and compels me to digress from my original purpose, in order to mention a still greater instance of extravagance, in reference to wood. C. Curio, who died during the civil wars, fighting on the side of Cæsar, found, to his dismay, that he could not, when celebrating the funeral games in honour of his father, surpass the riches and magnificence of Scaurus — for where, in fact, was to be found such a stepsire as Sylla, and such a mother as Metella, that bidder at all auctions for the property of the proscribed? Where, too, was he to find for his father, M. Scaurus, so long the principal man in the city, and one who had acted, in his alliance with Marius, as a receptacle for the plunder of whole provinces? — Indeed, Scaurus himself was now no longer able to rival himself; and it was at least one advantage which he derived from this destruction by fire of so many objects brought from all parts of the earth, that no one could ever after be his equal in this species of folly. Curio, consequently, found himself compelled to fall back upon his own resources, and to think of some new device of his own. It is really worth our while to know what this device was, if only to congratulate ourselves upon the manners of the present day, and to reverse the ordinary mode of expression, and term ourselves the men of the olden time.

He caused to be erected, close together, two theatres of very large dimensions, and built of wood, each of them nicely poised, and turning on a pivot. Before mid-day, a spectacle of games was exhibited in each; the theatres being turned back to back, in order that the noise of neither of them might interfere with what was going on in the other. Then, in the latter part of the day, all on a sudden, the two theatres were swung round, and, the corners uniting, brought face to face; the outer frames, too, were removed, and thus an amphitheatre was formed, in which combats of gladiators were presented to the view; men whose safety was almost less compromised than was that of the Roman people, in allowing itself to be thus whirled round from side to side. Now, in this case, which have we most reason to admire, the inventor or the invention? the artist, or the author of the project? him who first dared to think of such an enterprize, or him who ventured to undertake it? him who obeyed the order, or him who gave it? But the thing that surpasses all is, the frenzy that must have possessed the public, to take their seats in a place which must of necessity have been so unsubstantial and so insecure. Lo and behold! here is a people that has conquered the whole earth, that has subdued the universe, that divides the spoils of kingdoms and of nations, that sends its laws to foreign lands, that shares in some degree the attributes of the immortal gods in

common with mankind, suspended aloft in a machine, and showering plaudits even upon its own peril!

This is indeed holding life cheap; and can we, after this, complain of our disasters at Cannæ? How vast the catastrophe that might have ensued! When cities are swallowed up by an earthquake, it is looked upon by mankind as a general calamity; and yet, here have we the whole Roman people, embarked, so to say, in two ships, and sitting suspended on a couple of pivots; the grand spectacle being its own struggle with danger, and its liability to perish at any moment that the overstrained machinery may give way! And then the object, too, of all this — that public favour may be conciliated for the tribune's harangues at a future day, and that, at the Rostra, he may still have the power of shaking the tribes, nicely balanced as they are! And really, what may he not dare with those who, at his persuasion, have braved such perils as these? Indeed, to confess the truth, at the funeral games celebrated at the tomb of his father, it was no less than the whole Roman people that shared the dangers of the gladiatorial combats. When the pivots had now been sufficiently worked and wearied, he gave another turn to his magnificent displays. For, upon the last day, still preserving the form of the amphitheatre, he cut the stage in two through the middle, and exhibited a spectacle of athletes; after which, the stage being suddenly withdrawn on either side, he exhibited a combat, upon the same day, between such of the gladiators as had previously proved victorious. And yet, with all this, Curio was no king, no ruler of the destinies of a nation, nor yet a person remarkable for his opulence even; seeing that he possessed no resources of his own, beyond what he could realize from the discord between the leading men.

But let us now turn our attention to some marvels which, justly appreciated, may be truthfully pronounced to remain unsurpassed. Q. Marcius Rex, upon being commanded by the senate to repair the Appian Aqueduct, and those of the Anio and Tepula, constructed during his prætorship a new aqueduct, which bore his name, and was brought hither by a channel pierced through the sides of mountains. Agrippa, in his ædileship, united the Marcian with the Virgin Aqueduct, and repaired and strengthened the channels of the others. He also formed seven hundred wells, in addition to five hundred fountains, and one hundred and thirty reservoirs, many of them magnificently adorned. Upon these works, too, he erected three hundred statues of marble or bronze, and four hundred marble columns; and all this in the space of a single year! In the work which he has written in commemoration of his ædileship, he also informs us that public games were celebrated for the space of fifty-nine days, and that one hundred and seventy gratuitous baths were opened. The number of these last at Rome, has increased to an infinite extent since his time.

The preceding aqueducts, however, have all been surpassed by the costly work which was more recently commenced by the Emperor Caius, and completed by Claudius. Under these princes, the Curtian and Cærulean

Waters, with the New Anio, were brought from a distance of forty miles, and at so high a level that all the hills were supplied with water, on which the City is built. The sum expended on these works was three hundred and fifty millions of sesterces. If we only take into consideration the abundant supply of water to the public, for baths, ponds, canals, household purposes, gardens, places in the suburbs, and country-houses; and then reflect upon the distances that are traversed, the arches that have been constructed, the mountains that have been pierced, the valleys that have been levelled, we must of necessity admit that there is nothing to be found more worthy of our admiration throughout the whole universe.

Among the most memorable works, too, I, for my own part, should include another undertaking of the Emperor Claudius, although it was afterwards abandoned in consequence of the hatred borne him by his successor; I mean the channel that was cut through a mountain as an emissary for Lake Fucinus; a work which cost a sum beyond all calculation, and employed a countless multitude of workmen for many years. In those parts where the soil was found to be terreous, it was necessary to pump up the water by the aid of machinery; in other parts, again, the solid rock had to be hewn through. All this, too, had to be done in the midst of darkness within; a series of operations which can only be adequately conceived by those who were witnesses of them, and which no human language can possibly describe.

I pass in silence the harbour that has been formed at Ostia; the various roads, too, that have been cut across mountains; the Tyrrhenian Sea separated by an embankment from Lake Lucrinus; and vast numbers of bridges constructed at an enormous expense. Among the many other marvels, too, of Italy, we are informed by Papirius Fabianus, a most diligent enquirer into the operations of Nature, that the marble there grows in the quarries; and those who work in the quarries assure us that the wounds thus inflicted upon the mountains fill up spontaneously. If such is the fact, luxury has good grounds for hoping that it will never be at a loss for a supply of materials for its gratification.

CHAP. 25. (16.)

THE MAGNET: THREE REMEDIES

Upon quitting the marbles to pass on to the other more remarkable stones, who can for a moment doubt that the magnet will be the first to suggest itself? For what, in fact, is there endowed with more marvellous properties than this? or in which of her departments has Nature displayed a greater degree of waywardness? She had given a voice to rocks, as already mentioned, and had enabled them to answer man, or rather, I should say, to throw back his own words in his teeth. What is there in existence more inert than a piece of rigid stone? And yet, behold! Nature has here endowed stone with both sense and hands. What is there more stubborn than hard iron? Nature has, in this instance, bestowed upon it both feet and intelligence. It allows itself, in fact, to be attracted by the magnet, and, itself a metal which subdues all other elements, it precipitates itself towards the source of an influence at once mysterious and unseen. The moment the metal comes near it, it springs towards the magnet, and, as it clasps it, is held fast in the magnet's embraces. Hence it is that this stone is sometimes known by the name of "sideritis;" another name given to it being "heraclion." It received its name "magnes," Nicander informs us, from the person who was the first to discover it, upon Ida. It is found, too, in various other countries, as in Spain, for example. Magnes, it is said, made this discovery, when, upon taking his herds to pasture, he found that the nails of his shoes and the iron ferrel of his staff adhered to the ground.

Sotacus describes five different kinds of magnet; the Æthiopian magnet; that of Magnesia, a country which borders on Macedonia, and lies to the right of the road which leads from the town of Bœbe to Iolcos; a third, from Hyettus in Bœotia; a fourth, from Alexandria in Troas; and a fifth, from Magnesia in Asia. The leading distinction in magnets is the sex, male and female, and the next great difference in them is the colour. Those of Magnesia, bordering on Macedonia, are of a reddish black; those of Bœotia are more red than black; and the kind that is found in Troas is black, of the female sex, and consequently destitute of attractive power. The most inferior, however, of all, are those of Magnesia in Asia: they are white, have no attractive influence on iron, and resemble pumice in appearance. It has been found by experience, that the more nearly the magnet approaches to an azure colour, the better it is in quality. The Æthiopian magnet is looked upon as the best of all, and is purchased at its weight in silver: Zmiris in Æthiopia is the place where it is found, such being the name of a region there, covered with sand.

In the same country, too, the magnet called "hæmatites" is found, a stone of a blood-red colour, and which, when bruised, yields a tint like that of

blood, as also of saffron. The hæmatites has not the same property of attracting iron that the ordinary magnet has. The Æthiopian magnet is recognized by this peculiarity, that it has the property, also, of attracting other magnets to it. All these minerals are useful as ingredients in ophthalmic preparations, in certain proportions according to the nature of each: they are particularly good, too, for arresting defluxions of the eyes. Triturated in a calcined state, they have a healing effect upon burns.

In Æthiopia, too, not far from Zmiris, there is a mountain in which the stone called “theamedes” is found, a mineral which repels and rejects all kinds of iron. Of the attractive and repulsive properties of iron, we have spoken more than once.

CHAP. 27. (17.)

SARCOPHAGUS, OR STONE OF ASSOS: TEN REMEDIES.

At Assos in Troas, there is found a stone of a laminated texture, called “sarcophagus.” It is a well-known fact, that dead bodies, when buried in this stone, are consumed in the course of forty days, with the sole exception of the teeth. According to Mucianus, too, mirrors, body-scrapers, garments, and shoes, that have been buried with the dead, become transformed into stone. In Lycia, and in the East, there are certain stones of a similar nature, which, when attached to the bodies of the living even, corrode the flesh.

[Detailed table of contents](#)

CHAP. 28.

CHERNITES.

Less active in its properties is chernites, a stone which preserves bodies without consuming them, and strongly resembles ivory in appearance: the body of King Darius, they say, was buried in it. The stone that is known as “porus,” is similar to Parian marble in hardness and whiteness, but is not so heavy. Theophrastus mentions also a transparent stone that is found in Egypt, and is similar to stone of Chios in appearance; it is by no means improbable that it may have existed in his time, for stones, we know, disappear, and new kinds are discovered. The stone of Assos, which is saltish to the taste, modifies the attacks of gout, the feet being placed in a vessel made of it for the purpose; in addition to which, in the quarries of this stone, all maladies of the legs disappear, whereas, in mines in general, the legs become affected with disease. “Flower of stone of Assos” is the name given to a soft stone which crumbles into dust, and is found very efficacious in some cases; it resembles red pumice in appearance. In combination with Cyprian wax, this stone is curative of affections of the mamillæ; and, employed with pitch or resin, it disperses scrofulous sores and inflammatory tumours. Used in the form of an electuary, it is good for phthisis, and, with honey, it causes old sores to cicatrize, and consumes proud flesh. It is used, also, for the cure of wounds of an obstinate nature inflicted by animals, and acts as a desiccative upon suppurations. Plaisters, too, are made of it for gout, bean-meal being incorporated with it for the purpose.

Detailed table of contents

CHAP. 29. (18.)

OSSEOUS STONES. PALM STONES. CORANI. BLACK STONES.

Theophrastus and Mucianus are of opinion that there are certain stones which bring forth other stones. Theophrastus states, also, that a fossil ivory is found, both white and black; that the earth, too, produces bones, and that osseous stones are sometimes found. In the vicinity of Munda in Spain, the place where the Dictator Cæsar defeated Pompeius, there are stones found, which, when broken asunder, bear the impression of palm leaves.

There are some black stones, also, which are held in much the same esteem as the marbles; the Tænarian stone, for example. Varro says that the black stone of Africa is more durable than that of Italy; while, on the other hand, the white corani are harder than Parian marble. He states, also, that the silex of Luna admits of being cut with a saw; that that of Tusculum decrepitates in the fire; that the tawny silex of the Sabine districts, with the addition of oil, will yield a flame even; and that, at Volsinii, molar stones for grinding are found. Among the prodigies that have happened, I find mention made of millstones that have moved of themselves.

Detailed table of contents

CHAP. 30.

MOLAR STONES. PYRITES; SEVEN REMEDIES.

In no country are the molar stones superior to those of Italy; stones, be it remembered, and not fragments of rock: there are some provinces, too, where they are not to be found at all. Some stones of this class are softer than others, and admit of being smoothed with the whetstone, so as to present all the appearance, at a distance, of ophites. There is no stone of a more durable nature than this; for in general, stone, like wood, suffers from the action, more or less, of rain, heat, and cold. Some kinds, again, become deteriorated by the action of the moon, while others are apt to contract a rust in lapse of time, or to change their white colour when steeped in oil.

(19.) Some persons give this molar stone the name of “pyrites,” from the circumstance that it has a great affinity to fire; but there is also another kind of pyrites, of a more porous nature, and another, again, which resembles copper. This last, it is said, is found in the mines, near Acamas, in the Isle of Cyprus; one variety of it being of a silver, another of a golden, colour. There are various methods of melting these stones, some persons fusing them twice, or three times even, in honey, till all the liquid has evaporated; while others, again, calcine them upon hot coals, and, after treating them with honey, wash them like copper.

The medicinal properties which these minerals possess are of a calorific, desiccative, dispersive, and resolvent nature, and, applied topically, they cause indurations to suppurate. They are employed also, in a crude state and pulverized, for the cure of scrofulous sores and boils. Some writers mention another kind of pyrites also. Those among them have the greatest affinity to fire which we distinguish as “live” pyrites. They are the most ponderous of all, and are found remarkably useful for advance-guards when laying out encampments; for, on being struck with a nail or any other kind of stone, they emit a spark, which, received upon sulphur, dried fungus, or leaves, produces a fire almost sooner than it could be named.

[Detailed table of contents](#)

CHAP. 31.

OSTRACITES; FOUR REMEDIES. AMIANTHUS; TWO REMEDIES.

The several varieties of ostracites bear a resemblance to shells. They are used by way of substitute for pumice-stone, for smoothing the skin. Taken in drink, they arrest discharges of blood; and, applied topically with honey, they are curative of ulcerations and pains in the mamillæ.

Amianthus resembles alumen in appearance, and suffers no diminution from the action of fire. This substance effectually counteracts all noxious spells, those wrought by magicians in particular.

[Detailed table of contents](#)

CHAP. 32.

GEODES; THREE REMEDIES.

Geodes is so called from its formation, it containing earth within. It is remarkably beneficial for the eyes, and is used for the cure of diseases of the testes and mamillæ.

Detailed table of contents

CHAP. 33.

MELITINUS; SIX REMEDIES.

The stone called “melitinus” yields a liquid that is sweet, like honey. Bruised and incorporated with wax, it is curative of pituitous eruptions, spots upon the skin, and ulcerations of the fauces. It removes epinyctis also, and, applied as a pessary, in wool, it alleviates pains in the uterus.

[Detailed table of contents](#)

CHAP. 34.

GAGATES: SIX REMEDIES.

Gagates is a stone, so called from Gages, the name of a town and river in Lycia. It is asserted, too, that at Leucolla the sea throws it up, and that it is found over a space twelve stadia in extent. It is black, smooth, light, and porous, differs but little from wood in appearance, is of a brittle texture, and emits a disagreeable odour when rubbed. Marks made upon pottery with this stone cannot be effaced. When burnt, it gives out a sulphureous smell; and it is a singular fact, that the application of water ignites it, while that of oil quenches it. The fumes of it, burnt, keep serpents at a distance, and dispel hysterical affections: they detect a tendency also to epilepsy, and act as a test of virginity. A decoction of this stone in wine is curative of tooth-ache; and, in combination with wax, it is good for scrofula. The magicians, it is said, make use of gagates in the practice of what they call axinomancy; and they assure us that it will be sure not to burn, if the thing is about to happen as the party desires.

[Detailed table of contents](#)

CHAP. 35.

SPONGITES: TWO REMEDIES.

The stone called “spongites” is found in sponges, and is a marine formation. By some persons it is called “tecolithos,” from the circumstance that it is curative of affections of the bladder. Taken in wine, it breaks and disperses urinary calculi.

Detailed table of contents

CHAP. 36.

PHRYGIAN STONE.

Phrygian stone is so called from the country which produces it, and is a porous mass like pumice. It is first saturated with wine, and then calcined, the fire being kept up with the bellows till the stone is brought to a red heat; which done, it is quenched in sweet wine. This operation is repeated three times. The only use made of it is for dyeing cloths.

[Detailed table of contents](#)

CHAP. 37. (20.)

HÆMATITES: FIVE REMEDIES. SCHISTOS: SEVEN REMEDIES.

Schistos and hæmatites have a certain affinity between them. The latter is found in mines, and, when burnt, has just the colour of minium. It is calcined in the same manner as Phrygian stone, but is not quenched in wine. Adulterations of it are detected by the appearance of red veins in it, and by its comparative friability. It is marvellously useful as an application for bloodshot eyes, and, taken internally, it acts as a check upon female discharges. To patients vomiting blood, it is administered in combination with pomegranate-juice. It is very efficacious also for affections of the bladder; and it is taken with wine for the cure of wounds inflicted by serpents.

In all these cases the stone called “schistos” is efficacious, though not in so high a degree as the other; the most serviceable being that which resembles saffron in colour. Applied with woman’s milk, it is particularly useful for arresting discharges from the corners of the eyes, and it is also very serviceable for reducing procidence of those organs. Such, at least, is the opinion of the authors who have most recently written on the subject.

[Detailed table of contents](#)

CHAP. 38.

ÆTHIOPIC HÆMATITES. ANDRODAMAS; TWO REMEDIES. ARABIAN
HÆMATITES. MILTITES OR HEPATITES. ANTHRACITES.

Sotacus, one of the most ancient writers, says, that there are five kinds of hæmatites, in addition to the magnet so called. He gives the preference among them to that of Æthiopia, a very useful ingredient in ophthalmic preparations and the compositions which he calls “panchresta,” and good for the cure of burns. The second, he says, is called “androdamas,” of a black colour, remarkable for its weight and hardness, to which it owes its name, in fact, and found in Africa more particularly. It attracts silver, he says, copper, and iron, and is tested with a touchstone made of basanites. It yields a liquid the colour of blood, and is an excellent remedy for diseases of the liver. The third kind that he mentions is the hæmatites of Arabia, a mineral of equal hardness, and which with difficulty yields, upon the water-whetstone, a liquid sometimes approaching the tint of saffron. The fourth kind, he says, is known as “hepatites,” while raw, and as “miltites” when calcined; a substance good for burns, and more efficacious than rubrica for all the purposes for which that mineral is employed. The fifth variety is schistos; a substance which, taken internally, arrests hæmorrhoidal discharges. Upon the same authority, it is recommended to take any kind of hæmatites, fasting, in doses of three drachmæ, triturated in oil, for affections of the blood.

The same author mentions also a kind of schistos which has no affinity to hæmatites, and to which he gives the name of “anthracites,” It is a native of Africa, he says, and is of a black colour. When rubbed upon a water-whetstone, it yields a black colour on the side which has adhered to the earth, and, on the opposite side, a saffron tint. He states also that it is a useful ingredient in ophthalmic preparations.

Detailed table of contents

CHAP. 39. (21)

AËTITES. TAPHIUSIAN STONE. CALLIMUS.

The stone called aëtites has a great reputation, in consequence of the name which it bears. It is found in the nests of eagles, as already mentioned in our Tenth Book. There are always two of these stones found together, they say, a male stone and a female; and without them, it is said, the various eagles that we have described would be unable to propagate. Hence it is, too, that the young of the eagle are never more than two in number. There are four varieties of the aëtites: that of Africa is soft and diminutive, and contains in the interior — in its bowels as it were — a sweet, white, argillaceous earth. It is friable, and is generally thought to be of the female sex. The male stone, on the other hand, which is found in Arabia, is hard, and similar to a nut-gall in appearance; or else of a reddish hue, with a hard stone in the interior. The third kind is a stone found in the Isle of Cyprus, and resembles those of Africa in appearance, but is larger and flat, while the others are of a globular form: it contains a sand within, of a pleasing colour, and mixed with small stones; being so soft itself as to admit of being crushed between the fingers.

The fourth variety is known as the Taphiusian aëtites, and is found near Leucas, at Taphiusa, a locality which lies to the right as you sail from Ithaca towards Cape Leucas. It is met with in the beds of rivers there, and is white and round; having another stone in the interior, the name given to which is “callimus:” none of the varieties of aëtites have a smoother surface than this. Attached to pregnant women or to cattle, in the skins of animals that have been sacrificed, these stones act as a preventive of abortion, care being taken not to remove them till the moment of parturition; for otherwise procidence of the uterus is the result. If, on the other hand, they are not removed at the moment when parturition is about to ensue, that operation of Nature cannot be effected.

Detailed table of contents

CHAP. 40.

SAMIAN STONE: EIGHT REMEDIES.

Samian stone comes from the same island which produces the earth in praise of which we have spoken already. It is useful for giving a polish to gold, and it is employed medicinally for the treatment of ulcerations of the eyes, combined with milk in manner already described. It is good, too, for watery discharges of a chronic nature, from the eyes. Taken internally, it is useful for affections of the stomach, and it has the effect of dispelling vertigo and restoring the spirits when depressed. Some writers are of opinion that this stone may be administered with advantage for epilepsy and strangury; and it is employed as an ingredient in the restoratives known as “acopa.” The test of its purity is its weight and its whiteness. Some persons will have it that, worn as an amulet, it acts as a preventive of abortion.

Detailed table of contents

CHAP. 41.

ARABIAN STONE; SIX REMEDIES.

Arabian stone resembles ivory in appearance; and in a calcined state it is employed as a dentifrice. It is particularly useful for the cure of hæmorrhoidal swellings, applied either in lint or by the aid of linen pledgets.

Detailed table of contents

CHAP. 42.

PUMICE; NINE REMEDIES.

And here, too, I must not omit to give some account of pumice. This name is very generally given, it is true, to those porous pieces of stone, which we see suspended in the erections known as “musæa,” with the view of artificially giving them all the appearance of caverns. But the genuine pumice-stones, that are in use for imparting smoothness to the skin of females, and not females only, but men as well, and, as Catullus says, for polishing books, are found of the finest quality in the islands of Melos and Nisyros and in the Æolian Isles. To be good, they should be white, as light as possible, porous and dry in the extreme, friable, and free from sand when rubbed.

Considered medicinally, pumice is of a resolvent and desiccative nature; for which purpose it is submitted to calcination, no less than three times, on a fire of pure charcoal, it being quenched as often in white wine. It is then washed, like cadmia, and, after being dried, is put by for keeping, in a place as free from damp as possible. In a powdered state, pumice is used in ophthalmic preparations more particularly, and acts as a lenitive detergent upon ulcerations of the eyes. It also makes new flesh upon cicatrizations of those organs, and removes all traces of the marks. Some prefer, after the third calcination, leaving the pumice to cool, and then triturating it in wine. It is employed also as an ingredient in emollient poultices, being extremely useful for ulcerations on the head and generative organs; dentifrices, too, are prepared from it. According to Theophrastus, persons when drinking for a wager are in the habit of taking powdered pumice first; but they run great risk, he says, if they fail to swallow the whole draught of wine at once; it being of so refrigerative a nature that grape-juice will absolutely cease to boil if pumice is put into it.

Detailed table of contents

CHAP. 43. (22.)

STONES FOR MORTARS USED FOR MEDICINAL AND OTHER PURPOSES.
ETESIAN STONE. THEBAIC STONE. CHALAZIAN STONE.

Authors, too, have paid some attention to the stones in use for mortars, not only those employed for the trituration of drugs and pigments, but for other purposes as well. In this respect they have given the preference to Etesian stone before all others, and, next to that, to Thebaic stone, already mentioned as being called “pyrrhopæcilon,” and known as “psaranus” by some. The third rank has been assigned to chrysites, a stone nearly allied to Chalazian stone. For medicinal purposes, however, basanites has been preferred, this being a stone that remits no particles from its surface.

Those stones which yield a liquid, are generally looked upon as good for the trituration of ophthalmic preparations; and hence it is, that the Æthiopian stone is so much in request for the purpose. Tænarian stone, they say, Phœnician stone, and hæmatites, are good for the preparation of those medicinal compositions in which saffron forms an ingredient; but they also speak of another Tænarian stone, of a dark colour, which, like Parian stone, is not so well adapted for medicinal purposes. We learn from them, too, that Egyptian alabastrites, or white ophites, from the virtues inherent in them, are considered still better adapted for these purposes than the kinds last mentioned. It is this kind of ophites, too, from which vessels, and casks even, are made.

Detailed table of contents

CHAP. 44.

STONE OF SIPHNOS. SOFT STONES.

At Siphnos, there is a kind of stone which is hollowed and turned in the lathe, for making cooking-utensils and vessels for keeping provisions; a thing too, that, to my own knowledge, is done with the green stone of Comum in Italy. With reference, however, to the stone of Siphnos, it is a singular fact, that, when heated in oil, though naturally very soft, it becomes hard and black; so great a difference is there in the qualities of stone.

There are some remarkable instances, too, beyond the Alps, of the natural softness of some kinds of stone. In the province of the Belgæ, there is a white stone which admits of being cut with the saw that is used for wood, and with greater facility even. This stone is used as a substitute for roof-tiles and gutter-tiles, and even for the kind of roofing known as the pavonaceous style, if that is preferred. Such are the stones that admit of being cut into thin slabs.

[Detailed table of contents](#)

CHAP. 45.

SPECULAR STONES.

As to specular stone — for this, too, is ranked as one of the stones — it admits of being divided with still greater facility, and can be split into leaves as thin as may be desired. The province of Nearer Spain used formerly to be the only one that furnished it — not, indeed, the whole of that country, but a district extending for a hundred miles around the city of Segobrica But at the present day, Cyprus, Cappadocia, and Sicily, supply us with it; and, still more recently, it has been discovered in Africa: they are all, however, looked upon as inferior to the stone which comes from Spain. The sheets from Cappadocia are the largest in size; but then they are clouded. This stone is to be found also in the territory of Bononia, in Italy; but in small pieces only, covered with spots and encrusted in a bed of silex, there being a considerable affinity, it would appear, in their nature.

In Spain, the specular-stone is extracted from shafts sunk in the earth to a very considerable depth; though it is occasionally to be found just beneath the surface, enclosed in the solid rock, and extracted without difficulty, or else cut away from its bed. In most cases, however, it admits of being dug up, being of an isolated nature, and lying in pieces, like ragstone, but never known as yet to exceed five feet in length. It would appear that this substance is originally a liquid, which, by an animating power in the earth, becomes congealed like crystal; and it is very evident that it is the result of petrification, from the fact that, when animals have fallen into the shafts from which it is extracted, the marrow of their bones becomes transformed into stone of a similar nature, by the end of a single winter. In some cases, too, it is found of a black colour: but the white stone has the marvellous property, soft as it is known to be, of resisting the action of the sun and of cold. Nor will it, if it is only protected from accidents, become deteriorated by lapse of time, a thing that is so generally the case with many other kinds of stone that are used for building purposes. The shavings, too, and scales of this stone, have been used of late for another purpose; the Circus Maximus having been strewed with them at the celebration of the games, with the object of producing an agreeable whiteness.

Detailed table of contents

CHAP. 46.

PHENGITES.

During the reign of Nero, there was a stone found in Cappadocia, as hard as marble, white, and transparent even in those parts where red veins were to be seen upon it; a property which has obtained for it the name of “phengites.” It was with this stone that Nero rebuilt the Temple of Fortune, surnamed Seia, originally consecrated by King Servius, enclosing it within the precincts of his Golden Palace. Hence it was that, even when the doors were closed, there was light in the interior during the day; not transmitted from without, as would be the case through a medium of specular-stone, but having all the appearance of being enclosed within the building.

In Arabia, too, according to Juba, there is a stone, transparent like glass, which is used for the same purposes as specular-stone.

Detailed table of contents

CHAP. 47.

WHETSTONES.

We must now pass on to the stones that are employed for handicrafts, and, first of all, whetstones for sharpening iron. Of these stones there are numerous varieties; the Cretan stones having been long held in the highest estimation, and the next best being those of Mount Taygetus, in Laconia; both of which are used as hones, and require oil. Among the water-whetstones, the first rank belonged to those of Naxos, and the second to the stones of Armenia, both of them already mentioned. The stones of Cilicia are of excellent quality, whether used with oil or with water; those of Arsinöe, too, are very good, but with water only. Whetstones have been found also in Italy, which with water give a remarkably keen edge; and from the countries beyond the Alps, we have the whetstones known as “passernices.”

To the fourth class belong the hones which give an edge by the agency of human saliva, and are much in use in barbers' shops. They are worthless, however, for all other purposes, in consequence of their soft and brittle nature: those from the district of Laminium, in Nearer Spain, are the best of the kind.

[Detailed table of contents](#)

CHAP. 48.

TOPHUS.

Among the multitude of stones which still remain undescribed, there is tophus; a material totally unsuited for building purposes, in consequence of its perishableness. Still, however, there are some localities which have no other, Carthage, in Africa, for example. It is eaten away by the emanations from the sea, crumbled to dust by the wind, and shattered by the pelting of the rain: but human industry has found the means of protecting walls of houses built of it, with a coating of pitch, as a plaster of lime would corrode it. Hence it is, that we have the well-known saying, “that the Carthaginians use pitch for their houses and lime for their wines,” this last being the method used by them in the preparation of their must.

In the territories of Fidenæ and Alba, in the vicinity of Rome, we find other soft kinds of stone; and, in Umbria and Venetia, there is a stone which admits of being cut with the teeth of a saw. These stones are easy to be worked, and are capable of supporting a considerable weight, if they are only kept sheltered from the weather. Rain, however, frost, and dew, split them to pieces, nor can they resist the humidity of the sea-air. The stone of Tibur can stand everything except heat, which makes it crack.

[Detailed table of contents](#)

CHAP. 49.

THE VARIOUS KINDS OF SILEX..

The black silex is in general the best; but in some localities, it is the red, and occasionally the white; as in the Anician quarries at Tarquinii, near Lake Volsinius, for example, and those at Statonia, the stone of which is proof against fire even. These stones, sculptured for monumental purposes, are subject to no deterioration by lapse of time: moulds, too, are made from them, for the purpose of fusing copper. There is a green silex, also, which offers a most powerful resistance to the action of fire, but is never found in any large quantities, and, in all cases, in an isolated form, and not as a constituent part of solid rock. Of the other kinds, the pale silex is but rarely used for erections: being of globular form, it is not liable to injury, but at the same time it is insecure for building purposes, unless it is well braced and tightly held together. Nor yet does river silex offer any greater security, for it always has the appearance of being wet.

Detailed table of contents

CHAP. 50.

OTHER STONES USED FOR BUILDING.

When the nature of stone is doubtful, the proper precaution is, to quarry it in summer, and not to use it for building before the end of a couple of years, leaving it in the meantime to be well seasoned by the weather. The slabs which have been damaged will be found to be better suited for the foundations under ground: while those, on the other hand, which have remained uninjured, may be employed with safety, and exposed to the open air even.

Detailed table of contents

CHAP. 51.

THE VARIOUS METHODS OF BUILDING.

The Greeks construct party-walls, resembling those of brickwork, of hard stone or of silex, squared. This kind of stonework is what they call “isodomon,” it being “pseudisodomon” when the wall is built of materials of unequal dimensions. A third kind of stonework is called “emplecton,” the two exteriors only being made with regularity, the rest of the material being thrown in at random. It is necessary that the stones should lie over one another alternately, in such a way that the middle of one stone meets the point of junction of the two below it; and this, too, in the middle of the wall, if possible; but if not, at all events, at the sides. When the middle of the wall is filled up with broken stones, the work is known as “diatoichon.”

The reticulated kind of building, which is mostly in use at Rome, is very liable to crack. All building should be done by line and rule, and ought to be strictly on the perpendicular.

Detailed table of contents

CHAP. 52. (23.)

CISTERNS.

Cisterns should be made of five parts of pure, gravelly, sand, two of the very strongest quicklime, and fragments of silex not exceeding a pound each in weight; when thus incorporated, the bottom and sides should be well beaten with iron rammers. The best plan, too, is to have the cisterns double; so that all superfluities may settle in the inner cistern, and the water filter through, as pure as possible, into the outer one.

Detailed table of contents

CHAP. 53.

QUICK-LIME.

Cato the Censor disapproves of lime prepared from stones of various colours: that made of white stone is the best. Lime prepared from hard stone is the best for building purposes, and that from porous stone for coats of plaster. For both these purposes, lime made from silex is equally rejected. Stone that has been extracted from quarries furnishes a better lime than that collected from the beds of rivers; but the best of all is the lime that is obtained from the molar-stone, that being of a more unctuous nature than the others. It is something truly marvellous, that quick-lime, after the stone has been subjected to fire, should ignite on the application of water!

[Detailed table of contents](#)

CHAP. 54.

THE VARIOUS KINDS OF SAND. THE COMBINATIONS OF SAND WITH LIME.

There are three kinds of sand: fossil sand, to which one-fourth part of lime should be added; river sand; and sea sand; to both of which last, one third of lime should be added. If, too, one third of the mortar is composed of bruised earthenware, it will be all the better. Fossil sand is found in the districts that lie between the Apennines and the Padus, but not in the parts beyond sea.

Detailed table of contents

CHAP. 55.

DEFECTS IN BUILDING. PLASTERS FOR WALLS.

The great cause of the fall of so many buildings in our City, is, that through a fraudulent abstraction of the lime, the rough work is laid without anything to hold it together. The older, too, the mortar is, the better it is in quality. In the ancient laws for the regulation of building, no contractor was to use mortar less than three months old; hence it is, that no cracks have disfigured the plaster coatings of their walls. These stuccos will never present a sufficiently bright surface, unless there have been three layers of sanded mortar, and two of marbled mortar upon that. In damp localities and places subject to exhalations from the sea, it is the best plan to substitute ground earthenware mortar for sanded mortar. In Greece, it is the practice, first to pound the lime and sand used for plastering, with wooden pestles in a large trough. The test by which it is known that marbled mortar has been properly blended, is its not adhering to the trowel; whereas, if it is only wanted for white-washing, the lime, after being well slaked with water, should stick like glue. For this last purpose, however, the lime should only be slaked in lumps.

At Elis, there is a Temple of Minerva, which was pargetted, they say, by Panænus, the brother of Phidias, with a mortar that was blended with milk and saffron: hence it is, that, even at the present day, when rubbed with spittle on the finger, it yields the smell and flavour of saffron.

Detailed table of contents

CHAP. 56.

COLUMNS. THE SEVERAL KINDS OF COLUMNS.

The more closely columns are placed together, the thicker they appear to be. There are four different kinds of pillars. Those of which the diameter at the foot is one-sixth part of the height, are called Doric. When the diameter is one-ninth, they are Ionic; and when it is one-seventh, Tuscan. The proportions in the Corinthian are the same as those of the Ionic; but they differ in the circumstance that the Corinthian capitals are of the same height as the diameter at the foot, a thing that gives them a more slender appearance; whereas, in the Ionic column, the height of the capital is only one-third of the diameter at the foot. In ancient times the rule was, that the columns should be one-third of the breadth of the temple in height.

It was in the Temple of Diana, at Ephesus, as originally built, that spirals were first placed beneath, and capitals added: and it was determined that the diameter of the shafts should be one-eighth of their height, and that the spirals should be one-half of the diameter in height, the upper extremity of the shaft being one-seventh less in diameter than the foot. In addition to these columns, there are what are called “Attic” columns, quadrangular, and with equal sides.

Detailed table of contents

CHAP. 57. (24.)

FIVE REMEDIES DERIVED FROM LIME.

Lime is also employed very extensively in medicine. For this purpose, fresh lime is selected, which has not been slaked with water. Its properties are caustic, resolvent, and attractive; and it prevents serpiginous ulcers from spreading, being incorporated with vinegar and oil of roses, for the purpose. When this has been effected, it is tempered with wax and oil of roses, and applied to promote cicatrization. In combination with honey, and liquid resin, or hogs' lard, lime is curative of sprains and scrofulous sores.

[Detailed table of contents](#)

CHAP. 58.

MALTHA.

Maltha is a cement prepared from fresh lime; lumps of which are quenched in wine, and then pounded with hogs' lard and figs, both of them, mollifying substances. It is the most tenacious of all cements, and surpasses stone in hardness. Before applying the maltha, the substance upon which it is used must be well rubbed with oil.

[Detailed table of contents](#)

CHAP. 59.

gypsum.

Gypsum has a close affinity with limestone, and there are numerous varieties of it. One kind is prepared from a calcined stone, as in Syria, and at Thurii, for example. In Cyprus and at Perrhæbia, gypsum is dug out of the earth, and at Tymphæ it is found just below the level of the soil. The stone that is calcined for this purpose, ought to be very similar to alabastrites, or else of a grain like that of marble. In Syria, they select the hardest stones for the purpose, and calcine them with cow-dung, to accelerate the process. Experience has proved, however, that the best plaster of all is that prepared from specular-stone, or any other stone that is similarly laminated. Gypsum, when moistened, must be used immediately, as it hardens with the greatest rapidity; it admits, however, of being trituated over again, and so reduced to powder. It is very useful for pargetting, and has a pleasing effect when used for ornamental figures and wreaths in buildings.

There is one remarkable fact connected with this substance; Caius Proculeius, an intimate friend of the Emperor Augustus, suffering from violent pains in the stomach, swallowed gypsum, and so put an end to his existence.

CHAP. 60. (25.)

PAVEMENTS. THE ASAROTOS ŒCOS.

Pavements are an invention of the Greeks, who also practised the art of painting them, till they were superseded by mosaics. In this last branch of art, the highest excellence has been attained by Sosus, who laid, at Pergamus, the mosaic pavement known as the “Asarotos œcos;” from the fact that he there represented, in small squares of different colours, the remnants of a banquet lying upon the pavement, and other things which are usually swept away with the broom, they having all the appearance of being left there by accident. There is a dove also, greatly admired, in the act of drinking, and throwing the shadow of its head upon the water; while other birds are to be seen sunning and pluming themselves, on the margin of a drinking-bowl.

Detailed table of contents

CHAP. 61.

THE FIRST PAVEMENTS IN USE AT ROME.

The first pavements, in my opinion, were those now known to us as barbaric and subtegulan pavements, a kind of work that was beaten down with the rammer: at least if we may form a judgment from the name that has been given to them. The first diamonded pavement at Rome was laid in the Temple of Jupiter Capitolinus, after the commencement of the Third Punic War. That pavements had come into common use before the Cimbric War, and that a taste for them was very prevalent, is evident from the line of Lucilius — “With checquered emblems like a pavement marked.”

Detailed table of contents

CHAP. 62.

TERRACE-ROOF PAVEMENTS.

The Greeks have also invented terrace-roof pavements, and have covered their houses with them; a thing that may easily be done in the hotter climates, but a great mistake in countries where the rain is apt to become congealed. In making these pavements, the proper plan is to begin with two layers of boards, running different ways, and nailed at the extremities, to prevent them from warping. Upon this planking a rough-work must be laid, one-fourth of which consists of pounded pottery: and upon this, another bed of rough-work, two-fifths composed of lime, a foot in thickness, and well beaten down with the rammer. The nucleus is then laid down, a bed six fingers in depth; and upon that, large square stones, not less than a couple of fingers in thickness; an inclination being carefully observed, of an inch and a half to every ten feet. This done, the surface is well rubbed down with a polishing stone. The general opinion is, that oak should never be used for the planking, it being so very liable to warp; and it is considered a good plan to cover the boards with a layer of fern or chaff, that they may be the better able to resist the action of the lime. It is necessary, too, before putting down the planking, to underset it with a bed of round pebbles. Wheat-ear tessellated pavements are laid down in a similar manner.

Detailed table of contents

CHAP. 63.

GRÆCANIC PAVEMENTS.

We must not omit here one other kind of pavement, that known as the “Græcanic.” The ground is well rammed down, and a bed of rough work, or else broken pottery, is then laid upon it. Upon the top of this, a layer of charcoal is placed, well trodden down with a mixture of sand, lime, and ashes; care being taken, by line and rule, to give it a uniform thickness of half a foot. The surface then presents the ordinary appearance of the ground; but if it is well rubbed with the polishing-stone, it will have all the appearance of a black pavement.

Detailed table of contents

CHAP. 64.

AT WHAT PERIOD MOSAIC PAVEMENTS WERE FIRST INVENTED. AT WHAT PERIOD ARCHED ROOFS WERE FIRST DECORATED WITH GLASS.

Mosaic pavements were first introduced in the time of Sylla; at all events, there is still in existence a pavement, formed of small segments, which he ordered to be laid down in the Temple of Fortune, at Præneste. Since his time, these mosaics have left the ground for the arched roofs of houses, and they are now made of glass. This, however, is but a recent invention; for there can be no doubt that, when Agrippa ordered the earthenware walls of the hot baths, in the Thermæ which he was building at Rome, to be painted in encaustic, and had the other parts coated with pargetting, he would have had the arches decorated with mosaics in glass, if the use of them had been known; or, at all events, if from the walls of the Theatre of Scaurus, where it figured, as already stated, glass had by that time come to be used for the arched roofs of apartments. It will be as well, therefore, to give some account, also, of glass.

Detailed table of contents

CHAP. 65. (26.)

THE ORIGIN OF GLASS.

In Syria there is a region known as Phœnice, adjoining to Judæa, and enclosing, between the lower ridges of Mount Carmelus, a marshy district known by the name of Cendebia. In this district, it is supposed, rises the river Belus, which, after a course of five miles, empties itself into the sea near the colony of Ptolemaïs. The tide of this river is sluggish, and the water unwholesome to drink, but held sacred for the observance of certain religious ceremonials. Full of slimy deposits, and very deep, it is only at the reflux of the tide that the river discloses its sands; which, agitated by the waves, separate themselves from their impurities, and so become cleansed. It is generally thought that it is the acridity of the sea-water that has this purgative effect upon the sand, and that without this action no use could be made of it. The shore upon which this sand is gathered is not more than half a mile in extent; and yet, for many ages, this was the only spot that afforded the material for making glass.

The story is, that a ship, laden with nitre, being moored upon this spot, the merchants, while preparing their repast upon the sea-shore, finding no stones at hand for supporting their cauldrons, employed for the purpose some lumps of nitre which they had taken from the vessel. Upon its being subjected to the action of the fire, in combination with the sand of the sea-shore, they beheld transparent streams flowing forth of a liquid hitherto unknown: this, it is said, was the origin of glass.

Detailed table of contents

CHAP. 66.

THE VARIOUS KINDS OF GLASS, AND THE MODE OF MAKING IT.

In process of time, as human industry is ingenious in discovering, it was not content with the combination of nitre, but magnet-stone began to be added as well; from the impression that it attracts liquefied glass as well as iron. In a similar manner, too, brilliant stones of various descriptions came to be added in the melting, and, at last, shells and fossil sand. Some authors tell us, that the glass of India is made of broken crystal, and that, in consequence, there is none that can be compared to it.

In fusing it, light and dry wood is used for fuel, Cyprian copper and nitre being added to the melting, nitre of Ophir more particularly. It is melted, like copper, in contiguous furnaces, and a swarthy mass of an unctuous appearance is the result. Of such a penetrating nature is the molten glass, that it will cut to the very bone any part of the body which it may come near, and that, too, before it is even felt. This mass is again subjected to fusion in the furnace, for the purpose of colouring it; after which, the glass is either blown into various forms, turned in a lathe, or engraved like silver. Sidon was formerly famous for its glass-houses, for it was this place that first invented mirrors.

Such was the ancient method of making glass: but, at the present day, there is found a very white sand for the purpose, at the mouth of the river Volturnus, in Italy. It spreads over an extent of six miles, upon the sea-shore that lies between Cumæ and Liternum, and is prepared for use by pounding it with a pestle and mortar; which done, it is mixed with three parts of nitre, either by weight or measure, and, when fused, is transferred to another furnace. Here it forms a mass of what is called “hammonitrum;” which is again submitted to fusion, and becomes a mass of pure, white, glass. Indeed, at the present day, throughout the Gallic and Spanish provinces even, we find sand subjected to a similar process. In the reign of Tiberius, it is said, a combination was devised which produced a flexible glass; but the manufactory of the artist was totally destroyed, we are told, in order to prevent the value of copper, silver, and gold, from becoming depreciated. This story, however, was, for a long time, more widely spread than well authenticated. But be it as it may, it is of little consequence; for, in the time of the Emperor Nero, there was a process discovered, by which two small glass cups were made, of the kind called “petroti,” the price of which was no less than six thousand sesterces!

CHAP. 67.

OBSIAN GLASS AND OBSIAN STONE.

Among the various kinds of glass, we may also reckon Obsian glass, a substance very similar to the stone which Obsius discovered in Æthiopia. This stone is of a very dark colour, and sometimes transparent; but it is dull to the sight, and reflects, when attached as a mirror to walls, the shadow of the object rather than the image. Many persons use it for jewellery, and I myself have seen solid statues in this material of the late Emperor Augustus, of very considerable thickness. That prince consecrated, in the Temple of Concord, as something marvellous, four figures of elephants made of Obsian stone. Tiberius Cæsar, too, restored to the people of Heliopolis, as an object of ceremonial worship, an image in this stone, which had been found among the property left by one of the præfects of Egypt. It was a figure of Menelaüs; a circumstance which goes far towards proving that the use of this material is of more ancient date than is generally supposed, confounded as it is at the present day with glass, by reason of its resemblance. Xenocrates says that Obsian stone is found in India also, and in Samnium in Italy; and that it is a natural product of Spain, upon the coasts which border on the Ocean.

There is an artificial Obsian stone, made of coloured glass for services for the table; and there is also a glass that is red all through, and opaque, known as “hæmatinum.” A dead white glass, too, is made, as also other kinds in imitation of murrhine colour, hyacinthine, sapphire, and every other tint: indeed, there is no material of a more pliable nature than this, or better suited for colouring. Still, however, the highest value is set upon glass that is entirely colourless and transparent, as nearly as possible resembling crystal, in fact. For drinking-vessels, glass has quite superseded the use of silver and gold; but it is unable to stand heat unless a cold liquid is poured in first. And yet, we find that globular glass vessels, filled with water, when brought in contact with the rays of the sun, become heated to such a degree as to cause articles of clothing to ignite. When broken, too, glass admits of being joined by the agency of heat; but it cannot be wholly fused without being pulverized into small fragments, as we see done in the process of making the small checquers, known as “abaculi,” for mosaic work; some of which are of variegated colours, and of different shapes. If glass is fused with sulphur, it will become as hard as stone.

CHAP. 68. (27.)

MARVELLOUS FACTS CONNECTED WITH FIRE.

Having now described all the creations of human ingenuity, reproductions, in fact, of Nature by the agency of art, it cannot but recur to us, with a feeling of admiration, that there is hardly any process which is not perfected through the intervention of fire. Submit to its action some sandy soil, and in one place it will yield glass, in another silver, in another minium, and in others, again, lead and its several varieties, pigments, and numerous medicaments. It is through the agency of fire that stones are melted into copper; by fire that iron is produced, and subdued to our purposes; by fire that gold is purified; by fire, too, that the stone is calcined, which is to hold together the walls of our houses.

Some materials, again, are all the better for being repeatedly submitted to the action of fire; and the same substance will yield one product at the first fusion, another at the second, and another at the third. Charcoal, when it has passed through fire and has been quenched, only begins to assume its active properties; and, when it might be supposed to have been reduced to annihilation, it is then that it has its greatest energies. An element this, of immense, of boundless power, and, as to which, it is a matter of doubt whether it does not create even more than it destroys!

[Detailed table of contents](#)

CHAP. 69.

THREE REMEDIES DERIVED FROM FIRE AND FROM ASHES.

Fire even has certain medicinal virtues of its own. When pestilences prevail, in consequence of the obscuration of the sun, it is a well-known fact, that if fires are lighted, they are productive of beneficial results in numerous ways. Empedocles and Hippocrates have proved this in several passages.

“For convulsions or contusions of the viscera,” says M. Varro — for it is his own words that I use— “let the hearth be your medicine-box; for lie of ashes, taken from thence, mixed with your drink, will effect a cure. Witness the gladiators, for example, who, when disabled at the Games, refresh themselves with this drink.” Carbuncle too, a kind of disease which, as already stated, has recently carried off two persons of consular rank, admits of being successfully treated with oak-charcoal, triturated with honey. So true is it that things which are despised even, and looked upon as so utterly destitute of all virtues, have still their own remedial properties, charcoal and ashes for example.

CHAP. 70.

PRODIGIES CONNECTED WITH THE HEARTH.

I must not omit too, one portentous fact connected with the hearth, and famous in Roman history. In the reign of Tarquinius Priscus, it is said, there appeared upon his hearth a resemblance of the male generative organ in the midst of the ashes. The captive Ocrisia, a servant of Queen Tanaquil, who happened to be sitting there, arose from her seat in a state of pregnancy, and became the mother of Servius Tullius, who eventually succeeded to the throne. It is stated, too, that while the child was sleeping in the palace, a flame was seen playing round his head; the consequence of which was, that it was believed that the Lar of the household was his progenitor. It was owing to this circumstance, we are informed, that the Compitalia, games in honour of the Lares, were instituted.

SUMMARY. — Remedies mentioned, eighty-nine. Facts and narratives, four hundred and thirty-four.

ROMAN AUTHORS QUOTED. — M. Varro, Cælius, Galba, Cincius, Mucianus, Nepos Cornelius, L. Piso, Q. Tubero, Fabius Vestalis, Annius Fætialis, Fabianus, Seneca, Cato the Censor, Vitruvius.

FOREIGN AUTHORS QUOTED. — Theophrastus, Pasiteles, King Juba, Nicander, Sotacus, Sudines, Alexander Polyhistor, Apion, Plistonius, Duris, Herodotus, Euhemerus, Aristagoras, Dionysius, Artemidorus, Butoridas, Antisthenes, Demetrius, Demoteles, Lyceas.

BOOK XXXVII. THE NATURAL HISTORY OF PRECIOUS STONES.

Detailed table of contents

CHAP. 1. (1.)

THE FIRST USE OF PRECIOUS STONES.

THAT nothing may be wanting to the work which I have undertaken, it still remains for me to speak of precious stones: a subject in which the majestic might of Nature presents itself to us, contracted within a very limited space, though, in the opinion of many, nowhere displayed in a more admirable form. So great is the value that men attach to the multiplied varieties of these gems, their numerous colours, their constituent parts, and their singular beauty, that, in the case of some of them, it is looked upon as no less than sacrilege to engrave them, for signets even, the very purpose for which, in reality, they were made. Others, again, are regarded as beyond all price, and could not be valued at any known amount of human wealth; so much so that, in the case of many, it is quite sufficient to have some single gem or other before the eyes, there to behold the supreme and absolute perfection of Nature's work.

We have already stated, to some extent, when speaking on the subject of gold and rings, how the use of precious stones first originated, and from what beginnings this admiration of them has now increased to such an universal passion. According to fabulous lore, the first use of them was suggested by the rocks of Caucasus, in consequence of an unhappy interpretation which was given to the story of the chains of Prometheus: for we are told by tradition, that he enclosed a fragment of this stone in iron, and wore it upon his finger; such being the first ring and the first jewel known.

Detailed table of contents

CHAP. 2.

THE JEWEL OF POLYCRATES.

With a beginning such as this, the value set upon precious stones increased to such a boundless extent, that Polycrates, the tyrant of Samos, who ruled over the islands and the adjacent shores, when he admitted that his good fortune had been too great, deemed it a sufficient expiation for all this enjoyment of happiness, to make a voluntary sacrifice of a single precious stone; thinking thereby to balance accounts with the inconstancy of fortune, and, by this single cause for regret, abundantly to buy off every ill-will she might entertain. Weary, therefore, of his continued prosperity, he embarked on board a ship, and, putting out to sea, threw the ring which he wore into the waves. It so happened, however, that a fish of remarkable size, one destined for the table of a king, swallowed the jewel, as it would have done a bait; and then, to complete the portentous omen, restored it again to the owner in the royal kitchen, by the ruling hand of a treacherous fortune.

The stone in this ring, it is generally agreed, was a sardonyx, and they still show one at Rome, which, if we believe the story, was this identical stone. It is enclosed in a horn of gold, and was deposited, by the Emperor Augustus, in the Temple of Concord, where it holds pretty nearly the lowest rank among a multitude of other jewels that are preferable to it.

Detailed table of contents

CHAP. 3.

THE JEWEL OF PYRRBUS.

Next in note after this ring, is the jewel that belonged to another king, Pyrrhus, who was so long at war with the Romans. It is said that there was in his possession an agate, upon which were to be seen the Nine Muses and Apollo holding a lyre; not a work of art, but the spontaneous produce of Nature, the veins in it being so arranged that each of the Muses had her own peculiar attribute.

With the exception of these two jewels, authors make no mention of any others that have been rendered famous. We only find it recorded by them, that Ismenias the flute-player was in the habit of displaying great numbers of glittering stones, a piece of vanity, on his part, which gave occasion to the following story. An emerald, upon which was engraved a figure of Amymone, being offered for sale in the Isle of Cyprus at the price of six golden denarii, he gave orders to purchase it. The dealer however, reduced the price, and returned two denarii; upon which, Ismenias remarked— “By Hercules! he has done me but a bad turn in this, for the merit of the stone has been greatly impaired by this reduction in price.”

It seems to have been this Ismenias who introduced the universal practice among musicians of proclaiming their artistic merit by this kind of ostentation. Thus Dionysodorus, for instance, his contemporary and rival, imitated his example, in order that he might not appear to be his inferior in skill; whereas, in reality, he only held the third rank among the musicians of that day. Nicomachus, too, it is said, was the possessor of great numbers of precious stones, though selected with but little taste. In mentioning these illustrations, by way of prelude to this Book, it is by no means improbable that they may have the appearance of being addressed to those, who, piquing themselves upon a similar display, become puffed up with a vanity which is evidently much more appropriate to a performer on the flute.

Detailed table of contents

CHAP. 4.

WHO WERE THE MOST SKILFUL LAPIDARIES. THE FINEST SPECIMENS OF ENGRAVING ON PRECIOUS STONES.

The stone of the ring which is now shown as that of Polycrates, is untouched and without engraving. In the time of Ismenias, long after his day, it would appear to have become the practice to engrave smaragdi even; a fact which is established by an edict of Alexander the Great, forbidding his portrait to be cut upon this stone by any other engraver than Pyrgoteles, who, no doubt, was the most famous adept in this art. Since his time, Apollonides and Cronius have excelled in it; as also Dioscurides, who engraved a very excellent likeness of the late Emperor Augustus upon a signet, which, ever since, the Roman emperors have used. The Dictator Sylla, it is said, always made use of a seal which represented the surrender of Jugurtha. Authors inform us also, that the native of Intercatia, whose father challenged Scipio Æmilianus, and was slain by him, was in the habit of using a signet with a representation of this combat engraved upon it; a circumstance which gave rise to the well-known joke of Stilo Præconinus, who naively enquired, what he would have done if Scipio had been the person slain?

The late Emperor Augustus was in the habit, at first, of using the figure of a Sphinx for his signet; having found two of them, among the jewels of his mother, that were perfectly alike. During the Civil Wars, his friends used to employ one of these signets, in his absence, for sealing such letters and edicts as the circumstances of the times required to be issued in his name; it being far from an unmeaning pleasantry on the part of those who received these missives, that the Sphinx always brought its enigmas with it. The frog, too, on the seal of Mæcenus, was held in great terror, by reason of the monetary imposts which it announced. At a later period, with the view of avoiding the sarcasms relative to the Sphinx, Augustus made use of a signet with a figure upon it of Alexander the Great.

Detailed table of contents

CHAP. 5.

THE FIRST DACTYLIOTHECÆ AT ROME.

A collection of precious stones bears the foreign name of “dactyliotheca.” The first person who possessed one at Rome was Scaurus, the step-son of Sylla; and, for a long time, there was no other such collection there, until at length Pompeius Magnus consecrated in the Capitol, among other donations, one that had belonged to King Mithridates; and which, as M. Varro and other authors of that period assure us, was greatly superior to that of Scaurus. Following his example, the Dictator Cæsar consecrated six dactyliothecæ in the Temple of Venus Genetrix; and Marcellus, the son of Octavia, presented one to the Temple of the Palatine Apollo.

Detailed table of contents

CHAP. 6.

JEWELS DISPLAYED AT ROME IN THE TRIUMPH OF POMPEIUS MAGNUS.

But it was this conquest by Pompeius Magnus that first introduced so general a taste for pearls and precious stones; just as the victories, gained by L. Scipio and Cneius Manlius, had first turned the public attention to chased silver, Attalic tissues, and banquetting-couches decorated with bronze; and the conquests of L. Mummius had brought Corinthian bronzes and pictures into notice.

(2.) To prove more fully that this was the case, I will here give the very words of the public Registers with reference to the triumphs of Pompeius Magnus. On the occasion of his third triumph, over the Pirates and over the Kings and nations of Asia and Pontus that have been already enumerated in the Seventh Book of this work, M. Piso and M. Messala being consuls, on the day before the calends of October, the anniversary of his birth, he displayed in public, with its pieces, a chess-board, made of two precious stones, three feet in width by two in length — and to leave no doubt that the resources of Nature do become exhausted, I will here observe, that no precious stones are to be found at the present day, at all approaching such dimensions as these; as also that there was upon this board a moon of solid gold, thirty pounds in weight! — three banquetting-couches; vessels for nine waiters, in gold and precious stones; three golden statues of Minerva, Mars, and Apollo; thirty-three crowns adorned with pearls; a square mountain of gold, with stags upon it, lions, and all kinds of fruit, and surrounded with a vine of gold; as also a musæum, adorned with pearls, with an horologe upon the top of it.

There was a likeness also in pearls of Pompeius himself, his noble countenance, with the hair thrown back from the forehead, delighting the eye. Yes, I say, those frank features, so venerated throughout all nations, were here displayed in pearls! the severity of our ancient manners being thus subdued, and the display being more the triumph of luxury than the triumph of conquest. Never, most assuredly, would Pompeius have so long maintained his surname of “Magnus” among the men of that day, if on the occasion of his first conquest his triumph had been such as this. Thy portrait in pearls, O Magnus! those resources of prodigality, that have been discovered for the sake of females only! Thy portrait in pearls, refinements in luxury, which the Roman laws would not have allowed thee to wear even! And was it in this way that thy value must be appreciated? Would not that trophy have given a more truthful likeness of thee which thou hadst erst erected upon the Pyrenæan mountain heights? Assuredly such a portrait as this had been no less than a downright ignominy and disgrace, were we not bound to behold in it a menacing presage of the anger of the gods, and to see foreshadowed thereby the time when that head, now laden with the wealth of the East, was to be

displayed, severed from the body.

But in other respects, how truly befitting the hero was this triumph! To the state, he presented two thousand millions of sesterces; to the legati and quæstors who had exerted themselves in defence of the sea coast, he gave one thousand millions of sesterces; and to each individual soldier, six thousand sesterces. He has rendered, however, comparatively excusable the Emperor Caius, who, in addition to other feminine luxuries, used to wear shoes adorned with pearls; as also the Emperor Nero, who used to adorn his sceptres with masks worked in pearls, and had the couches, destined for his pleasures, made of the same costly materials. Nay, we have no longer any right, it would seem, to censure the employment of drinking-cups adorned with precious stones, of various other articles in daily use that are similarly enriched, and of rings that sparkle with gems: for what species of luxury can there be thought of, that was not more innocent in its results than this on the part of Pompeius?

[Detailed table of contents](#)

CHAP. 7.

AT WHAT PERIOD MURRHINE VESSELS WERE FIRST INTRODUCED AT ROME.
INSTANCES OF LUXURY IN REFERENCE TO THEM.

It was the same conquest, too, that first introduced murrhine vessels at Rome; Pompeius being the first to dedicate, at the conclusion of this triumph, vases and cups, made of this material, in the Temple of Jupiter Capitolinus: a circumstance which soon brought them into private use, waiters, even, and eating-utensils made of murrhine being in great request. This species of luxury, too, is daily on the increase, a single cup, which would hold no more than three sextarii, having been purchased at the price of seventy thousand sesterces. A person of consular rank, who some years ago used to drink out of this cup, grew so passionately fond of it, as to gnaw its edges even, an injury, however, which has only tended to enhance its value: indeed there is now no vessel in murrhine that has ever been estimated at a higher figure than this. We may form some opinion how much money this same personage swallowed up in articles of this description, from the fact that the number of them was so great, that, when the Emperor Nero deprived his children of them, and they were exposed to public view, they occupied a whole theatre to themselves, in the gardens beyond the Tiber; a theatre which was found sufficiently large even, for the audience that attended on the occasion when Nero rehearsed his musical performances before his appearance in the Theatre of Pompeius. It was at this exhibition, too, that I saw counted the broken fragments of a single cup, which it was thought proper to preserve in an urn and display, I suppose, with the view of exciting the sorrows of the world, and of exposing the cruelty of fortune; just as though it had been no less than the body of Alexander the Great himself!

T. Petronius, a personage of consular rank, intending, from his hatred of Nero, to disinherit the table of that prince, broke a murrhine basin, which had cost him no less than three hundred thousand sesterces. But Nero himself, as it was only proper for a prince to do, surpassed them all, by paying one million of sesterces for a single cup: a fact well worthy of remembrance, that an emperor, the father of his country, should have drunk from a vessel of such costly price!

Detailed table of contents

CHAP. 8.

THE NATURE OF MURRHINE VESSELS.

Murrhine vessels come from the East, in numerous localities of which, remarkable for nothing else, they are to be found. It is in the empire of the Parthians, more particularly, that they are met with, though those of the very finest quality come to us from Carmania. It is generally thought that these vessels are formed of a moist substance, which under ground becomes solidified by heat. In size they never exceed a small waiter, and, as to thickness, they rarely admit of being used as drinking-cups, so large as those already mentioned. The brightness of them is destitute of strength, and it may be said that they are rather shining than brilliant. But the chief merit of them is the great variety of their colours, and the wreathed veins, which, every here and there, present shades of purple and white, with a mixture of the two; the purple gradually changing, as it were, to a fiery red, and the milk-white assuming a ruddy hue. Some persons praise the edges of these vessels more particularly, with a kind of reflection in the colours, like those beheld in the rain-bow. Others, again, are more pleased with them when quite opaque, it being considered a demerit when they are at all transparent, or of a pallid hue. The appearance, too, of crystals in them is highly prized, and of spots that look like warts; not prominent, but depressed, as we mostly see upon the human body. The perfume, too, of which they smell, is looked upon as an additional recommendation.

Detailed table of contents

CHAP. 9.

THE NATURE OF CRYSTAL.

It is a diametrically opposite cause to this that produces crystal, a substance which assumes a concrete form from excessive congelation. At all events, crystal is only to be found in places where the winter snow freezes with the greatest intensity; and it is from the certainty that it is a kind of ice, that it has received the name which it bears in Greek. The East, too, sends us crystal, there being none preferred to the produce of India. It is to be found, also, in Asia, that of the vicinity of Alabanda, Orthosia, and the neighbouring mountains, being held in a very low degree of esteem. In Cyprus, also, there is crystal, but that found upon the Alpine heights in Europe is, in general, more highly valued. According to Juba, there is crystal in a certain island of the Red Sea, opposite the coast of Arabia, called “Necron;” as, also, in another neighbouring island which produces the precious stone known as the “topazus;” where a block of crystal was extracted, he says, by Pythagoras, the præfect of King Ptolemaeus, no less than a cubit in length.

Cornelius Bocchus informs us that in Lusitania, there have been blocks of crystal found, of extraordinary weight, in sinking shafts in the Ammiensian mountains there, to a water-level for the supply of wells. It is a marvellous fact, stated by Xenocrates of Ephesus, that in Asia and in the Isle of Cyprus, crystal is turned up by the plough; it having been the general belief that it is never to be found in terreous soils, and only in rocky localities. That is much more probable which the same Xenocrates tells us, when he says that the mountain streams often bring down with them fragments of crystal. Sudines says, that crystal is only to be found in localities that face the south, a thing that is known to be really the fact: indeed, it is never found in humid spots, however cold the climate may be, even though the rivers there freeze to the very bottom. Rain-water and pure snow are absolutely necessary for its formation, and hence it is, that it is unable to endure heat, being solely employed for holding liquids that are taken cold. From the circumstance of its being hexagonal and hexahedral, it is not easy to penetrate this substance; and the more so, as the pyramidal terminations do not always have the same appearance. The polish on its faces is so exquisite, that no art can possibly equal it.

Detailed table of contents

CHAP. 10.

LUXURY DISPLAYED IN THE USE OF CRYSTAL. REMEDIES DERIVED FROM CRYSTAL.

The largest block of crystal that has ever been beheld by us, is the one that was consecrated by Julia Augusta in the Capitol, and which weighed about one hundred and fifty pounds. Xenocrates speaks of having seen a vase of crystal, which held one amphora, and we find other writers mentioning a vessel from India which held four sextarii. For my own part, I can positively say, that there is crystal amid the crags of the Alps, so difficult of access, that it is usually found necessary to be suspended by ropes in order to extract it. Persons who are experienced in the matter detect its presence by certain signs and indications.

Crystal is subject to numerous defects, sometimes presenting a rough, solder-like, substance, or else clouded by spots upon it; while occasionally it contains some hidden humour within, or is traversed by hard and brittle knurrs, which are known as “salt grains.” Some crystal, too, has a red rust upon it, while, in other instances, it contains filaments that look like flaws, a defect which artists conceal by engraving it. But where crystals are entirely free from defect, they are preferred uncut; in which case, they are known as “acenteta,” and have the colour, not of foam, but of limpid water. In the last place, the weight of crystals is a point which is taken into consideration.

I find it stated by medical men that the very best cautery for the human body is a ball of crystal acted upon by the rays of the sun. This substance, too, has been made the object of a mania; for, not many years ago, a mistress of a family, who was by no means very rich, gave one hundred and fifty thousand sesterces for a single basin made of crystal. Nero, on receiving tidings that all was lost, in the excess of his fury, dashed two cups of crystal to pieces; this being his last act of vengeance upon his fellow-creatures, preventing any one from ever drinking again from these vessels. Crystal, when broken, cannot by any possibility be mended. Vessels in glass have been brought to a marvellous degree of resemblance to crystal; and yet, wonderful to say, they have only tended to enhance the value of crystal, and in no way to depreciate it.

CHAP. 11.

AMBER: THE MANY FALSEHOODS THAT HAVE BEEN TOLD ABOUT IT.

Next in rank among the objects of luxury, we have amber; an article which, for the present, however, is in request among women only. All these three last-mentioned substances hold the same rank, no doubt, as precious stones; the two former for certain fair reasons; crystal, because it is adapted for taking cool drinks, and murrhine vessels, for taking drinks that are either hot or cold. But as for amber, luxury has not been able, as yet, to devise any justification for the use of it. This is a subject which affords us an excellent opportunity of exposing some of the frivolities and falsehoods of the Greeks; and I beg that my readers will only have patience with me while I do so, it being really worth while, for our own practical improvement, to become acquainted with the marvellous stories which they have promulgated respecting amber.

After Phaëthon had been struck by lightning, his sisters, they tell us, became changed into poplars, which every year shed their tears upon the banks of the Eridanus, a river known to us as the "Padus." To these tears was given the name of "electrum," from the circumstance that the Sun was usually called "elector." Such is the story, at all events, that is told by many of the poets, the first of whom were, in my opinion, Æschylus, Philoxenus, Euripides, Satyrus, and Nicander; and the falsity of which is abundantly proved upon the testimony of Italy itself. Those among the Greeks who have devoted more attention to the subject, have spoken of certain islands in the Adriatic Sea, known as the "Electrides," and to which the Padus, they say, carries down electrum. It is the fact, however, that there never were any islands there so called, nor, indeed, any islands so situate as to allow of the Padus carrying down anything in its course to their shores. As to Æschylus placing the Eridanus in Iberia, or, in other words, in Spain, and giving it the name of Rhodanus; and as to Euripides and Apollonius representing the Rhodanus and the Padus as discharging themselves by one common mouth on the shores of the Adriatic; we can forgive them all the more readily for knowing nothing about amber when they betray such monstrous ignorance of geography.

Other writers, again, who are more guarded in their assertions, have told us, though with an equal degree of untruthfulness, that, at the extremity of the Adriatic Gulf, upon certain inaccessible rocks there, there are certain trees which shed their gum at the rising of the Dog-Star. Theophrastus has stated that amber is extracted from the earth in Liguria; Chares, that Phaëthon died in the territory of Hammon, in Æthiopia, where there is a temple of his and an oracle, and where amber is produced; Philemon, that it is a fossil substance, and that it is found in two different localities in Scythia, in one of which it is of a white and waxen colour, and is known as "electrum;" while in the other it

is red, and is called "sualiternicum." Demonstratus calls amber "lyncurion," and he says that it originates in the urine of the wild beast known as the "lynx;" that voided by the male producing a red and fiery substance, and that by the female an amber of a white and less pronounced colour: he also informs us that by some persons it is called "langurium," and that in Italy, there are certain wild beasts known as "languri." Zenothemis, however, calls these wild beasts "langæ," and gives the banks of the river Padus as their locality. Sudines says, that it is a tree in reality, that produces amber, and that, in Etruria, this tree is known by the name of "lynx;" an opinion which is also adopted by Metrodorus. Sotacus expresses a belief that amber exudes from certain stones in Britannia, to which he gives the name of "electrides." Pytheas says that the Gutones, a people of Germany, inhabit the shores of an æstuary of the Ocean called Mentonomon, their territory extending a distance of six thousand stadia; that, at one day's sail from this territory, is the Isle of Abalus, upon the shores of which, amber is thrown up by the waves in spring, it being an excretion of the sea in a concrete form; as, also, that the inhabitants use this amber by way of fuel, and sell it to their neighbours, the Teutones. Timæus, too, is of the same belief, but he has given to the island the name of Basilia.

Philemon says that electrum does not yield a flame. Nicias, again, will have it, that it is a liquid produced by the rays of the sun; and that these rays, at the moment of the sun's setting, striking with the greatest force upon the surface of the soil, leave upon it an unctuous sweat, which is carried off by the tides of the Ocean, and thrown up upon the shores of Germany. He states, also, that in Egypt it is similarly produced, and is there called "sacal;" that it is found in India, too, where it is held as a preferable substitute for frankincense; and that in Syria the women make the whirls of their spindles of this substance, and give it the name of "harpax," from the circumstance that it attracts leaves towards it, chaff, and the light fringe of tissues. According to Theochrestus, amber is thrown up by the tides of the Ocean, at the foot of the Pyrenæan range; an opinion adopted also by Xenocrates. Asarubas, who has written the most recently upon these subjects, and is still living, informs us, that near the shores of the Atlantic is Lake Cephisis, known to the Mauri by the name of "Electrum;" and that when this lake is dried up by the sun, the slime of it produces amber, which floats upon the surface. Mnaseas speaks of a locality in Africa called Sicyon, and of a river Crathis there, which discharges itself from a lake into the Ocean, the banks of which are frequented by birds which he calls "meleagrides" and "penelopes:" it is here that, according to him, electrum is produced, in manner above mentioned. Theomenes says that near the Greater Syrtis are the Gardens of the Hesperides, and Lake Electrum: on the banks, he says, are poplars, from the summits of which amber falls into the water below, where it is gathered by the maidens of the Hesperides.

Ctesias asserts that there is in India a river called Hypobarus, a word which signifies "bearer of all good things;" that this river flows from the north into

the Eastern Ocean, where it discharges itself near a mountain covered with trees which produce electrum; and that these trees are called "sīptachoræ," the meaning of which is "intense sweetness." Mithridates says, that off the shores of Germany there is an island called "Serita," covered with a kind of cedar, from which amber falls upon the rocks. According to Xenocrates, this substance is called, in Italy, not only "succinum," but "thieum" as well, the Scythian name of it, for there also it is to be found, being "sacrium:" others, he says, are of opinion that it is a product of Numidia. But the one that has surpassed them all is Sophocles, the tragic poet; a thing that indeed surprises me, when I only consider the surpassing gravity of his lofty style, the high repute that he enjoyed in life, his elevated position by birth at Athens, his various exploits, and his high military command. According to him, amber is produced in the countries beyond India, from the tears that are shed for Meleager, by the birds called "meleagrides!" Who can be otherwise than surprised that he should have believed such a thing as this, or have hoped to persuade others to believe it? What child, too, could possibly be found in such a state of ignorance as to believe that birds weep once a year, that their tears are so prolific as this, or that they go all the way from Greece, where Meleager died, to India to weep? "But then," it will be said, "do not the poets tell many other stories that are quite as fabulous?" Such is the fact, no doubt, but for a person seriously to advance such an absurdity with reference to a thing so common as amber, which is imported every day and so easily proves the mendacity of this assertion, is neither more nor less than to evince a supreme contempt for the opinions of mankind, and to assert with impunity an intolerable falsehood.

(3.) There can be no doubt that amber is a product of the islands of the Northern Ocean, and that it is the substance by the Germans called "glæsum;" for which reason the Romans, when Germanicus Cæsar commanded the fleet in those parts, gave to one of these islands the name of Glæsaria, which by the barbarians was known as Austeravia. Amber is produced from a marrow discharged by trees belonging to the pine genus, like gum from the cherry, and resin from the ordinary pine. It is a liquid at first, which issues forth in considerable quantities, and is gradually hardened by heat or cold, or else by the action of the sea, when the rise of the tide carries off the fragments from the shores of these islands. At all events, it is thrown up upon the coasts, in so light and voluble a form that in the shallows it has all the appearance of hanging suspended in the water. Our forefathers, too, were of opinion that it is the juice of a tree, and for this reason gave it the name of "succinum:" and one great proof that it is the produce of a tree of the pine genus, is the fact that it emits a pine-like smell when rubbed, and that it burns, when ignited, with the odour and appearance of torch-pine wood.

Amber is imported by the Germans into Pannonia, more particularly; from whence the Veneti, by the Greeks called Eneti, first brought it into general notice, a people in the vicinity of Pannonia, and dwelling on the shores of the

Adriatic Sea. From this it is evident how the story which connects it with the Padus first originated; and at the present day we see the female peasantry in the countries that lie beyond that river wearing necklaces of amber, principally as an ornament, no doubt, but on account of its remedial virtues as well; for amber, it is generally believed, is good for affections of the tonsillary glands and fauces, the various kinds of water in the vicinity of the Alps being apt to produce disease in the human throat.

From Carnuntum in Pannonia, to the coasts of Germany from which the amber is brought, is a distance of about six hundred miles, a fact which has been only very recently ascertained; and there is still living a member of the equestrian order, who was sent thither by Julianus, the manager of the gladiatorial exhibitions for the Emperor Nero, to procure a supply of this article. Traversing the coasts of that country and visiting the various markets there, he brought back amber, in such vast quantities, as to admit of the nets, which are used for protecting the podium against the wild beasts, being studded with amber.

The arms too, the litters, and all the other apparatus, were, on one day, decorated with nothing but amber, a different kind of display being made each day that these spectacles were exhibited. The largest piece of amber that this personage brought to Rome was thirteen pounds in weight.

That amber is found in India too, is a fact well ascertained. Archelaüs, who reigned over Cappadocia, says that it is brought from that country in the rough state, and with the fine bark still adhering to it, it being the custom there to polish it by boiling it in the grease of a sucking-pig. One great proof that amber must have been originally in a liquid state, is the fact that, owing to its transparency, certain objects are to be seen within, ants for example, gnats, and lizards. These, no doubt, must have first adhered to it while liquid, and then, upon its hardening, have remained enclosed within.

Detailed table of contents

CHAP. 12.

THE SEVERAL KINDS OF AMBER: THE REMEDIES DERIVED FROM IT.

There are several kinds of amber. The white is the one that has the finest odour; but neither this nor the wax-coloured amber is held in very high esteem. The red amber is more highly valued; and still more so, when it is transparent, without presenting too brilliant and igneous an appearance. For amber, to be of high quality, should present a brightness like that of fire, but not flakes resembling those of flame. The most highly esteemed amber is that known as the "Falernian," from its resemblance to the colour of Falernian wine; it is perfectly transparent, and has a softened, transparent, brightness. Other kinds, again, are valued for their mellowed tints, like the colour of boiled honey in appearance. It ought to be known, however, that any colour can be imparted to amber that may be desired, it being sometimes stained with kid-suet and root of alkanet; indeed, at the present day, amber is dyed purple even. When a vivifying heat has been imparted to it by rubbing it between the fingers, amber will attract chaff, dried leaves, and thin bark, just in the same way that the magnet attracts iron. Pieces of amber, steeped in oil, burn with a more brilliant and more lasting flame than pith of flax.

So highly valued is this as an object of luxury, that a very diminutive human effigy, made of amber, has been known to sell at a higher price than living men even, in stout and vigorous health. This single ground for censure, however, is far from being sufficient; in Corinthian objects of vertu, it is the copper that recommends them, combined with silver and gold; and in embossed works it is the skill and genius of the artist that is so highly esteemed. We have already said what it is that recommends vessels of murrhine and of crystal; pearls, too, are of use for wearing upon the head, and gems upon the fingers. In the case of all other luxuries, in fact, it is either a spirit of ostentation or some utility that has been discovered in them that pleads so strongly in their behalf; but in that of amber we have solely the consciousness that we are enjoying a luxury, and nothing more. Domitius Nero, among the other portentous extravagances of his life, bestowed this name upon the ringlets of his wife Poppæa, and, in certain verses of his, he has even gone so far as to call them "succini." As fine names, too, are never wanting for bodily defects, a third tint has been introduced of late for hair among our ladies, under the name of "amber-colour."

Amber, however, is not without its utility in a medicinal point of view; though it is not for this reason that the women are so pleased with it. It is beneficial for infants also, attached to the body in the form of an amulet; and, according to Callistratus, it is good for any age, as a preventive of delirium and as a cure for strangury, either taken in drink or attached as an amulet to the body. This last author, too, has invented a new variety of amber; giving

the name of “chryselectrum” to an amber of a golden colour, and which presents the most beautiful tints in the morning. This last kind attracts flame, too, with the greatest rapidity, and, the moment it approaches the fire, it ignites. Worn upon the neck, he says, it is a cure for fevers and other diseases, and, triturated with honey and oil of roses, it is good for maladies of the ears. Beaten up with Attic honey, it is good for dimness of sight; and the powder of it, either taken by itself or with gum mastich in water, is remedial for diseases of the stomach. Amber, too, is greatly in request for the imitation of the transparent precious stones, amethystos in particular: for, as already stated, it admits of being dyed of every colour.

CHAP. 13.

LYNCURIUM: TWO ASSERTED REMEDIES.

The pertinacity that has been displayed by certain authors compels me to speak of lyncurium next; for even those who maintain that it is not a variety of amber, still assure us that it is a precious stone. They assert, too, that it is a product of the urine of the lynx and of a kind of earth, the animal covering up the urine the moment it has voided it, from a jealousy that man should gain possession of it; a combination which hardens into stone. The colour of it, they inform us, like that of some kinds of amber, is of a fiery hue, and it admits, they say, of being engraved. They assert, too, that this substance attracts to itself not only leaves or straws, but thin plates of copper even or of iron; a story which Theophrastus even believes, on the faith of a certain Diocles.

For my own part, I look upon the whole of these statements as untrue, and I do not believe that in our time there has ever been a precious stone seen with such a name as this. I regard, too, the assertions that have been made as to its medicinal properties, as equally false; to the effect that, taken in drink, it disperses urinary calculi, and that, taken in wine, or only looked at, it is curative of jaundice.

CHAP. 14.

THE VARIOUS PRECIOUS STONES, CLASSIFIED ACCORDING TO THEIR PRINCIPAL COLOURS.

We will now proceed to speak of the various kinds of precious stones, the existence of which is generally admitted, beginning with those which are the most highly esteemed. Nor shall we content ourselves with doing this only; but, with the view of consulting the general welfare of mankind, we shall also refute the infamous lies that have been promulgated by the magicians: for it is with reference to precious stones, more particularly, that they have circulated most of their fabulous stories, stepping, under that most alluring guise of ascertaining remedial virtues, beyond all bounds, and entering the region of the marvellous.

Detailed table of contents

CHAP. 15. (4.)

ADAMAS: SIX VARIETIES OF IT. TWO REMEDIES.

The substance that possesses the greatest value, not only among the precious stones, but of all human possessions, is adamas; a mineral which, for a long time, was known to kings only, and to very few of them. Such was the name given to a nodosity of gold, sometimes, though but rarely, found in the mines, in close proximity with gold, and only there to be found, it was thought. The ancients supposed that adamas was only to be discovered in the mines of Æthiopia, between the Temple of Mercury and the island of Meroë; and they have informed us that it was never larger than a cucumber-seed, or differing at all from it in colour.

At the present day, for the first time, there are no less than six different varieties of it recognized. The Indian adamas is found, not in a stratum of gold, but in a substance of a kindred nature to crystal; which it closely resembles in its transparency and its highly polished hexangular and hexahedral form. In shape it is turbinated, running to a point at either extremity, and closely resembling, marvellous to think of, two cones united at the base. In size, too, it is as large even as a hazel-nut. Resembling that of India, is the adamas of Arabia, which is found in a similar bed, but not so large in size. Other varieties have a pallid hue like that of silver, and are only to be found in the midst of gold of the very finest quality. These stones are tested upon the anvil, and will resist the blow to such an extent, as to make the iron rebound and the very anvil split asunder. Indeed its hardness is beyond all expression, while at the same time it quite sets fire at defiance and is incapable of being heated; owing to which indomitable powers it is, that it has received the name which it derives from the Greek.

One kind, about as large as a grain of millet in size, has been called “cenchros,” and another, that is found in the gold mines at Philippi, is known as the “Macedonian” adamas: this last is about as large as a cucumber-seed in size. We next come to the Cyprian adamas, so called from its being found in the Isle of Cyprus: it is of a colour somewhat inclining to that of copper, but, in reference to its medicinal virtues, of which we shall have to make further mention, it is the most efficacious of them all. Next in succession to this we have siderites, a stone which shines like iron, and is more ponderous than any of the others, but differs in its properties from them all. For it breaks when struck by the hammer, and admits of being perforated by other kinds of adamas; a thing which is the case, also, with that of Cyprus: in short, these two are degenerate stones, and only bear the name of “adamas” for the purpose of enhancing their value.

Now with reference to those affinities and repugnances which exist between certain objects, known to the Greeks as “sympathia” and

“antipathia,” phænomena to which we have endeavoured to draw attention throughout these books, they nowhere manifest themselves with greater distinctness than here. This indomitable power, in fact, which sets at nought the two most violent agents in Nature, fire, namely, and iron, is made to yield before the blood of a he-goat. The blood, however must be no otherwise than fresh and warm; the stone, too, must be well steeped in it, and then subjected to repeated blows: and even then, it is apt to break both anvils and hammers of iron, if they are not of the very finest temper. To what spirit of research, or to what accident, are we indebted for this discovery? or what conjecture can it have been, that first led man to experiment upon a thing of such extraordinary value as this, and that, too, with the most unclean of all animals? Surely a discovery, such as this, must have been due solely to the munificence of the gods, and we must look for the reason of it in none of the elementary operations of Nature, but wholly in her will.

When, by good fortune, this stone does happen to be broken, it divides into fragments so minute as to be almost imperceptible. These particles are held in great request by engravers, who enclose them in iron, and are enabled thereby, with the greatest facility, to cut the very hardest substances known. So great is the antipathy borne by this stone to the magnet, that when placed near, it will not allow of its attracting iron; or if the magnet has already attracted the iron, it will seize the metal and drag it away from the other. Adamas, too, overcomes and neutralizes poisons, dispels delirium, and banishes groundless perturbations of the mind; hence it is that some have given it the name of “ananchites.” Metrodorus of Scepsis is the only author, that I know of, who says that this stone is found also in Germany, and in the island of Basilia, where amber is found. He says, too, that this is preferable to the stone of Arabia; but can there be any doubt that his statement is incorrect?

Detailed table of contents

CHAP. 16.

SMARAGDUS.

Next in esteem with us are the pearls of India and Arabia, of which we have already spoken in the Ninth Book, when treating of the marine productions.

(5.) The third rank, for many reasons, has been given to the smaragdus. Indeed there is no stone, the colour of which is more delightful to the eye; for whereas the sight fixes itself with avidity upon the green grass and the foliage of the trees, we have all the more pleasure in looking upon the smaragdus, there being no green in existence of a more intense colour than this. And then, besides, of all the precious stones, this is the only one that feeds the sight without satiating it. Even when the vision has been fatigued with intently viewing other objects, it is refreshed by being turned upon this stone; and lapidaries know of nothing that is more gratefully soothing to the eyes, its soft green tints being wonderfully adapted for assuaging lassitude, when felt in those organs.

And then, besides, when viewed from a distance, these stones appear all the larger to the sight, reflecting as they do, their green hues upon the circumambient air. Neither sunshine, shade, nor artificial light effects any change in their appearance; they have always a softened and graduated brilliancy; and transmitting the light with facility, they allow the vision to penetrate their interior; a property which is so pleasing, also, with reference to water. In form they are mostly concave, so as to re-unite the rays of light and the powers of vision: and hence it is, that it is so universally agreed upon among mankind to respect these stones, and to forbid their surface to be engraved. In the case, however, of the stones of Scythia and Egypt, their hardness is such, that it would be quite impossible to penetrate them. When the surface of the smaragdus is flat, it reflects the image of objects in the same manner as a mirror. The Emperor Nero used to view the combats of the gladiators upon a smaragdus.

Detailed table of contents

CHAP. 17.

TWELVE VARIETIES OF THE SMARAGDUS.

Of this stone there are no less than twelve different kinds; of which the finest is the Scythian smaragdus, so called from the country where it is found. None of them has a deeper colour than this, or is more free from defects: indeed, in the same degree that the smaragdus is superior to other precious stones, the Scythian smaragdus is superior to the other varieties. Next in esteem to this, as also in locality, is the smaragdus of Bactriana. These stones are collected, it is said, in the fissures of rocks, when the Etesian winds prevail; a period at which the earth that covers them is removed, and the stones are detected by their brightness, the sands being greatly agitated by the action of the winds. These last, however, are much inferior, they say, to those of Scythia in size. The third rank is held by the stones of Egypt, which are extracted from the hills in the vicinity of Coptos, a city of Thebais.

All the other kinds are found in copper-mines, and hence it is that, of these varieties, the smaragdus of Cyprus holds the highest rank. The merit of them consists in their clear colour, which has nothing thin or diluted in it, but presents a rich and humid transparency, closely resembling the tints of the sea, in fact. Hence it is that these stones are at once diaphanous and shining, or, in other words, reflect their colours and allow the vision to penetrate within. They say that in this island, upon the tomb of a petty king named Hermias, near the fisheries there, there was formerly a lion in marble, with eyes made of smaragdi; the brilliancy of which penetrated the sea to such a degree, as to alarm the tunnies and put them to flight: a novel circumstance, which for a long time excited wonder in the fishermen, till at last the stones in the statue were changed for others.

Detailed table of contents

CHAP. 18.

DEFECTS IN THE SMARAGDUS.

It will be only proper, too, seeing that the prices of these stones are so exorbitant, to point out their defects. Some defects, no doubt, are common to all of them, while others, again, like those found in the human race, are peculiar only to those of a certain country. Thus, for example, the stones of Cyprus are not all green alike, and in the same smaragdus some parts are more or less so than others, the stone not always preserving that uniform deep tint which characterizes the smaragdus of Scythia. In other instances, a shadow runs through the stone, and the colour becomes dulled thereby; the consequence of which is, that its value is depreciated; and even more so, when the colour is thin and diluted.

In consequence of the defects in these stones, they have been divided into several classes. Some of them are obscure, and are then known as "blind" stones; some have a certain density, which impairs their transparency; others, again, are mottled, and others covered with a cloud. This cloud, however, is altogether different from the shadow above mentioned; for it is a defect which renders the stone of a whitish hue, and not of a transparent green throughout; presenting, as it does, in the interior or upon the surface, a certain degree of whiteness which arrests the vision. Other defects, again, in these stones, are filaments, salt-like grains, or traces of lead ore, faults which are mostly common to them all.

Next after the kinds above described, the smaragdus of Æthiopia is held in high esteem; being found, as Juba tells us, at a distance of twenty-five days' journey from Coptos. These are of a bright green, but are seldom to be met with perfectly clear or of an uniform colour. Democritus includes in this class the stones that are known as "herminei," and as "Persian" stones; the former of which are of a convex, massive shape, while the latter are destitute of transparency, but have an agreeable, uniform colour, and satisfy the vision without allowing it to penetrate them; strongly resembling, in this respect, the eyes of cats and of panthers, which are radiant without being diaphanous. In the sun, he says, they lose their brilliancy, but they are radiant in the shade, the brightness of them being seen at a greater distance than in the case of other stones. One other fault, too, in all these stones is, that they often have a colour like that of honey or rancid oil, or else are clear and transparent, but not green.

These defects exist in the smaragdi of Attica, more particularly, which are found in the silver-mines there, at a place known by the name of Thoricos. These last are never so massive as the others, and are always more pleasing to the sight when viewed from a distance: lead ore, too, is often to be detected in them, or, in other words, they have a leaden appearance when looked at in the

sun. One peculiarity in them is, that some of them become impaired by age, gradually lose their green colour, and are even deteriorated by exposure to the sun. Next to the stones of Attica come those of Media, a variety which presents the most numerous tints of all, and sometimes approaches sapphiros in colour. These stones are wavy, and represent various natural objects, such as poppy-heads, for example, birds, the young of animals, and feathers: all of them appear naturally of a green colour, but become improved by the application of oil. No stones of this species are of a larger size than these.

I am not aware that any of these stones are still in existence at Chalcedon, the copper mines of that locality being now exhausted: but be this as it may, they were always the smallest in size and the most inferior in value. Brittle, and of a colour far from distinctly pronounced, they resembled in their tints the feathers that are seen in the tail of the peacock or on the necks of pigeons. More or less brilliant, too, according to the angle at which they were viewed, they presented an appearance like that of veins and scales. There was another defect, also, peculiar to these stones, known as “sarcion,” from the circumstance that a kind of flesh appeared to attach itself to the stone. The mountain near Chalcedon, where these stones were gathered, is still known by the name of “Smaragdites.” Juba informs us that a kind of smaragdus, known as “cloras,” is used in Arabia as an ornament for buildings, as also the stone which by the people of Egypt is called “alabastrites.” On the same authority, too, we learn that there are several varieties of the smaragdus in the neighbouring mountains, and that stones like those of Media are found in Mount Taygetus, as also in Sicily.

Detailed table of contents

CHAP. 19.

THE PRECIOUS STONE CALLED TANOS. CHALCOSMA-RAGDOS.

Among the smaragdi is also included the precious stone known as “tanos.” It comes from Persia, and is of an unsightly green, and of a soiled colour within. There is the chalcosmaragdus also, a native of Cyprus, the face of which is mottled with coppery veins. Theophrastus relates that he had found it stated in the Egyptian histories, that a king of Babylon once sent to the king of Egypt a smaragdus four cubits in length by three in breadth. He informs us, also, that in a temple of Jupiter in Egypt there was an obelisk made of four smaragdi, forty cubits in length, and four in breadth at one extremity, and two at the other. He says, too, that at the period at which he wrote, there was in the Temple of Hercules at Tyrus a large column made of a single smaragdus; though very possibly it might only be pseudo-smaragdus, a kind of stone not uncommonly found in Cyprus, where a block had been discovered, composed, one half of smaragdus, and one half of jasper, and the liquid in which had not as yet been entirely transformed. Apion, surnamed “Plistonices,” has left a very recent statement, that there was still in existence, in his time, in the Labyrinth of Egypt, a colossal statue of Serapis made of a single smaragdus, nine cubits in height.

CHAP. 20.

BERYLS: EIGHT VARIETIES OF THEM. DEFECTS IN BERYLS.

Beryls, it is thought, are of the same nature as the smaragdus, or at least closely analogous. India produces them, and they are rarely to be found elsewhere. The lapidaries cut all beryls of an hexagonal form; because the colour, which is deadened by a dull uniformity of surface, is heightened by the reflection resulting from the angles. If they are cut in any other way, these stones have no brilliancy whatever. The most esteemed beryls are those which in colour resemble the pure green of the sea; the chrysoberyl being next in value, a stone of a somewhat paler colour, but approaching a golden tint. Closely allied to this last in its brilliancy, but of a more pallid colour, and thought by some to constitute a separate genus, is chrysoprasus. In the fourth rank are reckoned the hyacinthine beryls; and in the fifth, those known as “aëroides.” Next, we have the wax-coloured beryls, and, after them, the oleaginous beryls, so called from the resemblance of their colour to that of oil. Last of all, there are the stones which closely resemble crystal in appearance; mostly disfigured by spots and filaments, and of a poor, faint, colour as well; all of them so many imperfections in the stone.

The people of India are marvellously fond of beryls of an elongated form, and say that these are the only precious stones they prefer wearing without the addition of gold: hence it is that, after piercing them, they string them upon the bristles of the elephant. It is generally agreed, however, that those stones should not be perforated which are of the finest quality; and in this case they only enclose the extremities of them in studs of gold. They prefer, too, cutting the beryls in a cylindrical form, instead of setting them as precious stones; an elongated shape being the one that is most highly esteemed. Some are of opinion that beryls are naturally angular, and that when pierced they become improved in colour; the white substance being thus removed that lies within, and their brilliancy heightened by the reflection of the gold in which they are set; or, at all events, their transparency being increased by this diminution in their thickness. In addition to the defects already mentioned, and which are pretty nearly the same as those to which the smaragdus is subject, beryls are affected with cloudy spots, like those on the finger-nails in appearance. In our own part of the world, it is thought that they are sometimes found in the countries that lie in the vicinity of Pontus. The people of India, by colouring crystal, have found a method of imitating various precious stones, beryls in particular.

CHAP. 21. (6.)

OPALS: SEVEN VARIETIES OF THEM.

Opals are at once very similar to, and very different from, beryls, and only yield to the smaragdus in value. India, too, is the sole parent of these precious stones, thus completing her glory as being the great producer of the most costly gems. Of all precious stones, it is opal that presents the greatest difficulties of description, it displaying at once the piercing fire of carbunculus, the purple brilliancy of amethystos, and the sea-green of smaragdus, the whole blended together and refulgent with a brightness that is quite incredible. Some authors have compared the effect of its refulgence to that of the colour known as Armenian pigment, while others speak of it as resembling the flame of burning sulphur, or of flame fed with oil. In size, the opal is about as large as a hazel-nut, and, with reference to it, there is a remarkable historical anecdote related. For there is still in existence a stone of this class, on account of which Antonius proscribed the senator Nonius, son of the Nonius Struma, whom the poet Catullus was so displeased at seeing in the curule chair, and grandfather of the Servilius Nonianus, who in our own times was consul. On being thus proscribed, Nonius took to flight, carrying with him, out of all his wealth, nothing but this ring, the value of which, it is well known, was estimated at two millions of sesterces. How marvellous must have been the cruelty, how marvellous the luxurious passion of Antonius, thus to proscribe a man for the possession of a jewel! and no less marvellous must have been the obstinacy of Nonius, who could thus dote upon what had been the cause of his proscription; for we see the very brutes even tear off the portion of their body for the sake of which they know their existence to be imperilled, and so redeem themselves by parting with it.

Detailed table of contents

CHAP. 22.

DEFECTS IN OPALS: THE MODES OF TESTING THEM.

Defects in opal are, a colour inclining to that of the flower called heliotropium, or to that of crystal or of hailstones; saltlike grains intervening; roughness on the surface; or sharp points, presenting themselves to the eye. There is no stone that is imitated by fraudulent dealers with more exactness than this, in glass, the only mode of detecting the imposition being by the light of the sun. For when a false opal is held between the finger and thumb, and exposed to the rays of that luminary, it presents but one and the same transparent colour throughout, limited to the body of the stone: whereas the genuine opal offers various refulgent tints in succession, and reflects now one hue and now another, as it sheds its luminous brilliancy upon the fingers.

This stone, in consequence of its extraordinary beauty, has been called “pæderos” by many authors; and some who make a distinct species of it, say that it is the same as the stone that in India is called “sangenon.” These last-mentioned stones, it is said, are found in Egypt also, Arabia, and, of very inferior quality, in Pontus. Galatia, too, is said to produce them, as also Thasos and Cyprus. The finest in quality of them have all the beauty of opal, but they are of a softer brilliancy, and are mostly rough on the surface. Their colour is a mixture of sky-blue and purple, and the green hues of the smaragdus are wanting: those, too, are preferred, which have their brilliancy deepened by a vinous hue, rather than those which have their colours diluted, as it were, with water.

Detailed table of contents

CHAP. 23.

SARDONYX; THE SEVERAL VARIETIES OF IT. DEFECTS IN THE SARDONYX.

Thus far we have spoken in reference to the stones, which, it is generally agreed, belong to the highest rank; in obedience, more particularly, to a decree that has been passed by the ladies to that effect. There is less certainty with respect to those upon which the men as well have been left to form a judgment; seeing that the value of each stone depends more particularly upon the caprice of the individual and the rivalry that exists in reference thereto; as, for example, when Claudius Cæsar was so much in the habit of wearing the smaragdus and the sardonyx. The first Roman who wore a sardonyx, according to Demostratus, was the elder Africanus, since whose time this stone has been held in very high esteem at Rome: for which reason, we shall give it the next place after the opal. By sardonyx, as the name itself indicates, was formerly understood a sarda with a white ground beneath it, like the flesh beneath the human finger-nail; both parts of the stone being equally transparent. Such, according to Ismenias, Demostratus, Zenothemis, and Sotacus, is the sardonyx of India; the last two giving the name of “blind” sardonyx to all the other stones of this class which are not transparent, and which have now entirely appropriated the name to themselves. For, at the present day, the Arabian sardonyx presents no traces whatever of the Indian sarda, it being a stone that has been found to be characterized by several different colours of late; black or azure for the base, and vermilion, surrounded with a line of rich white, for the upper part, not without a certain glimpse of purple as the white passes into the red.

We learn from Zenothemis that in his time these stones were not held by the people of India in any high esteem, although they are found there of so large a size as to admit of the hilts of swords being made of them. It is well known, too, that in that country they are exposed to view by the mountain-streams, and that in our part of the world they were formerly valued from the fact that they are nearly the only ones among the engraved precious stones that do not bring away the wax when an impression is made. The consequence is, that our example has at last taught the people of India to set a value upon them, and the lower classes there now pierce them even, to wear them as ornaments for the neck; the great proof, in fact, at the present day, of a sardonyx being of Indian origin. Those of Arabia are remarkable for their marginal line of brilliant white, of considerable breadth, and not glistening in hollow fissures in the stone or upon the sides, but shining upon the very surface, at the margin, and supported by a ground intensely black beneath. In the stones of India, this ground is like wax in colour, or else like cornel, with a circle also of white around it. In some of these stones, too, there is a play of colours like those of the rainbow, while the surface is redder even than the

shell of the sea-locust.

Those stones which are like honey in appearance, or of a fæculent colour — such being the name given to one defect in them — are generally disapproved of. They are rejected also when the white zone blends itself with the other colours, and its limits are not definitely marked; or if, in like manner, it is irregularly intersected by any other colour; it being looked upon as an imperfection if the regularity of any one of the colours is interrupted by the interposition of another. The sardonyx of Armenia is held in some esteem, but the zone round it is of a pallid hue.

Detailed table of contents

CHAP. 24.

ONYX: THE SEVERAL VARIETIES OF IT.

We must give some account also of onyx, because of the name which it partly shares in common with sardonyx. This name, though in some places given to a marble, is here used to signify a precious stone. Sudines says, that in this stone there is a white portion which resembles the white of the human-finger nail, in addition to the colours of chrysolithos, sarda, and iaspis. According to Zenothemis, there are numerous varieties of the Indian onyx, the fiery-coloured, the black, and the cornel, with white veins encircling them, like an eye as it were, and in some cases running across them obliquely. Sotacus mentions an Arabian onyx, which differs from the rest; that of India, according to him, presenting small flames, each surrounded by one or more white zones; in a manner altogether different from the Indian sardonyx, which presents a series of white specks, while in this case it is one continuous circle. The Arabian onyx, on the other hand, is black, he says, with a white zone encircling it.

Satyrus says, that there is an onyx in India of a flesh colour, partly resembling carbunculus, and partly chrysolithos and amethystos; a variety, however, which he altogether disapproves of. The real onyx, according to him, has numerous veins of variegated colours, interspersed with others of a milk-white hue; the shades of which, as they pass into one another, produce a tint which surpasses all description, and blends itself into one harmonious whole, of a most beautiful appearance.

Not unlike sardonyx, too, is sarda, a stone which also has, in part, a kindred name with it; but before passing on to it, we must first take some notice of all those precious stones which have a brilliancy like that of flame.

Detailed table of contents

CHAP. 25. (7.)

CARBUNCULUS: TWELVE VARIETIES OF IT.

In the first rank among these is carbunculus, so called from its resemblance to fire; though in reality it is proof against the action of that element: hence it is that some persons call these stones “acaustoi.” There are various kinds of carbunculus, the Indian and the Garamantic, for example, which last has been also called the Carchedonian, in compliment to the former opulence of Great Carthage. To these are added the Æthiopian and the Alabandic stones, the latter of which are found at Orthosia in Caria, but are cut and polished at Alabanda. In addition to this, each kind is subdivided into the male carbunculus and the female, the former of which is of a more striking brilliancy, the brightness of the latter being not so strong. In the male varieties too, we see some in which the fire is clearer than in others; while some, again, are of a darker hue, or else have their brilliancy more deeply seated, and shine with a more powerful lustre than others when viewed in the sun.

The most highly esteemed, however, is the amethyst-coloured stone, the fire at the extremity of which closely approaches the violet tint of amethystos: next in value to which, are the stones known as “syrtites,” radiant with a wavy, feathery, refulgence. They are found more particularly, it is said, where the reflection is most powerful of the rays of the sun. Satyrus says that the carbunculus of India has no lustre, that it is mostly soiled, and that in all cases its brilliancy is of a tawny complexion. The Æthiopian stones, he says, are dense, emit no lustre, and burn with a concentrated flame. According to Callistratus, the refulgence of this stone should be of a whitish hue, and, when placed upon a table, it should heighten by its lustre other stones placed near it that are clouded at the edge. Hence it is, that many writers speak of this stone as the white carbunculus, while the Indian stone, with its comparatively feeble lustre, is known by the name of “lignyzon.” The Carchedonian stones, they say, are of much smaller size than the others; but those of India admit of being hollowed out, and making vessels that will hold as much as one sextarius even.

According to Archelaüs, the Carchedonian carbunculus is of a more swarthy appearance than the others, but, when exposed to the light of the fire or sun, and viewed obliquely, the brilliancy of it is much more intense than that of the rest. He says, too, that this stone, when overshadowed by a roof, has a purple tint; that when viewed in the open air, it is of a flame colour; and that, when exposed to the rays of the sun, it scintillates. He states also that wax, if sealed with these stones, in the shade even, will melt. Many authors have asserted that the Indian stones are paler than the Carchedonian, and that, quite the converse of these last, they are all the less brilliant when viewed obliquely; as also, that in the male Carchedonian stone there are luminous

points like stars within, while, in the case of the female stone, the whole of its refulgence is thrown beyond it. The stones of Alabanda too, it is said, are darker than the other kinds, and rough on the surface. In the vicinity also of Miletus, there are stones of this description found in the earth, resembling those of Alabanda in colour, and proof against the action of fire.

According to Theophrastus, these stones are to be found also at Orchomenus in Arcadia and in the Isle of Chios; the former of which are of a darker hue, and are used for making mirrors. He says too, that at Trœzen they are found of various colours and mottled with white spots, those found at Corinth being of a more pallid, whitish, hue. He states also, that they are sometimes imported from Massilia. Bocchus informs us in his writings, that these stones are extracted from the ground at Olisipo; at the cost of great labour, however, in consequence of the parched, argillaceous, nature of the soil.

[Detailed table of contents](#)

CHAP. 26.

DEFECTS IN CARBUNCULUS, AND THE MODE OF TESTING IT.

Nothing is more difficult than to distinguish the several varieties of this stone, so great an opportunity do they afford to artistic skill of compelling them to reflect the colours of substances placed beneath. It is possible, they say, to heighten the brilliancy of dull stones, by steeping them for fourteen days in vinegar, this adventitious lustre being retained by them as many months. They are counterfeited, too, with great exactness in glass; but the difference may be detected with the touchstone; the same being the case also with other artificial stones, as the material is always of a softer nature and comparatively brittle. When thus tested by the stone, hard knots, too, are detected in them; and the weight of the glass counterfeit is always less. In some cases, too, they present small blisters within, which shine like silver.

Detailed table of contents

CHAP. 27.

ANTHRACITIS.

There is also a fossil stone found in Thesprotia, known as “anthracitis,” and resembling a burning coal in appearance. Those who have stated that it is a native also of Liguria, are mistaken, in my opinion, unless perhaps it was to be found there in their time. Some of these stones, they say, are surrounded with a vein of white. Like those which we have mentioned above, they have a fiery colour, but there is this peculiarity in them, that when thrown into the fire they have all the appearance of becoming quenched and deadened; while, on the other hand, if they are drenched with water, they become doubly glowing.

Detailed table of contents

CHAP. 28.

SANDASTROS. SANDARESOS.

Of a kindred nature, too, is sandastros, known as “garamantites” by some: it is found in India, at a place of that name, and is a product also of the southern parts of Arabia. The great recommendation of it is, that it has all the appearance of fire placed behind a transparent substance, it burning with star-like scintillations within, that resemble drops of gold, and are always to be seen in the body of the stone, and never upon the surface. There are certain religious associations, too, connected with this stone, in consequence of the affinity which it is supposed to bear with the stars; these scintillations being mostly, in number and arrangement, like the constellations of the Pleiades and Hyades; a circumstance which had led to the use of it by the Chaldæi in the ceremonials which they practise.

Here, too, the male stones are distinguished from the female, by their comparative depth of colour and the vigorousness of the tints which they impart to objects near them: indeed the stones of India, it is said, quite dim the sight by their brilliancy. The flame of the female sandastros is of a more softened nature, and may be pronounced to be lustrous rather than brilliant. Some prefer the stone of Arabia to that of India, and say that this last bears a considerable resemblance to a smoke-coloured chrysolithos. Ismenias asserts that sandastros, in consequence of its extreme softness, will not admit of being polished, a circumstance which makes it sell all the dearer: other writers, again, call these stones “sandrisitæ.” One point upon which all the authorities are agreed is, that the greater the number of stars upon the stone, the more costly it is in price.

The similarity of the name has sometimes caused this stone to be confounded with that known as “sandaresos,” and which Nicander calls “sandaserion,” and others “sandaseron.” Some, again, call this last-mentioned stone “sandastros,” and the former one “sandaresos.” The stone that is thus mentioned by Nicander, is a native of India as well as the other, and likewise takes its name from the locality where it is found. The colour of it is that of an apple, or of green oil, and no one sets any value on it.

Detailed table of contents

CHAP. 29.

LYCHNIS: FOUR VARIETIES OF IT.

To the same class of flame-coloured stones belongs that known as “lychnis;” so called from its lustre being heightened by the light of the lamp, under which circumstances its tints are particularly pleasing. It is found in the vicinity of Orthosia, throughout the whole of Caria, and in the neighbouring localities; but the most approved stones are those that come from India. Some writers have given the name of “deadened” carbunculus to a lychnis of second-rate quality, and similar in colour to the flower known as the “flower of Jove.” I find other varieties also mentioned, one with a purple radiance, and another of a scarlet tint. It is asserted, too, that these stones, when heated or rubbed between the fingers, will attract chaff and filaments of paper.

Detailed table of contents

CHAP. 30.

CARCHEDONIA.

Carchedonia, too, is said to have the same property, though far inferior in value to the stones already mentioned. It is found in the mountains among the Nasamones, being produced, the natives think, by showers sent for the purpose from heaven. These stones are found by the light of the moon, more particularly when at full: in former days, Carthage was the entrepôt for them. Archelaüs speaks of a brittle variety being found in the vicinity of Thebes also, in Egypt, full of veins, and similar to dying embers in appearance. I find it stated, too, that in former times, drinking-vessels used to be made of this stone and of lychnis: all these kinds of stone, however, offer the most obstinate resistance to the graver, and, if used for seals, are apt to bring away a part of the wax.

Detailed table of contents

CHAP. 31.

SARDA : FIVE VARIETIES OF IT.

Sarda, on the other hand, is remarkably useful for this purpose; a stone which shares its name, in part, with sardonyx. It is a common stone, and was first found at Sardes, but the most esteemed kind is that of the vicinity of Babylon. When certain quarries are being worked, these stones are found, adhering, like a kind of heart, to the interior of the rock. This mineral, however, is said to be now extinct in Persia; though it is to be found in numerous other localities, Paros and Assos, for example.

In India there are three varieties of this stone; the red sarda, the one known as “pionia,” from its thickness, and a third kind, beneath which they place a ground of silver tinsel. The Indian stones are transparent, those of Arabia being more opaque. There are some found also in the vicinity of Leucas in Epirus, and in Egypt, which have a ground placed beneath them of leaf gold. In the case of this stone, too, the male stone shines with a more attractive brilliancy than the female, which is of a thicker substance, and more opaque. Among the ancients there was no precious stone in more common use than this; at all events, it is this stone that is made so much parade of in the comedies of Menander and Philemon. No one, too, among the transparent stones is tarnished more speedily by exposure to moisture than this; though of all liquids, it is oil that acts the most readily upon it. Those stones which are like honey in colour, are generally disapproved of, and still more so, when they have the complexion of earthenware.

Detailed table of contents

CHAP. 32. (8.)

TOPAZOS: TWO VARIETIES OF IT.

Topazos is a stone that is still held in very high estimation for its green tints: indeed, when it was first discovered, it was preferred to every other kind of precious stone. It so happened that some Troglodytic pirates, suffering from tempest and hunger, having landed upon an island off the coast of Arabia known as Cytis, when digging there for roots and grass, discovered this precious stone: such, at least, is the opinion expressed by Archelaüs. Juba says that there is an island in the Red Sea called “Topazos,” at a distance of three hundred stadia from the main land; that it is surrounded by fogs, and is often sought by navigators in consequence; and that, owing to this, it received its present name, the word “topazin” meaning “to seek,” in the language of the Troglodytæ. He states also, that Philon, the king’s præfect, was the first to bring these stones from this island; that, on his presenting them to Queen Berenice, the mother of the second Ptolemæus, she was wonderfully pleased with them; and that, at a later period, a statue, four cubits in height, was made of this stone, in honour of Arsinoë, the wife of Ptolemæus Philadelphus, it being consecrated in the temple known as the “Golden Temple.”

The most recent writers say that this stone is found also in the vicinity of Alabastrum, a city of Thebais, and they distinguish two varieties of it, the prasoïdes and the chrysopteron; which last is similar to chrysoprasus, all the shades of it tending, more or less, to resemble the colouring principle of the leek. Topazos is the largest of all the precious stones, and is the only one among those of high value that yields to the action of the file, the rest being polished by the aid of stone of Naxos. It admits, too, of being worn by use.

Detailed table of contents

CHAP. 33.

CALLAINA.

With this stone we must also couple another, which resembles it more closely in appearance than in value, the stone known as “callaina,” and of a pale green colour. It is found in the countries that lie at the back of India, among the Phycari, namely, who inhabit Mount Caucasus, the Sacæ, and the Dahæ. It is remarkable for its size, but is covered with holes and full of extraneous matter; that, however, which is found in Carmania is of a finer quality, and far superior. In both cases, however, it is only amid frozen and inaccessible rocks that it is found, protruding from the surface, like an eye in appearance, and slightly adhering to the rock; not as though it formed an integral part of it, but with all the appearance of having been attached to it. People so habituated as they are to riding on horseback, cannot find the energy and dexterity requisite for climbing the rocks to obtain the stones, while, at the same time, they are quite terrified at the danger of doing so. Hence it is, that they attack the stones with slings from a distance, and so bring them down, moss and all. It is with this stone that the people pay their tribute, and this the rich look upon as their most graceful ornament for the neck. This constitutes the whole of their wealth, with some, and it is their chief glory to recount how many of these stones they have brought down from the mountain heights since the days of their childhood. Their success, however, is extremely variable; for while some, at the very first throw, have brought down remarkably fine specimens, many have arrived at old age without obtaining any.

Such is the method of procuring these stones; their form being given them by cutting, a thing that is easily effected. The best of them have just the colour of smaragdus, a thing that proves that the most pleasing property in them is one that belongs of right to another stone. Their beauty is heightened by setting them in gold, and there is no stone to which the contrast of the gold is more becoming. The finest of them lose their colour by coming in contact with oil, unguents, or undiluted wine even; whereas those of a poorer quality preserve their colour better. There is no stone, too, that is more easily counterfeited in glass. Some writers say, that this stone is to be found in Arabia also, in the nest of the bird known as the “melancoryphus.”

[Detailed table of contents](#)

CHAP. 34.

PRASIUS; THREE VARIETIES OF IT.

There are numerous other kinds also of green stones. To the more common class belongs prasius; one variety of which is disfigured with spots like blood, while another kind is marked with three streaks of white. To all these stones chrysoprasus is preferred, which is also similar to the colouring matter of the leek, but varies in tint between topazos and gold. This stone is found of so large a size as to admit of drinking- boats even being made of it, and is cut into cylinders very frequently.

[Detailed table of contents](#)

CHAP. 35.

NILION.

India, which produces these stones, produces nilion also, a stone that differs from the last in its dull, diminished lustre, which, when steadily looked upon, soon fades from the sight. Sudines says that it is to be found also in the Siberus, a river of Attica. In appearance it resembles a smoke-coloured topazos, or, in some cases, a topazos with a tint like honey. According to Juba, Æthiopia produces it, upon the shores of the river known to us as the Nilus; to which circumstance, he says, it owes its name.

[Detailed table of contents](#)

CHAP. 36.

MOLOCHITIS.

Molochitis is not transparent, being of a deeper green, and more opaque than smaragdus; its name is derived from the mallow, which it resembles in colour. It is highly esteemed for making seals, and it is endowed by Nature with medicinal properties which render it a preservative for infants against certain dangers which menace them. This stone is a native of Arabia.

[Detailed table of contents](#)

CHAP. 37.

IASPIS; FOURTEEN VARIETIES OF IT. DEFECTS FOUND IN IASPIS.

Iaspis, too, is green, and often transparent; a stone which, if surpassed by many others, still retains the renown which it acquired in former times. Many countries produce this stone: that of India is like smaragdus in colour; that of Cyprus is hard, and of a full sea-green; and that of Persia is sky-blue, whence its name, "aërizusa." Similar to this last is the Caspian iaspis. On the banks of the river Thermodon the iaspis is of an azure colour; in Phrygia, it is purple; and in Cappadocia of an azure purple, sombre, and not refulgent. Amisos sends us an iaspis like that of India in colour, and Chalcedon, a stone of a turbid hue.

But it is of less consequence to distinguish the several localities that furnish it, than it is to remark upon the degrees of excellence which they present. The best kind is that which has a shade of purple, the next best being the rose-coloured, and the next the stone with the green colour of the smaragdus; to each of which the Greeks have given names according to their respective tints. A fourth kind, which is called by them "boria," resembles in colour the sky of a morning in autumn; this, too, will be the same that is known as "aërizusa." There is an iaspis also which resembles sarda in appearance, and another with a violet tint. Not less numerous, too, are the other kinds that are left undescribed; but they are all blue to a fault, or else resemble crystal in appearance, or the tints of the myxa plum. There is the terebenthine-coloured iaspis also; improperly so called, in my opinion, as it has all the appearance of being a composition of numerous gems of this description.

The best of these stones are set in an open bezel, the gold of which only embraces the margins of the stone, leaving the upper and lower surfaces uncovered. One great defect in them is a subdued lustre, and a want of refulgence when viewed from a distance. Grains also like salt appear within the stone, and all the other defects which are common to precious stones in general. Sometimes they are imitated in glass; a fraud, however, which may be easily detected, from the material throwing out its refulgence, instead of concentrating it within itself. To this class also belongs the stone called "sphragis," which is only reckoned as belonging to the domain of precious stones, from the circumstance that it is the best of all for making signets.

(9.) Throughout all the East, it is the custom, it is said, to wear iaspis by way of amulet. The variety of this stone which resembles smaragdus in colour is often found with a white line running transversely through the middle; in which case it is known as "monogrammos;" when it is streaked with several lines, it is called "polygrammos." Here, too, I may take the opportunity of exposing the falsehoods of the magicians, who pretend that this stone is

beneficial for persons when speaking in public. There is a stone also that is formed of iaspis and onyx combined, and is known as “iasponyx.” Sometimes this stone has a clouded appearance; sometimes it has spots upon the surface like snow; and sometimes it is stellated with red spots. One kind resembles salt of Megara in appearance, and another is known as capnias, and looks as if it had been smoked. We have seen in our day an iaspis fifteen inches in length, of which a figure of Nero was made, armed with a cuirass.

Detailed table of contents

CHAP. 38.

CYANOS; THE SEVERAL VARIETIES OF IT.

We must also give a separate account of cyanos, a name which, until very recently, was given to a species of iaspis, on account of its cærulean colour. The best kind is that of Scythia, the next best being the produce of Cyprus, and, last of all, that of Egypt. An artificial kind is much in use, that is prepared by dyeing other substances; and this invention is looked upon as one of the great glories of the kings of Egypt, the name of the king who first discovered it being still preserved in their annals. This stone, too, is divided into male and female, and sometimes it has the appearance of being powdered with a golden dust, in much the same way as sapphiros.

Detailed table of contents

CHAP. 39.

SAPPHIROS.

For sapphiros, too, is refulgent with spots like gold. It is also of an azure colour, though sometimes, but rarely, it is purple; the best kind being that which comes from Media. In no case, however, is this stone diaphanous; in addition to which, it is not suited for engraving when intersected with hard particles of a crystalline nature. Those among them that have the colour of cyanos are generally thought to be the male stones.

[Detailed table of contents](#)

CHAP. 40.

AMETHYSTOS; FOUR VARIETIES OF IT. SOCONDION. SAPENOS. PHARANITIS.
APHRODITES BLEPHARON, ANTEROS, OR PÆDEROS.

We will now commence with another class of precious stones, those of a purple colour, or whose tints are derived from purple. To the first rank belongs the amethystos of India; a stone which is also found in the part of Arabia that adjoins Syria and is known as Petra, as also in Lesser Armenia, Egypt, and Galatia; the very worst of all, and the least valued, being those of Thasos and Cyprus. The name which these stones bear, originates, it is said, in the peculiar tint of their brilliancy, which, after closely approaching the colour of wine, passes off into a violet without being fully pronounced; or else, according to some authorities, in the fact that in their purple there is something that falls short of a fiery colour, the tints fading off and inclining to the colour of wine.

All these stones are transparent and of an agreeable violet colour, and are easy to engrave. Those of India have in perfection the very richest shades of purple, and it is to attain this colour that the dyers in purple direct all their endeavours; it presenting a fine mellowed appearance to the eye, and not dazzling the sight, as in the case with the colours of the carbunculus. Another variety approaches more nearly the hyacinth in colour: the people of India call this tint “socon,” and the stone itself “socondion.” A third stone of this class is of a more diluted colour, and is known as “sapenos,” being identical with “pharanitis,” so called from a country on the frontiers of Arabia that produces it. Of a fourth kind, the colour is like that of wine; and in a fifth it borders very closely upon that of crystal, the purple gradually passing off into white. This last kind is but little valued; for a fine amethyst should always have, when viewed sideways and held up to the light, a certain purple refulgence, like that of carbunculus, slightly inclining to a tint of rose.

Some prefer giving these stones the name of “pæderos” or of “anteros,” while to many they are known as “Venus’ eyelid,” a name which would seem to be particularly appropriate to the colour and general appearance of the gem. The falsehoods of the magicians would persuade us that these stones are preventive of inebriety, and that it is from this that they have derived their name. They tell us also, that if we inscribe the names of the sun and moon upon this stone, and then wear it suspended from the neck, with some hair of the cynocephalus and feathers of the swallow, it will act as a preservative against all noxious spells. It is said too, that worn in any manner, this stone will ensure access to the presence of kings; and that it will avert hail and the attacks of locusts, if a certain prayer is also repeated which they mention. They make similar promises, too, in reference to the smaragdus, if graven with the figure of an eagle or of a scarabæus: statements which, in my opinion, they cannot have committed to writing without a feeling of contempt

and derision for the rest of mankind.

Detailed table of contents

CHAP. 41.

HYACINTHOS.

Very different from this stone is hyacinthos, though partaking of a colour that closely borders upon it. The great difference between them is, that the brilliant violet which is so refulgent in the amethystos, is diluted in the other stone. Though pleasing at first sight, its beauty fades before the eye is satiated; indeed, so far is it from satisfying the sight, that it almost wholly fails to attract the eye, its lustre disappearing more rapidly than the tints of the flower known by the same name.

[Detailed table of contents](#)

CHAP. 42.

CHRY SOLITHOS: SEVEN VARIETIES OF IT.

Æthiopia, which produces hyacinthos, produces chrysolithos also, a transparent stone with a refulgence like that of gold. The stones of India are the most highly esteemed, as also those found among the Tibareni, provided these last are not of a mottled hue. The worst in quality are those of Arabia, the colour of them being turbid and mottled, and their brilliancy interrupted by cloudy spots: even too, when they happen to be limpid, they have all the appearance of being full, as it were, of a peculiar dust. The best stones are those which, when placed by the side of gold, impart to it a sort of whitish hue, and so give it the appearance of silver. When this is the case, they are set in a bezel that is open on either side; but when the stone is of inferior quality, a ground of aurichalcum is placed beneath.

Detailed table of contents

CHAP. 43.

CHRYSELECTRUM.

Though it has now altogether gone out of use for jewellery, there is a precious stone known as “chryselectrum,” the colour of which inclines to that of amber; but only when viewed by a morning light. The stones of Pontus are known by their lightness. Some of them are hard and reddish, while others, again, are soft and of a soiled appearance. According to Bocchus, these stones are found in Spain as well; in a spot where, according to him, fossil crystal has been discovered, in sinking to the water-level for wells. He tells us also that he once saw a chrysolithos twelve pounds in weight.

[Detailed table of contents](#)

CHAP. 44.

LEUCOCHRYSOS: FOUR VARIETIES OF IT.

There is also a stone known as “leucochrysos,” with a white vein running across it. To this class, too, belongs capnias; a stone also which resembles glass in appearance; and another which reflects a tint like that of saffron. These stones are imitated in glass, to such a degree of perfection, that it is impossible to distinguish them by the eye. The touch, however, detects the difference, the imitation being not so cold as the real stone.

Detailed table of contents

CHAP. 45.

MELICHRYsos. XUTHON.

To this class also belongs melichrysos, a stone which has all the appearance of pure honey, seen through transparent gold. India produces these stones, and, although hard, they are very brittle, but not unpleasing to the sight. The same country, too, produces xuthon, a stone much used by the lower classes there.

[Detailed table of contents](#)

CHAP. 46.

PÆDEROS, SANGENON, OR TENITES.

At the very head of the white stones is pæderos; though it may still be questionable to which of the colours it in reality belongs. As to the name, it has been so much bandied about among other precious stones of conspicuous beauty, that it has quite assumed the privilege of being a synonymous term for all that is charming to the eye. Still, however, there is one stone in particular which fully merits all the commendation that might be expected for a stone with so prepossessing a name: for in itself it reunites the transparency of crystal, the peculiar green of the sky, the deep tints of purple, and a sort of bright reflex, like that of a golden-coloured wine; a reflex, indeed, that is always the last to meet the eye, but is always crowned with the lustrous hues of purple. The stone, in fact, has all the appearance of having been bathed in each of these tints, individually, and yet in the whole of them at once. There is no precious stone either that has a clearer water than this, or that presents a more pleasing sweetness to the eye.

Pæderos of the finest quality comes from India, where it is known as “sangenon;” the next best being that of Egypt, called “tenites.” That of third-rate quality is found in Arabia, but it is rough upon the surface. Next, we have the stone of Pontus, the radiance of which is softer than in that of Thasos, which, in its turn, is of a more mellowed colour than the stones of Galatia, Thrace, and Cyprus. The defects commonly found in these stones are, a want of brilliancy, a confusion with colours which do not properly belong to them, and the other imperfections which are found in stones in general.

Detailed table of contents

CHAP. 47.

ASTERIA.

Next among the white stones is “asteria,” a gem which holds its high rank on account of a certain peculiarity in its nature, it having a light enclosed within, in the pupil of an eye as it were. This light, which has all the appearance of moving within the stone, it transmits according to the angle of inclination at which it is held; now in one direction, and now in another. When held facing the sun, it emits white rays like those of a star, and to this, in fact, it owes its name. The stones of India are very difficult to engrave, those of Carmania being preferred.

Detailed table of contents

CHAP. 48.

ASTRION.

Of a similar white radiance is the stone that is known as “astrion,” closely resembling crystal in its nature, and found in India and upon the coasts of Pallene. In the centre of it there shines internally a brilliant star, with a refulgence like that of the moon when full. Some will have it that this stone receives its name from the fact that, when held opposite to the stars, it absorbs the light they emit and then returns it. The finest stones, they say, are those of Carmania, there being none more entirely free from all defects. They add, also, that a stone of inferior quality is known as “ceraunia,” and that, in the worst of all, the light is very similar to that given by a lamp.

Detailed table of contents

CHAP. 49.

ASTRIOTES.

Astriotes, too, is a stone that is highly esteemed, and Zoroaster, they say, has sung its wondrous praises as an adjunct of the magic art.

[Detailed table of contents](#)

CHAP. 50.

ASTROBOLOS.

Sudines says, that astrobolos resembles the eye of a fish in appearance, and that it has a radiant white refulgence when viewed in the sun.

[Detailed table of contents](#)

CHAP. 51.

CERAUNIA; FOUR VARIETIES OF IT.

Among the white stones also, there is one known as “ceraunia,” which absorbs the brilliancy of the stars. It is of a crystalline formation, of a lustrous azure colour, and is a native of Carmania. Zenothemis admits that it is white, but asserts that it has the figure of a blazing star within. Some of them, he says, are dull, in which case it is the custom to steep them for some days in a mixture of nitre and vinegar; at the end of which period the star makes its appearance, but gradually dies away by the end of as many months.

Sotacus mentions also two other varieties of ceraunia, one black and the other red; and he says that they resemble axes in shape. Those which are black and round, he says, are looked upon as sacred, and by their assistance cities and fleets are attacked and taken: the name given to them is “bætyli,” those of an elongated form being known as “cerauniæ.” They make out also that there is another kind, rarely to be met with, and much in request for the practices of magic, it never being found in any place but one that has been struck by lightning.

Detailed table of contents

CHAP. 52.

IRIS; TWO VARIETIES OF IT.

The next name mentioned by these authors is that of the stone called “iris;” which is found, in a fossil state, in a certain island of the Red Sea, forty miles distant from the city of Berenice. It is partly composed of crystal, and hence it is that some have called it “root of crystal.” It takes its name “iris” from the properties which it possesses; for, when struck by the rays of the sun in a covered spot, it projects upon the nearest walls the form and diversified colours of the rainbow; continually changing its tints, and exciting admiration by the great variety of colours which it presents. That it is hexahedral in form, like crystal, is generally agreed; but some say that it is rough on the sides and of unequal angles; and that, when exposed to a full sun, it disperses the rays that are thrown upon it, while at the same time, by throwing out a certain brightness before it, it illumines all objects that may happen to be adjacent. The stone, however, as already stated, only presents these colours when under cover; not as though they were in the body of the stone itself, but, to all appearance, as if they were the result of the reflected light upon the surface of the wall. The best kind is the one that produces the largest arcs, with the closest resemblance to the rainbow.

“Iritis” is the name of another stone, similar to the last in all other respects, but remarkable for its extreme hardness. Horus says, in his writings, that this stone, calcined and triturated, is a remedy for the bite of the ichneumon, and that it is a native of Persia.

Detailed table of contents

CHAP. 53.

LEROS.

The stone called “leros” is similar in appearance, but does not produce the same effects. It is a crystal, with streaks of white and black running across it.

Detailed table of contents

CHAP. 54.

ACHATES; THE SEVERAL VARIETIES OF IT. ACOPOS; THE REMEDIES DERIVED FROM IT. ALABASTRITIS; THE REMEDIES DERIVED FROM IT. ALECTORIA. ANDRODAMAS. ARGYRODAMAS. ANTIPATHES. ARABICA. AROMATITIS. ASBESTOS. ASPISATIS. ATIZÖE. AUGETIS. AMPHIDANES OR CHRYSOCOLLA. APHRODISIACA. APSYCTOS. ÆGYPTILLA.

Having now described the principal precious stones, classified according to their respective colours, I shall proceed to mention the rest of them in their alphabetical order.

(10.) Achates was a stone formerly in high esteem, but now held in none. It was first found in Sicily, near a river of that name; but has since been discovered in numerous other localities. In size it exceeds any other stones of this class, and the varieties of it are numerous, the name varying accordingly. Thus, for example, we have iaspachates, cerachates, smaragdachates, hæmachates, leucachates, dendrachates, marked with small shrubs, as it were; autachates, which when burnt has a smell like that of myrrh; and coralloachates, spotted all over, like sapphiros, with drops of gold, and commonly found in Crete, where it is also known as “sacred” achates. This last, it is thought, is good for wounds inflicted by spiders and scorpions; a property which I could really believe to belong to the stones of Sicily, for, the moment they breathe the air of that province, scorpions lose their venom.

The stones, too, that are found in India are possessed of similar properties, and of other great and marvellous properties as well; for they present the appearance in them of rivers, woods, beasts of burden, and forms even, like ivy and the trappings of horses. Medical men, too, make grinding-hones of these stones, and indeed the very sight of them is beneficial for the eyes: held in the mouth, they allay thirst. Those found in Phrygia have no green in them, and those of Thebes in Egypt are destitute of red and white veins. These last are good as a counterpoison to the venom of the scorpion, and the stones of Cyprus are held in similar repute. Some persons set the highest value upon those stones which present a transparency like that of glass. They are found also in Trachinia, in the vicinity of Mount Cæta, upon Mount Parnassus, in the Isle of Lesbos, in Messene, where they resemble the flowers that grow in the hedges, and at Rhodes.

The magicians make other distinctions in reference to these stones: those, they tell us, which have spots upon them like the spots on the lion’s skin, are efficacious as a protection against scorpions; and in Persia, they say, these stones are used, by way of fumigation, for arresting tempests and hurricanes, and for stopping the course of rivers, the proof of their efficacy being their turning the water cold, if thrown into a boiling cauldron. To be duly efficacious, they must be attached to the body with hairs from a lion’s mane. The hair, however, of the hyæna is held in abomination for this purpose, as

being a promoter of discord in families. The stone that is of an uniform colour renders athletes invincible, they say; the way of testing it is to throw it, along with colouring matter, into a pot full of oil; after being kept for a couple of hours gently on the boil, if genuine, it will impart an uniform colour of vermilion to the mixture.

Acopos is a stone like nitre in appearance, porous, and starred with drops of gold: gently boiled with oil and applied as an unguent, it relieves lassitude, if we choose to believe it. Alabastritis is a stone which comes from Alabastron in Egypt and Damascus in Syria: it is of a white colour, spotted with various other tints. Calcined with fossil salt and pulverized, it is a cure for affections of the mouth and teeth, it is said. Alectoria is the name given to a stone that is found in the crop of poultry, like crystal in appearance, and about as large as a bean in size; Milo of Crotona, some will have it, was thought to be in the habit of carrying this stone about him, a thing that rendered him invincible in his athletic contests. Andradamas has the shining colour of silver, like adamas; it is always quadrangular, like small cubes in shape. The magicians are of opinion that it was thus named from the fact that it subdues anger and violence in man. Whether argyrodamas is the same stone or not, authors do not inform us. Antipathes is a black stone, and not transparent: the mode of testing it, is by boiling it in milk, to which, if genuine, it imparts a colour like that of myrrh. A person might probably expect to find some extraordinary virtues in this stone, seeing that, among so many other substances possessed of antipathetic properties, it is the only one that bears this name. The magicians will have it that it possesses the power of counteracting fascinations.

Arabica is a stone which closely resembles ivory in appearance, and, indeed, might easily be taken for it, were it not for its superior hardness: persons who have this stone about them, it is thought, will experience a cure of diseases of the sinews. Aromatitis, too, is a stone that is found in Arabia, as also in the vicinity of Phiræ in Egypt: it is always full of small stones, and like myrrh in colour and smell, a thing that makes it much in request with ladies of rank. Asbestos is found in the mountains of Areadia, and is of an iron colour. Democritus informs us that aspisatis is a native of Arabia, that it is of a fiery colour, and that patients should wear it attached to the body with camels' dung; he says, too, that it is found in the nests of certain birds in Arabia. The same writer also mentions another stone of this name, that is found at Leucopetra in the same country, of a silver colour, radiant, and an excellent preservative against delirium. In India, he says, and on Mount Acidane in Persia, there is a stone found that is known as "atizoë of a silver lustre, three fingers in length, like a lentil in shape, possessed of a pleasant smell, and considered necessary by the Magi at the consecration of a king. Augetis is thought by many to be identical with callaina. Amphidanes, which is also known as "chrysocolla," is a stone found in that part of India where the ants throw up gold, and in it there are certain square pieces, like gold in

appearance. The nature of this stone, it is asserted, is similar to that of the magnet; in addition to which, it is said to have the property of increasing gold.

Aphrodisiaca is a stone of a reddish white colour. Apsyctos, when heated by fire, retains the warmth so long as seven days; it is black and ponderous, and is streaked with red veins. It is good too, it is thought, as a preservative against cold. According to Iacchus, Ægyptilla is a kind of white and black sarda, intersected with veins; but the stone commonly known by that name is black at the lower part, and azure on the surface. It takes its name from the country that produces it.

CHAP. 55.

BALANITES. BATRACHITIS. BAPTES. BELI OCULUS. BELUS. BAROPTENUS OR
BARIPPE. BOTRYITIS. BOSTRYCHITIS. BUCARDIA. BRONTEA. BOLOS.

Of balamites there are two kinds, the one of a greenish hue, and the other like Corinthian bronze in appearance; the former comes from Coptos, and the latter from Troglodytica. They are both of them intersected by a flame-like vein, which runs through the middle. Coptos, too, sends us batrachitis; one kind of which is like a frog in colour, another has the tint of ebony, and a third is blackish inclining to red. Baptes is a soft stone, and of a most excellent smell. Beli oculus is a stone of a whitish hue, surrounding a black pupil in the middle, which shines amid a lustre like that of gold. This stone, in consequence of its singular beauty, has been consecrated to the deity held in the highest veneration by the people of Assyria. According to Democritus, there is also a stone called belus, and found at Arbela; it is about the size of a walnut, and looks like glass. Baroptenus or barippe is black, and covered with knots of a white and blood-red colour: the use of it as an amulet is avoided, as being apt to produce monstrosities.

Botryitis is sometimes black and sometimes purple-red, and resembles a bunch of grapes in form, when making its first appearance. Zoroaster says, that bostrychitis is a stone which is more like the hair of females than anything else. Bucardia resembles an ox-heart in appearance, and is only found at Babylon. Brontea is a stone like the head of a tortoise, which falls with thunder, it is supposed: if too, we are to believe what is said, it has the property of quenching the fire in objects that have been struck by lightning. Bolos is the name of a stone found in Iberia, similar to a clod of earth in appearance.

Detailed table of contents

CHAP. 56.

CADMITIS. CALLAIS. CAPNITIS. CAPPADOCIA. CALLAICA. CATOCHITIS.
CATOPTRITIS. CEPITIS OR CEPOLATITIS. CERAMITIS. CINÆDIA. CERITIS.
CIRCOS. CORSOÏDES. CORALLOACHATES. CORALLIS. CRATERITIS. CROCALLIS.
CYTIS. CHALCOPHONOS. CHELIDONIA. CHELONIA. CHELONITIS. CHLORITIS.
CHOASPITIS. CHRYSOLAMPIS. CHRYSOPIS. CEPONIDES.

Cadmitis differs only from the stone that is known as ostracitis in being sometimes surrounded with blisters of an azure colour. Callais is like sapphires in colour, only that it is paler and more closely resembles the tint of the water near the sea-shore in appearance. Capnitis, in the opinion of some, is a peculiar species of stone: it is covered with numerous spiral streaks, of a smoky colour, as already stated in the appropriate place. Cappadocia is a native of Phrygia, and resembles ivory in appearance. Callaica is the name given to a stone like a clouded callaina; a number of them are always found united, it is said. Catochitis is a stone found in Corsica, of larger size than the other precious stones; and of a more wonderful nature, if the story is true, that it retains the hand like gum, when placed upon it. Catoptritis is found in Cappadocia, and, from its whiteness, reflects figures like a mirror. Cepitis or cepolatitis is a white stone, with veins upon it uniting together. Ceramitis has a colour like that of earthenware.

Cinædia is a stone found in the brain of a fish of a corresponding name. It is white and oblong, and possessed of marvellous virtues, if we are to put faith in what is said, that it announces before-hand whether the sea will be tranquil or stormy. Ceritis is a stone like wax: circos resembles the plumage of the hawk: corsoides is like white hair in appearance. Coralloachates is very similar to coral, marked with drops of gold; and corallis, a native of India and Syene, resembles minium in appearance. Crateritis is in colour a medium between chrysolithos and amber, and is remarkable for its hardness. Crocallis is a gem like the cherry in its tints. Cytis is a stone found in the vicinity of Coptos; it is white, and to all appearance has an embryo stone within, the rattling of which may be heard on shaking it. Chalcophonos is a black stone, but when struck it clinks like brass: tragic actors are recommended to carry it about them. Of chelidonia there are two varieties, both resembling the swallow in colour: one of them is purple on one side, and the other is purple besprinkled with black spots. Chelonia is the eye of the Indian tortoise, and is the most marvellous of all the stones, if we believe the lying stories told by the magicians. For, according to them, this stone, placed upon the tongue after rinsing the mouth with honey, will ensure power of divination, if this is done at full moon or new moon, for one whole day. If, however, this plan is adopted while the moon is on the increase, the power of divination will be acquired before sun-rise only, and if upon other days, from the first hour to the sixth.

Chelonitis, too, is a stone that resembles the tortoise in appearance, and the many virtues of which are talked of for calming storms and tempests. As to the one that has all the appearance of being sprinkled with spots of gold, if thrown with a scarabæus into boiling water, it will raise a tempest, they say. Chloritis is a stone of a grass-green colour: according to the magicians, it is found in the crop of the motacilla, being engendered with the bird. They recommend also that it should be set in iron, for the purpose of working certain portentous marvels which they promise, as usual. Choaspitis is a stone so called from the river Choaspes, of a brilliant, golden colour mixed with green. Chrysolampis is a native of Æthiopia, and is pale by day, but of a fiery lustre by night. Chrysopsis has all the appearance of gold. Ceponides is found at Atarna, a borough, and once a city, of Æolis. It is transparent, presents numerous tints, and has sometimes the appearance of glass, sometimes of crystal, and sometimes of iaspis. Indeed, the stones of this kind that are tarnished even, are possessed of such singular brilliancy as to reflect objects like a mirror.

Detailed table of contents

CHAP. 57.

DAPHNEA. DIADOCHOS. DIPHYES. DIONYSIAS. DRACONITIS.

Daphnea is mentioned by Zoroaster as curative of epilepsy. Diadochos is a stone that resembles the beryl. Of diphyes there are two kinds, the white and the black, male and female, with a line dividing the characteristics of either sex. Dionysias is hard and black, and covered with red spots. Triturated in water, this stone imparts to it the flavour of wine, and it is generally thought to be a preservative against intoxication. Draconitis or dracontia is a stone produced from the brain of the dragon; but unless the head of the animal is cut off while it is alive, the stone will not assume the form of a gem, through spite on the part of the serpent, when finding itself at the point of death: hence it is that, for this purpose, the head is cut off when it is asleep.

Sotacus, who tells us that he once saw a stone of this kind in the possession of a king, says that persons go in search of it in a chariot drawn by two horses; and that, the moment they see the serpent, they strew narcotic drugs in its way, and then cut off its head when asleep. According to him, this stone is white and pellucid, and admits of no polishing or engraving.

Detailed table of contents

CHAP. 58.

ENCARDIA OR ARISTE. ENORCHIS. EXEBENUS. ERYTHALLS. EROTYLOS.
AMPHICOMOS, OR HIEROMNEMON. EUMECES. EUMITHRES. EUPETALOS.
EUREOS. EUROTIAS. EUSEBES. EPIMELAS.

The stone encardia is also called “ariste.” There are three varieties of it; one of a black colour, with a figure in relief upon it like a heart: a second of a green colour, and like a heart in shape; and a third, with a black heart upon it, the rest of the stone being white. Enorchis is a white stone, the fragments of which, when it is split asunder, resemble the testes in shape. Exebenus, Zoroaster tells us, is a white, handsome stone, employed by goldsmiths for polishing gold. Erythallis, though a white stone, assumes a red hue when viewed at an inclined angle. Erotyles, also known as “amphicomos” and “hieromnemon,” is highly praised by Democritus for its use in the art of divination.

Eumeces is a stone of Bactriana, like silex in appearance; placed beneath the head, it produces visions in the night of an oracular description. Eumithres is called by the Assyrians “gem of Belus,” the most sacred of all their gods; it is of a leek-green colour, and greatly in request for superstitious purposes. Eupetalos is a stone that has four different tints, azure, fiery, vermilion, and apple-colour. Eureos is similar to an olive-stone in form, streaked like a shell, and moderately white. Eurotias has all the appearance of concealing its black colour beneath a coat of mould. Eusebes is the stone, it is said, of which the seat was made in the Temple of Hercules at Tyrus, from which the pious [only] could raise themselves without difficulty. Epimelas is a white gem, with a black hue reflected from its surface.

Detailed table of contents

CHAP. 59.

GALAXIAS. GALACTITIS, LEUCOGÆA, LEUCOGRAPHITIS, OR SYNNEPHITIS.
GALLAICA. GASSINADE. GLOSSOPETRA. GORGONIA. GONIAÆA.

Galaxias, by some called “galactitis,” is a stone that closely resembles those next mentioned, but is interspersed with veins of blood-red or white. Galactitis is of the uniform colour of milk; other names given to it are, leucogæa, leucographitis, and synnephtis, and, when pounded in water, both in taste and colour it marvellously resembles milk. This stone promotes the secretion of the milk in nursing women, it is said; in addition to which, attached to the neck of infants, it produces saliva, and it dissolves when put into the mouth. They say, too, that it deprives persons of their memory: it is in the rivers Nilus and Acheloüs that it is produced. Some persons give the name of “galactitis” to a smaragdus surrounded with veins of white. Gallaica is a stone like argyrodamas, but of a somewhat more soiled appearance; these stones are found in twos and threes clustered together. The people of Media send us gassinade, a stone like orobus in colour, and sprinkled with flowers, as it were: it is found at Arbela. This stone, too, conceives, it is said; a fact which it admits when shaken; the conception lasting for a period of three months. Glossopetra, which resembles the human tongue, is not engendered, it is said, in the earth, but falls from the heavens during the moon’s eclipse; it is considered highly necessary for the purposes of selenomancy. To render all this however, still more incredible, we have the evident untruthfulness of one assertion made about it, that it has the property of silencing the winds. Gorgonia is nothing but a coral, which has been thus named from the circumstance that, though soft in the sea, it afterwards assumes the hardness of stone: it has the property of counteracting fascinations, it is said. Goniæa, it is asserted, and with the same degree of untruthfulness, ensures vengeance upon our enemies.

Detailed table of contents

CHAP. 60.

HELIOTROPIUM. HEPILESTITIS. HERMUAIDOION. HEXLCONTALITROS.
HIERACITIS. HAMMITIS. HAMMONIS CORNU. HORMISCION. HYÆNIA.
HÆMATITIS.

Heliotropium is found in Æthiopia, Africa, and Cyprus: it is of a leek-green colour, streaked with blood-red veins. It has been thus named, from the circumstance that, if placed in a vessel of water and exposed to the full light of the sun, it changes to a reflected colour like that of blood; this being the case with the stone of Æthiopia more particularly. Out of the water, too, it reflects the figure of the sun like a mirror, and it discovers eclipses of that luminary by showing the moon passing over its disk. In the use of this stone, also, we have a most glaring illustration of the impudent effrontery of the adepts in magic, for they say that, if it is combined with the plant heliotropium, and certain incantations are then repeated over it, it will render the person invisible who carries it about him.

Hephæstitis also, though a radiant stone, partakes of the properties of a mirror in reflecting objects. The mode of testing it is to put it into boiling water, which should immediately become cold. If exposed to the rays of the sun, it should instantly cause dry fuel to ignite: Corycus is the place where it is found. Hermuaidoion is so called from the resemblance to the male organs which it presents, on a ground that is sometimes white, sometimes black, and sometimes of a pallid hue, with a circle surrounding it of a golden colour. Hexecontalithos receives its name from the numerous variety of colours which, small as it is, it presents: it is found in Troglodytica. Hieracitis is entirely covered with mottled streaks, resembling a kite's feathers alternately with black. Hammitis is similar in appearance to the spawn of fish: there is also one variety of it which has all the appearance of being composed of nitre, except that it is remarkably hard. Hammonis cornu is reckoned among the most sacred gems of Æthiopia; it is of a golden colour, like a ram's horn in shape, and ensures prophetic dreams, it is said.

Hormiscion is one of the most pleasing stones to the sight; it is of a fiery colour, and emits rays like gold, tipped at the extremity with a whitish light. Hyænia is derived from the eyes of the hyæna, it is said, the animal being hunted to obtain it; placed beneath the tongue, if we believe the story, it will enable a person to prophesy the future. Hæmatitis, of the very finest quality, comes from Æthiopia, but it is found in Arabia and Africa as well. It is a stone of a blood-red colour, and we must not omit to mention the assurance given [by the magicians], that the possession of it reveals treacherous designs on the part of the barbarians. Zachalias of Babylon, in the books which he dedicated to King Mithridates, attributing the destinies of man to certain properties innate in precious stones, is not content with vaunting the merits of this stone as curative of diseases of the eyes and liver, but recommends it also as

ensuring success to petitions addressed to kings. He also makes it play its part in lawsuits and judgments, and even goes so far as to say that it is highly beneficial to be rubbed with it on the field of battle. There is another stone of the same class, called “menui” by the people of India, and “xanthos” by the Greeks: it is of a whitish, tawny colour.

Detailed table of contents

CHAP. 61.

IDÆI DACTYLI. ICTERIAS. JOVIS GEMMA. INDICA. ION.

The stones called Idæi dactyli, and found in Crete, are of an iron colour, and resemble the human thumb in shape. The colour of icterias resembles that of livid skin, and hence it is that it has been thought so excellent a remedy for jaundice. There is also another stone of this name, of a still more livid colour; while a third has all the appearance of a leaf. This last is broader than the others, almost imponderous, and streaked with livid veins. A fourth kind again is of the same colour, but blacker, and marked all over with livid veins. Jovis gemma is a white stone, very light, and soft: another name given to it is “drosolithos.” Indica retains the name of the country that produces it: it is a stone of a reddish colour, and yields a purple liquid when rubbed. There is another stone also of this name, white, and of a dusty appearance. Ion is an Indian stone, of a violet tint: it is but rarely, however, that it is found of a deep, full, colour.

Detailed table of contents

CHAP. 62

LEPIDOTIS. LESBIAS. LEUCOPHTHALMOS. LEUCOPÆCILOS. LIBANOCHRUS.
LIMONIATIS. LIPAREA. LYSIMACHOS. LEUCOCHRYSOS.

Lepidotis is a stone of various colours, and resembles the scales of fish in appearance. Lesbias, so called from Lesbos which produces it, is a stone found in India as well. Leucophthalmos, which in other respects is of a reddish hue, presents all the appearance of an eye, in white and black. Leucopæcilos is white, variegated with drops of vermilion of a golden hue. Libanochrus strongly resembles frankincense, and yields a liquid like honey. Limoniatis would appear to be the same as smaragdus; and all that we find said about liparea is, that employed in the form of a fumigation, it allures all kinds of wild beasts. Lysimachos resembles Rhodian marble, with veins of gold: in polishing it, it is reduced very considerably in size, in order to remove all defects. Leucochrysos is a kind of chrysolithos interspersed with white.

Detailed table of contents

CHAP. 63.

MEMNONIA. MEDIA. MECONITIS. MITHRAX. MOROCHTHOS. MORMORION OR
PROMNION. MURRHITIS. MYRMECIAS. MYRSINITIS. MESOLEUCOS.
MESOMELAS.

What kind of stone memnonia is, we do not find mentioned. Medea is a black stone, said to have been discovered by the Medea of fable: it has veins of a golden lustre, and yields a liquid like saffron in colour and with a vinous flavour. Meconitis strongly resembles poppies. Mithrax comes from Persia and the mountains of the Red Sea: it is of numerous colours, and reflects various tints when exposed to the sun. Morochthos is a stone of a leek-green colour, from which a milk exudes. Mormorion is a transparent stone from India, of a deep black colour, and known also as “promnion.” When it has a mixture of the colour of carbunculus, it is from Alexandria; and when it shares that of sarda, it is a native of Cyprus. It is found also at Tyrus and in Galatia; and, according to Xenocrates, it has been discovered at the foot of the Alps. These stones are well adapted for cutting in relief. Murrhitis has just the colour of myrrh, and very little of the appearance of a gem: it has the odour also of an unguent, and smells like nard when rubbed. Myrmecias is black, and has excrescences upon it like warts. Myrsinitis has a colour like that of honey, and the smell of myrtle. “Mesoleucos” is the name given to a stone when a white line runs through the middle; and when a black vein intersects any other colour, it is called “mesomelas.”

Detailed table of contents

CHAP. 64.

NASAMONITIS. NEBRITIS. NIPPARENE.

Nasamonitis is a blood-red stone, marked with black veins. Nebritis, a stone sacred to Father Liber, has received its name from its resemblance to a nebris. There is also another stone of this kind, that is black. Nipparene bears the name of a city and people of Persia, and resembles the teeth of the hippopotamus.

[Detailed table of contents](#)

CHAP. 65.

OICA. OMBRIA OR NOTIA. ONOCARDIA. ORITIS OR SIDERITIS. OSTRACIAS.
OSTRITIS. OPHICARDELON. OBSIAN STONE.

Oica is the barbarian name given to a stone which is pleasing for its colours, black, reddish yellow, green, and white. Ombria, by some called notia,” falls with showers and lightning, much in the same manner as ceraunia and brontea, the properties of which it is said to possess. There is a statement also, that if this stone is placed upon altars it will prevent the offerings from being consumed. Onocardia is like kermesberry in appearance, but nothing further is said about it. Oritis, by some called “sideritis,” is a stone of globular form, and proof against the action of fire. Ostracias, or ostracitis, is a testaceous stone, harder than ceramitis, and similar in all respects to achates, except that the latter has an unctuous appearance when polished: indeed, so remarkably hard is ostritis, that with fragments of it other gems are engraved. Ostritis receives its name from its resemblance to an oyster-shell. Ophicardelon is the barbarian name for a stone of a black colour, terminated by a white line on either side. Of Obsian stone we have already spoken in the preceding Book. There are gems, too, of the same name and colour, found not only in Æthiopia and India, but in Samnium as well, and, in the opinion of some, upon the Spanish shores that lie towards the Ocean.

Detailed table of contents

CHAP. 66.

PANCHRUS. PANGONUS. PANEROS OR PANERASTOS. PONTICA; FOUR
VARIETIES OF IT. PHLOGINOS OR CHRYSITIS. PHÆNICITIS. PHYCITIS.
PERILEUCOS. PÆANITIS OR GÆANIS.

Panchrus is a stone which displays nearly every colour. Pangonus is no longer than the finger: the only thing that prevents it from being taken for a crystal, is, its greater number of angles. What kind of stone paneros is, Metrodorus does not inform us; but he gives some lines, by no means without elegance, that were written upon this stone by Queen Timaris, and dedicated to Venus; from which we have reason to conclude that certain fecundating virtues were attributed to it. By some writers it is called panerastos. Of the stone called “pontica” there are numerous varieties: one is stellated, and presents either blood-red spots, or drops like gold, being reckoned in the number of the sacred stones. Another, in place of stars, has streaks of the same colour, and a fourth presents all the appearance of mountains and valleys.

Phloginos, also called “chrysitis,” strongly resembles Attic ochre, and is found in Egypt. Phænicitis is a stone so called from its resemblance to a date. Phycitis receives its name from its resemblance to sea-weed. Perileucos is the name given to a gem, in which a white colour runs down from the margin of the stone to the base. Pæanitis, by some called “gæanis,” conceives, it is said, and is good for females at the time of parturition: this stone is found in Macedonia, near the monument of Tiresias there, and has all the appearance of congealed water.

Detailed table of contents

CHAP. 67.

SOLIS GEMMA. SAGDA. SAMOTHRACIA. SAURITIS. SARCITIS. SELENITIS.
SIDERITIS. SIDEROPÆCILOS. SPONGITIS. SYNODONTITIS. SYRTITIS.
SYRINGITIS.

Solis gemma is white, and, like the luminary from which it takes its name, emits brilliant rays in a circular form. Sagda is found by the people of Chaldæa adhering to ships, and is of a leek-green colour. The Isle of Samothrace gives its name to a stone which it produces, black and imponderous, and similar to wood in appearance. Sauritis is found, they say, in the belly of the green lizard, cut asunder with a reed. Sarcitis is a stone, like beef in appearance. Selenitis is white and transparent, with a reflected colour like that of honey. It has a figure within it like that of the moon, and reflects the face of that luminary, if what we are told is true, according to its phases, day by day, whether on the wane or whether on the increase: this stone is a native of Arabia, it is thought. Sideritis is a stone like iron, the presence of which in lawsuits creates discord. Sideropæcilos, which is a variety of the same stone, is a native of Æthiopia, and is covered with variegated spots.

Spongitis has its name from its resemblance to sponge. Synodontitis is a stone found in the brain of the fish known as “synodus.” Syrtitis is a stone that used formerly to be found on the shores of the Syrtes, though now it is found on the coasts of Lucania as well: it is of a honey colour, with a reflected tint of saffron, and contains stars of a feeble lustre within. Syringitis is hollow throughout, like the space between the two joints in a straw.

Detailed table of contents

CHAP. 68.

TRICHRUS. THELYRRHIZOS. THELYCARDIOS OR MULC. THRACIA; THREE
VARIETIES OF IT. TEPHRITIS. TECOLITHOS.

Trichrus comes from Africa: it is of a black colour, but yields three different liquids, black at the lower part, blood- red in the middle, and of an ochre colour at the top. Thelyrrhizos is of an ashy or russet colour, but white at the lower part. Thelycardios is like a heart in colour, and is held in high esteem by the people of Persia, in which country it is found: the name given to it by them is “mule.” Of thracia there are three varieties; a green stone, one of a more pallid colour, and a third with spots like drops of blood. Tephritis is crescent-shaped, with horns like those of the new moon, but it is of an ashy colour. Tecolithos has all the appearance of an olive stone: it is held in no estimation as a gem, but a solution of it will break and expel urinary calculi.

Detailed table of contents

CHAP. 69.

VENERIS CRINES. VEIENTANA.

Veneris crines is the name given to a stone that is remarkably black and shining, with an appearance like red hair within. Veientana is an Italian stone, found at Veii: it is black, divided by a line of white.

Detailed table of contents

CHAP. 70.

ZATHENE. ZMILAMPIS. ZORANISCÆA.

Zathene, according to Democritus, is a native of Media. It is like amber in colour, and, if beaten up with palm-wine and saffron, it will become soft like wax, yielding a very fragrant smell. Zmilampis is found in the river Euphrates: it resembles marble of Proconnesus in appearance, and is of a seagreen colour within. Zoraniscæa is found in the river Indus: it is a stone used by magicians, it is said, but I find no further particulars relative to it.

[Detailed table of contents](#)

CHAP. 71. (11.)

PRECIOUS STONES WHICH DERIVE THEIR NAMES FROM VARIOUS PARTS OF
THE HUMAN BODY. HEPATITIS. STEATITIS. ADADUNEPHROS.
ADADUOPHTHALMOS. ADADUDACTYLOS. TRIOPHTHALMOS.

There is also another method of classifying stones; according to the resemblance which they bear to various other objects. Thus, for example, the different parts of the body give the following names to stones: — Hepatitis is so called from the liver; and steatitis from its resemblance to the fat of various animals. Adadunephros, adaduophthalmos, and adadudactylos, mean “kidney of Adad,” “eye of Adad,” and “finger of Adad,” a god of the Syrians so called. Triophthalmos is a stone found in conjunction with onyx, which resembles three human eyes at once.

Detailed table of contents

CHAP. 72.

PRECIOUS STONES WHICH DERIVE THEIR NAMES FROM ANIMALS. CARCINIAS.
ECHITIS. SCORPITIS. SCARITIS. TRIGLITIS. ÆGOPHTHALMOS. HYOPHTHALMOS.
GERANITIS. HIERACITIS. AETITIS. MYRMECITIS. CANTHARIAS.
LYCOPHTHALMOS. TAOS. TIMICTONIA.

Other stones, again, derive their names from various animals. Carcinias is so called from the colour of the sea-crab; echitis, from the colour of the viper; scorpitis, from either the colour or the shape of the scorpion; scaritis, from the fish called scarus; triglitis, from the sur-mullet; ægophthalmos, from the eye of the goat; hyophthalmos, from the eye of the swine; geranitis, from the neck of the crane; hieracitis, from the neck of the hawk; and aëtitis, from the colour of the whitetailed eagle. Myrmecitis presents the appearance of an ant crawling within, and cantharias, of a scarabæus. Lycophthalmos is a stone of four different colours; on the exterior it is ruddy and blood-red, and within it is black, surrounded with a line of white, closely resembling the eye of the wolf in every respect. Taos is a stone with colours like those of the peacock. Timictonia, I find, is the name of a stone, like the asp in colour.

Detailed table of contents

CHAP. 73.

PRECIOUS STONES WHICH DERIVE THEIR NAMES FROM OTHER OBJECTS.
HAMMOCHRYOS. CENCHRITIS. DRYITIS. CISSITIS. NARCISSITIS. CYAMIAS.
PYREN. PHŒNICITIS. CHALAZIAS. PYRITIS. POLYZONOS. ASTRAPÆA.
PHLOGITIS. ANTHEACITIS. ENHYGROS. POLYTHRIX. LEONTIOS. PAEDALIOS.
DROSOLITHOS. MELICHRUS. MELICHLOROS, CROCias. POLIAS.
SPARTOPOLIAS. RHODITIS. CHALCITIS. SYCITIS. BOSTRYCHITIS. CHERNITIS.
ANANCITIS. SYNOCHITIS. DENDRITIS.

Hammochrysos resembles sand in appearance, but sand mixed with gold. Cenchritis has all the appearance of grains of millet scattered here and there. Dryitis resembles the trunk of a tree, and burns like wood. Cissitis, upon a white, transparent surface, has leaves of ivy running all over it. Narcissitis is distinguished by veins on the surface, and has a smell like that of the narcissus. Cyamias is a black stone, but when broken, produces a bean to all appearance. Pyren is so called from its resemblance to an olive-stone: in some cases it would appear to contain the back-bone of a fish. Phœnicitis resembles a palm-date in form. Chalazias resembles a hailstone, both in form and colour: it is as hard as adamant, so much so, indeed, that in the fire even it retains its coolness, it is said. Pyritis, though a black stone, burns the fingers when rubbed by them. Polyzonos is a black stone traversed by numerous zones of white.

Astrapæa has rays like flashes of lightning, running across the middle on a ground of white or blue. In phlogitis, there is, to all appearance, a flame burning within, but not reaching the surface of the stone. In anthracitis, there are sometimes sparks, to all appearance, flying to and fro. Enhygros is always perfectly round, smooth, and white; but when it is shaken a liquid is heard to move within, just like the yolk within an egg. Polythrix presents the appearance of hair upon a green surface; but it causes the hair to fall off, it is said. Leontios and pardalios are names given to stones, from their resemblance to the skin of the lion and panther. Drosolithos has received its name from its colour. Melichrus is a honey-coloured stone, of which there are several varieties. Melichloros is a stone of two colours, partly honey-coloured, partly yellow. Crocias is the name given to a stone which reflects a colour like that of saffron; polias, to a stone resembling white hair in colour; and spartopolias, to a stone more thinly sprinkled with white.

Rhoditis is like the rose in colour, chalcitis resembles copper, and sycitis is in colour like a fig. Bostrychitis is covered with branches of a white or blood-red colour, upon a ground of black; and chernitis has, on a stony surface, a figure like that of two hands grasping each other. Anancitis is used in hydromancy, they say, for summoning the gods to make their appearance; and synochitis, for detaining the shades from below when they have appeared. If white dendritis is buried beneath a tree that is being felled, the edge of the axe

will never be blunted, it is asserted. There are many other stones also, of a still more outrageously marvellous nature, to which, admitted as it is that they are stones, barbarous names have been given: we have refuted, however, a quite sufficient number of these portentous lies already.

Detailed table of contents

CHAP. 74. (12.)

PRECIOUS STONES THAT SUDDENLY MAKE THEIR APPEARANCE. COCHLIDES.

New species of precious stones are repeatedly brought into existence, and fresh ones are found all at once, destitute of names. Thus, for example, there was a stone formerly discovered in the gold-mines of Lampsacus, which, on account of its extraordinary beauty, was sent to King Alexander, as we learn from Theophrastus. Cochlides, too, which are now so common, are rather artificial productions than natural, and in Arabia there have been found vast masses of them; which are boiled, it is said, in honey, for seven days and nights without intermission. By doing this, all earthy and faulty particles are removed; after which, the mass, thus cleansed and purified, is adorned by the ingenuity of artists with variegated veins and spots, and cut into such shapes as may be most to the taste of purchasers. Indeed, these articles, in former times, were made of so large a size, that they were employed in the East as frontals for the horses of kings, and as pendants for their trappings.

All precious stones in general are improved in brilliancy by being boiled in honey, Corsican honey more particularly; but acrid substances are in every respect injurious to them. As to the stones which are variegated, and to which new colours are imparted by the inventive ingenuity of man, as they have no name in common use, they are usually known by that of “*physis*,” a name which claims for them, as it were, that admiration which we are more ready to bestow upon the works of Nature. But really, these artificial stones have names without end, and I could never think of recounting the infinite series of them, coined as they have been by the frivolous tendencies of the Greeks.

Having already described the more noble gems, and indeed those of inferior quality which are found among the stones that are held in high esteem, I must content myself with knowing that I have pointed out those kinds which are the most deserving of mention. It will be as well, however, for the reader to bear in mind, that, according to the varying number of the spots and inequalities on their surface, according to the numerous intersections of lines and their multiplied tints and shades, the names of precious stones are subject to repeated changes; the material itself, for the most part, remaining just the same.

Detailed table of contents

CHAP. 75.

THE VARIOUS FORMS OF PRECIOUS STONES.

We will now make some observations in reference to precious stones in general, following therein the opinions that have been expressed by various authors. Stones with a level surface are preferred to those which are concave or protuberant on the face. An oblong shape is the one that is most approved of, and, next to that, the lenticular form, as it is called. After this, the stone with a plane surface and circular is admired, those which are angular being held in the least esteem. There is considerable difficulty in distinguishing genuine stones from false; the more so, as there has been discovered a method of transforming genuine stones of one kind into false stones of another. Sardonyx, for example, is imitated by cementing together three other precious stones, in such a way that no skill can detect the fraud; a black stone being used for the purpose, a white stone, and one of a vermilion colour, each of them, in its own way, a stone of high repute. Nay, even more than this, there are books in existence, the authors of which I forbear to name, which give instructions how to stain crystal in such a way as to imitate smaragdus and other transparent stones, how to make sardonyx of sarda, and other gems in a similar manner. Indeed, there is no kind of fraud practised, by which larger profits are made.

Detailed table of contents

CHAP. 76. (13.)

THE METHODS OF TESTING PRECIOUS STONES.

On the contrary, we will make it our business to point out the methods of detecting these false stones, seeing that it is only proper to put luxury even on its guard against fraud. In addition to the particulars which we have already given, when treating of each individual kind of precious stone, it is generally agreed that transparent stones should be tested by a morning light, or even, if necessary, so late as the fourth hour, but never after that hour. The modes of testing stones are numerous: first, by their weight, the genuine stone being the heavier of the two; next, by their comparative coolness, the genuine stone being cooler than the other to the mouth; and, next to that, by their substance; there being blisters perceptible in the body of the fictitious stone, as well as a certain roughness on the surface; filaments, too, an unequal brilliancy, and a brightness that falls short before it reaches the eye. The best mode of testing is to strike off a fragment with an iron saw; but this is a thing not allowed by the dealers, who equally refuse to let their gems be tested by the file. Dust of Obsian stone will not leave a mark upon the surface of a genuine stone: but where the gem is artificial, every mark that is made will leave a white scratch upon it. In addition to this, there is such a vast diversity in their degrees of hardness, that some stones do not admit of being engraved with iron, and others can only be cut with a graver blunted at the edge. In all cases, however, precious stones may be cut and polished by the aid of adamas; an operation which may be considerably expedited by heating the graver. The rivers which produce precious stones, are the Acesinus and the Ganges; and, of all countries, India is the most prolific of them.

Detailed table of contents

CHAP. 77.

A COMPARATIVE VIEW OF NATURE AS SHE APPEARS IN DIFFERENT COUNTRIES. THE COMPARATIVE VALUES OF THINGS.

Having now treated of all the works of Nature, it will be as well to take a sort of comparative view of her several productions, as well as the countries which supply them. Throughout the whole earth, then, and wherever the vault of heaven extends, there is no country so beautiful, or which, for the productions of Nature, merits so high a rank as Italy, that ruler and second parent of the world; recommended as she is by her men, her women, her generals, her soldiers, her slaves, her superiority in the arts, and the illustrious examples of genius which she has produced. Her situation, too, is equally in her favour; the salubrity and mildness of her climate; the easy access which she offers to all nations; her coasts indented with so many harbours; the propitious breezes, too, that always prevail on her shores; advantages, all of them, due to her situation, lying, as she does, midway between the East and the West, and extended in the most favourable of all positions. Add to this, the abundant supply of her waters, the salubrity of her groves, the repeated intersections of her mountain ranges, the comparative innocuousness of her wild animals, the fertility of her soil, and the singular richness of her pastures.

Whatever there is that the life of man ought not to feel in want of, is nowhere to be found in greater perfection than here; the cereals, for example, wine, oil, wool, flax, tissues, and oxen. As to horses, there are none, I find, preferred to those of Italy for the course; while, for mines of gold, silver, copper, and iron, so long as it was deemed lawful to work them, Italy was held inferior to no country whatsoever. At the present day, teeming as she is with these treasures, she contents herself with lavishing upon us, as the whole of her bounties, her various liquids, and the numerous flavours yielded by her cereals and her fruits. Next to Italy, if we except the fabulous regions of India, I would rank Spain, for my own part, those districts, at least, that lie in the vicinity of the sea. She is parched and sterile in one part, it is true; but where she is at all productive, she yields the cereals in abundance, oil, wine, horses, and metals of every kind. In all these respects, Gaul is her equal, no doubt; but Spain, on the other hand, outdoes the Gallic provinces in her spartum and her specular stone, the products of her desert tracts, in her pigments that minister to our luxuries, in the ardour displayed by her people in laborious employments, in the perfect training of her slaves, in the robustness of body of her men, and in their general resoluteness of character.

As to the productions themselves, the greatest value of all, among the products of the sea, is attached to pearls: of objects that lie upon the surface of the earth, it is crystals that are most highly esteemed: and of those derived from the interior, adamas, smaragdus, precious stones, and murrhine, are the things upon which the highest value is placed. The most costly things that are

matured by the earth, are the kermes-berry and laser; that are gathered from trees, nard and Seric tissues; that are derived from the trunks of trees, logs of citrus-wood; that are produced by shrubs, cin- namon, cassia, and amomum; that are yielded by the juices of trees or of shrubs, amber, opobalsamum, myrrh, and frankincense; that are found in the roots of trees, the perfumes derived from costus. The most valuable products furnished by living animals, on land, are the teeth of elephants; by animals in the sea, tortoise-shell; by the coverings of animals, the skins which the Seres dye, and the substance gathered from the hair of the she-goats of Arabia, which we have spoken of under the name of "ladanum;" by creatures that are common to both land and sea, the purple of the murex. With reference to the birds, beyond plumes for warriors' helmets, and the grease that is derived from the geese of Commagene, I find no remarkable product mentioned. We must not omit, too, to observe, that gold, for which there is such a mania with all mankind, hardly holds the tenth rank as an object of value, and silver, with which we purchase gold, hardly the twentieth!

HAIL to thee, Nature, thou parent of all things! and do thou deign to show thy favour unto me, who, alone of all the citizens of Rome, have, in thy every department, thus made known thy praise.

SUMMARY. — Facts, narratives, and observations, one thousand three hundred.

ROMAN AUTHORS QUOTED. — M. Varro, the Register of the Triumphs, Mæcenas, Iacchus, Cornelius Bocchus.

FOREIGN AUTHORS QUOTED. — King Juba, Xenocrates the son of Zeno, Sudines, Æschylus, Philoxenus, Euripides, Nicander, Satyrus, Theophrastus, Chares, Philemon, Demostratus, Zenothemis, Metrodorus, Sotacus, Pytheas, Timæus the Sicilian, Nicias, Theochrestus, Asarubas, Mnaseas, Theomenes, Ctesias, Mithridates, Sophocles, King Archelaüs, Callistratus, Democritus, Ismenias, Olympicus, Alexander Polyhistor, Apion, Horus, Zoroaster, Zachalias.

PREFACE

libros naturalis historiae, novicium camenis quiritium tuorum opus, natos apud me proxima fetura licentiore epistula narrare constitui tibi, iucundissime imperator; sit enim haec tui praefatio, verissima, dum maximi consenescit in patre. “namque tu solebas nugas esse aliquid meas putare,” ut obiter emolliam catullum conterraneum meum (agnoscis et hoc castrense verbum): ille enim, ut scis, permutatis prioribus syllabis duriusculum se fecit quam volebat existimari, a veraniolis suis et fabullis. simul ut hac mea petulantia fiat quod proxime non fieri questus es in alia procaci epistula nostra, ut in quaedam acta exeat sciantque omnes quam ex aequo tecum vivat imperium. triumphalis et censorius tu sexiesque consul ac tribuniciae potestatis particeps et, quod his nobilius fecisti, dum illud patri pariter et equestri ordini praestas, praefectus praetorii eius omniaque haec rei publicae es: nobis quidem qualis in castrensi contubernio, nec quicquam in te mutavit fortunae amplitudo, nisi ut prodesse tantundem posses et velles. itaque cum ceteris in veneratione tui pateant omnia alia, nobis ad colendum te familiaris audacia sola superest: hanc igitur tibi imputabis et in nostra culpa tibi ignoscas. perfricui faciem nec tamen profeci, quoniam alia via occurris ingens et longius etiam summoves ingenii fascibus. fulgurare in nullo umquam verius dicta vis eloquentiae, tribunicia potestas facundiae. quanto tu ore patris laudes tonas! quanto fratris amas! quantus in poetica es! o magna fecunditas animi! quem ad modum fratrem quoque imitareris excogitasti.

sed haec quis possit intrepidus aestimare subiturus ingenii tui iudicium, praesertim lacessitum neque enim similis est condicio publicantium et nominatim tibi dicantium. tum possem dicere: ‘quid ista legis, imperator humili vulgo scripta sunt, agricolarum, opificum turbae, denique studiorum otiosis. quid te iudicem facis cum hanc operam condicerem, non eras in hoc albo. maiorem te sciebam, quam ut descensurum huc putarem.’ praeterea est quaedam publica etiam eruditorum reiectio. utitur illa et m. tullius extra omnem ingenii aleam positus et, quod miremur, per advocatum defenditur: “nec doctissimis. manium persium haec legere nolo, iunium congium volo.” quod si hoc lucilius, qui primus condidit stili nasum, dicendum sibi putavit, cicero mutuandum, praesertim cum de re publica scriberet, quanto nos causatius ab aliquo iudice defendimur sed haec ego mihi nunc patrocinia ademi nuncupatione, quoniam plurimum refert, sortiatur aliquis iudicem an eligat, multumque apparatus interest apud invitatum hospitem et oblatum. cum apud catonem, illum ambitus hostem et repulsis tamquam honoribus inemptis gaudentem, flagrantibus comitiis pecunias deponerent candidati, hoc se facere, quod tum pro innocentia ex rebus humanis summum esset, profitebantur. inde illa nobilis m. ciceronis suspiratio: “o te felicem, m. porci, a quo rem inprobam petere nemo audet!” cum tribunos appellaret l. scipio asiaticus, inter quos erat gracchus, hoc adtestabatur vel inimico iudici se

probari posse. adeo summum quisque causae suae iudicem facit quemcumque, cum eligit. unde provocatio appellatur. te quidem in excelsissimo generis humani fastigio positum, summa eloquentia, summa eruditione praeditum, religiose adiri etiam a salutantibus scio, et ideo curant, quae tibi dicantur ut digna sint. verum dis lacte rustici multaeque gentes et mola litant salsa qui non habent tura, nec ulli fuit vitio deos colere quoquo modo posset.

meae quidem temeritati accessit hoc quoque, quod levioris operae hos tibi dedicavi libellos. nam nec ingenii sunt capaces, quod alioqui in nobis perquam mediocre erat, neque admittunt excessus aut orationes sermonesve aut casus mirabiles vel eventus varios, iucunda dictu aut legentibus blanda sterili materia: rerum natura, hoc est vita, narratur, et haec sordidissima sui parte ac plurimarum rerum aut rusticis vocabulis aut externis, immo barbaris etiam, cum honoris praefatione ponendis. praeterea iter est non trita auctoribus via nec qua peregrinari animus expetat. nemo apud nos qui idem temptaverit, nemo apud graecos qui unus omnia ea tractaverit. magna pars studiorum amoenitates quaerimus; quae vero tractata ab aliis dicuntur immensae subtilitatis, obscuris rerum tenebris premuntur. ante omnia attingenda quae graeci τῆς ἔγκυκλίου παιδείας vocant, et tamen ignota aut incerta ingeniis facta; alia vero ita multis prodita, ut in fastidium sint adducta. res ardua vetustis novitatem dare, novis auctoritatem, obsoletis nitorem, obscuris lucem, fastiditis gratiam, dubiis fidem, omnibus vero naturam et naturae sua omnia. itaque etiam non assecutis voluisse abunde pulchrum atque magnificum est.

equidem ita sentio, peculiarem in studiis causam eorum esse, qui difficultatibus victis utilitatem iuvandi praetulerint gratiae placendi, idque iam et in aliis operibus ipse feci et profiteor mirari me t. livium, auctorem celeberrimum, in historiarum suarum, quas repetit ab origine urbis, quodam volumine sic orsum: “iam sibi satis gloriae quaesitum, et potuisse se desiderare, ni animus inquires pasceretur opere.” profecto enim populi gentium victoris et romani nominis gloriae, non suae, composuisse illa decuit. maius meritum esset operis amore, non animi causa, perseverasse et hoc populo romano praestitisse, non sibi. [xx] rerum dignarum cura - quoniam, ut ait domitius piso, thesaurus oportet esse, non libros - lectione voluminum circiter [ii], quorum pauca admodum studiosi attingunt propter secretum materiae, ex exquisitis auctoribus centum inclusimus xxxvi voluminibus, adiectis rebus plurimis, quas aut ignoraverant priores aut postea invenerat vita. nec dubitamus multa esse quae et nos praeterierint. homines enim sumus et occupati officiis subsicivisque temporibus ista curamus, id est nocturnis, ne quis vestrum putet his cessatum horis. dies vobis inpendimus, cum somno valetudinem computamus, vel hoc solo praemio contenti, quod, dum ista, ut ait M. Varro, musinamur, pluribus horis vivimus. profecto enim vita vigilia est. quibus de causis atque difficultatibus nihil auso promittere hoc ipsum tu praestas, quod ad te scribimus. haec fiducia operis, haec est indicatura. multa valde pretiosa ideo videntur, quia sunt templis dicata.

vos quidem omnes, patrem, te fratremque, diximus opere iusto, temporum

nostrorum historiam orsi a fine aufidii. ubi sit ea, quaeres. iam pridem peracta sancitur et alioqui statutum erat heredi mandare, ne quid ambitioni dedisse vita iudicaretur. proinde occupantibus locum faveo, ego vero et posteris, quos scio nobiscum decertaturos, sicut ipsi fecimus cum prioribus. argumentum huius stomachi mei habebis quod in his voluminibus auctorum nomina praetexui. est enim benignum, ut arbitror, et plenum ingenui pudoris fateri per quos profeceris, non ut plerique ex iis, quos attigi, fecerunt. scito enim conferentem auctores me deprehendisse a iuratissimis ex proximis veteres transcriptos ad verbum neque nominatos, non illa vergiliana virtute, ut certarent, non tulliana simplicitate, qui de re publica platonis se comitem profitetur, in consolatione filiae “crantorem”, inquit, “sequor,” item panaetium de officiis, quae volumina ediscenda, non modo in manibus cotidie habenda, nosti. obnoxii profecto animi et infelicis ingenii est deprehendi in furto malle quam mutuum reddere, cum praesertim sors fiat ex usura.

inscriptionis apud graecos mira felicitas: κηπίον inscripsere, quod volebant intellegi favum, alii κέρας ... ἁμαλθείας, quod copiae cornu, ut vel lactis gallinaei sperare possis in volumine haustum; iam ἴα, ... μοῦσαι, πανδέκται, ἐγχειρίδια, λειμών, πινάξ, σχεδίων: inscriptiones, propter quas vadimonium deserui possit; at cum intraveris, di deaeque, quam nihil in medio invenies! nostri graviore antiquitatum, exemplorum artiumque, facetissimi lucubrationum, puto quia bibaculus erat et vocabatur. paulo minus asserit Varro in satiris suis sesculixe et flextabula. apud graecos desiit nugari diodorus et βιβλιοθήκης historiam suam inscripsit. apion quidem grammaticus - hic quem tiberius caesar cymbalum mundi vocabat, cum propriae famae tympanum potius videri posset - immortalitate donari a se scripsit ad quos aliqua componebat. me non paenitet nullum festiviorem excogitasse titulum et, ne in totum videar graecos insectari, ex illis mox velim intellegi pingendi fingendique conditoribus, quos in libellis his invenies absoluta opera et illa quoque, quae mirando non satiamur, pendenti titulo inscripsisse, ut “Apelles faciebat” aut “polyclitus”, tamquam inchoata semper arte et imperfecta, ut contra iudiciorum varietates superesset artifici regressus ad veniam velut emendaturo quicquid desideraretur, si non esset interceptus. quare plenum verecundiae illud, quod omnia opera tamquam novissima inscripsere et tamquam singulis fato adempti. tria non amplius, ut opinor, absolute traduntur inscripta “ille fecit”, quae suis locis reddam. quo apparuit summam artis securitatem auctori placuisse, et ob id magna invidia fuere omnia ea.

ego plane meis adici posse multa confiteor, nec his solis, sed et omnibus quos edidi, ut obiter caveam istos homeromastigas (ita enim verius dixerim), quoniam audio et stoicos et dialecticos epicureosque - nam de grammaticis semper expectavi - parturire adversus libellos, quos de grammatica edidi, et subinde abortus facere iam decem annis, cum celerius etiam elephantum pariant. ceu vero nesciam adversus theophrastum, hominem in eloquentia tantum, ut nomen divinum inde invenerit, scripsisse etiam feminam, et proverbium inde natum suspensio arborem eligendi. non queo mihi temperare quo minus ad

hoc pertinentia ipsa censorii catonis verba ponam, ut appareat etiam catoni de militari disciplina commentanti, qui sub africano, immo vero et sub Hannibale didicisset militare et ne africanum quidem ferre potuisset, qui imperator triumphum reportasset, paratos fuisse istos, qui obtrectatione alienae scientiae famam sibi aucupantur: “quid enim” ait in eo volumine, “scio ego, quae scripta sunt si palam proferantur, multos fore qui vitiligit, sed ii potissimum, qui verae laudis expertes sunt. eorum ego orationes sivi praeterfluere.” nec plancus inlepide, cum diceretur asinius pollio orationes in eum parare, quae ab ipso aut libertis post mortem planci ederentur, ne respondere posset: “cum mortuis non nisi larvas luctari.” quo dicto sic percussit illas, ut apud eruditos nihil impudentius iudicetur. ergo securi etiam contra vitiligitores, quos cato eleganter ex vitiis et litigatoribus composuit - quid enim illi aliud quam litigant aut litem quaerunt - , exequemur reliqua propositi. quia occupationibus tuis publico bono parcendum erat, quid singulis contineretur libris, huic epistulae subiunxi summaque cura, ne legendos eos haberes, operam dedi. tu per hoc et aliis praestabis ne perlegant, sed, ut quisque desiderabit aliquid, id tantum quaerat et sciat quo loco inveniat. hoc ante me fecit in litteris nostris valerius soranus in libris, quos ἑποπτιδων inscripsit.

LIBER I

libro ii continentvr an finitus sit mundus et an unus de forma eius de motu eius. cur mundus dicatur de elementis de deo de siderum errantium natura de lunae et solis defectibus. de nocte de magnitudine siderum quae quis inuenerit in observatione caelesti de lunae motu errantium motus et luminum canonica quare eadem altiora, alias propiora videantur catholica siderum errantium quae ratio colores eorum mutet solis motus. dierum inaequalitatis ratio quare fulmina iovi adsignentur intervalla siderum de sideribus musica de mundo geometrica de repentinis sideribus. de cometis. natura et situs et genera eorum hipparchea de sideribus agnoscendis de caelestibus prodigiis per exempla historica lampades, bolides trabes caelestes, chasma caeli de caeli coloribus de flamma caelesti de coronis caelestibus de circulis repentinis plures soles plures lunae dierum modo noctibus lux clipei ardentes ostentum caeli semel notatum de discursu stellarum de stellis quae castores vocantur de ae+re de statis tempestatibus

LIBER II

mundum et hoc quodcumque nomine alio caelum appellare libuit, cuius circumflexu degunt cuncta, numen esse credi par est, aeternum, inmensum, neque genitum neque interiturum umquam. huius extera indagare nec interest hominum nec capit humanae coniectura mentis. sacer est, aeternus, immensus, totus in toto, immo vero ipse totum, infinitus ac finito similis, omnium rerum certus et similis incerto, extra intra cuncta complexus in se, idemque rerum naturae opus et rerum ipsa natura. furor est mensuram eius animo quosdam agitasse atque prodere ausos, alios rursus occasione hinc sumpta aut hic data innumerabiles tradidisse mundos, ut totidem rerum naturas credi oporteret aut, si una omnes incubaret, totidem tamen soles totidemque lunas et cetera etiam in uno et inmensa et innumerabilia sidera, quasi non eadem quaestiones semper in termino cogitationi sint occursurae desiderio finis alicuius aut, si haec infinitas naturae omnium artificii possit adsignari, non idem illud in uno facilius sit intellegi, tanto praesertim opere. furor est profecto, furor egredi ex eo et, tamquam interna eius cuncta plane iam nota sint, ita scrutari extera, quasi vero mensuram ullius rei possit agere qui sui nesciat, aut mens hominis videre quae mundus ipse non capiat.

formam eius in speciem orbis absoluti globatam esse nomen in primis et consensus in eo mortalium orbem appellantium, sed et argumenta rerum docent, non solum quia talis figura omnibus sui partibus vergit in sese ac sibi ipsa toleranda est seque includit et continet nullarum egens compagium nec finem aut initium ullis sui partibus sentiens, nec quia ad motum, quo subinde verti mox adparebit, talis aptissima est, sed oculorum quoque probatione, quod convexus mediusque quacumque cernatur, cum id accidere in alia non possit figura.

hanc ergo formam eius aeterno et inrequieto ambitu, inenarrabili celeritate, viginti quattuor horarum spatio circumagi solis exortus et occasus haut dubium reliquere. an sit inmensus et ideo sensum aurium excedens tantae molis rotatae vertigine adsidua sonitus, non equidem facile dixerim, non, hercule, magis quam circumactorum simul tinnitus siderum suosque volventium orbes an dulcis quidam et incredibili suavitate concentus. nobis qui intus agimus iuxta diebus noctibusque tacitus labitur mundus. esse innumeras ei effigies animalium rerumque cunctarum inpressas nec, ut in volucrum notamus ovis, levitate continua lubricum corpus, quod clarissimi auctores dixere, terrenorum argumentis indicatur, quoniam inde deciduis rerum omnium seminibus innumerae, in mari praecipue ac plerumque confusis monstrificae, gignantur effigies, praeterea visus probatione, alibi ursi, tauri alibi, alibi litterae figura, candidiore medio per verticem circulo. equidem et consensu gentium moveor; namque et graeci nomine ornamenti appellavere eum et nos a perfecta absolutaque elegantia mundum. caelum quidem haut dubie caelati argumento diximus, ut interpretatur M. Varro.

adiuvat rerum ordo discripto circulo qui signifer vocatur in duodecim animalium effigies et per illas solis cursus congruens tot saeculis ratio.

nec de elementis video dubitari quattuor esse ea: ignium summum, inde tot stellarum illos conluentium oculos; proximum spiritus, quem graeci nostrique eodem vocabulo ae+ra appellant, vitalem hunc et per cuncta rerum meabilem totoque consertum; huius vi suspensam cum quarto aquarum elemento librari medio spatii tellurem. ita mutuo complexu diversitatis effici nexum et levia ponderibus inhiberi quo minus evolent, contraque gravia ne ruant suspendi, levibus in sublime tendentibus. sic pari in diversa nisu in suo quaeque consistere, inrequieto mundi ipsius constricta circuitu, quo semper in se recurrente imam atque mediam in toto esse terram, eandemque universo cardine stare pendentem, librantem per quae pendeat, ita solam immobilem circa eam volubili universitate; eandem ex omnibus necti eidemque omnia inniti. inter hanc caelumque eodem spiritu pendent certis discreta spatiis septem sidera, quae ab incessu vocamus errantia, cum errent nulla minus illis. eorum medius sol fertur, amplissima magnitudine ac potestate nec temporum modo terrarumque, sed siderum etiam ipsorum caelique rector. hunc esse mundi totius animum ac planius mentem, hunc principale naturae regimen ac numen credere decet opera eius aestimantes. hic lucem rebus ministrat aufertque tenebras, hic reliqua sidera occultat, inlustrat; hic vices temporum annumque semper renascentem ex usu naturae temperat; hic caeli tristitiam discutit atque etiam humani nubila animi serenat; hic suum lumen ceteris quoque sideribus fenerat, praeclarus, eximius, omnia intuens, omnia etiam exaudiens, ut principi litterarum homero placuisse in uno eo video.

quapropter effigiem dei formamque quaerere inbecillitatis humanae reor. quisquis est deus, si modo est alius, et quacumque in parte, totus est sensus, totus visus, totus auditus, totus animae, totus animi, totus sui. innumeros quidem credere atque etiam ex vitiis hominum, ut pudicitiam, concordiam, mentem, spem, honorem, clementiam, fidem, aut, ut democrito placuit, duos omnino, poenam et beneficium, maiorem ad socordiam accedit. fragilis et laboriosa mortalitas in partes ita digessit infirmitatis suae memor, ut portionibus coleret quisque quo maxime indigeret. itaque nomina alia aliis gentibus et numina in iisdem innumerabilia invenimus, inferis quoque in genera discriptis morbisque et multis etiam pestibus, dum esse placatas trepido metu cupimus. ideoque etiam publice febris fanum in palatio dictum est, orbonae ad aedem larum, ara et malae fortunae esquiliiis. quam ob rem maior caelitum populus etiam quam hominum intellegi potest, cum singuli quoque ex semet ipsis totidem deos faciant iunones geniosque adoptando sibi, gentes vero quaedam animalia et aliqua etiam obscena pro dis habeant ac multa dictu magis pudenda, per fetidos cibos, alia et similia, iurantes. matrimonia quidem inter deos credi tantoque aevo ex iis neminem nasci et alios esse grandaevos semper canosque, alios iuvenes atque pueros, atri coloris, aligeros, claudos, ovo editos et alternis diebus viventes morientesque, puerilium prope deliramentorum est, sed super omnem inpuentiam, adulteria

inter ipsos fingi, mox iurgia et odia, atque etiam furtorum esse et scelerum numina. deus est mortali iuvare mortalem, et haec ad aeternam gloriam via. hac proceres iere romani, hac nunc caelesti passu cum liberis suis vadit maximus omnis aevi rector Vespasianus Augustus fessis rebus subveniens. hic est vetustissimus referendi bene merentibus gratiam mos, ut tales numinibus adscribant. quippe et aliorum nomina deorum et quae supra retuli siderum ex hominum nata sunt meritis. iovem quidem aut mercurium aliterve alios inter se vocari et esse caelestem nomenclaturam, quis non interpretatione naturae fateatur inridendum agere curam rerum humanarum illud, quicquid est, summum ac vel tam tristi atque multiplici ministerio non pollui credamus dubitemusne vix prodest iudicare, utrum magis conducat generi humano, quando aliis nullus est deorum respectus, aliis pudendus. externis famulantur sacris ac digitis deos gestant, monstra quoque colunt, damnant et excogitant cibos, imperia dira in ipsos, ne somno quidem quieto, inrogant. non matrimonia, non liberos, non denique quicquam aliud nisi iuvantibus sacris deligunt. alii in capitolio fallunt ac fulminantem periurant iovem. et hos iuvant scelera, illos sacra sua poenis agunt.

invenit tamen inter has utrasque sententias medium sibi ipsa mortalitas numen, quo minus etiam plana de deo coniectatio esset. toto quippe mundo et omnibus locis omnibusque horis omnium vocibus fortuna sola invocatur ac nominatur, una accusatur, rea una agitur, una cogitatur, sola laudatur, sola arguitur et cum conviciis colitur, volubilis ... que, a plerisque vero et caeca existimata, vaga, inconstans, incerta, varia indignorumque faultrix. huic omnia expensa, huic feruntur accepta, et in tota ratione mortalium sola utramque paginam facit, adeoque obnoxiae sumus sortis, ut prorsus ipsa pro deo sit qua deus probatur incertus. pars alia et hanc pellit astroque suo eventus adsignat et nascendi legibus, semelque in omnes futuros umquam deo decretum, in reliquum vero otium datum. sedere coepit sententia haec, pariterque et eruditum vulgus et rude in eam cursu vadit. ecce fulgurum monitus, oraculorum praescita, haruspicum praedicta atque etiam parva dictu in auguriis sternumenta et offensiones pedum. Divus Augustus prodidit laevum sibi calceum praepostere inductum quo die seditione militari prope afflictus est. quae singula inprovidam mortalitatem involvunt, solum ut inter ista vel certum sit nihil esse certi nec quicquam miserius homine aut superbius. ceteris quippe animantium sola victus cura est, in quo sponte naturae benignitas sufficit, uno quidem vel praefereundo cunctis bonis, quod de gloria, de pecunia, ambitione superque de morte non cogitant.

verum in his deos agere curam rerum humanarum credi ex usu vitae est poenasque maleficiis aliquando seras, occupato deo in tanta mole, numquam autem inritas esse nec ideo proximum illi genitum hominem, ut vilitate iuxta beluas esset. imperfectae vero in homine naturae praecipua solatia, ne deum quidem posse omnia - namque nec sibi potest mortem consciscere, si velit, quod homini dedit optimum in tantis vitae poenis, nec mortales aeternitate donare aut revocare defunctos nec facere ut qui vixit non vixerit, qui honores

gessit non gesserit - nullumque habere in praeterita ius praeterquam oblivionis atque (ut facietis quoque argumentis societas haec cum deo copuletur) ut bis dena viginti non sint aut multa similiter efficere non posse. per quae declaratur haut dubie naturae potentia idque esse quod deum vocemus. in haec divertisse non fuerit alienum, vulgata iam propter adsiduam quaestionem de deo.

hinc redeamus ad reliqua naturae. sidera, quae adfixa diximus mundo, non illa, ut existimat volgus, singulis attributa nobis et clara divitibus, minora pauperibus, obscura defectis ac pro sorte cuiusque lucentia adnumerata mortalibus, cum suo quaeque homine orta moriuntur nec aliquem exstingui decidua significant. non tanta caelo societas nobiscum est, ut nostro fato mortalis sit ibi quoque siderum fulgor. illa nimio alimento tracti umoris ignea vi abundantiam reddunt, cum decidere creduntur, ut apud nos quoque luminibus accensis liquore olei notamus accidere. ceterum aeterna caelestibus est natura intextentibus mundum intextuque concretis, potentia autem ad terram magnopere eorum pertinens, quae propter effectus claritatemque et magnitudinem in tanta subtilitate nosci potuerunt, sicut suo demonstrabimus loco. circularum quoque caeli ratio in terrae mentione aptius dicitur, quando ad eam tota pertinet, signiferi modo inventoribus non dilatis. obliquitatem eius intellexisse, hoc est rerum fores aperuisse, anaximander milesius traditur primus olympiade quinquagesima octava, signa deinde in eo cleostratus, et prima arietis ac sagittarii, sphaeram ipsam ante multo atlas.

nunc relicto mundi ipsius corpore reliqua inter caelum terrasque tractentur. summum esse quod vocant saturni sidus ideoque minimum videri et maximo ambire circulo ac tricesimo anno ad brevissima sedis suae principia regredi certum est, omnium autem errantium siderum meatus, interque ea solis et lunae, contrarium mundo agere cursum, id est laevum, illo semper in dextra praecipiti. et quamvis adsidua conversione immensae celeritatis attollantur ab eo rapianturque in occasum, adverso tamen ire motu per suos quaeque passus. ita fieri, ne convolutus aer eandem in partem aeterna mundi vertigine ignavo globo torpeat, sed fundatur adverso siderum verbere discretus et digestus. saturni autem sidus gelidae ac rigentis esse naturae, multumque ex eo inferiorem iovis circulum et ideo motu celeriore duodenis circumagi annis. tertium martis, quod quidam herculis vocant, igne ardens solis vicinitate, binis fere annis converti, ideoque huius ardore nimio et rigore saturni, interiectum ambobus, ex utroque temperari iovem salutareque fieri. deinde solis meatum esse partium quidem trecentarum sexaginta, sed ut observatio umbrarum eius redeat ad notas, quinos annis dies adici superque quartam partem diei. quam ob causam quinto anno unus intercalarius dies additur, ut temporum ratio solis itineri congruat.

infra solem ambit ingens sidus appellatum veneris, alterno meatu vagum ipsisque cognominibus aemulum solis ac lunae. praeveniens quippe et ante matutinum exoriens luciferi nomen accepit ut sol alter diemque maturans, contra ab occasu refulgens nuncupatur vespere ut prorogans lucem vicemve lunae reddens. quam naturam eius pythagoras samius primus apprehendit

olympiade circiter xlii, qui fuit urbis romae annus cxlii. iam magnitudine extra cuncta alia sidera est, claritatis quidem tantae, ut unius huius stellae radiis umbrae reddantur. itaque et in magno nominum ambitu est. alii enim iunonis, alii isidis, alii matris deum appellavere. huius natura cuncta generantur in terris. namque in alterutro exortu genitali rore conspergens non terrae modo conceptus inplet, verum animantium quoque omnium stimulat. signiferi autem ambitum peragit trecentis et duodequingenis diebus, a sole numquam absistens partibus sex atque quadraginta longius, ut timaeo placet.

simili ratione, sed nequaquam magnitudine aut vi, proximum illi mercurii sidus, a quibusdam appellatum apollinis, inferiore circulo fertur viiii diebus ocioe ambitu, modo ante solis exortum, modo post occasum splendens, numquam ab eo xxii partibus remotior, ut cidenas et sosigenes docent. ideo et peculiaris horum siderum ratio est neque communis cum supra dictis. nam ea et quarta parte caeli a sole abesse et tertia, et adversa soli saepe cernuntur, maioresque alios habent cuncta plenae conversionis ambitus in magni anni ratione dicendos.

sed omnium admirationem vincit novissimum sidus, terris familiarissimum et in tenebrarum remedium ab natura repertum, lunae. multiformis haec ambigua torsit ingenia contemplantium et proximum ignorare sidus maxime indignantium, crescens semper aut senescens et modo curvata in cornua facie, modo aequa portione divisa, modo sinuata in orbem, maculosa eademque subito praenitens, immensa orbe pleno ac repente nulla, alias pernox, alias sera et parte diei solis lucem adiuvens, deficiens et in defectu tamen conspicua - quae mensis exitu latet, tum laborare non creditur - , iam vero humilis et excelsa, et ne id quidem uno modo, sed alias admota caelo, alias contigua montibus, nunc in aquilonem elata, nunc in austros deiecta. quae singula in ea deprehendit hominum primus endymion; ob id amor eius fama traditur. non sumus profecto grati erga eos qui labore curaque lucem nobis aperuere in hac luce, miraue humani ingeni peste sanguinem et caedes condere annalibus iuvat, ut scelera hominum noscantur mundi ipsius ignaris. proxima ergo cardini, ideoque minimo ambitu, vicens diebus septenisque et tertia diei parte peragit spatia eadem, quae saturni sidus altissimum xxx, ut dictum est, annis. dein morata in coitu solis biduo, cum tardissime, a tricesima luce rursum ad easdem vices exit, haut scio an omnium, quae in caelo pernosci potuerunt, magistra: in xii mensium spatia oportere dividi annum, quando ipsa totiens solem redeuntem ad principia consequitur; solis fulgore, ut reliqua siderum, regi, siquidem in totum mutuata ab eo luce fulgere, qualem in repercussu aquae volitare conspiciamus; ideo molliore et imperfecta vi solvere tantum umorem atque etiam augere, quem solis radii absumant. ideo inaequali lumine adspici, quia, ex adverso demum plena, reliquis diebus tantum ex se terris ostendat, quantum a sole ipsa concipiat; in coitu quidem non cerni, quoniam haustum omnem lucis aversa illo regerat, unde acceperit. sidera vero haut dubie umore terreno pasci, quia dimidio orbe numquam maculoso cernatur, scilicet nondum suppetente ad hauriendum ultra iusta vi; masculas enim non

aliud esse quam terrae raptas cum umore sordes. defectus autem suos et solis, rem in tota contemplatione naturae maxime miram et ostento similem, magnitudinum umbraeque indices exsistere. quippe manifestum est solem interventu lunae occultari lunamque terrae obiectu ac vices reddi, eosdem solis radios luna interposito suo auferente terrae terraque lunae. hac subeunte repentinas obduci tenebras rursumque illius umbra sidus hebetari. neque aliud esse noctem quam terrae umbram, figuram autem umbrae similem metae ac turbini inverso, quando mucrone tantum ingruat neque lunae excedat altitudinem, quoniam nullum aliud sidus eodem modo obscuretur et talis figura semper mucrone deficiat. spatio quidem consumi umbras indicio sunt volucrum praealti volatus. ergo confinium illis est ae+ris terminus initiumque aetheris. supra lunam pura omnia ac diurnae lucis plena. a nobis autem per noctem cernuntur sidera, ut reliqua lumina e tenebris, et propter has causas nocturno tempore deficit luna. statim atque menstrui non sunt utrique defectus propter obliquitatem signiferi lunaeque multivagos, ut dictum est, flexus, non semper in scripulis partium congruente siderum motu.

haec ratio mortales animos subducit in caelum ac velut inde contemplantibus trium maximarum rerum naturae partium magnitudinem detegit. non posset quippe totus sol adimi terris intercedente luna, si terra maior esset quam luna. tertia ex utroque vastitas solis aperietur, ut non sit necesse amplitudinem eius oculorum argumentis atque coniectura animi scrutari: immensum esse, quia arborum in limitibus porrectarum in quotlibet passuum milia umbras paribus iaciat intervallis, tamquam toto spatio medius, et quia per aequinoctium omnibus in meridiana plaga habitantibus simul fiat a vertice, item quia circa solstitialem circulum habitantium meridie ad septentrionem umbrae cadant, ortu vero ad occasum, quae fieri nullo modo possent, nisi multo quam terra maior esset, nec non quod montem idam exoriens latitudine exsuperet, dextra laevaue large amplectens, praesertim tanto discretus intervallo.

defectus lunae magnitudinem eius haut dubia ratione declarat, sicut terrae parvitatem ipse deficiens. namque cum sint tres umbrarum figurae constetque, si par lumini sit materia quae iaciat, umbram columnae effigie iaci nec habere finem, si vero maior materia quam lumen, turbinis recti, ut sit imum eius angustissimum et simili modo infinita longitudo, si minor materia quam lux, metae existere effigiem in cacuminis finem desinentem talemque cerni umbram deficiente luna: palam fit, ut nulla amplius relinquatur dubitatio, superari magnitudinem terrae. id quidem et tacitis naturae ipsius indiciis: cur enim partitis vicibus anni brumalis abscedit aut noctium opacitate terras reficit exustus haut dubie, et sic quoque exurens quadam in parte. tanta magnitudo est.

et rationem quidem defectus utriusque primus romani generis in vulgum extulit sulpicius gallus, qui consul cum m. marcello fuit, sed tum tribunus militum, sollicitudine exercitu liberato pridie quam perses rex superatus a paulo est in concionem ab imperatore productus ad praedicendam eclipsim,

mox et composito volumine. apud graecos autem investigavit primus omnium thales milesius olympiadis xlviii anno quarto praedicto solis defectu, qui alyatte rege factus est urbis conditae anno clxx. post eos utriusque sideris cursum in sexcentos annos praecedinit hipparchus, menses gentium diesque et horas ac situs locorum et visus populorum complexus, aevo teste haut alio modo quam consiliorum naturae particeps. viri ingentes supraque mortalia, tantorum numinum lege deprehensa et misera hominum mente iam soluta, in defectibus scelera aut mortem aliquam siderum pavente - quo in metu fuisse stesichori et pindari vatium sublimia ora palam est deliquio solis - aut in luna veneficia arguente mortalitate et ob id crepitu dissono auxiliante - quo pavore ignarus causae nicias atheniensium imperator veritus classem portu educere opes eorum adflixit - : macte ingenio este, caeli interpretes rerumque naturae capaces, argumenti repertoires, quo deos hominesque vicistis! quis enim haec cernens et statos siderum (quoniam ita appellare placuit) labores non suae necessitati mortales genitos ignoscat

nunc confessa de iisdem breviter atque capitulatim attingam ratione admodum necessariis locis strictimque reddita, nam neque instituti operis talis argumentatio est neque omnium rerum afferri posse causas minus mirum est quam constare in aliquis.

defectus ccxxiii mensibus redire in suos orbes certum est, solis defectus non nisi novissima primave fieri luna, quod vocant coitum, lunae autem non nisi plena, semperque citra quam proxime fuerint; omnibus autem annis fieri utriusque sideris defectus statis diebus horisque sub terra nec tamen, cum superne fiant, ubique cerni, aliquando propter nubila, saepius globo terrae obstante convexitatibus mundi. intra ducentos annos hipparchi sagacitate compertum est et lunae defectum aliquando quinto mense a priore fieri, solis vero septimo, eundem bis in xxx diebus super terras occultari, sed ab aliis hoc cerni, quaeque sunt in hoc miraculo maxime mira, cum conveniat umbra terrae lunam hebetari, nunc ab occasus parte hoc ei accidere, nunc ab exortus, quam ratione, cum solis exortu umbra illa hebetatrix sub terra esse debeat, semel iam acciderit ut in occasu luna deficeret utroque super terram conspicuo sidere. nam ut xv diebus utrumque sidus quaereretur, et nostro aevo accidit imperatoribus vespasianis patre iii. filio consulibus.

lunam semper aversis a sole cornibus, si crescat, ortus spectare, si minuatur, occasus, haut dubium est; lucere dodrantes semuncias horarum ab secunda adicientem usque ad plenum orbem detrahentemque in deminutionem; intra xiiii autem partes solis semper occultam esse. quo argumento amplior errantium stellarum quam lunae magnitudo colligitur, quando illae et a septenis interdum partibus emergant. sed altitudo cogit minores videri, sicut adfixas caelo solis fulgor interdiu non cerni, cum aequae ac noctu luceant idque manifestum fiat defectu solis et praealtis puteis.

errantium autem tres, quas supra solem diximus sitas, occultantur meantes cum eo, exoriuntur vero matutino discedentes partibus numquam amplius undenis. postea radiorum eius contactu reguntur et in triquetra a partibus cxx

stationes matutinas faciunt, quae et primae vocantur, mox in adverso a partibus clxxx exortus vespertinos, iterumque in cxx ab alio latere appropinquantibus stationes vespertinas, quas et secundas vocant, donec assecutus in partibus duodenis occultet illas, qui vespertini occasus appellantur. martis stella, ut propior, etiam ex quadrato sentit radios, a xc partibus, unde et nomen accepit motus primus et secundus nonagenarius dictus ab utroque exortu. eadem stationalis senis mensibus commoratur in signis, alioqui bimenstris, cum ceterae utraque statione quaternos menses non impleant. inferiores autem duae occultantur in coitu vespertino simili modo, relictæque a sole totidem in partibus faciunt exortus matutinos, ad quos longissimis distantiae suae metis solem insequuntur adeptæque occasu matutino conduntur ac praetereunt. mox eodem intervallo vespere exoriuntur usque ad quos diximus terminos. ab his retrogradiuntur ad solem et occasu vespertino delitescent. veneris stella et stationes duas, matutinam vespertinamque, ab utroque exortu facit a longissimis distantiae suae finibus, mercurii stationum brevioris momento quam ut deprehendi possint.

haec est luminum occultationumque ratio, perplexior motu multisque involuta miraculis, siquidem magnitudines suas et colores mutant, et eadem ad septentrionem accedunt abeuntque ad austrum terrisque propiores aut caelo repente cernuntur. in quibus aliter multa quam priores tradituri fatemur ea quoque illorum esse muneris qui primi vias quaerendi demonstraverint, modo ne quis desperet saecula proficere semper. pluribus de causis haec omnia accidunt: prima circulorum, quos graeci ἀψίδας in stellis vocant; etenim graecis utendum erit vocabulis. sunt autem hi sui cuique earum aliique quam mundo, quoniam terra a verticibus duobus, quos appellaverunt polos, centrum caeli nec non et signiferi est oblique inter eos siti. omnia autem haec constant ratione circini semper indubitata. ergo ab alio cuique centro apsides suae exsurgunt ideoque diversos habent orbes motusque dissimiles, quoniam interiores apsidas necesse est breviores esse. igitur a terrae centro apsides altissimae sunt saturno in scorpiione, iovi in virgine, marti in leone, soli in geminis, veneri in sagittario, mercurio in capricorno, lunae in tauro, mediis omnium partibus, et e contrario ad terrae centrum humillimae atque proximae. sic fit ut tardius moveri videantur, cum altissimo ambitu feruntur, non quia adcelerent tardentve naturales motus, qui certi ac singuli sunt illis, sed quia deductas ab summa apside lineas coartari ad centrum necesse est, sicut in rotis radios, idemque motus alias maior, alias minor centri propinquitate sentitur. altera sublimitatum causa, quoniam a suo centro apsidas altissimas habent in aliis signis, saturnus in librae parte vicesima, iuppiter cancri quinta decima, mars capricorni xxviii, sol arietis xviii, venus piscium xxvii, mercurius virginis xv, luna tauri iii. tertia altitudinum ratio caeli mensura, non circuli, intellegitur, subire eas aut descendere per profundum aetheris oculis aestimantibus.

huic conexa latitudinum signiferi obliquitatisque causa est. per hunc stellae quas diximus feruntur, nec aliud habitatur in terris quam quod illi subiaceret,

reliqua a polis squalent. veneris tantum stella excedit eum binis partibus, quae causa intellegitur efficere ut quaedam animalia et in desertis mundi nascantur. luna quoque per totam latitudinem eius vagatur, sed omnino non excedens eum. ab his mercurii stella laxissime, ut tamen e duodenis partibus - tot enim sunt latitudinis - non amplius octonas pererret, neque has aequaliter, sed duas in medio eius et supra quattuor, infra duas. sol deinde medio fertur inter duas partes flexuoso draconum meatu inaequalis, martis stella quattuor mediis, iovis media et super eam duabus, saturni duabus ut sol. haec erit latitudinum ratio ad austrum descendantium aut ad aquilonem subeuntium. hac constare et tertiam illam a terra subeuntium in caelum, et pariter scandi eam quoque existimavere plerique falso. qui ut coarguantur, aperienda est subtilitas immensa et omnes eas complexa causas.

convenit stellas in occasu vespertino proximas esse terrae et altitudine et latitudine, exortusque matutinos in initio cuiusque fieri, stationes in mediis latitudinum articulis, quae vocant ecliptica. perinde confessum est motum augeri, quamdiu in vicino sint terrae; cum abscedant in altitudinem, minui. quae ratio lunae maxime sublimitatibus adprobatur. aequae non est dubium in exortibus matutinis etiamnum augeri atque a stationibus primis tris superiores deminuere se usque ad stationes secundas. quae cum ita sint, manifestum erit ab exortu matutino latitudines scandi, quoniam in eo primum habitu incipiat parcius adici motus, in stationibus vero primis et altitudinem subiri, quoniam tum primum incipiant detrahi numeri stellaeque retroire. cuius rei ratio privatim reddenda est. percussae in qua diximus parte et triangulo solis radio inhibentur rectum agere cursum et ignea vi levantur in sublime. hoc non protinus intellegi potest visu nostro, ideoque existimantur stare, unde et nomen accepit statio. progreditur deinde eiusdem radii violentia et retroire cogit vapore percussas. multo id magis in vespertino earum exortu, toto sole adverso cum in summas apsidas expelluntur minimaeque cernuntur, quoniam altissime absunt, et minimo feruntur motu, tanto minore, cum hoc in altissimis apsidum evenit signis. ab exortu vespertino latitudo descenditur parcius iam se minuente motu, non tamen ante stationes secundas augente, cum et altitudo descenditur, superveniente ab alio latere radio eademque vi rursus ad terras deprimente, qua sustulerat in caelum e priore triquetra. tantum interest, subeant radii an superveniant, multoque eadem magis in vespertino occasu accidunt. haec est superiorum stellarum ratio; difficilior reliquarum et a nullo ante nos reddita.

primum igitur dicatur, cur veneris stella numquam longius xlii partibus, mercurii xx ab sole abscedant, saepe citra eas ad solem reciprocant. conversas habent utraeque apsidas ut infra solem sitae, tantumque circulis earum subter est quantum superne praedictarum, et ideo non possunt abesse amplius, quoniam curvatura apsidum ibi non habet longitudinem maiorem. ergo utrique simili ratione modum statuunt apsidum suarum margines, ac spatia longitudinis latitudinum evagatione pensant. at enim cur non semper ad quadraginta sex et ad partes viginti perveniunt immo vero, sed ratio canonicos

fallit. namque apparet apsidas quoque earum moveri, quod numquam transeant solem. itaque cum in partem ipsam eius incidere margines alterutro latere, tum et stellae ad longissima sua intervalla pervenire intelleguntur. cum citra fuere margines, totidem partibus et ipsae ocius redire coguntur, cum sit illa semper utrique extremitas summa.

hinc et ratio motuum conversa intellegitur. superiores enim celerrime feruntur in occasu vespertino, hae tardissime; illae a terra altissime absunt, cum tardissime moventur, hae, cum ocissime, quia, sicut in illis propinquitas centri adcelerat, ita in his extremitas circuli. illae ab exortu matutino minuere celeritatem incipiunt, hae vero augere; illae retro cursum agunt a statione matutina usque ad vespertinam, veneris a vespertina usque ad matutinam. incipit autem ab exortu matutino latitudinem scandere, altitudinem vero ac solem insequi a statione matutina, ocissima in occasu matutino et altissima, degredi autem latitudine motumque minuere ab exortu vespertino, retro quidem ire simulque altitudine degredi ab statione vespertina, mercurii rursus stella utroque modo scandere ab exortu matutino, degredi vero latitudine a vespertino, consecutoque sole ad quindecim partium intervallum consistit quadriduo prope immobilis. mox ab altitudine descendit retroque graditur ab occasu vespertino usque ad exortum matutinum, tantumque haec et luna totidem diebus, quot subiere, descendunt. veneris quindecies pluribus subit, rursus saturni et iovis duplicato degrediuntur, martis etiam quadruplicato. tanta est naturae varietas, sed ratio evidens. nam quae in vaporem solis nituntur, etiam descendunt aegre.

multa promi amplius circa haec possunt secreta naturae legesque, quibus ipsa serviat, exempli gratia in martis sidere, cuius est maxime inobservabilis cursus, numquam id stationem facere iovis sidere triquetrum, raro admodum lx partibus discreto, qui numerus sexangulas mundi efficit formas, nec exortus nisi in duobus signis tantum, cancro et leonis, simul edere, mercurii vero sidus exortus vespertinos in piscibus raros facere, creberrimos in virgine, in libra matutinos, item matutinos in aquario, rarissimos in leone, retrogradum in tauro et geminis non fieri, in cancro vero non citra vicesimam quintam partem, lunam bis coitum cum sole in nullo alio signo facere quam geminis, non coire aliquando in sagittario tantum, novissimam vero primamque eadem die vel nocte nullo alio in signo quam ariete conspici - id quoque paucis mortalium contigit, et inde fama cernendi lynceo - , non comparere in caelo saturni sidus et martis, cum plurimum, diebus clxx, iovis xxxvi aut, cum minimum, denis detractis diebus, veneris lxviii aut, cum minimum, lii, mercuri xiii aut, cum plurimum, xvii.

colores ratio altitudinum temperat, siquidem earum similitudinem trahunt, in quarum aethra venere subeundo, tingitque adpropinquantes utralibet alieni meatus circulus, frigidior in pallorem, ardentior in ruborem, ventosus in horrorem, sol atque commissurae apsidum extremaeque orbitae atram in obscuritatem. suus quidem cuique color est: saturno candidus, iovi clarus, marti igneus, lucifero candens, vesperi refulgens, mercurio radians, lunae

blandus, soli, cum oritur, ardens, postea radians, his causis conexo visu et earum quae caelo continentur. namque modo multitudo conferta inest circa dimidios orbes lunae, placida nocte leniter inlustrante eas, modo raritas, ut fugisse miremur, plenilunio abscondente aut cum solis suprave dictarum radii visus praestrinxere nostros. et ipsa autem luna ingruentium solis radiorum haut dubie differentias sentit, hebetante cetero inflexos mundi convexitate eos praeterquam ubi recti angulorum competant ictus. itaque in quadrato solis dividua est, in triquetro seminani ambitur orbe, inpletur autem in adverso, rursusque minuens easdem effigies paribus edit intervallis, simili ratione qua super solem tria sidera.

sol autem ipse quattuor differentias habet, bis aequata nocte diei, vere et autumnus, in centrum incidens terrae octavis in partibus arietis ac librae, bis permutatis spatiis, in auctum diei bruma, octava in parte capricorni, noctis vero solstitio, totidem in partibus cancri. inaequalitatis causa obliquitas est signiferi, cum pars aequa mundi super subterque terras omnibus fiat momentis. sed quae recta in exortu suo consurgunt signa longiore tractu tenent lucem; quae vero obliqua, ociore transeunt spatio.

latet plerosque magna caeli adsestatione conpertum principibus doctrinae viris, superiorum trium siderum ignes esse qui decidui ad terras fulminum nomen habeant, sed maxime iovis medio loco siti, fortassis quoniam contagium nimii umoris ex superiore circulo atque ardoris ex subiecto per hunc modum egerat, ideoque dictum iovem fulmina iaculari. ergo ut e flagrante ligno carbo cum crepitu, sic a sidere caelestis ignis exspuitur praescita secum adferens, ne abdicata quidem sui parte in divinis cessante operibus. idque maxime turbato fit ae+re, quia collectus umor abundantiam stimulat aut quia turbatur quodam ceu gravidi sideris partu.

intervalla quoque siderum a terra multi indagare temptarunt, et solem abesse a luna undeviginti partes quantam lunam ipsam a terra prodiderunt. pythagoras vero, vir sagacis animi, a terra ad lunam [cxxxvi] stadiorum esse collegit, ad solem ab ea duplum, inde ad duodecim signa triplicatum, in qua sententia et gallus sulpicius fuit noster.

sed pythagoras interdum et musica ratione appellat tonum quantum absit a terra luna, ab ea ad mercurium dimidium spatii et ab eo ad veneris, a quo ad solem sescuplum, a sole ad martem tonum id est quantum ad lunam a terra, ab eo ad iovem dimidium et ab eo ad saturni, et inde sescuplum ad signiferum; ita septem tonis effici quam διὰ πασῶν ἁρμονίαν vocant, hoc est universitatem concentus; in ea saturnum dorio moveri phthongo, iovem phrygio et in reliquis similia, iucunda magis quam necessaria subtilitate.

stadium xxv nostros efficit passus, hoc est pedes dcxxv. posidonius non minus xl stadiorum a terra altitudinem esse, in quam nubila ac venti nubesque perveniant, inde purum liquidumque et inperturbatae lucis ae+ra, sed a turbido ad lunam viciens c milia stadiorum, inde ad solem quinquies miliens, et spatio fieri, ut tam immensa eius magnitudo non exurat terras. plures autem dcccc in altitudinem nubes subire prodiderunt. inconperta haec et

inextricabilia, sed prodenda, quia sunt prodita, in quis tamen una ratio geometricae collectionis numquam fallacis possit non repudiari, si cui libeat altius ista persequi, nec ut mensura - id enim velle paene dementis otii est -, sed ut tantum aestimatio coniectanti constet animo. nam cum ccclx et fere sex partibus orbis solis ex circuitu eius patere appareat circulum, per quem meat, semperque dimetiens tertiam partem ambitus et tertiae paulo minus septimam colligat, apparet dempta eius dimidia, quoniam terra centralis interveniat, sextam fere partem huius immensi spatii, quod circa terram circuli solaris animo comprehenditur, inesse altitudinis spatio, lunae vero duodecimam, quoniam tanto brevior quam sol ambitu currit. ita fieri eam in medio solis ac terrae. miror quo procedat improbitas cordis humani parvulo aliquo invitata successu, sicut in supra dictis occasionem inpudentiae ratio largitur. ausique divinare solis ad terram spatia eadem ad caelum agunt, quoniam sit medius sol, ut protinus mundi quoque ipsius mensura veniat in digitos. quantas enim dimetiens habeat septimas, tantas habere circulum duoetvicesimas, tamquam plane a perpendiculo mensura caeli constet. aegyptia ratio, quam petosiris et nechepsos ostendere, singulas partes in lunari circulo, ut dictum est, minimo xxxiii stadiis paulo amplius patere colligit, in saturni amplissimo duplum, in solis, quem medium esse diximus, utriusque mensurae dimidium. quae computatio plurimum habet pudoris, quoniam ad saturni circulum addito signiferi ipsius intervallo nec numerabilis multiplicatio efficitur.

restant pauca de mundo. namque et in ipso caelo stellae repente nascuntur. plura earum genera. cometas graeci vocant, nostri crinitas, horrentes crine sanguineo et comarum modo in vertice hispidas. iidem pogonias quibus inferiore ex parte in speciem barbae longae promittitur iuba. acontiae iaculi modo vibrantur, ocissimo significatu. haec fuit, de qua quinto consulatu suo titus imperator caesar praeclaro carmine perscripsit, ad hunc diem novissima visa. easdem breviores et in mucronem fastigatas xiphias vocavere, quae sunt omnium pallidissimae et quodam gladii nitore ac sine ullis radiis, quos et disceus, nomini similis, colore autem electro, raros e margine emittit. pitheus doliorum cernitur figura, in concavo fumidae lucis. ceratias cornus speciem habet, qualis fuit cum graecia apud salamina depugnavit. lampadias ardentes imitatur faces, hippeus equinas iubas, celerrimi motus atque in orbem circa se euntes. fit et candidus Διὸς cometes, argenteo crine ita refulgens, ut vix contueri liceat, specieque humana dei effigiem in se ostendens. fiunt et hirci, villorum specie et nube aliqua circumdati. semel adhuc iubae effigies mutata in hastam est, olympiade cviii, urbis anno ccccviii. brevissimum quo cernerentur spatium vii dierum adnotatum est, longissimum clxxx.

moventur autem aliae errantium modo, aliae immobiles haerent, omnes ferme sub ipso septentrione aliqua eius parte non certa, sed maxime in candida, quae lactei circuli nomen accepit. aristoteles tradit et simul plures cerni, nemini conpertum alteri, quod equidem sciam, ventos autem ab iis graves aestusve significari. fiunt et hibernis mensibus et in austrino polo, sed ibi citra ullum iubar. diraque conperta aethiopum et aegypti populis cui nomen

aevi eius rex dedit typhon, ignea specie ac spirae modo intorta, visu quoque torvo, nec stella verius quam quidam igneus nodus. sparguntur aliquando et errantibus stellis ceterisque crines. sed cometes numquam in occasura parte caeli est, terrificum magna ex parte sidus atque non leviter piatum, ut civili motu octavio consule iterumque pompeii et caesaris bello, in nostro vero aevo circa veneficium, quo claudius caesar imperium reliquit domitio neroni, ac deinde principatu eius adsiduum prope ac saevum. referre arbitrantur, in quas partes sese iaculetur aut cuius stellae vires accipiat quasque similitudines reddat et quibus in locis emicet: tibiarum specie musicae arti portendere, obscenis autem moribus in verendis partibus signorum, ingeniis et eruditioni, si triquetram figuram quadratamve paribus angulis ad aliquos perennium stellarum situs edat; venena fundere in capite septentrionalis austrinaeve serpentis.

cometes in uno totius orbis loco colitur in templo romae, admodum faustus Divo Augusto iudicatus ab ipso, qui incipiente eo apparuit ludis, quos faciebat veneri genetrici non multo post obitum patris caesaris in collegio ab eo instituto. namque his verbis in ... gaudium prodit is: “ipsis ludorum meorum diebus sidus crinitum per septem dies in regione caeli sub septemtrionibus est conspectum. id oriebatur circa undecimam horam diei clarumque et omnibus e terris conspicuum fuit. eo sidere significari vulgus credidit caesaris animam inter deorum immortalium numina receptam, quo nomine id insigne simulacro capitis eius, quod mox in foro consecravimus, adiectum est.” haec ille in publicum; interiore gaudio sibi illum natum seque in eo nasci interpretatus est. et, si verum fatemur, salutare id terris fuit.

sunt qui et haec sidera perpetua esse credant suoque ambitu ire, sed non nisi relictā ab sole cerni; alii vero qui nasci umore fortuito et ignea vi ideoque solvi.

idem hipparchus numquam satis laudatus, ut quo nemo magis adprobaverit cognationem cum homine siderum animasque nostras partem esse caeli, novam stellam et aliam in aevo suo genitam deprehendit eiusque motu, qua fulsit, ad dubitationem est adductus, anne hoc saepius fieret moverenturque et eae, quas putamus adfixas, ideoque ausus rem etiam deo inprobam, adnumerare posteris stellas ac sidera ad nomen expungere organis excogitatis, per quae singularum loca atque magnitudines signaret, ut facile discerni posset ex eo non modo an obirent ac nascerentur, sed an omnino aliquae transirent moverenturque, item an crescerent minuerenturque, caelo in hereditate cunctis relicto, si quisquam, qui cretionem eam caperet, inventus esset.

emicant et faces, non nisi cum decidunt visae, qualis germanico caesare gladiatorum spectaculum edente praeter ora populi meridiano transcucurrit. duo genera earum. lampadas vocant plane faces, alterum bolidas, quale mutinensibus malis visum est. distant quod faces vestigia longa faciunt priore ardente parte, bolis vero perpetua ardens longiorem trahit limitem.

emicant et trabes simili modo, quas δοκοὺς vocant, qualis cum

lacedaemonii classe victi imperium graeciae amisere. fit et caeli ipsius hiatus, quod vocant chasma, fit et sanguinea species et, quo nihil terribilius mortalium timori est, incendium ad terras cadens inde, sicut olympiadis cvii anno tertio, cum rex philippus graeciam quateret. atque ego haec statis temporibus naturae vi, ut cetera, arbitror existere, non, ut plerique, variis de causis, quas ingeniorum acumen excogitat, quippe ingentium malorum fuere praenuntia; sed ea accidisse non quia haec facta sunt arbitror, verum haec ideo facta quia incasura erant illa, raritate autem occultam eorum esse rationem ideoque non, sicut exortus supra dictos defectusque et multa alia, nosci.

cernuntur et stellae cum sole totis diebus, plerumque et circa solis orbem ceu spicae coronae et versicolores circuli, qualiter Augusto Caesare in prima iuventa urbem intrante post obitum patris ad nomen ingens capessendum. existunt eaedem coronae circa lunam et circa nobilia astra caeloque inhaerentia. circa solem arcus adparuit l. opimio q. fabio cos., orbis c. porcio m'. acilio, circulus rubri coloris l. iulio p. rutilio cos.

fiunt prodigiosi et longiores solis defectus, qualis occiso dictatore caesare et antoniano bello totius paene anni pallore continuo. et rursus soles plures simul cernuntur, nec supra ipsum nec infra, sed ex obliquo, numquam iuxta nec contra terram nec noctu, sed aut oriente aut occidente. semel et meridie conspecti in bosporo produntur, qui ab matutino tempore duraverunt in occasum. trinos soles et antiqui saepius videre, sicut sp. postumio q. mucio et q. marcio m. porcio et m. antonio p. dolabella et m. lepidio l. planco cos., et nostra aetas vidit divo claudio principe, consulatu eius cornelio orfito collega. plures quam tres simul visi ad hoc aevi numquam produntur.

lunae quoque trinae, ut cn. domitio c. fannio consulibus, apparuere.

quod plerique appellaverunt soles nocturnos, lumen de caelo noctu visum est c. caecilio cn. papirio consulibus et saepe alias, ut diei species nocte luceret.

clipeus ardens ab occasu ad ortum scintillans transcucurrit solis occasu l. valerio c. mario consulibus.

scintillam visam e stella cadere et augeri terrae adpropinquantem ac, postquam lunae magnitudine facta sit, inluxisse ceu nubilo die, dein, cum in caelum se reciperet, lampadem factam semel umquam proditur cn. octavio c. scribonio consulibus. vidit id silanus proconsul cum comitatu suo.

fieri videntur et discursus stellarum numquam temere, ut non ex ea parte truces venti cooriantur.

existunt stellae et in mari terrisque. vidi nocturnis militum vigiliis inhaerere pilis pro vallo fulgorem effigie ea; et antemnis navigantium aliisque navium partibus ceu vocali quodam sono insistunt, ut volucres sedem ex sede mutantes, graves, cum solitariae venere, mergentesque navigia et, si in carinae ima deciderint, exurentes, geminae autem salutes et prosperi cursus nuntiae, quarum adventu fugari diram illam ac minacem appellatamque helenam ferunt et ob id polluci ac castori id numen adsignant eosque in mari invocant. hominum quoque capita vespertinis magno praesagio circumfulgent. omnia

incerta ratione et in naturae maiestate abdita.

hactenus de mundo ipso sideribusque: nunc reliqua caeli memorabilia. namque et hoc caelum appellavere maiores quod alio nomine ae+ra, omne quod inani simile vitalem hunc spiritum fundit. infra lunam haec sedes multoque inferior, ut animadverto propemodum constare, infinitum ex superiore natura ae+ris, infinitum terreni halitus miscens utraque sorte confunditur. hinc nubila, tonitrua et alia fulmina, hinc grandines, pruinae, imbres, procellae, turbines, hinc plurima mortalium mala et rerum naturae pugna secum. terrena in caelum tendentia deprimit siderum vis eademque quae sponte non subeant ad se trahit. decidunt imbres, nebulae subeunt, siccantur amnes, ruunt grandines. torrent radii et terram in medium undique inpellunt, iidem infracti resiliunt et quae potuere auferunt secum. vapor ex alto cadit rursusque in altum redit. venti ingruunt inanes iidemque cum rapina remeant. tot animalium haustus spiritum e sublimi trahit, at ille contra nititur, tellusque ut inani caelo spiritum fundit. sic ultro citro commeante natura ut tormento aliquo mundi celeritate discordia accenditur. nec stare pugnae licet, sed adsidue rapta convolvitur et circa terram immenso rerum causas globo ostendit, subinde per nubes caelum aliud obtexens. ventorum hoc regnum. itaque praecipua eorum natura ibi et ferme reliquas complexa eas causas, quoniam tonitruum et fulminum iactus horum violentiae plerique adsignant, quin et ideo lapidibus pluere interim, quia vento sint rapti, et multa similiter. quam ob rem simul plura dicenda sunt.

tempestatum imbrumque quasdam statas esse causas, quasdam vero fortuitas aut adhuc rationis inconpertae, manifestum est. quis enim aestates et hiemes quaeque in temporibus annua vice intelleguntur siderum motu fieri dubitet ergo ut solis natura temperando intellegitur anno, sic reliquorum quoque siderum propria est cuiusque vis et ad suam cuique naturam fertilis. alia sunt in liquorem soluti umoris fecunda, alia concreti in pruinas aut coacti in nives aut glaciati in grandines, alia flatus, teporis alia aut vaporis, alia roris, alia rigoris. nec vero haec tanta debent existimari, quanta cernuntur, cum esse eorum nullum minus luna tam immensae altitudinis ratio declaret. igitur in suo quaeque motu naturam suam exercent, quod manifestum saturni maxime transitus imbris faciunt. nec meantium modo siderum haec vis est, sed multorum etiam adhaerentium caelo, quotiens errantium accessu impulsa aut coniectu radiorum exstimulata sunt, qualiter in suculis sentimus accidere, quas graeci ob id pluvio nomine appellant. quin et sua sponte quaedam stisque temporibus, ut haedorum exortus. arcturi vero sidus non ferme sine procellosa grandine emergit.

nam caniculae exortu accendi solis vapores quis ignorat cuius sideris effectus amplissimi in terra sentiuntur: fervent maria exoriente eo, fluctuant in cellis vina, moventur stagna. orygem appellat aegyptus feram, quam in exortu eius contra stare et contueri tradit ac velut adorare, cum sternuerit. canes quidem toto eo spatio maxime in rabiem agi non est dubium.

quin partibus quoque signorum quorundam sua vis inest, ut autumnali

aequinoctio brumaeque, cum tempestatibus confici sidus intellegimus, nec imbris tantum tempestatibusque, sed multis et corporum et ruris experimentis. adflantur alii sidere, alii commoventur statis temporibus alvo, nervis, capite, mente. olea et populus alba et salices solstitio folia circumagunt. floret ipso brumali die suspensi in tectis arentis herba pulei. rumpuntur intentae spiritu membranae. miretur hoc qui non observet cotidiano experimento, herbam unam, quae vocatur heliotropium, abeuntem solem intueri semper omnibusque horis cum eo verti, vel nubilo obumbrante. iam quidem lunari potestate ostrearum conchyliorumque et concharum omnium corpora augeri ac rursus minui, quin et soricum fibras respondere numero lunae exquisivere diligentiores, minimumque animal, formicam, sentire vires sideris interlunio semper cessantem. quo turpior homini inscitia est fatenti praecipue iumentorum quorundam in oculis morbos cum luna increscere ac minui. patrocinator vastitas rei, immensa discreta altitudine in duo atque septuaginta signa, hoc est rerum aut animantium effigies, in quas digessere caelum periti. in iis quidem mdc adnotavere stellas, insignes scilicet effectum visuve, exempli gratia in cauda tauri septem quas appellavere vergilias, in fronte suculas, booten, quae sequitur septem triones.

extra has causas non negaverim existere imbres ventosque, quoniam umidam a terra, alias vero propter vaporem fumidam exhalari caliginem certum est nubesque liquore egresso in sublime aut ex ae+re coacto in liquorem gigni. densitas earum corpusque haut dubio coniectatur argumento, cum solem obumbrent, perspicuum alias etiam urinantibus in quamlibet profundam aquarum altitudinem.

igitur non eam infitias posse in has et ignes superne stellarum decidere, quales sereno saepe cernimus, quorum ictu concuti ae+ra verum est, quando et tela vibrata stridunt, cum vero in nubem perveniunt, vaporem dissonum gigni, ut candente ferro in aquam demerso, et fumidum verticem volvi. hinc nasci procellas et, si in nube luctetur flatus aut vapor, tonitrua edi; si erumpat ardens, fulmina; si longiore tractu nitatur, fulgetras. his findi nubem, illis perumpi, et esse tonitrua inactorum ignium plagas, ideoque protinus coruscare igneas nubium rimas. posse et repulso siderum depressum qui a terra meaverit spiritum nube cohibitum tonare, natura strangulante sonitum, dum rixetur, edito fragore, cum erumpat, ut in membrana spiritu intenta. posse et attritu, dum praeceps feratur, illum, quisquis est, spiritum accendi. posse et conflictu nubium elidi, ut duorum lapidum, scintillantibus fulgetris. sed haec omnia esse fortuita. hinc bruta fulmina et vana, ut quae nullam habeant rationem naturae. his percuti montes, his maria, omnesque alios inritos iactus. illa vero fatidica ex alto statisque de causis et ex suis venire sideribus.

simili modo ventos vel potius flatus posse et arido siccoque anhelitu terrae gigni non negaverim, posse et aquis ae+ra exspirantibus, qui neque in nebulam densetur nec crassescat in nubes, posse et solis impulsu agi, quoniam ventus haut aliud intellegatur quam fluctus ae+ris, pluribusque etiam modis. namque et e fluminibus ac nivibus et e mari videmus, et quidem tranquillo, et

alios, quos vocant altanos, e terra consurgere. qui, cum e mari redeunt, tropaei vocantur, si pergunt, apogei.

montium vero flexus crebrique vertices et conflera cubito aut confracta in umeros iuga, concavi vallium sinus, scindentes inaequalitate ideo resultantem ae+ra - quae causa etiam voces multis in locis reciprocas facit - , sine fine ventos generant. iam quidem et specus, qualis in dalmatia ore vasto, praeceps hiatu, in quem deiecto levi pondere quamvis tranquillo die turbini similis emicat procella; nomen loco est senta. quin et in cyrenaica provincia rupes quaedam austro traditur sacra, quam profanum sit attrectari hominis manu, confestim austro volvente harenas. in domibus etiam multis madefacta inclusa opacitate conceptacula auras suas habent. adeo causa non deest.

sed plurimum interest, flatus sit an ventus. illos statos atque perspirantes, quos non tractus aliquis, verum terrae sentiunt, qui non aura, non procella, sed, mares appellatione quoque ipsa, venti sunt, sive adsiduo mundi motu et contrario siderum occurso nascuntur, sive hic est ille generabilis rerum naturae spiritus huc illuc tamquam in utero aliquo vagus, sive disparili errantium siderum ictu radiorumque multiformi iactu flagellatus ae+r, sive a suis sideribus exeunt his propioribus sive ab illis caelo adfixis cadunt, palam est illos quoque legem habere naturae non ignotam, etiamsi nondum percognitam. viginti amplius auctores graeci veteres prodidere de his observationes. quo magis miror orbe discordi et in regna, hoc est in membra, diviso tot viris curae fuisse tam ardua inventu, inter bella praesertim et infida hospitia, piratis etiam, omnium mortalium hostibus, transituros fama terrentibus, ut hodie quaedam in suo quisque tractu ex eorum commentariis, qui numquam eo accessere, verius noscat quam indigenarum scientia, nunc vero pace tam festa, tam gaudente proventu rerum artiumque principe, omnino nihil addisci nova inquisitione, immo ne veterum quidem inventa perdisci. non erant maiora praemia, in multos dispersa fortunae magnitudine, et ista plures sine praemio alio quam posteros iuvandi eruerunt. namque mores hominum senuere, non fructus, et inmensa multitudo aperto, quodcumque est, mari hospitalique litorum omnium adpulsu navigat, sed lucri, non scientiae, gratia. nec reputat caeca mens et tantum avaritiae intenta id ipsum scientia posse tutius fieri. quapropter scrupulosius, quam instituto fortassis conveniat operi, tractabo ventos, tot milia navigantium cernens.

veteres quattuor omnino servavere per totidem mundi partes - ideo nec homerus plures nominat - hebeti, ut mox iudicatum est, ratione; secuta aetas octo addidit nimis subtili atque concisa. proximis inter utramque media placuit, ad brevem ex numerosa additis quattuor. sunt ergo bini in quattuor caeli partibus, ab oriente aequinoctiali subsolanus, ab oriente brumali vulturnus. illum apelioten, hunc graeci eorum appellant. a meridie auster et ab occasu brumali africanus; notum et liba nominant. ab occasu aequinoctiali favonius, ab occasu solstitiali corus; zephyrum et argesten vocant. a septentrionibus septentrio, interque eum et exortum solstitialem aquilo, aparcias et boreas dicti. numerosior ratio quattuor his interiecerat, thrascian

media regione inter septentrionem et occasum solstitialem, itemque caecian media inter aquilonem et exortum aequinoctialem ab ortu solstitiali, phoenica media regione inter ortum brumalem et meridiem, item inter liba et notum compositum ex utroque medium inter meridiem et hibernum occidentem libonotum. nec finis. alii quippe mesen nomine etiamnum addidere inter borean et caecian, et inter eurum notumque euronotum. sunt etiam quidam peculiare quibusque gentibus venti, non ultra certum procedentes tractum, ut atheniensibus sciron, paulo ab argeste deflexus, reliquae graeciae ignotus. aliubi flatus idem olympias vocatur. consuetudo omnibus his nominibus argesten intellegit. caecian aliqui vocant hellespontian, et eosdem alii aliter. item in narbonensi provincia clarissimus ventorum est circius nec ullo omnium violentia inferior, ostiam plerumque secto ligustico mari perferens. idem non modo in reliquis partibus caeli ignotus est, sed ne viennam quidem eiusdem provinciae urbem attingens: paucis ante milibus iugi modici occursum tantus ille ventorum coercitus! et austros in aegyptum penetrare negat fabianus. quo fit manifesta lex naturae, ventis etiam et tempore et fine dicto.

ver ergo aperit navigantibus maria, cuius in principio favonii hibernum molliunt caelum sole aquarii xxv obtinente partem. is dies sextus februarius ante idus. competit ferme et hoc omnibus, quos deinde ponam, per singulas intercalationes uno die anticipantibus rursusque lustro sequenti ordinem servantibus. favonium quidam a. d. viii kalendas martias chelidonian vocant ab hirundinis visu, nonnulli vero ornithian, uno et lxx die post brumam ab adventu avium flantem per dies viiii. favonio contrarius est quem subsolanum appellavimus. dat aestatem exortus vergiliarum in totidem partibus tauri vi diebus ante maias idus, quod tempus austrinum est, huic vento septentrione contrario. ardentissimo autem aestatis tempore exoritur caniculae sidus sole primam partem leonis ingrediente, qui dies xv ante augustas kalendas est. huius exortum diebus viii ferme aquilones antecedunt, quos prodromos appellant. post biduum autem exortus iidem aquilones constantius perflant diebus xl. quos etesias appellant. mollire eos creditur solis vapor geminatus ardore sideris, nec ulli ventorum magis statim sunt. post eos rursus austri frequentes usque ad sidus arcturi, quod exoritur xi diebus ante aequinoctium autumnii. cum hoc corus incipit. corus autumnat; huic est contrarius vulturnus. post id aequinoctium diebus fere iiii et xl vergiliarum occasus hiemem inchoat, quod tempus in iii idus novembres incidere consuevit; hoc est aquilonis hiberni multumque aestivo illi dissimilis, cuius ex adverso est africanus. ante brumam autem vii diebus totidemque post eam sternitur mare alcyonum feturae, unde nomen ii dies traxere. reliquum tempus hiemat. nec tamen saevitia tempestatum concludit mare. piratae primum coegere mortis periculo in mortem ruere et hiberna experiri maria; nunc idem avaritia cogit.

ventorum frigidissimi sunt quos a septentrione diximus spirare et vicinus iis corus. hi et reliquos conpescunt et nubes abigunt. umidi africanus et praecipue auster italiae. narrant et in ponto caecian in se trahere nubes. sicci corus et vulturnus, praeterquam desinentes. nivales aquilo et septentrio.

grandines septentrio inportat et corus. aestuosus auster, tepidi vulturnus et favonius. iidem subsolano sicciores, et in totum omnes a septentrione et occidente sicciores quam a meridie et oriente. saluberrimus autem omnium aquilo, noxius auster et magis siccus, fortassis quia umidus frigidior est. minus esurire eo spirante creduntur animantes. etesiae noctu desinunt fere et a tertia diei oriuntur. in hispania et asia ab oriente flatus est eorum, in ponto ab aquilone, reliquis in partibus a meridie. spirant autem et a bruma, cum vocantur ornithiae, sed leniores et paucis diebus. permutant et duo naturam cum situ: auster africae serenus, aquilo nubilus. omnes venti vicibus suis spirant, maiore ex parte autem ut contrarius desinenti incipiat. cum proximi cadentibus surgunt, a laevo latere in dextrum ut sol ambiunt. de ratione eorum menstrua quarta maxime luna decernit. isdem autem ventis in contrarium navigatur prolatis pedibus, ut noctu plerumque adversa vela concurrant. austro maiores fluctus eduntur quam aquilone, quoniam ille inferus ex imo mari spirat, hic summo. ideoque post austros noxii praecipue terrae motus. noctu auster, interdiu aquilo vehementior, et ab ortu flantes diuturniores sunt ab occasu flantibus. septentriones impari fere desinunt numero, quae observatio et in aliis multis rerum naturae partibus valet; mares itaque existimantur in pares numeri. sol et auget et comprimit flatus: auget exoriens, occidens, comprimit meridianus aestivis temporibus. itaque medio diei aut noctis plerumque sopiuntur, quia aut nimio frigore aut aestu solvuntur. et imbris venti sopiuntur. exspectantur autem maxime unde nubes discussae adaperuere caelum. omnium quidem - si libeat observare minimos ambitus - redire easdem vices quadriennio exacto eudoxus putat, non ventorum modo, verum et reliquarum tempestatum magna ex parte. et est principium lustris eius semper intercalario anno caniculae ortu. de generalibus ventis haec.

nunc de repentinis flatibus, qui exhalante terra, ut dictum est, coorti rursusque deiecti, interim obducta nubium cute, multiformes exsistunt. vagi quippe et ruentes torrentium modo, ut aliquis placere ostendimus, tonitrua et fulgura edunt. maiore vero inlati pondere incursuque, si late siccam rupere nubem, procellam gignunt, quae vocatur a graecis ecnephias; sin vero depresso sinu artius rotati effregerunt, sine igni, hoc est sine fulmine, verticem faciunt, qui typhon vocatur, id est vibratus ecnephias. defert hic secum aliquid abruptum e nube gelida, convolvens versansque et ruinam suam illo pondere adgravans ac locum ex loco mutans rapida vertigine, praecipua navigantium pestis, non antemnas modo, verum ipsa navigia contorta frangens, tenui remedio aceti in advenientem effusi, cui frigidissima est natura. idem inlisu ipso percussus correpta secum in caelum refert sorbetque in excelsum. quod si maiore depressae nubis eruperit specu, sed minus lato quam procella, nec sine fragore, turbinem vocant, proxima quaeque prosternentem. idem ardentior accensusque, dum furit, prester vocatur, amburens contacta pariter et proterens. non fit autem aquilonius typhon, nec nivalis aut nive iacente ecnephias. quod si simul rupit nubem exarsitque et ignem habuit, non postea concepit, fulmen est. distat a prestere quo flamma ab igni. hic late funditur

flatu, illud conglobatur impetu. vertex autem remeando distat a turbine et quo stridor a fragore, procella latitudine ab utroque, disiecta nube verius quam rupta. fit et caligo beluae similis in nube, dira navigantibus. vocatur et columna, cum spissatus umor rigensque ipse se sustinet, ex eodem genere et aulon, cum veluti fistula nubes aquam trahit.

hieme et aestate rara fulmina contrariis de causis, quoniam hieme densatus aer nubium crassiore corio spissatur, omnisque terrarum exhalatio rigens ac gelida quicquid accipit ignei vaporis exstinguit. quae ratio immunem scythiam et circa rigentia a fulminum casu praestat, e diverso nimius ardor aegyptum, siquidem calidi siccique halitus terrae raro admodum tenuesque et infirmas densantur in nubes. vere autem et autumnus crebriora fulmina, corruptis in utroque tempore aestatis hiemisque causis, qua ratione crebra in italia, quia mobilior aer mitiore hieme et aestate nimbose semper quodammodo vernat vel autumnat. italiaeque partibus iis, quae a septentrione descendunt ad teporem, qualis est urbis et campaniae tractus, iuxta hieme et aestate fulgurat, quod non in alio situ.

fulminum ipsorum plura genera traduntur. quae sicca veniunt, non adurunt, sed dissipant; quae umida, non urunt, sed infusant. tertium est quod clarum vocant, mirificae maxime naturae, quo dolia exhauriuntur intactis operimentis nulloque alio vestigio relicto, aurum et aes et argentum liquatur intus, sacculis ipsis nullo modo ambustis ac ne confuso quidem signo cerae. marcia, ... princeps romanorum, icta gravida partu exanimato ipsa citra ullum aliud incommodum vixit. in catilinianis prodigiis pompeiano ex municipio m. herennius decurio sereno die fulmine ictus est.

tuscorum litterae novem deos emittere fulmina existimant, eaque esse undecim generum; iovem enim trina iaculari. romani duo tantum ex iis servavere, diurna attribuentes iovi, nocturna summano, rariora sane eadem de causa frigidioris caeli. etruscia erumpere terra quoque arbitratur, quae infera appellat, brumali tempore facta saeva maxime et execrabilia, cum sint omnia, quae terrena existimant, non illa generalia nec a sideribus venientia, sed ex proxima atque turbidiore natura. argumentum evidens, quod omnia superiora e caelo decidentia obliquos habent ictus, haec autem, quae vocant terrena, rectos. et quae ex propiore materia cadunt, ideo creduntur e terra exire, quoniam ex repulso nulla vestigia edunt, cum sit illa ratio non inferi ictus, sed adversi. a saturni ea sidere proficisci subtilius ista consecrati putant, sicut cremantia a martis, qualiter cum volsinii, oppidum tuscorum opulentissimum, totum concrematum est fulmine. vocant et familiaria in totam vitam fatidica, quae prima fiunt familiam suam cuique indepto. ceterum existimant non ultra decem annos portendere privata, praeterquam aut primo patrimonio facta aut natali die, publica non ultra tricesimum annum, praeterquam in deductione oppidi.

exstat annalium memoria sacris quibusdam et precationibus vel cogi fulmina vel impetrari. vetus fama etrusciae est, impetratum volsinios urbem depopulatis agris subeunte monstro, quod vocavere oltam, evocatum a porsina

suo rege. et ante eum a numa saepius hoc factitatum in primo annalium suorum tradidit l. piso, gravis auctor, quod imitatum parum rite tullum hostilium ictum fulmine. lucosque et aras et sacra habemus interque statores ac tonantes et feretrios elicum quoque accepimus iovem. varia in hoc vitae sententia et pro cuiusque animo. imperare naturae sacra audacis est credere, nec minus hebetis beneficiis abrogare vires, quando in fulgurum quoque interpretatione eo profecit scientia, ut ventura alia finito die praecinatur et an peremptura sint factum aut prius alia facta quae lateant, innumerabilibus in utroque publicis privatisque experimentis. quam ob rem sint ista ut rerum naturae libuit, alias certa alias dubia, aliis probata aliis damnanda: nos de cetero quae sunt in his memorabilia non omittemus.

fulgetrum prius cerni quam tonitrua audiri, cum simul fiant, certum est, nec mirum, quoniam lux sonitu velocior, ictum autem et sonitum congruere ita modulante natura, sed sonitum profecti esse fulminis, non inlati, etiamnum spiritum ociorem fulmine, ideo quati prius omne et adflari quam percuti, nec quemquam tangi qui prior viderit fulmen aut tonitrua audierit. laeva prospera existimantur, quoniam laeva parte mundi ortus est. nec tam adventus spectatur quam reditus, sive ab ictu resilit ignis sive opere confecto aut igne consumpto spiritus remeat. in sedecim partes caelum in eo spectu divisere tusci. prima est a septemtrionibus ad aequinoctialem exortum, secunda ad meridiem, tertia ad aequinoctialem occasum, quarta obtinet quod est reliquum ab occasu ad septemtriones. has iterum in quaternas divisere partes, ex quibus octo ab exortu sinistras, totidem e contrario appellavere dexter. ex iis maxime dirae quae septemtriones ab occasu attingunt. itaque plurimum refert unde venerint fulmina et quo concesserint. optimum est in exortivas redire partes. ideo cum a prima caeli parte venerint et in eandem concesserint, summa felicitas portenditur, quale sullae dictatori ostentum datum accepimus. cetera ad ipsius mundi portionem minus prospera aut dira. quaedam fulgura enuntiare non putant fas nec audire, praeterquam si hospiti indicentur aut parenti. magna huius observationis vanitas tacta iunonis aede romae deprehensa est Scauro consule, qui mox princeps fuit. noctu magis quam interdiu sine tonitribus fulgurat.

num animal, hominem, non semper exstinguit, cetera ilico, hunc videlicet natura tribuente honorem, cum tot beluae viribus praestent. omnia contrarias incubant partes. homo, nisi convertatur in percussas, non respirat. superne icti considunt. vigilans ictus coniventibus oculis, dormiens patentibus reperitur. hominem ita exanimatum cremari fas non est, condi terra religio tradidit. nullum animal nisi exanimatum fulmine accenditur. vulnera fulminatorum frigidiora sunt reliquo corpore. ex iis, quae terra gignuntur, lauri fruticem non icit nec umquam quinque altius pedibus descendit in terram. ideo pavidi altiores specus tutissimos putant aut tabernacula pellibus beluarum, quas vitulos appellant, quoniam hoc solum animal ex marinis non percutiat, sicut nec e volucribus aquilam, quae ob hoc armigera huius teli fingitur. in italia inter tarracinam et aedem feroniae turres belli civilis temporibus desiere fieri,

nulla non earum fulmine diruta.

praeter haec inferiore caelo relatum in monumenta est lacte et sanguine pluisse m'. acilio c. porcio cos. et saepe alias, sicut carne p. volumnio servo sulpicio cos., exque ea non perputruisse quod non diripuissent aves, item ferro in lucanis anno ante quam M. Crassus a parthis interemptus est omnesque cum eo lucani milites, quorum magnus numerus in exercitu erat. effigies quo pluit ferri spongiarum similis fuit. haruspices praemonuerunt superna volnera. l. autem paulo c. marcello cos. lana pluit circa castellum carissanum, iuxta quod post annum t. annius milo occisus est. eodem causam dicente lateribus coctis pluisse in acta eius anni relatum est.

armorum crepitus et tubae sonitus auditos e caelo cimbricis bellis accepimus, crebroque et prius et postea. tertio vero consulatu mari ab amerinis et tudertibus spectata arma caelestia ab ortu occasuque inter se concurrentia, pulsae quae ab occasu erant. ipsum ardere caelum minime mirum est et saepius visum maiore igni nubibus correptis.

celebrant graeci anaxagoran clazomenium olympiadis lxxviii secundo anno praedixisse caelestium litterarum scientia, quibus diebus saxum casurum esset e sole, idque factum interdum in thraciae parte ad aegaeum flumen, qui lapis etiam nunc ostenditur magnitudine vehis, colore adusto, comete quoque illis noctibus flagrante. quod si quis praedictum credat, simul fateatur necesse est, maioris miraculi divinitatem anaxagorae fuisse solvique rerum naturae intellectum et confundi omnia, si aut ipse sol lapis esse aut umquam lapidem in eo fuisse credatur. decidere tamen crebro non erit dubium. in abydi gymnasium ex ea causa colitur hodieque modicus quidem, sed quem in media terrarum casurum idem anaxagoras praedixisse narretur. colitur et cassandriae, quae potidaea quondam vocitata est, ob id deducta. ego ipse vidi in vocontiorum agro paulo ante delatum.

arcus vocamus extra miraculum frequentes et extra ostentum. nam ne pluvios quidem aut serenos dies cum fide portendunt. manifestum est radium solis inmissum cavae nubi repulsa acie in solem refringi, colorumque varietatem mixtura nubium, ignium, aeris fieri. certe nisi sole adverso non fiunt nec umquam nisi dimidia circuli forma nec noctu, quamvis aristoteles prodat aliquando visum, quod tamen fatetur idem non nisi xxx luna posse fieri. fiunt autem hieme maxime ab aequinoctio autumnali die decrescente. quo rursus crescente ab aequinoctio verno non existunt, nec circa solstitium longissimis diebus, bruma vero id est brevissimis frequenter, iidem sublimes humili sole humilesque sublimi, et minores oriente aut occidente, sed in latitudinem dimissi, meridie exiles, verum ambitus maioris. aestate autem per meridiem non cernuntur, post autumnii aequinoctium quacumque hora, nec umquam plures simul quam duo.

cetera eiusdem naturae non multis dubia esse video: grandinem congelato imbri gigni et nivem eodem umore mollius coacto, pruina autem ex rore gelido; per hiemem nives cadere, non grandines, ipsasque grandines interdum saepius quam noctu, et multo celerius resolvi quam nives; nebulas nec aestate

nec maximo frigore exsistere, rores neque gelu neque ardoribus neque ventis nec nisi serena nocte; gelando liquorem minui, resolutaque glacie non eundem inveniri modum; varietates colorum figurarumque in nubibus cerni, prout admixtus ignis superet aut vincatur.

praeterea quasdam proprietates quibusdam locis esse, roscidas aestate africae noctes, in italia locris et in lacu velino nullo non die apparere arcus, rhodi et syracusis numquam tanta nubila obduci, ut non aliqua hora sol cernatur, qualia aptius suis referentur locis. haec sint dicta de ae+re.

sequitur terra, cui uni rerum naturae partium eximia propter merita cognomen indidimus maternae venerationis. sic hominum illa, ut caelum dei, quae nos nascentes excipit, natos alit semelque editos et sustinet semper, novissime complexa gremio iam a reliqua natura abdicatos, tum maxime ut mater operiens, nullo magis sacra merito quam quo nos quoque sacros facit, etiam monimenta ac titulos gerens nomenque prorogans nostrum et memoriam extendens contra brevitatem aevi, cuius numen ultimum iam nullis precamur irati grave, tamquam nesciamus hanc esse solam quae numquam irascatur homini. aquae subeunt in imbres, rigescunt in grandines, tumescunt in fluctus, praecipitantur in torrentes, aer densatur nubibus, furit procellis: at haec benigna, mitis, indulgens ususque mortalium semper ancilla, quae coacta generat, quae sponte fundit, quos odores saporisque, quos sucos, quos tactus, quos colores! quam bona fide creditum faenus reddit! quae nostra causa alit! pestifera enim animantia, vitali spiritu habente culpam: illi necesse est semina excipere et genita sustinere; sed in malis generantium noxa est. illa serpentem homine percusso amplius non recipit poenasque etiam inertium nomine exigit. illa medicas fundit herbas et semper homini parturit. quin et venena nostri miseritam instituisse credi potest, ne in taedio vitae fames, mors terrae meritis alienissima, lenta nos consumeret tabe, ne lacerum corpus abrupta dispergerent, ne laquei torqueret poena praepostera incluso spiritu, cui quaereretur exitus, ne in profundo quaesita morte sepultura pabulo fieret, ne ferri cruciatus scinderet corpus. ita est, miserita genuit id, cuius facillimo haustu inlibato corpore et cum toto sanguine exstingeremur, nullo labore, sitientibus similes, qualiter defunctos non volucres, non ferae attingerent terraeque servaretur qui sibi ipsi periisset. verum fateamur: terra nobis malorum remedium genuit, nos illud vitae facimus venenum. non enim et ferro, quo carere non possumus, simili modo utimur nec tamen quereremur merito, etiamsi maleficii causa tulisset. adversus unam quippe naturae partem ingrati sumus. quas non ad delicias quasque non ad contumelias servit homini in maria iacitur aut, ut freta admittamus, eroditur. aquis, ferro, igni, ligno, lapide, fruge omnibus cruciatur horis multoque plus, ut deliciis quam ut alimentis famuletur nostris. et tamen quae summa patitur atque extrema cute tolerabilia videantur: penetramus in viscera, auri argentique venas et aeris ac plumbi metalla fodientes, gemmas etiam et quosdam parvulos quaerimus lapides scrobibus in profundum actis. viscera eius extrahimus, ut digito gestetur gemma, quo petitur. quot manus atteruntur, ut unus niteat articulus! si

ulli essent inferi, iam profecto illos avaritiae atque luxuriae cuniculi refodissent. et miramur, si eadem ad noxam genuit aliqua! ferae enim, credo, custodiunt illam arcentque sacrilegas manus. non inter serpentes fodimus et venas auri tractamus cum veneni radicibus placatiore tamen dea ob haec, quod omnes hi opulentiae exitus ad scelera caedesque et bella tendunt, quodque sanguine nostro rigamus insepultisque ossibus tegimus, quibus tamen velut exprobrato furore tandem ipsa se obducit et scelera quoque mortalium occultat.

inter crimina ingrati animi et hoc duxerim quod naturam eius ignoramus. est autem figura prima, de qua consensus iudicat. orbem certe dicimus terrae globumque verticibus includi fatemur. neque enim absoluti orbis est forma in tanta montium excelsitate, tanta camporum planitie, sed cuius amplexus, si cuncta liniarum comprehendantur ambitu, figuram absoluti orbis efficiat, id quod ipsa rerum natura cogit, non isdem causis, quas attulimus in caelo. namque in illo cava in se convexitas vergit et cardini suo, hoc est terrae, undique incumbit. haec ut solida ac conferta adsurgit intumescenti similis extraque protenditur. mundus in centrum vergit, at terra exit a centro, immensum eius globum in formam orbis adsidua circa eam mundi volubilitate cogente.

ingens hic pugna litterarum contraque vulgi, circumfundi terrae undique homines conversisque inter se pedibus stare, et cunctis similem esse verticem, simili modo et quacumque parte media calcari, illo quaerente, cur non decidant contra siti, tamquam non ratio praesto sit, ut nos non decidere mirentur illi. intervenit sententia quamvis indocili probabilis turbae, inaequali globo, ut si sit figura pineae nucis, nihilo minus terram undique incoli. sed quid hoc refert, alio miraculo exoriente, pendere ipsam ac non cadere nobiscum, ceu spiritus vis, mundo praesertim inclusi, dubia sit, aut possit cadere, natura repugnante et quo cadat negante. nam sicut ignium sedes non est nisi in ignibus, aquarum nisi in aquis, spiritus nisi in spiritu, sic terrae, arcentibus cunctis, nisi in se locus non est. globum tamen effici mirum est in tanta planitie maris camporumque. cui sententiae adest dicaearchus, vir in primis eruditus, regum cura permensus montes, ex quibus altissimum prodidit pelium mcl passuum ratione perpendiculi, nullam esse eam portionem universae rotunditatis colligens. mihi incerta haec videtur coniectatio, haud ignaro quosdam alpium vertices longo tractu nec brevior quinquaginta milium passuum adsurgere. sed vulgo maxime haec pugna est, si coactam in verticem aquarum quoque figuram credere cogatur. atqui non aliud in rerum natura adspectu manifestius. namque et dependentes ubique guttae parvis globantur orbibus et pulveri inlatae frondiumque lanugini inpositae absoluta rotunditate cernuntur, et in poculis repletis media maxime tument, quae propter subtilitatem umoris mollitiamque in se residentem ratione facilius quam visu deprehenduntur. idque etiam magis mirum, in poculis repletis addito umore minimo circumfluere quod supersit, contra evenire ponderibus additis ad vicanos saepe denarios, scilicet quia intus recepta liquorem in

verticem attollant, at cumulo eminenti infusa delabantur. eadem est causa, propter quam e navibus terra non cernatur, e navium malis conspicua, ac procul recedente navigio, si quid quod fulgeat religetur in mali cacumine, paulatim descendere videatur et postremo occultetur. denique oceanus, quem fatemur ultimum, quanam alia figura cohaereret atque non decideret nullo ultra margine includente id ipsum ad miraculum redit, quonam modo, etiamsi globetur, extremum non decidat mare. contra quod, ut sint plana maria et qua videntur figura, non posse id accidere, magno suo gaudio magnaue gloria inventores graeci subtilitate geometrica docent. namque cum e sublimi in inferiora aquae ferantur et sit haec natura earum confessa nec quisquam dubitet in litore ullo accessisse eas quo longissime devexitas passa sit, procul dubio apparere, quo quid humilior sit, propius a centro esse terrae, omnesque linias, quae emittantur ex eo ad proximas aquas, breviores fieri quam quae ad extremum mare a primis aquis; ergo totas omnique ex parte aquas vergere in centrum ideoque non decidere, quoniam in interiora nitantur.

quod ita formasse artifex natura credi debet, ut, cum terra arida et sicca constare per se ac sine umore non posset, nec rursus stare aqua nisi sustinente terra, mutuo inplexu iungerentur, hac sinus pandente, illa vero permeante totam, intra extra, supra infra, venis ut vinculis discurrentibus, atque etiam in summis iugis erumpente, quo spiritu acta et terrae pondere expressa siphonum modo emicat tantumque a periculo decidendi abest, ut in summa quaeque et altissima exsiliat. qua ratione manifestum est, quare tot fluminum cotidiano accessu maria non crescant. est igitur in toto suo globo tellus medio ambitu praecincta circumfluo mari, nec argumentis hoc investigandum, sed iam experimentis cognitum.

a gadibus columnisque herculis hispaniae et galliarum circuitu totus hodie navigatur occidens. septentrionalis vero oceanus maiore ex parte navigatus est, auspiciis Divi Augusti germaniam classe circumvecta ad cimbrorum promunturium et inde in immenso mari prospecto aut fama cognito scythicam ad plagam et umore nimio rigentia. propter quod minime verisimile est illic maria deficere, ubi umoris vis superet. iuxta vero ab ortu ex indico mari sub eodem sidere pars tota vergens in caspium mare pernavigata est macedonum armis seleuco atque antiocho regnantibus, qui et seleucida et antiochida ab ipsis appellari voluere. et circa caspium multa oceani litora explorata parvoque brevius quam totus hinc aut illinc septentrio eremigatus, ut iam coniecturae locum sic quoque non relinquat ingens argumentum paludis maeoticae, sive ea illius oceani sinus est, ut multos adverte credidisse, sive angusto discreti situ restagnatio. alio latere gadium ab eodem occidente magna pars meridiani sinus ambitu mauretaniae navigatur hodie. maiorem quidem eius partem et orientis victoriae magni alexandri lustravere usque in arabicum sinum, in quo res gerente c. caesare Augusti filio signa navium ex hispaniensibus naufragiis feruntur agnita. et hanno carthaginis potentia florente circumvectus a gadibus ad finem arabiae navigationem eam prodidit scripto, sicut ad extera europae noscenda missus eodem tempore himilco.

praeterea nepos cornelius auctor est eudoxum quendam sua aetate, cum lathyrum regem fugeret, arabico sinu egressum gades usque pervectum, multoque ante eum caelius antipater vidisse se qui navigasset ex hispania in aethiopiam commercii gratia. idem nepos de septentrionali circuitu tradit quinto metello celeri, afrani in consulatu collegae, sed tum galliae proconsuli, indos a rege sueborum dono datos, qui ex india commercii causa navigantes tempestatibus essent in germaniam abrepti. sic maria circumfusa undique dividuo globo partem orbis auferunt nobis, nec inde huc nec hinc illo pervio tractu. quae contemplatio apta detegendae mortalium vanitati poscere videtur, ut totum hoc, quicquid est, in quo singulis nihil satis est, ceu subiectum oculis quantum sit ostendam.

iam primum in dimidio computari videtur, tamquam nulla portio ipsi decedat oceano, qui toto circumdatus medio et omnes ceteras fundens recipiensque aquas et quicquid exit in nubes ac sidera ipsa tot ac tantae magnitudinis pascens, quo tandem amplitudinis spatio credetur habitare improba et infinita debet esse tam vastae molis possessio. adde quod ex relicto plus abstulit caelum. nam cum sint eius quinque partes, quas vocant zonas, infesto rigore et aeterno gelu premitur omne, quicquid est subiectum duabus extremis utrimque circa vertices, hunc, qui trionum septem vocatur, eumque, qui adversus illi austrinus appellatur. perpetua caligo utrobique et alieno molliorum siderum adspectu maligna ac pruina tantum albicans lux. verum media terrarum, qua solis orbita est, exusta flammis et cremata comminus vapore torretur. circa duae tantum inter exustam et rigentes temperantur eaeque ipsae inter se non perviae propter incendium siderum. ita terrae tres partes abstulit caelum; oceani rapina in incerto est. sed et relicta nobis una portio haud scio an etiam in maiore damno sit, idem siquidem oceanus infusus in multos, ut dicemus, sinus adeo vicino accessu interna maria adlatrat, ut centum quindecim milibus passuum arabicus sinus distet ab aegyptio mari, caspius vero [ccclxxv] a pontico, idem interfusus intrat per tot maria, quibus africanam, europam, asiam dispescit, ut quantum terrarum occupet computetur etiamnum mensura tot fluminum, tantarum paludum, addantur et lacus, stagna, iam elata in caelum et ardua aspectu quoque iuga, iam silvae vallesque praeruptae et solitudines ac mille causis deserta; detrahantur hae tot portiones terrae, immo vero, ut plures tradidere, mundi puncto (neque enim aliud est terra in universo): haec est materia gloria nostrae, haec sedes. hic honores gerimus, hic exercemus imperia, hic opes cupimus, hic tumultuamur humanum genus, hic instauramus bella etiam civilia mutisque caedibus laxiorem facimus terram! et, ut publicos gentium furores transeam, haec, in qua conterminos pellimus furtoque vicini caespitem nostro solo adfodimus, ut, qui latissime rura metatus fuerit ultraque famam exegerit adcolas, quota terrarum parte gaudeat vel, cum ad mensuram avaritiae suae propagaverit, quam tandem portionem eius defunctus obtineat

mediam esse mundi totius haut dubiis constat argumentis, sed clarissimo aequinocti paribus horis. nam nisi in medio esset, aequales dies noctesque

habere non posse deprehendere est dioptraeque vel maxime confirmant, cum aequinoctiali tempore ex eadem linea ortus occasusque cernatur, solstitiali exortus per suam lineam, brumali occasus. quae accidere nullo modo possent nisi in centro sita.

tres autem circuli supra dictis zonis inplexi inaequalitates temporum distinguunt: solstitialis a parte signiferi excelsissima nobis ad septentrionalem plagam versus, contraque ad alium polum brumalis, item medio ambitu signiferi orbis incedens aequinoctialis.

reliquorum quae miramur causa in ipsius terrae figura est, quam globo similem et cum ea aquas isdem intellegitur argumentis. sic enim fit haut dubie, ut nobis septentrionalis plagae sidera numquam occidant, contra meridianae numquam oriantur, rursusque haec illis non cernantur, attollente se contra medios visus terrarum globo. septentriones non cernit trogodytice et confinis aegyptus, nec canopum italia et quem vocant berenices crinem, item quem sub Divo Augusto cognominavere caesaris thronon, insignes ibi stellas. adeoque manifesto adsurgens fastigium curvatur, ut canopus quartam fere partem signi unius supra terram eminere alexandriae intuentibus videatur, eadem a rhodo terram quodammodo ipsam stringere, in ponto omnino non cernatur, ubi maxime sublimis septentrio. idem a rhodo absconditur magisque alexandriae, in arabia novembri mense, prima vigilia occultus, secunda se ostendit, in meroe+ solstitio vesperi paulisper apparet paucisque ante exortum arcturi diebus pariter cum die cernitur. navigantium haec maxime cursus deprehendunt, in alia adverso, in alia prono mari, subitoque conspicuis atque ut e freto emergentibus, quae in anfractu pilae latuere, sideribus. neque enim, ut dixere aliqui, mundus hoc polo excelsiore se attollit - aut undique cernerentur haec sidera - , verum haec eadem quibusque proximis sublimiora creduntur eademque demersa longinquis, utque nunc sublimis in deiectu positus videtur hic vertex, sic in illam terrae devexitatem transgressis illa se attollunt, residentibus quae hic excelsa fuerant, quod nisi in figura pilae accidere non posset.

ideo defectus solis ac lunae vespertinos orientis incolae non sentiunt nec matutinos ad occasum habitantes, meridianos vero serius nobis illi. apud arbilam magni alexandri victoria luna defecisse noctis secunda hora est prodita eademque in sicilia exoriens. solis defectum vipstano et fonteio cos., qui fuere ante paucos annos, factum pridie kalendas maias campania hora diei inter septimam et octavam sensit, corbulo dux in armenia inter horam diei decimam et undecimam prodidit visum, circuitu globi alia aliis detegente et occultante. quod si plana esset terra, simul omnia apparerent cunctis noctesque non fierent inaequales; nam aequae aliis quam in medio sitis paria duodecim horarum intervalla cernerentur, quae nunc non in omni parte simili modo congruunt.

ideo nec nox diesque, quamvis eadem, toto orbe simul est, oppositu globi noctem aut ambitu diem adferente. multis hoc cognitum experimentis, in africa hispaniaque turrium Hannibalis, in asia vero propter piraticos terrores

simili specularum praesidio excitato, in quis praenuntios ignes sexta hora diei accensos saepe conpertum est tertia noctis a tergo ultimis visos. eiusdem alexandri cursor philonides ex sicyone elin mille et ducenta stadia novem diei confecit horis indeque, quamvis declivi itinere, tertia noctis hora remensus est saepius. causa, quod eunti cum sole iter erat, eundem remeans obvium contrario praetervertebat occursu. qua de causa ad occasum navigantes, quamvis brevissimo die, vincunt spatia nocturnae navigationis, ut solem ipsum comitantes.

vasaque horoscopa non ubique eadem sunt usui, in trecentis stadiis aut, ut longissime, in quingenis mutantibus semet umbris solis. itaque umbilici, quem gnomonem appellant, umbra in aegypto meridiano tempore aequinoctii die paulo plus quam dimidiam gnomonis mensuram efficit, in urbe roma nona pars gnomonis deest umbrae, in oppido ancona superest quinta tricesima, in parte italiae, quae venetia appellatur, isdem horis umbra gnomoni par fit.

simili modo tradunt in syene oppido, quod est supra alexandriam quinque milibus stadium, solstiti die medio nullam umbram iaci puteumque eius experimenti gratia factum totum inluminari. ex quo apparere tum solem illi loco supra verticem esse, quod et in india supra flumen hypasim fieri tempore eodem onesicritus scribit. constatque in berenice urbe trogodytarum, et inde stadiis [iiii] dcccxx in eadem gente ptolemaide oppido, quod in margine rubri maris ad primos elephantorum venatus conditum est, hoc idem ante solstitium quadragenis quinque diebus totidemque postea fieri, et per eos xc dies in meridiem umbras iaci. rursus in meroe+ - insula haec caputque gentis aethiopum v milibus stadium a syene in amne nilo habitatur - bis anno absumi umbras, sole duodevicesimam tauri partem et quartam decimam leonis tunc obtinente. in indiae gente oretum mons est maleus nomine, iuxta quem umbrae aestate in austrum, hieme in septentrionem iaciuntur. quindecim tantum noctibus ibi apparet septentrio. in eadem india patalis, celeberrimo portu, sol dexter oritur, umbrae in meridiem cadunt. septentrionem ibi alexandro morante adnotatum prima tantum parte noctis aspici. onesicritus, dux eius, scripsit, quibus in locis indiae umbrae non sint, septentrionem non conspici, et ea loca appellari ascia, nec horas dinumerari ibi. et tota trogodytice umbras bis quadragenis quinque diebus in anno eratosthenes in contrarium cadere prodidit. sic fit, ut vario lucis incremento in meroe+ longissimus dies xii horas aequinoctiales et octo partes unius horae colligat, alexandriae vero xiiii horas, in italia xv, in britannia xvii, ubi aestate lucidae noctes haut dubie se promittunt, id quod cogit ratio credi, solstiti diebus accedente sole propius verticem mundi angusto lucis ambitu subiecta terrae continuos dies habere senis mensibus noctesque e diverso ad brumam remoto. quod fieri in insula thyle pytheas massiliensis scribit, sex dierum navigatione in septentrionem a britannia distante, quidam vero et in mona, quae distat a camaloduno britanniae oppido circiter [cc], adfirmant.

vmbrarum hanc rationem et quam vocant gnomonice invenit anaximenes milesius, anaximandri, de quo diximus, discipulus, primusque horologium,

quod appellant sciothericon, lacedaemone ostendit.

ipsum diem alii aliter observavere: babylonii inter duos solis exortus, athenienses inter duos occasus, vmbri a meridie ad meridiem, vulgus omne a luce ad tenebras, sacerdotes romani et qui diem finire civilem, item aegyptii et hipparchus a media nocte in mediam. minora autem intervalla esse lucis inter ortus solis iuxta solstitia quam aequinoctia apparet, quia positio signiferi circa media sui obliquior est, iuxta solstitium autem rector.

contexenda sunt his caelestibus nexa causis. namque et aethiopas vicini sideris vapore torreri adustisque similes gigni, barba et capillo vibrato, non est dubium, et adversa plaga mundi candida atque glaciali cute esse gentes, flavis promissas crinibus, truces vero ex caeli rigore has, illas mobilitate sapientes, ipsoque crurum argumento illis in supera sucum revocari natura vaporis, his in inferas partes depelli umore deciduo; hic graves feras, illic varias effigies animalium provenire et maxime alitum multas figuras igni volucres; corporum autem proceritatem utrobique, illic ignium nisu, hic umoris alimento; medio vero terrae salubri utrimque mixtura fertiles ad omnia tractus, modicos corporum habitus magna et in colore temperie, ritus molles, sensus liquidos, ingenia fecunda totiusque naturae capacia, isdem imperia, quae numquam extimis gentibus fuerint, sicut ne illae quidem his paruerint, avolsae ac pro numine naturae urgentis illas solitariae.

babyloniorum placita et motus terrae hiatusque, qua cetera omnia, siderum vi existimant fieri, sed illorum trium, quibus fulmina adsignant, fieri autem meantium cum sole aut congruentium et maxime circa quadrata mundi. praeclara quaedam et immortalis in eo, si credimus, divinitas perhibetur anaximandro milesio physico, quem ferunt lacedaemoniis praedixisse ut urbem ac tecta custodirent, instare enim motum terrae, cum et urbs tota eorum corrui et taygeti montis magna pars, ad formam puppis eminens, abrupta cladem eam insuper ruina pressit. perhibetur et pherecydi, pythagorae doctori, alia coniectatio, sed et illa divina, haustu aquae e puteo praesensisse ac praedixisse civibus terrae motum. quae si vera sunt, quantum a deo tandem videri possunt tales distare, dum vivant et haec quidem arbitrio cuiusque existimanda relinquantur: ventos in causa esse non dubium reor. neque enim umquam intremiscunt terrae nisi sopito mari caeloque adeo tranquillo, ut volatus avium non pendeant, subtracto omni spiritu qui vehit, nec umquam nisi post ventos, condito scilicet in venas et cava eius occulta flatu. neque aliud est in terra tremor quam in nube tonitruum, nec hiatus aliud quam cum fulmen erumpit incluso spiritu luctante et ad libertatem exire nitente.

varie itaque quatitur, et mira eduntur opera, alibi prostratis moenibus, alibi hiatu profundo haustis, alibi egestis molibus, alibi emissis amnibus, nonnumquam etiam ignibus calidisve fontibus, alibi averso fluminum cursu. praecedat vero comitaturque terribilis sonus, alias murmuri similis, alias mugitibus aut clamori humano armorumve pulsantium fragori, pro qualitate materiae excipientis formaque vel cavernarum vel cuniculi, per quem meet, exilius grassante in angusto, eodem rauco in recurvis, resultante in duris,

fervente in umidis, fluctuante in stagnantibus, furente contra solida. itaque et sine motu saepe editur sonus. nec simplici modo quatur umquam, sed tremit vibratque. hiatus vero alias remanet ostendens quae sorbuit, alias occultat ore compresso rursusque ita inducto solo, ut nulla vestigia exstent, urbibus plerumque devoratis agrorumque tractu hausto. maritima autem maxime quatuntur, nec montuosa tali malo carent. exploratum mihi est alpes appenninumque saepius tremuisse. et autumnno ac vere terrae crebrius moventur, sicut fulmina. ideo galliae et aegyptus minime quatuntur, quoniam hic aestatis causa obstat, illic hiemis. item noctu saepius quam interdiu. maximi autem motus existunt matutini vespertinique, sed propinqua luce crebri, interdiu autem circa meridiem. fiunt et solis lunaeque defectu, quoniam tempestates tunc sopiuntur, praecipue vero cum sequitur imbres aestus imbresve aestum.

navigantes quoque sentiunt non dubia coniectura, sine flatu intumescente fluctu subito aut quatiente ictu. intremunt vero et in navibus postes aequae quam in aedificiis crepituque praenuntiant. quin et volucres non inpavidae sedent. est et in caelo signum praeceditque motu futuro aut interdiu aut paulo post occasum sereno tenuis ceu lineae nube in longum porrecta spatium.

est et in puteis turbidior aqua nec sine odoris taedio, sicut in isdem et remedium, quale et crebri specus praebent; conceptum enim spiritum exhalant. quod in totis notatur oppidis: minus quatuntur crebris ad eluviem cuniculis cavata, multoque sunt tutiora in isdem illis quae pendent, sicuti neapoli in italia intellegitur, parte eius, quae solida est, ad tales casus obnoxia. tutissimi sunt aedificiorum fornices, anguli quoque parietum postesque, alterno pulsu renitente. et latere terreno facti parietes minore noxa quatuntur. magna differentia est et in ipso genere motus, pluribus siquidem modis quatur. tutissimum est cum vibrat crispante aedificiorum crepitu et cum intumescit adsurgens alternoque motu residit; innoxium et cum concurrentia tecta contrario ictu arietant, quoniam alter motus alteri renitur. undantis inclinatio et fluctus more quaedam volutatio infesta est aut cum in unam partem totus se motus inpellit. desinunt autem tremores, cum ventus emersit; sin vero duravere, non ante xl dies sistuntur, plerumque et tardius, utpote cum quidam annuo et bienni spatio duraverint.

factum est semel, quod equidem in etruscae disciplinae voluminibus invenio, ingens terrarum portentum l. marcio sexto iulio cos. in agro mutinensi. namque montes duo inter se concurrerunt crepitu maximo adsultantes recedentesque, inter eos flamma fumoque in caelum exeunte interdiu, spectante e via aemilia magna equitum romanorum familiarumque et viatorum multitudine. eo concursu villae omnes elisae, animalia permulta, quae intra fuerant, exanimata sunt, anno ante sociale bellum, quod haud scio an funestius terrae ipsi italiae fuerit quam civilia. non minus mirum ostentum et nostra cognovit aetas anno neronis principis supremo, sicut in rebus eius exposuimus, pratis oleisque intercedente publica via in contrarias sedes transgressis in agro marrucino praediis veti marcelli equitis romani res

neronis procurantis.

fiunt simul cum terrae motu et inundationes maris, eodem videlicet spiritu infusi aut terrae sidentis sinu recepti. maximus terrae memoria mortalium exstitit motus tiberii caesaris principatu, xii urbibus asiae una nocte prostratis; creberrimus punico bello intra eundem annum septies ac quinquagies nuntiatum romam, quo quidem anno ad trasimenum lacum dimicantes maximum motum neque poeni sentire nec romani. nec vero simplex malum aut in ipso tantum motu periculum est, sed par aut maius ostento. numquam urbs roma tremuit, ut non futuri eventus alicuius id praenuntium esset.

eadem nascentium causa terrarum est, cum idem ille spiritus adtollendo potens solo non valuit erumpere. nascuntur enim, nec fluminum tantum invectu, sicut echinades insulae ab acheloo amne congestae maiorque pars aegypti a nilo, in quam a pharo insula noctis et diei cursum fuisse homero credimus, nec recessu maris, sicuti olim cerceis. quod accidisse et in ambraciae portu decem milium passuum intervallo et atheniensium quinque milium ad piraeum memoratur. et ephesus quondam aedem dianae adluebat. herodoto quidem si credimus, mare fuit supra memphim usque ad aethiopum montes itemque a planis arabiae, mare circa ilium et tota teuthranie quaque campos intulerit maeander.

nascuntur et alio modo terrae ac repente in aliquo mari emergunt, velut paria secum faciente natura quaeque hauserit hiatus alio loco reddente.

clarae iam pridem insulae delos et rhodos memoriae produntur; et natae postea minores, ultra melon anaphe, inter lemnum et hellespontum neae, inter lebedum et teon halone, inter cycladas thera et therasia, inter easdem olympiadis cxlv anno quarto post annos cxxx hiera eademque automate, et ab ea duobus stadiis post annos ccxlii nostro aevo iunio silano valerio balbo cos. a. d. viii idus iulias thia. ante nos et iuxta italiam inter aeolias insulas, item iuxta cretam emersit mm d passuum una cum calidis fontibus, altera olympiadis clxiii anno tertio in tusco sinu, flagrans haec violento cum flatu, proditurque memoriae, magna circa eam multitudine piscium fluitante confestim expirasse quibus ex his cibis fuisset. sic et pithecussas in campano sinu ferunt ortas, mox in his montem epopon, cum repente flamma ex eo emicuisset, campestri aequatum planitie. in eadem et oppidum haustum profundo, alioque motu terrae stagnum emersisse, et alio provolutis montibus insulam extitisse prochyta.

namque et hoc modo insulas rerum natura fecit: avellit siciliam italiae, cyprum syriae, euboeam boeotiae, euboeae atalanten et macrian, besbicum bithyniae, leucosiam sirenum promunturio. rursus abstulit insulas mari iunxitque terris, antissam lesbo, zephyrium halicarnaso, aethusan myndo, dromiscon et pernen mileto, narthecusam parthenio promunturio. hybanda, quondam insula ioniae, ducentis nunc a mari abest stadiis, syrien ephesus in mediterraneo habet, derasidas et sapphoniam vicina ei magnesia. epidaurus et oricum insulae esse desierunt. in totum abstulit terras primum omnium ubi atlanticum mare est, si platoni credimus, inmenso spatio, mox interno quoque:

videmus hodie mersam acarnaniam ambracio sinu, achaiam corinthio, europam asiamque propontide et ponto. ad hoc perrupit mare leucada, antirrhium, hellespontum, bosporos duos.

atque ut sinus et stagna praeteream, ipsa se comest terra. devoravit cibotum altissimum montem cum oppido cariae, sipylum in magnesia et prius in eodem loco clarissimam urbem, quae tantalis vocabatur, galenes et gamales urbium in phoenice agros cum ipsis, phegium, aethiopiae iugum excelsissimum, tamquam non infida grassarentur et litora. pyrram et antissam circa maeotim pontus abstulit, helicen et buram sinus corinthius, quarum in alto vestigia apparent. ex insula cea amplius triginta milia passuum abrupta subito cum plurimis mortalium rapuit et in sicilia dimidiam tyndarida urbem ac quicquid ab italia deest, similiter in boeotia eleusina.

motus enim terrae sileantur et quicquid est, ubi saltem busta urbium exstant, simul ut terrae miracula potius dicamus quam scelera naturae. et, hercules, non caelestia enarratu difficiliora fuerint. metallorum opulentia tam varia, tam dives, tam fecunda, tot saeculis suboriens, cum tantum cotidie orbe toto populentur ignes, ruinae, naufragia, bella, fraudes, tantum vero luxuria et tot mortales conterant; gemmarum pictura tam multiplex, lapidum tam discolores maculae interque eos candor alicuius praeter lucem omnia excludens; medicatorum fontium vis; ignium tot locis emicantium perpetua tot saeculis incendia; spiritus letales aliubi aut scrobibus emissi aut ipso loci situ mortiferi, aliubi volucris tantum, ut soracte vicino urbi tractu, aliubi praeter hominem ceteris animantibus, nonnumquam et homini, ut in sinuessano agro et puteolano! spiracula vocant, alii charonea, scrobes mortiferum spiritum exhalantes, item in hirpinis ampsancti ad mephitis aedem locum, quem qui intravere moriuntur; simili modo hierapoli in asia, matris tantum magnae sacerdoti innoxium. aliubi fatidici specus, quorum exhalatione temulenti futura praecinant, ut delphis nobilissimo oraculo. quibus in rebus quid possit aliud causae adferre mortalium quispiam quam diffusae per omne naturae subinde aliter atque aliter numen erumpens

quaedam vero terrae ad ingressus tremunt, sicut in gabiensi agro non procul urbe roma iugera ferme ducenta equitantium cursu; similiter in reatino. quaedam insulae semper fluctuantur, sicut in agro caecubo et eodem reatino, mutinensi, statoniensi, in vadimonis lacu, ad cutilias aquas opaca silva, quae numquam die ac nocte eodem loco visitur, in lydia quae vocantur calaminae, non ventis solum, sed etiam contis quo libeat impulsae, multorum civium mithridatico bello salus. sunt et in nymphaeo parvae, saliares dictae, quoniam in symphoniae cantu ad ictus modulantium pedum moventur. in tarquiniensi lacu magno italiae duae nemora circumferunt, nunc triquetram figuram edentes, nunc rotundam complexu ventis inpellentibus, quadratam numquam.

celebre fanum habet veneris paphos, in cuius quandam aream non inpluit, item in nea, oppido troadis, circa simulacrum minervae; in eodem et relictia sacrificia non putrescunt. iuxta harpasa oppidum asiae cautes stat horrenda, uno digito mobilis, eadem, si toto corpore inpellatur, resistens. in taurorum

paeninsula in civitate parasino terra est, qua sanantur omnia vulnera. at circa asson troadis lapis nascitur, quo consumuntur omnia corpora; sarcophagus vocatur. duo sunt montes iuxta flumen indum: alteri natura ut ferrum omne teneat, alteri ut respuat, itaque, si sint clavi in calciamento, vestigia evelli in altero non possint, in altero sisti. locris et crotone pestilentiam numquam fuisse nec in ilio terrae motum adnotatum est, in lycia vero semper a terrae motu quadraginta dies serenos esse. in agro arpano frumentum satum non nascitur; ad aras mucias in veiente et apud tusculanum et in silva ciminia loca sunt, in quibus in terram depacta non extrahuntur. in crustumino natum faenum ibi noxium, extra salubre est.

et de aquarum natura complura dicta sunt, sed aestus maris accedere ac reciprocare maxime mirum, pluribus quidem modis, verum causa in sole lunaque. bis inter duos exortus lunae adfluunt bisque remeant vicenis quaternisque semper horis, et primum attollente se cum ea mundo intumescentes, mox a meridiano caeli fastigio vergente in occasum residentes, rursusque ab occasu subter ad caeli ima et meridiano contraria accedente inundantes, hinc, donec iterum exoriatur, se resorbentes nec umquam eodem tempore quo pridie refluui, velut anhelantes sidere avido trahente secum haustu maria et adsidue aliunde quam pridie exoriente, paribus tamen intervallis reciproci senisque semper horis, non cuiusque diei aut noctis aut loci, sed aequinoctialibus ideoque inaequales vulgarium horarum spatio, utcumque plures in eos aut diei aut noctis illarum mensurae cadant, et aequinoctio tantum pares ubique. ingens argumentum plenumque lucis ac vocis etiam diurnae, hebetes esse qui negent subtermere sidera ac rursus eadem exurgere, similemque terris, immo vero naturae universae, et inde faciem in isdem ortus occasusque operibus, non aliter sub terra manifesto sideris cursu aliove effectum quam cum praeter oculos nostros feratur.

multiplex etiamnum lunaris differentia, primumque septenis diebus. quippe modici a nova ad dividuam aestus, pleniores ab ea exundant plenaque maxime fervent. inde mitescunt, pares ad septimam primis, iterumque alio latere dividua augentur. in coitu solis pares plenae. eadem in aquilonia et a terris longius recedente mitiores quam cum in austros digressa propiore nisu vim suam exercet. per octonos quosque annos ad principia motus et paria incrementa centesimo lunae revocantur ambitu. augent ea cuncta solis annuis causis, duobus aequinoctiis maxime tumentes et autumnali amplius quam verno, inanes vero bruma et magis solstitio. nec tamen in ipsis quos dixi temporum articulis, sed paucis post diebus, sicuti neque in plena aut novissima, sed postea, nec statim ut lunam mundus ostendat occultetve aut media plaga declinet, verum fere duabus horis aequinoctialibus serius, tardiore semper ad terras omnium, quae geruntur in caelo, effectum cadente quam visu, sicuti fulguris et tonitrus et fulminum.

omnes autem aestus in oceano maiora integunt spatia nudantque quam in reliquo mari, sive quia in totum universitate animosius quam parte est, sive quia magnitudo aperta sideris vim laxae grassantis efficacius sentit, eandem

angustiis arcentibus. qua de causa nec lacus nec amnes similiter moventur. - (octogenis cubitis supra britanniam intumescere aestus pytheas massiliensis auctor est.) - et interiora autem maria terris clauduntur ut portu; quibusdam tamen in locis spatiosior laxitas dicioni paret, utpote cum plura exempla sint in tranquillo mari nulloque velorum pulsu tertio die ex italia pervectorum vticam aestu fervente. circa litora autem magis quam in alto deprehenduntur hi motus, quoniam et in corpore extrema pulsum venarum, id est spiritus, magis sentiunt. in plerisque tamen aestuariis propter dispares siderum in quoque tractu exortus diversi existunt aestus, tempore, non ratione discordes, sicut in syrtibus.

et quorundam tamen privata natura est, velut tauromenitani euripi saepius et in euboea septies die ac nocte reciprocantis. idem aestus triduo in mense consistit, septima, octava nonaque luna. gadibus qui est delubro herculis proximus fons, inclusus ad putei modum, alias simul cum oceano augetur minuiturque, alias utrumque contrariis temporibus; eodem in loco alter oceani motibus consentit. in ripa baetis oppidum est, cuius putei crescente aestu minuuntur, augescunt decedente, mediis temporum immobiles. eadem natura hispali oppido uni puteo, ceteris vulgaris. et pontus semper extra meat in propontidem, introrsus in pontum numquam refluo mari.

omnia plenilunio maria purgantur, quaedam et stato tempore. circa messanam et mylas fimo similia expuuntur in litus purgamenta, unde fabula est solis boves ibi stabulari. his addit - ut nihil, quod equidem noverim, praeteream - aristoteles nullum animal nisi aestu recedente expirare. observatum id multis in gallico oceano et dumtaxat in homine compertum. quo vera coniectatio existit, haut frustra spiritus sidus lunam existimari; hoc esse quod terras saturet accedensque corpora impleat, abscedens inaniat. ideo cum incremento eius augeri conchylia et maxime spiritum sentire quibus sanguis non sit, sed et sanguinem, hominum etiam, cum lumine eius augeri ac minui, frondes quoque et pabula - ut suo loco dicitur - sentire, in omnia eadem penetrante vi. itaque solis ardore siccatur liquor, et hoc esse masculum sidus acceperimus, torrens cuncta sorbensque. sic mari late patenti saporem incoqui salis, aut quia exhausto inde dulci tenuique, quod facillime trahat vis ignea, omne asperius crassiusque linquatur - ideo summam aequorum aquam dulciorem profunda; hanc esse veriorem causam asperi saporis quam quod mare terrae sudor sit aeternus - aut quia plurimus ex arido misceatur illi vapor aut quia terrae natura sicut medicatas aquas inficiat. est in exemplis dionysio siciliae tyranno, cum pulsus est ea potentia, accidisse prodigium, ut uno die in portu dulcesceret mare. e contrario ferunt lunae femineum ac molle sidus, atque nocturnum solvere umorem et trahere, non auferre. id manifestum esse, quod ferarum occisa corpora in tabem visu suo resolvat somnoque sopitis torporem contractum in caput revocet, glaciem refundat cunctaque umifico spiritu laxet. ita pensari naturae vices semperque sufficere, aliis siderum elementa cogentibus, aliis vero fundentibus. sed in dulcibus aquis lunae alimentum esse, sicut in marinis solis.

altissimum mare xv stadiorum fabianus tradit. alii in ponto ex adverso coraxorum gentis - vocant bathea ponti - trecentis fere a continente stadiis immensam altitudinem maris tradunt, vadis numquam repertis. mirabilius id faciunt aquae dulces iuxta mare ut fistulis emicantes. nam nec aquarum natura miraculis cessat. dulces mari invehuntur, leviores haut dubie; ideo et marinae, quarum natura gravior, magis invecta sustinent. quaedam vero et dulces inter se supermeant alias, ut in fucino lacu invectus pitonius amnis, in lario addua, in verbanno ticinus, in benaco mincius, in sebinno ollius, in lemano rhodanus: hic trans alpis, superiores in italia, multorum milium transitu hospitali suas tantum nec largiores quam intulere aquas evehentes. proditum hoc et in oronte amne syriae multisque aliis. quidam vero odio maris ipsa subeunt vada, sicut arethusa, fons syracusanus, in quo redduntur iacta in alpheum, qui per olympiam fluens peloponnesiaco litori infunditur. subeunt terras rursusque redduntur lycus in asia, erasinus in argolica, tigris in mesopotamia et, quae in aesculapi fonte athenis mersa sunt, in phalerico redduntur. et in atinate campo fluvius mersus post xx milia passuum exit et in aquileiensi timavus. nihil in asphaltite iudaeae lacu, qui bitumen gignit, mergi potest nec in armeniae maioris aretissa; is quidem nitrosus pisces alit. in sallentino iuxta oppidum manduriam lacus, ad margines plenus, neque exhaustis aquis minuitur neque infusus augetur. in ciconum flumine et in piceno lacu velino lignum deiectum lapideo cortice obducitur et in surio colchidis flumine adeo, ut lapidem plerumque durans adhuc integat cortex. similiter in flumine silero ultra surrentum non virgulta modo immersa, verum et folia lapidescunt, alias salubri potu eius aquae. in exitu paludis reatinae saxum crescit et in rubro mari oleae virentesque frutices enascuntur.

sed fontium plurimorum natura mira est fervore, idque etiam in iugis alpium ipsoque in mari inter italiam et aenariam in baiano sinu et in liri fluvio multisque aliis. nam dulcis haustus in mari plurimis locis, ut ad chelidonias insulas et aradum et in gaditano oceano. patavinorum aquis calidis herbae virentes innascuntur, pisanorum ranae, ad vetulonios in etruria non procul a mari pisces. in casinate fluvius appellatur scatebra, frigidus, abundantior aestate; in eo, ut in arcadia stymphali, nascuntur aquatiles muscoli. in dodone iovis fons, cum sit gelidus et immersas faces extinguat, si extinctae admoveantur, accendit. idem meridie semper deficit, qua de causa ἀναπαύομενον vocant, mox increscens ad medium noctis exuberat, ab eo rursus sensim deficit. in illyricis supra fontem frigidum expansae vestes accenduntur. iovis hammonis stagnum, interdum frigidum, noctibus fervet. in trogodytis fons solis appellatur dulcis et circa meridiem maxime frigidus; mox paulatim tepescens ad noctis media fervore et amaritudine infestatur.

padi fons mediis diebus aestivis velut interquiescens semper aret. in tenedo insula fons semper a tertia noctis hora in sextam ab aestivo solstitio exundat, et in delo insula inopus fons eodem quo nilus modo ac pariter cum eo decrescit augetur. contra timavum amnem insula parva in mari est cum fontibus calidis, qui pariter cum aestu maris crescunt minuunturque. in agro

pitinate trans appenninum fluvius novanus, omnibus solstitiis torrens, bruma siccatur.

in falisco omnis aqua pota candidos boves facit, in boeotia amnis melas oves nigras, cephisus ex eodem lacu profluens albas, rursus nigras penius rufasque iuxta ilium xanthus, unde et nomen amni. in ponto fluvius axiaces rigat campos, in quibus pastae nigro lacte equae gentem alunt. in reatino fons neminie appellatus alio atque alio loco exoritur, annonae mutationem significans. brundisi in portu fons incorruptas praestat aquas navigantibus. lyncestis aqua quae vocatur acidula vini modo temulentos facit; item in paphlagonia et in agro caleno. andro in insula templo liberi patris fontem nonis ianuariis semper vini saporem fundere mucianus ter consul credit. dies Θεοδοσία vocatur. iuxta nonacrim in arcadia styx, nec odore differens nec colore, pota ilico necat; item in liberoso taurorum colle tres fontes sine remedio, sine dolore mortiferi. in carrinensi hispaniae agro duo fontes iuxta fluunt, alter omnia respuens, alter obsorbens. in eadem gente alius aurei coloris omnes ostendit pisces, nihil extra illam aquam differentes. in comensi iuxta larium lacum fons largus horis singulis semper intumescit ac residit. in cydonea insula ante lesbum fons calidus vere tantum fluit. lacus sannaus in asia circa nascente absinthio inficitur. colophone in apollinis clarii specu lacuna est, cuius potu mira redduntur oracula, bibentium brevior vita. amnes retro fluere et nostra vidit aetas neronis principis supremis, sicut in rebus eius rettulimus.

iam omnes fontes aestate quam hieme gelidiores esse quem fallit sicut illa permira naturae opera, aes ac plumbum in massa mergi, dilatatum fluitare, eiusdemque ponderis alia sidere, alia invehī, onera in aqua facilius moveri, syrium lapidem quamvis grandem innatare eundemque comminutum mergi, recentia cadavera ad vadum labi, intumescētia attolli, inania vasa haud facilius quam plena extrahi; pluvias salinis aquas dulciores esse quam reliquas, nec fieri salem nisi admixtis dulcibus; marinas tardius gelari, celerius accendi; hieme mare calidius esse, autumnale salsius; omne oleo tranquillari, et ob id urinantes ore spargere, quoniam mitiget naturam asperam lucemque deportet; nives in alto mari non cadere; cum omnis aqua deorsum feratur, exilire fontes atque etiam in aetnae radicibus, flagrantis in tantum, ut quinquagena, centena milia passuum harenas flammarum globo eructet. namque et ignium, quod est naturae quartum elementum, reddamus aliqua miracula, sed primum ex aquis.

in urbe commagenes samosata stagnum est emittens limum - maltham vocant - flagrantem. cum quid attigit solidi, adhaeret; praeterea tactu et sequitur fugientes. sic defendere muros oppugnante lucullo: flagrabat miles armis suis. aquis et accenditur; terra tantum restingui docuere experimenta. similis est natura naphthae. ita appellatur circa babylonem et in austacenis parthiae profluens bituminis liquidi modo. huic magna cognatio ignium, transiliuntque in eam protinus undecumque visam. ita ferunt a medea paelicem crematam, postquam sacrificatura ad aras accesserat, corona igne

rapto. verum in montium miraculis ardet aetna noctibus semper tantoque aevo materia ignium sufficit, nivalis hibernis temporibus egestumque cinerem pruinis operiens. nec in illo tantum natura saevit exustionem terris denuntians: flagrat in phaselitis mons chimaera, et quidem inmortalis diebus ac noctibus flamma; ignem eius accendi aqua, extinguere vero terra aut fimo cnidius ctesias tradit. eadem in lycia hephaesti montes taeda flammante tacti flagrant, et adeo ut lapides quoque rivorum et harenae in ipsis aquis ardeant, aliturque ignis ille pluviis; baculo si quis ex iis accenso traxerit sulcum, rivos ignium sequi narrant. flagrat in bactris cophanti noctibus vertex. flagrat in medis et in sittacene confinio persidis, susis quidem ad turrim albam xv caminis, maximo eorum et interdiu, campus. babylone flagrat e quadam veluti piscina iugeri magnitudine, aethiopum iuxta hesperu montem stellarum modo campi noctu; similiter in megalopolitanorum agro. nam si intermisit ille iucundus frondemque densi supra se nemoris non adurens et iuxta gelidum fontem semper ardens nymphaei crater, dira apolloniatis suis portendit, ut theopompus tradidit; augetur imbribus egeritque bitumen temperandum fonte illo ingustabili, et alias omni bitumine dilutius. sed quis haec miretur in medio mari hiera et lipara insulae aeoliae iuxta italiam cum ipso mari arsere per aliquot dies sociali bello, donec legatio senatus piavit. maximo tamen ardet incendio theon ochema dictum aethiopum iugum torrentesque solis ardoribus flammam egerit. tot locis, tot incendiis rerum natura terras cremat!

praeterea cum sit huius unius elementi ratio fecunda seque ipsa pariat et minimis crescat a scintillis, quid fore putandum est in tot rogis terrae quae est illa natura, quae voracitatem in toto mundo avidissimam sine damno sui pascit addantur his sidera innumera ingensque sol, addantur humani ignes et lapidum quoque insiti naturae attritique inter se ligni, iam nubium et origines fulminum: excedet profecto miracula omnia ullum diem fuisse, quo non cuncta conflagrarent, cum specula quoque concava adversa solis radiis facilius etiam accendant quam ullus alius ignis. quid quod innumerabiles parvi, sed naturales, scatent in nymphaeo exit e petra flamma, quae pluviis accenditur; exit et ad aquas scantias, haec quidem invalida, cum transit, nec longe in alia durans materia - viret aeterno hunc fontem igneum contegens fraxinus - ; exit in mutinensi agro statis vulcano diebus. reperitur apud auctores subiectis ariciae arvis, si carbo deciderit, ardere terram, in agro sabino et sidicino unctum flagrare lapidem, in sallentino oppido gnatia inposito ligno in saxum quoddam ibi sacrum protinus flammam existere, in laciniae iunonis ara sub diu sita cinerem immobilem esse perflantibus undique procellis; quin et repentinos existere ignes et in aquis et in corporibus, etiam humanis: trasimenum lacum arsisse totum; servio tullio dormienti in pueritia ex capite flammam emicuisse, l. marcio in hispania interemptis scipionibus contionanti et milites ad ultionem exhortanti arsisse simili modo valerius antias narrat. plura mox et distinctius; nunc enim quadam mixtura rerum omnium exhibentur miracula. verum egressa mens interpretationem naturae festinat legentium animos per totum orbem veluti manu ducere.

pars nostra terrarum, de qua memoro, ambienti, ut dictum est, oceano velut innatans longissime ab ortu ad occasum patet, hoc est ab india ad herculis columnas gadibus sacratas [30lxxxv]30 [lxxviii] p., ut artemidoro auctori placet, ut vero isidoro, [30xcviii]30 [xviii]. artemidorus adicit amplius a gadibus circuitu sacri promunturii ad promunturium artabrum, quo longissime frons procurrat hispaniae, [dccccxi] d. mensura currit duplici via: a gange amne ostioque eius, quo se in eum oceanum effundit, per indiam parthyenenque ad myriandrum urbem syriae in issico sinu positam [30lii]30 [xv], inde proxima navigatione cyprum insulam, patara lyciae, rhodum, astypalaeam in carpathio mari insulam, taenarum laconicae, lilybaeum siciliae, caralim sardiniae [30xxi]30 [xiii], deinde gades [30xii]30 [i], quae mensura universa ab eoo mari efficit [30lxxxv]30 [lxxviii]. alia via, quae certior et iniri terreno maxime potest, a gange ad euphraten amnem [30li]30 [lxix], inde cappadociae mazaca [ccxliiii], inde per phrygiam, cariam, ephesum [ccccxcviii], ab epheso per aegaeum pelagus delum [cc], isthmum [ccxii] d, inde terra et laconico mari et corinthiaco sinu patras peloponnesi [xc], leucadem [lxxxvii] d, corcyram totidem, acroceraunia [lxxxii] d, brundisium [lxxxvii] d, romam [ccclx], alpes usque ad scingomagum vicum [dxviii], per galliam ad pyrenaeos montes illiberim [cccclxviii], ad oceanum et hispaniae oram [dccccxxi], traiectu gadis [vii] d, quae mensura artemidori ratione [30lxxxix]30 [xlv] efficit.

latitudo autem terrae a meridiano situ ad septentriones, dimidio fere minor, isidoro colligit [30liiii]30 [lxii], quo palam fit quantum et hinc vapor abstulerit et illinc rigor. neque enim deesse terris arbitror aut non esse globi formam, sed inhabitabilia utrimque inconperta esse. haec mensura currit a litore aethiopici oceani, qua modo habitatur, ad meroen [dcxxv], inde alexandriam [30xii]30 [i], rhodum [dlxxxiii], cnidum [lxxxvii] d, coum [xxv], samum [c], chium [xciii], mytilenen [lxv], tenedum [cxix], sigeum promunturium [xii] d, os ponti [cccxi] d, carambin promunturium [cccl], os maeotis [cccxi] d, ostium tanais [cclxxv], qui cursus conpendiis maris brevior fieri potest [lxxix]. ab ostio tanais nihil inmodicum diligentissimi auctores fecere. artemidorus ulteriora inconperta existimavit, cum circa tanain sarmatarum gentes degere fateretur ad septentriones versus; isidorus adiecit [30xii]30 [i] usque ad thylen, quae coniectura divinationis est. ego non minore quam proxime dicto spatio sarmatarum fines nosci intellego. et alioqui quantum esse debet quod innumerabiles gentes subinde sedem mutantes capiat unde ulteriorem mensuram inhabitabilis plagae multo esse maiorem arbitror. nam et a germania inmensas insulas non pridem conpertas cognitum habeo.

de longitudine ac latitudine haec sunt, quae digna memoratu putem. universum autem circuitum eratosthenes, in omnium quidem litterarum subtilitate, set in hac utique praeter ceteros solers, quem cunctis probari video, cclii milium stadiorum prodidit, quae mensura romana computatione efficit trecentiens quindeciens centena milia passuum: inprobum ausum, verum ita subtili argumentatione comprehensum, ut pudeat non credere. hipparchus, et in

coarguendo eo et in reliqua omni diligentia mirus, adicit stadiorum paulo minus [xxvi]. alia dionysodoro fides. neque enim subtraham exemplum vanitatis graecae maximum. melius hic fuit, geometricae scientia nobilis; senecta diem obiit in patria. funus duxere ei propinquae, ad quas pertinebat hereditas. hae cum secutis diebus iusta peragerent, invenisse dicuntur in sepulchro epistulam dionysodori nomine ad superos scriptam: pervenisse eum a sepulchro ad infimam terram; esse eo stadiorum [xlii]. nec defuere geometrae qui interpretarentur, significare epistulam a medio terrarum orbe missam, quod deorsum ab summo longissimum esset spatium et idem pilae medium. ex quo consecuta computatio est, ut circuitum esse [cclii] stadiorum pronuntiarent.

harmonica ratio, quae cogit rerum naturam sibi ipsam congruere, addit huic mensurae stadiorum [xii] terramque xcvi partem totius mundi facit.

LIBER III

hactenus de situ et miraculis terrae aquarumque et siderum ac ratione universitatis atque mensura. nunc de partibus, quamquam infinitum id quoque existimatur nec temere sine aliqua reprehensione tractatum, haut ullo in genere venia iustiore, si modo minime mirum est hominem genitum non omnia humana novisse. quapropter auctorem neminem unum sequar, sed ut quemque verissimum in quaque parte arbitrabor, quoniam commune ferme omnibus fuit, ut eos quisque diligentissime situs diceret, in quibus ipse prodebat. ideo nec culpabo aut coarguam quemquam. locorum nuda nomina et quanta dabitur brevitate ponentur, claritate causisque dilatis in suas partes; nunc enim sermo de toto est. quare sic accipi velim, ut si vidua fama sua nomina, qualia fuere primordio ante ulla res gestas, nuncupentur et sit quaedam in his nomenclatura quidem, sed mundi rerumque naturae.

terrarum orbis universus in tres dividitur partes, europam, asiam, africanam. origo ab occasu solis et gaditano freto, qua inrumpens oceanus atlanticus in maria interiora diffunditur. hinc intranti dextera africa est, laeva europa, inter has asia. termini amnes tanais et nilus. [xv] p. in longitudinem quas diximus fauces oceani patent, [v] in latitudinem, a vico mellaria hispaniae ad promunturium africae album, auctore turrano gracile iuxta genito. t. livius ac nepos cornelius latitudinis tradiderunt minus [vii] p., ubi vero plurimum, [x]: tam modico ore tam inmensa aequorum vastitas panditur. nec profunda altitudo miraculum minuit. frequentes quippe taeniae candicantis vadi carinas teritant. qua de causa limen interni maris multi eum locum appellavere. proximis autem faucibus utrimque inpositi montes coercent claustra, abila africae, europae calpe, laborum herculis metae, quam ob causam indigenae columnas eius dei vocant creduntque perfossas exclusa antea admisisse maria et rerum naturae mutasse faciem.

primum ergo de europa, altrice victoris omnium gentium populi longeque terrarum pulcherrima, quam plerique merito non tertiam portionem fecere, verum aequam, in duas partes ab amne tanai ad gaditanum fretum universo orbe diviso. oceanus a quo dictum est spatio atlanticum mare infundens et avido meatu terras, quaecunque venientem expavere, demergens resistentes quoque flexuoso litorum anfractu lambit, europam vel maxime recessibus crebris excavans, sed in quattuor praecipuos sinus, quorum primus a calpe hispaniae extimo, ut dictum est, monte locros, bruttium usque promunturium, inmenso ambitu flectitur.

in eo prima hispania terrarum est, ulterior appellata, eadem baetica, mox a fine murgitano citerior eademque tarraconensis ad pyrenaei iuga. ulterior in duas per longitudinem provincias dividitur, si quidem baeticae latere septentrionali praetenditur lusitania, amne ana discreta. ortus hic in laminitano agro citerioris hispaniae et modo in stagna se fundens, modo in angustias resorbens aut in totum cuniculis condens et saepius nasci gaudens in

atlanticum oceanum effunditur. tarraconensis autem, adfixa pyrenaeo totoque eius a latere decurrens et simul ad gallicum oceanum hiberico a mari transversa se pandens, solorio monte et oretanis iugis carpetanisque et asturum a baetica atque lusitania distinguitur.

baetica, a flumine mediam secante cognominata, cunctas provinciarum diviti cultu et quodam fertili ac peculiari nitore praecedit. iuridici conventus ei iiii, gaditanus, cordubensis, astigitanus, hispalensis. oppida omnia numero clxxv, in iis coloniae viiii, municipia c. r. x, latio antiquitus donata xxvii, libertate vi, foedere iii, stipendiaria cxx. ex his digna memoratu aut latio sermone dictu facilia, a flumine ana litore oceani oppidum ossonoba, aestuaria cognominatum, inter confluentes luxiam et vrium, harenii montes, baetis fluvius, litus curensis inflexo sinu, cuius ex adverso gadis inter insulas dicenda, promunturium iunonis, portus baesippo, oppidum baelo, mellaria, fretum ex atlantico mari, carteia, tartesos a graecis dicta, mons calpe. dein litore interno oppida barbesula cum fluvio, item salduba, oppidum suel, malaca cum fluvio foederatorum. dein maenuba cum fluvio, sexi cognomine firmum iulium, sel, abdara, murgi, baeticae finis. oram eam in universum originis poenorum existimavit m. agrippa; ab ana autem atlantico oceano obversa bastulorum turdulorumque est. in universam hispaniam M. Varro pervenisse hiberos et persas et phoenicas celtasque et poenos tradit. lusum enim liberi patris aut lyssam cum eo bacchantium nomen dedisse lusitaniae et pana praefectum eius universae. at quae de hercule ac pyrene vel saturno traduntur fabulosa in primis arbitror.

baetis, in tarraconensis provinciae non, ut aliqui dixerunt, mentesa oppido, sed tugiensi exoriente saltu - iuxta quem tader fluvius, qui carthaginensem agrum rigat - , ilorci refugit scipionis rogam versusque in occasum oceanum atlanticum, provinciam adoptans, petit, modicus primo, sed multorum fluminum capax, quibus ipse famam aquasque aufert. baeticae primum ab ossigitania infusus, amoeno blandus alveo, crebris dextra laevaue accolitur oppidis.

celeberrima inter hunc et oceani oram in mediterraneo segida quae augurina cognominatur, vllia quae fidentia, vrgao quae alba, ebora quae cerialis, iliberri quod florentini, ilipula quae laus, artigi quod iulienses, vesci quod faventia, singili, ategua, arialdunum, agla minor, baebro, castra vinaria, cisimbrium, hippo nova, ilurco, osca, oscua, sucaelo, vnditanum, tucci vetus, omnia bastetaniae vergentis ad mare. conventus vero cordubensis circa flumen ipsum ossigi quod cognominatur latonium, iliturgi quod forum iulium, ipra, isturgi quod triumphales, vcia et [xiiii] p. remotum in mediterraneo obulco quod pontificense appellatur, mox ripa, epora foederatorum, sacili martialium, onuba et dextra corduba colonia patricia cognomine, inde primum navigabili baete oppida carbula, detumo, fluvius singilis, eodem baetis latere incidens.

oppida hispalensis conventus celti, axati, arua, canama, naeva, ilipa cognomine ilpa, italica et a laeva hispal colonia cognomine romulensis, ex adverso oppidum osset quod cognominatur iulia constantia, lucurgentum quod

iuli genius, orippo, caura, siarum, fluvius maenuba, baeti et ipse a dextro latere infusus. at inter aestuaria baetis oppida nabrissa cognomine veneria et colobana, coloniae hasta quae regia dicitur et in mediterraneo asido quae caesarina.

singilis fluvius, in baetim quo dictum est ordine inrumpens, astigitanam coloniam adluit, cognomine augustam firmam, ab ea navigabilis. huius conventus sunt reliquae coloniae immunes tucci quae cognominatur augusta gemella, ituci quae virtus iulia, vcubi quae claritas iulia, vrsso quae genetiva vrbano, inter quae fuit munda, cum pompeio filio rapta; oppida libera astigi vetus, ostippo; stipendiaria callet, callicula, castra gemina, ilipula minor, marruca, sacrana, obulcula, oningi, sabora, ventippo. maenubam amnem, et ipsum navigabilem, haut procul accolunt olontigi, laelia, lastigi.

quae autem regio a baete ad fluvium anam tendit extra praedicta, baeturia appellatur, in duas divisa partes totidemque gentes: celticos, qui lusitaniam attingunt, hispalensis conventus, turdulos, qui lusitaniam et tarraconensem accolunt, iura cordubam petunt. celticos a celtiberis ex lusitania advenisse manifestum est sacris, lingua, oppidorum vocabulis, quae cognominibus in baetica distinguuntur: seriae adicitur fama iulia, nertobrigae concordia iulia, segidae restituta iulia, contributa iulia vgultuniae, cum qua et curiga nunc est, lacimurgae constantia iulia, steresibus fortuneales et callensibus aeneanici. praeter haec in celtica acinippo, arunda, arunci, turobriga, lastigi, salpesa, saepone, serippo. altera baeturia, quam diximus turdulorum et conventus cordubensis, habet oppida non ignobilia arsam, mellariam, mirobrigam reginam, sosintigi, sisaponem. gaditani conventus civium romanorum regina, latinorum laepia regia, carisa cognomine aurelia, vrgia cognominata castrum iulium, item caesaris salutiensis; stipendiaria besaro, belippo, barbesula, blacippo, baesippo, callet, cappa cum oleastro, iptuci, ibrona, lascuta, saguntia, saudo, vsaepo.

longitudinem universam eius prodidit m. agrippa [ccccxxv] p., latitudinem [cclviii], sed cum termini carthaginem usque procederent: quae causa magnos errores computatione mensurae saepius parit, alibi mutato provinciarum modo, alibi itinerum, auctisque aut deminutis passibus. incubuere maria tam longo aevo, alibi processere litora, torsere se fluminum aut correxere flexus. praeterea aliunde aliis exordium mensurae est et alia meatus. ita fit ut nulli duo concinant. baeticae longitudo nunc a castulonis oppidi fine gadis [ccl] et a murgi maritima ora [xxv] p. amplior, latitudo a carteia anam ora [ccxxxiiii] p. agrippam quidem in tanta viri diligentia praeterque in hoc opere cura, cum orbem terrarum orbi spectandum propositurus esset, errasse quis credat et cum eo divum augustum is namque complexam eum porticum ex destinatione et commentariis m. agrippae a sorore eius inchoatam peregit.

citerioris hispaniae sicut conplurium provinciarum aliquantum vetus forma mutata est, utpote cum pompeius magnus tropaeis suis, quae statuebat in pyrenaeo, dcccclxvi oppida ab albis ad fines hispaniae ulterioris in dicionem ab se redacta testatus sit. nunc universa provincia dividitur in conventus vii,

carthaginiensem, tarraconensem, caesaraugustanum, cluniensem, asturum, lucensem, bracarum. accedunt insulae, quarum mentione seposita civitates provincia ipsa praeter contributas aliis cccxiii continet, oppida clxxviii, in iis colonias xii, oppida civium romanorum xiii, latinorum veterum xviii, foederatorum unum, stipendiaria cxxxv.

primi in ora bastuli, post eos quo dicitur ordine intus recedentes mentesani, oretani et ad tagum carpetani, iuxta eos vaccae, vettones et celtiberi arevaci. oppida orae proxima vrci adscriptumque baeticae baria, regio bastitania, mox deinde contestania, carthago nova colonia, cuius a promunturio, quod saturni vocatur, caesaream mauretaniae urbem [clxxxxvii] p. traiectus. reliqua in ora flumen tader, colonia immunis ilici, unde ilicitanus sinus. in eam contribuuntur icositani. mox latinorum lucentum, dianium stipendiarium, sucro fluvius et quondam oppidum, contestaniae finis. regio edetania, amoeno praetendente se stagno, ad celtiberos recedens. valentia colonia [iii] p. a mari remota, flumen turium, et tantundem a mari saguntum civium romanorum, oppidum fide nobile, flumen vdiva. regio ilergaonum, hiberus amnis, navigabili commercio dives, ortus in cantabris haut procul oppido iuliobrica, per [cccci] p. fluens, navium per [ccclx] a vareia oppido capax, quem propter universam hispaniam graeci appellavere hiberiam. regio cessetania, flumen subi, colonia tarracon, scipionum opus, sicut carthago poenorum. regio ilergetum, oppidum subur, flumen rubricatum, a quo laetani et indigetes. post eos quo dicitur ordine intus recedentes radice pyrenaei ausetani fitani, iacetani perque pyrenaeum ceretani, dein vascones. in ora autem colonia barcino cognomine faventia, oppida civium romanorum baetulo, iluro, flumen arnum, blandae, flumen alba, emporiae, geminum hoc veterum incolarum et graecorum, qui phocaeensium fuere suboles, flumen ticer. ab eo pyrenaea venus in latere promunturii altero [xl].

nunc per singulos conventus reddentur insignia praeter supra dicta. tarracone disceptant populi xlii, quorum celeberrimi civium romanorum dertosani, bisgargitani; latinorum ausetani, ceretani qui iuliani cognominantur et qui augustani, edetani, gerundenses, iessonienses, teari qui iulienses; stipendiariorum aquicaldenses, aesonenses, baeculonenses.

caesaraugusta colonia immunis, amne hiberno adfusa, ubi oppidum antea vocabatur salduba, regionis edetaniae, recipit populos lv: ex his civium romanorum bilbilitanos, celsenses ex colonia, calagurritanos qui nasici cognominantur, ilerdenses surdaonum gentis, iuxta quos sicoris fluvius, oscenses regionis suessetaniae, turiassonenses; latinorum veterum cascantenses, ergavicensenses, graccurritanos, leonicenses, oscicardenses; foederatos tarraconenses; stipendiarios arcobrigenses, andelonenses, aracelitanos, bursaonenses, calagurritanos qui fibularenenses cognominantur, conplutenses, carensenses, cincienses, cortonenses, damanitanos, ispallenses, ilursenses, iluberitanos, iacetanos, libienses, pompelonenses, segiensenses.

carthaginem conveniunt populi lxv exceptis insularum incolis ex colonia accitana gemellense, ex libisosana cognomine foroaugustana, quibus duabus

iūs italiae datum, ex colonia salariense, oppidani latī veteris castulonenses qui caesarii iuvenales appellantur, saetabitani qui augustani, valerenses. stipendiariorum autem celeberrimi alabanenses, bastitani, consaburrenses, dianenses, egelestani, ilorcitani, laminitani, mentesani qui et oretani, mentesani qui et bastuli, oretani qui et germani cognominantur, caputque celtiberiae segobrigenses, carpetaniae toletani tago flumini inpositi, dein viatienses et virgilienses.

in cluniensem conventum varduli ducunt populos xiiii, ex quibus alabanenses tantum nominare libeat, turmogidi iiii, in quibus segisamonenses et segisamaiulienses. in eundem conventum carietes et vennenses v civitatibus vadunt, quarum sunt velienses. eodem pelendones celtiberum iiii populis, quorum numantini fuere clari, sicut in vaccaeorum xvii civitatibus intercatienses, palantini, iacobrigenses, caucenses. nam in cantabricis viiii populis iuliobriga sola memoretur, in autrigonum x civitatibus tritium et virovesca. arevacis nomen dedit fluvius areva. horum vi oppida, secontia et vxama, quae nomina crebro aliis in locis usurpantur, praeterea segovia et nova augusta, termes ipsaque clunia, celtiberiae finis. ad oceanum reliqua vergunt vardulique ex praedictis et cantabri.

iunguntur iis asturum xxii populi divisi in augustanos et transmontanos, asturica urbe magnifica. in iis sunt gigurri, paesici, lancienses, zoelae. numerus omnis multitudinis ad ccxi liberorum capitum.

lucensis conventus populorum est sedecim, praeter celticos et lemavos ignobilium ac barbarae appellationis, sed liberorum capitum ferme [clxvi].

simili modo bracarum xxiiii civitates [cclxxxv] capitum, ex quibus praeter ipsos bracos bibali, coelerni, callaeci, equaesii, limici, querquerni citra fastidium nominentur.

longitudo citerioris hispaniae est ad finem castulonis a pyrenaeo [dc] vii p. et ora paulo amplius, latitudo a tarracone ad litus oiarsonis [cccvii], e radicibus pyrenaei, ubi cuneatur angustis inter duo maria; paulatim deinde se pandens, qua contingit ulteriorem hispaniam, tantundem et amplius latitudini adicit. metallis plumbi, ferri, aeris, argenti, auri tota ferme hispania scatet, citerior et specularis lapidis, baetica et minio. sunt et marmorum lapicidinae. universae hispaniae Vespasianus imperator Augustus iactatum procellis rei publicae latium tribuit. pyrenaei montes hispanias galliasque disternunt promonturiis in duo diversa maria proiectis.

arbonensis provincia appellatur pars galliarum quae interno mari adluitur, bradata antea dicta, amne varo ab italia discreta alpiumque vel saluberrimis romano imperio iugis, a reliqua vero gallia latere septentrionali montibus cebenna et iuribus, agrorum cultu, virorum morumque dignatione, amplitudine opum nulli provinciarum postferenda breviterque italia verius quam provincia. in ora regio sordorum intusque consuaranorum, flumina tecum, vernodubrum, oppida illiberis, magnae quondam urbis tenue vestigium, ruscino latinorum, flumen atax, e pyrenaeo rubrensem permeans lacum, narbo martius decumanorum colonia [xii] p. a mari distans, flumina

araris, liria. oppida de cetero rara praeiacentibus stagnis: agatha quondam massiliensium et regio volcarum tectosagum atque ubi rhoda rhodiorum fuit, unde dictus multo galliarum fertilissimus rhodanus amnis, ex alpibus se rapiens per lemannum lacum segnemque deferens ararim nec minus se ipso torrentes isaram et druantiam. libica appellantur duo eius ora modica, ex his alterum hispaniense, alterum metapinum, tertium idemque amplissimum massalioticum. sunt auctores et heracleam oppidum in ostio rhodani fuisse. ultra fossae ex rhodano, c. mari opere et nomine insignes, stagnum mastromela, oppidum maritima avaticorum, superque campi lapidei, herculis proeliorum memoria, regio anatiliorum et intus dexivatium cavarumque; rursus a mari tritorium et intus tritollorum vocontiorumque et segovellaunorum, mox allobrogum. at in ora massilia graecorum phocaeensium foederata, promunturium zao, citharista portus, regio camactulicorum, dein suelteri supraque verucini. in ora autem athenopolis massiliensium, forum iuli octavanorum colonia, quae pacensis appellatur et classica, amnis nomine argenteus, regio oxubiorum ligaunorumque, super quos suebri, quariates, adunicates. at in ora oppidum latinum antipolis, regio deciatium, amnis varus, ex alpium monte caenia profusus.

in mediterraneo coloniae arelate sextanorum, baeterrae septimanorum, arausio secundanorum, in agro cavarum valentia, vienna allobrogum. oppida latina aquae sextiae salluviorum, avennio cavarum, apta iulia vulgientium, alebaece reiorum apollinarium, alba helvorum, augusta tricastinorum, anatilia, aerea, bormani, comani, cabellio, carcasum volcarum tectosagum, cessero, carbantorate memnorum, caenicenses, cambolactri qui atlantici cognominantur, forum voconi, glanum libii, lutevani qui et foroneronienses, nemausum arecomicorum, piscinae, ruteni, samnagenses, tolosani tectosagum aquitaniae contermini, tasgoduni, tarusconienses, vmbranici, vocontiorum civitatis foederatae duo capita vasio et lucus augusti, oppida vero ignobilia xviii, sicut xxiii nemausiensibus adtributa. adiecit formulae galba imperator ex in alpinis avanticos atque bodionticos, quorum oppidum dinia. longitudinem provinciae narbonensis [ccclxx] p. agrippa tradit, latitudinem [ccxlviii].

italia dehinc primique eius ligures, mox etruria, vmbria, latium, ibi tiberina ostia et roma, terrarum caput, [xvi] p. intervallo a mari. volscum postea litus et campaniae, picentinum inde ac lucanum bruttiumque, quo longissime in meridiem ab alpium paene lunatis iugis in maria excurrit italia. ab eo graeciae ora, mox sallentini, poeduculi, apuli, paeligni, frentani, marrucini, vestini, sabini, picentes, galli, vmbri, tusci, veneti, carni, iapudes, histri, liburni. nec ignoro ingrati ac segnis animi existimari posse merito, si obiter atque in transcurso ad hunc modum dicatur terra omnium terrarum alumna eadem et parens, numine deum electa quae caelum ipsum clarius faceret, sparsa congregaret imperia ritusque molliret et tot populorum discordes ferasque linguas sermonis commercio contraheret ad conloquia et humanitatem homini daret breviterque una cunctarum gentium in toto orbe patria fieret. sed quid

agam tanta nobilitas omnium locorum, quos quis attigerit, tanta rerum singularum populorumque claritas tenet. urbs roma vel sola in ea, ... et digna iam tam festa cervice facies, quo tandem narrari debet opere qualiter campaniae ora per se felixque illa ac beata amoenitas, ut palam sit uno in loco gaudentis opus esse naturae iam vero tota ea vitalis ac perennis salubritas, talis caeli temperies, tam fertiles campi, tam aprici colles, tam innoxii saltus, tam opaca nemora, tam munifica silvarum genera, tot montium adflatus, tanta frugum vitiumque et olearum fertilitas, tam nobilia pecudi vellera, tam opima tauris colla, tot lacus, tot amnium fontiumque ubertas totam eam perfundens, tot maria, portus, gremiumque terrarum commercio patens undique et tamquam iuvandos ad mortales ipsa avidae in maria procurrens! neque ingenia ritusque ac viros et lingua manuque superatas commemoro gentes. ipsi de ea iudicare grai, genus in gloriam sui effusissimum, quotam partem ex ea appellando graeciam magnam! nimirum id, quod in caeli mentione fecimus, hac quoque in parte faciendum est, ut notas quasdam et pauca sidera attingamus. legentes tantum quaeso meminerint ad singula toto orbe edisserenda festinari.

est ergo folio maxime querno adsimulata, multo proceritate amplior quam latitudine, in laevam se flectens cacumine et amazonicae figura desinens parmae, ubi a medio excursu cocynthos vocatur, per sinus lunatos duo cornua emittens, leucopetram dextra, lacinium sinistra. patet longitudine ab in alpine fine praetoriae augustae per urbem capuamque cursu meante regium oppidum, in umero eius situm, a quo veluti cervicis incipit flexus, decies centena et viginti milia passuum, multoque amplior mensura fieret lacinium usque, nisi talis obliquitas in latus degredi videretur. latitudo eius varia est, quadringentorum decem milium inter duo maria inferum et superum amnesque varum atque arsum, media autem ferme circa urbem romam ab ostio aeterni amnis in hadriaticum mare influentis ad tiberina ostia [cxxxvi], et paulo minus a castro novo hadriatici maris alsium ad tuscum aequor, haud ullo in loco [cc] latitudinem excedens. universae autem ambitus a varo ad arsum [30xx]30 [xlvi] p. efficit. abest a circumdatis terris hystria ac liburnia quibusdam locis centena milia, ab epiro et illyrico quinquaginta, ab africa minus ducenta, ut auctor est M. Varro, ab sardinia centum viginti milia, ab sicilia md, a corcyra minus [lxxx], ab issa [l]. incedit per maria caeli regione ad meridiem quidem, sed, si quis id diligenti subtilitate exigat, inter sextam horam primamque brumalem.

nunc ambitum eius urbesque enumerabimus, qua in re praefari necessarium est auctorem nos Divum Augustum secuturos descriptionemque ab eo factam italiae totius in regiones xi, sed ordine eo, qui litorum tractu fiet; urbium quidem vicinitates oratione utique praepropera servari non posse, itaque interiore parte digestionem in litteras eiusdem nos secuturos, coloniarum mentione signata, quas ille in eo prodidit numero. nec situs originesque persequi facile est, ingaunis liguribus - ut ceteri omittantur - agro tricies dato.

igitur ab amne varo nicaea a massiliensibus conditum, fluvius palo, alpes

populique inalpini multis nominibus, sed maxime capillati, oppido vediantiorum civitatis cemenelo, portus herculis monoeci, ligustina ora. ligurum celeberrimi ultra alpes sallui, deciates, oxubi, citra veneni, turri, soti, bagienni, statielli, binbelli, maielli, caburriates, casmonates, velleiates et quorum oppida in ora proxime dicemus. flumen rutuba, oppidum album intimilium, flumen merula, oppidum album ingaunum, portus vadorum sabatium, flumen porcifera, oppidum genua, fluvius fertor, portus delphini, tigulia intus, segesta tiguliorum, flumen macra, liguriae finis. a tergo autem supra dictorum omnium appenninus mons italiae amplissimus, perpetuis iugis ab alpinis tendens ad siculum fretum. ab altero eius latere ad padum amnem italiae ditissimum omnia nobilibus oppidis nitent, libarna, dertona colonia, iria, vardacate, industria, pollentia, carrea quod potentia cognominatur, foro fulvi quod valentinum, augusta bagiennorum, alba pompeia, hasta, aquis statiellorum. haec regio ex discriptione Augusti nona est. patet ora liguriae inter amnes varum et macram [ccxi] p.

adnectitur septima, in qua eturia est ab amne macra, ipsa mutatis saepe nominibus. vmbros inde exegere antiquitus pelasgi, hos lydi, a quorum rege tyrreni, mox a sacrificio ritu lingua graecorum tusci sunt cognominati. primum eturiae oppidum luna, portu nobile, colonia luca a mari recedens propiorque pisae inter amnes ausere et arnum, ortae a pelopidis sive a teutanis, graeca gente. vada volaterrana, fluvius caecina, populonium, etruscorum quondam hoc tantum in litore. hinc amnes prile, mox vmbro, navigiorum capax, et ab eo tractus vmbriae portusque telamo, cosa volcentium a populo romano deducta, graviscae, castrum novum, pyrgi, caeretanus amnis et ipsum caere intus m. p. vii, agylla a pelasgis conditoribus dictum, alsium, fregene, tiberis amnis a macra [cclxxxiii] p. intus coloniae falisca, argis orta, ut auctor est cato, quae cognominatur etruscorum, lucus feroniae, rusellana, seniensis, sutrina. de cetero arretini veteres, arretini fidentiores, arretini iulienses, amitinenses, aquenses cognomine taurini, blerani, cortonenses, capenates, clusini novi, clusini veteres, florentini praefluenti arno adpositi, faesulae, ferentinum, fescennia, hortanum, herbanum, nepes, novem pagi, praefectura claudia foroclori, pistorium, perusia, suanenses, saturnini qui ante aurini vocabantur, subertani, statonienses, tarquinienses, tuscanienses, vetulonienses, veientani, vesentini, volaterrani, volcentani cognomine etrusci, volsinienses. in eadem parte oppidorum veterum nomina retinent agri crustuminus, caetrinus.

tiberis, antea thybris appellatus et prius albula, e media fere longitudine appennini finibus arretinorum profluit, tenuis primo nec nisi piscinis corrivatus emissusque navigabilis, sicuti tinia et clanis influentes in eum, novenorum ita conceptu dierum, si non adjuvent imbres. sed tiberis propter aspera et confragosa ne sic quidem, praeterquam trabibus verius quam ratibus, longe meabilis fertur, per [cl] p. non procul tiferno perusiaque et oriculo eturiam ab vmbria ac sabinis, mox citra [xvi] p. urbis veientem agrum a crustumino, dein fidenatem latinumque a vaticano dirimens. sed infra

arretinum clanim duobus et quadraginta fluviis auctus, praecipuis autem nare et aniene, qui et ipse navigabilis latium includit a tergo, nec minus tamen aquis ac tot fontibus in urbem perductis, et ideo quamlibet magnarum navium ex italo mari capax, rerum in toto orbe nascentium mercator placidissimus, pluribus prope solus quam ceteri in omnibus terris amnes accolitur aspiciturque villis. nullique fluviorum minus licet inclusis utrimque lateribus, nec tamen ipse depugnat, quamquam creber ac subitus incrementis est, nusquam magis aquis quam in ipsa urbe stagnantibus. quin immo vates intellegitur potius ac monitor, auctu semper religiosus verius quam saevus.

latium antiquum a tiberi cerceios servatum est m. p. l longitudine: tam tenues primordio imperi fuere radices. colonis saepe mutatis tenuere alii aliis temporibus, aborigines, pelasgi, arcades, siculi, aurunci, rutuli et ultra cerceios volschi, osci, ausones, unde nomen lati processit ad lirim amnem. in principio est ostia colonia ab romano rege deducta, oppidum laurentum, lucus iovis indigetis, amnis numicius, ardea a danae+ persei matre condita. dein quondam aphrodisium, antium colonia, astura flumen et insula, fluvius nymphaeus, clostra romana, cercei, quondam insula inmenso quidem mari circumdata, ut creditur homero, et nunc planitie. mirum est quod hac de re tradere hominum notitiae possumus. theophrastus, qui primus externorum aliqua de romanis diligentius scripsit - nam theopompus, ante quem nemo mentionem habuit, urbem dumtaxat a gallis captam dixit, clitarchus, ab eo proximus, legationem tantum ad alexandrum missam - hic iam plus quam ex fama cerceiorum insulae et mensuram posuit stadia lxxx in eo volumine, quod scripsit nicodoro atheniensium magistratu, qui fuit urbis nostrae cccxli anno. quicquid ergo terrarum est praeter [x] p. ambitus adnexum insulae, post eum annum accessit italiae. aliud miraculum a cerceis palus pomptina est, quem locum xxiiii urbium fuisse mucianus ter consul prodidit. dein flumen aufentum, supra quod tarracina oppidum, lingua volschorum anxur dictum, et ubi fuere amyclae sive amynclae, a serpentibus deletae, dein locus speluncae, lacus fundanus, caieta portus, oppidum formiae, hormiae dictum, ut existimavere, antiqua laestrygonum sedes. ultra fuit oppidum pirae, est colonia minturnae, liri amne divisa, clani olim appellato, sinuessa, extremum in adiecto latio, quam quidam sinopen dixere vocitatum. hinc felix illa campania, ab hoc sinu incipiunt vitiferi colles et temulentia nobilis suco per omnes terras incluto atque, ut veteres dixere, summum liberi patris cum cerere certamen. hinc setini et caecubi protenduntur agri; his iunguntur falerni, caleni, dein consurgunt massici, gaurani surrentinique montes. ibi leborini campi sternuntur et in delicias alicae politur messis. haec litora fontibus calidis rigantur praeterque cetera in toto mari conchylio et pisce nobili adnotantur. nusquam generosior oleae liquor est, hoc quoque certamen humanae voluptatis. tenuere osci, graeci, vmbri, tusci, campani. in ora savo fluvius, volturnum oppidum cum amne, liternum, cumae chalcidensium, misenum, portus baiarum, bauli, lacus lucrinus et avernus, iuxta quem cimmerium oppidum quondam, dein puteoli colonia dicaearchae dicti, postque phlegraei campi, acherusia palus cumis

vicina; litore autem neapolis, chalcidensium et ipsa, parthenope a tumulo sirenis appellata, herculaneum, pompeii haud procul spectato monte vesuvio, adluente vero sarno amne, ager nucerinus et [viii] p. a mari ipsa nuceria, surrentum cum promunturio minervae, sirenum quondam sede. navigatio a cerceis [ii] de [lxxx] patet. regio ea a tiberi prima italiae servatur ex discriptione Augusti.

intus coloniae capua, ab [xl] campo dicta, aquinum, suessa, venafrum, sora, teanum sidicinum cognomine, nola; oppida abellinum, aricia, alba longa, acerrani, allifani, atinates, aletrinales, anagnini, atellani, aefulani, arpinates, auximates, abellani, alfaterni et qui ex agro latino, item hernico, item labicano cognominantur, bovillae, caiatia, casinum, calenum, capitulum hernicum, cereatini qui mariani cognominantur, corani a dardano troiano orti, cubulterini, castrimoenenses, cingulani, cabienses in monte albano, foropopulienses ex falerno, frusinates, ferentinates, freginates, fabraterni veteres, fabraterni novi, ficolenses, fregellani, forum appi, forentani, gabini, interamnates sucasini qui et lirenates vocantur, ilionenses, lanivini, norbani, nomentani, praenestini urbe quondam stephane dicta, privernates, setini, signini, suessulani, telesini, trebulani cognomine ballienses, trebani, tusculani, verulani, veliterni, vlubrenses, vrbanae superque roma ipsa, cuius nomen alterum dicere nisi arcanis caerimoniarum nefas habetur optimaque et salutari fide abolitum enuntiavit valerius soranus luitque mox poenas. non alienum videtur inserere hoc loco exemplum religionis antiquae ob hoc maxime silentium institutae. namque diva angerona, cui sacrificatur a. d. xii kal. ian., ore obligato obsignatoque simulacrum habet.

urbem tris portas habentem romulus reliquit aut, ut plurimas tradentibus credamus, iiii. moenia eius collegere ambitu imperatoribus censoribusque vespasianis anno conditae dcccxxvi m. p. xiii cc, complexa montes septem. ipsa dividitur in regiones xiiii, compita larum cclxv. eiusdem spatium mensura currente a miliario in capite romani fori statuto ad singulas portas, quae sunt hodie numero xxxvii, ita ut xii portae semel numerentur praetereanturque ex veteribus vii, quae esse desierunt, efficit passuum per directum xx m dclxv. ad extrema vero tectorum cum castris praetoriis ab eodem miliario per vicos omnium viarum mensura colligit paulo amplius [lx] p. quod si quis altitudinem tectorum addat, dignam profecto aestimationem concipiat fateaturque nullius urbis magnitudinem in toto orbe potuisse ei comparari. clauditur ab oriente aggere tarquini superbi, inter prima opere mirabili; namque eum muris aequavit qua maxime patebat aditu plano. cetera munita erat praecelsis muris aut abruptis montibus, nisi quod exspatiantia tecta multas addidere urbes.

in prima regione praeterea fuere in latio clara oppida satricum, pometia, scaptia, politorium, tellena, tifata, caenina, ficana, crustumeria, ameriola, medullum, corniculum, saturnia ubi nunc roma est, antipolis quod nunc ianiculum in parte romae, antemnae, camerium, collatia, amitinum, norbe, sulmo, et cum iis carnem in monte albano soliti accipere populi albenses:

albani, aesolani, accienses, abolani, bubetani, bolani, cusuetani, coriolani, fidenates, foreti, hortenses, latinienses, longani, manates, macrales, munienses, numinienses, olliculani, octulani, pedani, poletaurini, querquetulani, sicani, sisolenses, tolerienses, tutienses, vimitellari, velienses, venetulani, vitellenses. ita ex antiquo latio liii populi interiere sine vestigiis. in campano autem agro stabiae oppidum fuere usque ad cn. pompeium l. catonem cos. pr. kal. mai., quo die l. sulla legatus bello sociali id delevit, quod nunc in villam abiit. intercidit ibi et taurania. sunt morientes casilini reliquiae. praeterea auctor est antias oppidum latinorum apiolas captum a l. tarquinio rege, ex cuius praeda capitolium is inchoaverit. a surrentino ad silerum amnem xxx m. p. ager picentinus fuit tuscorum, templo iunonis argivae ab iasone condito insignis. intus oppidum salerni, picentia.

a silero regio tertia et ager lucanus bruttiusque incipit, nec ibi rara incolarum mutatione. tenuerunt eum pelasgi, oenotri, itali, morgetes, siculi, graeciae maxime populi, novissime lucani samnitibus orti duce lucio. oppidum paestum, graecis posidonia appellatum, sinus paestanus, oppidum elea quae nunc velia, promunturium palinurum, a quo sinu recedente traiectus ad columnam regiam c m. p. proximum autem flumen melpes, oppidum buxentum, graeciae pyxus, laus amnis. fuit et oppidum eodem nomine. ab eo bruttium litus, oppidum blanda, flumen baletum, portus parthenius phocensium et sinus vibonensis, locus clampetiae, oppidum tempsa, a graecis temese dictum, et crotoniensium terina sinusque ingens terinaeus. oppidum consentia intus. in paeninsula fluvius acheron, a quo oppidani aceruntini. hippo, quod nunc vibonem valentiam appellamus, portus herculis, metaurus amnis, tauroentum oppidum, portus orestis et medma. oppidum scyllaeum, crataeis fluvius, mater, ut dixere, scyllae. dein columna regia, siculum fretum ac duo adversa promunturia, ex italia caenus, e sicilia pelorum, xii stadiorum intervallo, unde regium xciv. inde appennini silva sila, promunturium leucopetra [xv] p., ab ea [li] locri, cognominati a promunturio zephyrio. absunt a silero [ccciii].

et includitur europae sinus primus. in eo maria nuncupantur: unde inrumpit, atlanticum, ab aliis magnum; qua intrat, porthmos a graecis, a nobis gaditanum fretum; cum intravit, hispanum quatenus hispanias adluit, ab aliis hibericum aut baliaricum; mox gallicum ante narbonensem provinciam; hinc ligusticum; ab eo ad siciliam insulam tuscum, quod ex graecis alii notium, alii tyrrenum, e nostris plurimi inferum vocant. ultra siciliam quod est ad sallentinos, ausonium polybius appellat, eratosthenes autem inter ostium oceani et sardiniam quicquid est sardoum, inde ad siciliam tyrrenum, ab hac cretam usque siculum, ab ea creticum.

insulae per haec maria primae omnium pityussae graecis dictae a frutice pineo; nunc ebusus vocatur utraque, civitate foederata, angusto freto interfluente. patent [xlvii], absunt ab dianio dcc stadia, totidem dianium per continentem a carthagine nova, tantundem a pityussis in altum baliarum duae et sucronem versus colubraria. baliarum funda bellicosas graeci gymnasias

dixere. maior [c] p. est longitudine, circuitu vero [ccccxxv]. oppida habet civium romanorum palmam et pollentiam, latina guium et tucim, et foederatum bocchorum fuit. ab ea [xxx] distat minor, longitudine [xl], circuitu [cl]. civitates habet iamonem, saniseram, magonem. a maiore [xii] in altum abest capraria, insidiosa naufragiis, et e regione palmae urbis menariae ac tiquadra et parva Hannibalis. ebusi terra serpentes fugat, colubrariae parit, ideo infesta omnibus nisi ebusitanam terram inferentibus; graeci ophiussam dixere. nec cuniculos ebusus gignit, populantes baliarium messes.

sunt aliae viginti ferme parvae mari vadoso, galliae autem ora in rhodani ostio metina, mox quae blascorum vocatur, et tres stoechades a vicinis massiliensibus dictae propter ordinem quo sitae sunt. nomina singulis prote, mese, quae et pomponiana vocatur, tertia hypaea, ab iis sturium, phoenice, phila, lero et lerina adversum antipolim, in qua berconi oppidi memoria.

in ligustico mari est corsica, quam graeci cyrnon appellavere, sed tusco propior, a septentrione in meridiem proiecta, longa passuum [cl], lata maiore ex parte [l], circuitu [cccxxv]. abest a vadis volaterranis [lxii], civitates habet xxxii et colonias marianam, a c. mario deductam, aleriam, a dictatore sulla. citra est oglasa, intra vero, et [lx] p. a corsica, planasia a specie dicta, aequalis freto ideoque navigiis fallax. amplior vrgo et capraria, quam graeci aegilion dixere, item igilium et dianium, quam artemisiam, ambae contra cosanum litus, et barpana, menaria, columbaria, venaria, ilva cum ferri metallis, circuitus [c], a populonio [x], a graecis aethalia dicta. ab ea planasia [xxviii]. ab iis ultra tiberina ostia in antiano astura, mox palmaria, sinonia, adversum formias pontiae. in puteolano autem sinu pandateria, prochyta, non ab aeneae nutrice, sed quia profusa ab aenaria erat, aenaria a statione navium aeneae, homero inarime dicta, pithecusa, non a simiarum multitudine, ut aliqui existimavere, sed a figlinis doliorum. inter pausilypum et neapolim megaris, mox a surrento [viii] distantes tiberi principis arce nobiles capreae circuitu xi m, leucothea extraque conspectum pelagus africanum attingens sardinia, minus [viii] p. a corsicae extremis, etiamnum angustias eas artantibus insulis parvis, quae cuniculariae appellantur, itemque phintonis et fossae, a quibus fretum ipsum taphros nominatur.

sardinia ab oriente patens [clxxxviii] p., ab occidente [clxxv], a meridie [lxxvii], a septentrione [cxxv], circuitu [dlxv], abest ab africa caralitano promunturio [cc], a gadibus [30xii]30 l. habet et a gorditano promunturio duas insulas quae vocantur herculis, a sulcensi enosim, a caralitano ficariam. quidam haut procul ab ea et leberidas ponunt et callode et quam vocant heras lutra. celeberrimi in ea populorum ilienses, balari, corsi, oppidorum xviii sulcitani, valentini, neapolitani, bitienses, caralitani civium r. et norenses, colonia autem una, quae vocatur ad turrem libisonis. sardiniam ipsam timaeus sandaliotim appellavit ab effigie soleae, myrsilus ichnusam a similitudine vestigii. contra paestanum sinum leucosia est, a sirene ibi sepulta appellata, contra veliam pontia et isacia, utraeque uno nomine oenotrides, argumentum possessae ab oenotris italiae, contra vibonem parvae quae vocantur ithacesiae

ab ulixis specula.

verum ante omnes claritate sicilia, sicania thucydidi dicta, trinacria pluribus aut trinacia a triangula specie, circuitu patens, ut auctor est agrippa, [dcxviii] p., quondam bruttio agro cohaerens, mox interfuso mari avulsa, [xv] in longitudinem freto, in latitudinem autem m d p. iuxta columnam regiam. ab hoc dehiscendi argumento rhegium graeci nomen dedere oppido in margine italiae sito. in eo freto est scopulus scylla, item charybdis mare verticosum, ambae clarae saevitia. ipsius triquetrae, ut diximus, promunturium pelorum vocatur adversus scyllam vergens in italiam, pachynum in graeciam, [ccccxl] ab eo distante peloponneso, lilybaeum in africanam [clxxx] intervallo a mercuri promunturio et a caralitano sardiniae [cxc]. inter se autem promunturia ac latera distant his spatiis: terreno itinere a peloro pachynum [clxxvi], inde lilybaeum [cc], unde pelorum [ccxlii], coloniae ibi v, urbes aut civitates lxiii. a peloro mare ionium ora spectante oppidum messana civium r., qui mamertini vocantur, promunturium drepanum, colonia tauromenium, quae antea naxos, flumen asines, mons aetna, nocturnis mirus incendiis. crater eius patet ambitu stadia viginti; favilla tauromenium et catinam usque pervenit fervens, fragor vero ad maroneum et gemellos colles. scopuli tres cyclopy, portus vlixis, colonia catina, flumina symaethum, terias. intus laestrygoni campi. oppida leontini, megaris, amnis pantagies, colonia syracusae cum fonte arethusa, quamquam et temenitis et archidemia et magea et cyane et milichie fontes in syracusano potantur agro, portus naustathmus, flumen elorum, promunturium pachynum, a quo ... fronte siciliae flumen hyrminum, oppidum camarina, fluvius gelas, oppidum agragas, quod agrigentum nostri dixere, thermae colonia, amnes achates, mazara, hypsa, selinus, oppidum lilybaeum, ab eo promunturium, drepana, mons eryx, oppida panormum, soluus, himera cum fluvio, cephaloedis, haluntium, agathyrnum, tyndaris colonia, oppidum mylae et, unde coepimus, pelorias. intus autem latinae condicionis centuripini, netini, segestani, stipendiarii assorini, aetnenses, agyrini, acestaei, acrensens, bidini, citarini, drepanitani, ergetini, echetlienses, erycini, entellini, egguini, gelani, galacteni, halaesini, hennenses, hyblenses, herbitenses, herbessenses, herbulenses, halicuenses, hadranitani, imacarenses, ichanenses, iaetenses, mutustratini, magellini, murgentini, mutycenses, menaini, naxi, noini, petrii, paropini, phintienses, semelitani, scherini, selinunti, symaethii, talarenses, tissienses, triocalini, tyracinenses. zancleae messeniorum in siculo freto sunt.

insulae in africanam versae gaulos, melita a camarina [lxxxvii], a lilybaeo [cxliii], cossyra, hieronnesos, caene, galata, lopadusa, aethusa, quam alii aegusam scripserunt, bucinna et a solunte [lxxv] osteodes contraque paropinos vstica. citra vero siciliam ex adverso metauri amnis [xxv] ferme p. ab italia septem aeoliae appellatae, eadem liparaeorum, hephaestides a graecis, a nostris volcaniae, aeoliae, quod aeolus iliadis temporibus ibi regnavit. lipara cum civium romanorum oppido, dicta a liparo rege, qui successit aeolo, antea milogonis vel meligunis vocitata, abest [xxv] ab italia, ipsa circuitu paulo minor [v]. inter hanc et siciliam altera, antea therasia appellata, nunc hiera,

quia sacra volcano est, colle in ea nocturnas evomente flammās. tertia strongyle, a lipara [vi] p. ad exortum solis vergens, in qua regnavit aeolus; quae a lipara liquidiore tantum flamma differt, e cuius fumo, quinam flaturi sint venti in triduo, praedicere incolae traduntur; unde ventos aeolo paruisse existimatum. quarta didyme, minor quam lipara. quinta ericusa, sexta phoenicusa, pabulo proximarum relictæ. novissima eademque minima euonymos. hactenus de primo europae sinu.

a locris italiae frons incipit, magna graecia appellata, in tris sinus recedens ausonii maris, quoniam ausones tenere primi. patet [lxxxvi], ut auctor est Varro; plerique [lxxv] fecere. in ea ora flumina innumera, sed memoratu digna a locris sagra et vestigia oppidi caulonis, mustiae, consilinum castrum, cocynthus, quod esse longissimum italiae promunturium aliqui existimant. dein sinus et oppidum scolacium, scylaceum et scylletium atheniensibus, cum conderent, dictum, quem locum occurrens terinaeus sinus paeninsulam efficit, et in ea portus qui vocatur castra Hannibalis, nusquam angustiore italia: [xl] p. latitudo est; itaque dionysius maior intercisam eo loco adicere siciliae voluit. amnes ibi navigabiles carcinus, crotalus, semirus, arogas, thagines, oppidum intus petelia, mons clibanus, promunturium lacinium, cuius ante oram insula [x] a terra dioscoron, altera calypsus, quam ogygiam appellasse homerus existimatur, praeterea tyris, eranusa, meloessa. ipsum a caulone abesse [lxx] prodit agrippa.

a lacinio promunturio secundus europae sinus incipit, magno ambitu flexus et acroceraunio epiro finitus promunturio, a quo abest [lxxv]. oppidum croto, amnis neaethus, oppidum thuri inter duos amnes crathim et sybarim, ubi fuit urbs eodem nomine. similiter est inter sirim et acirim heraclea, aliquando siris vocitata. flumina talandrum, casuentum, oppidum metapontum, quo tertia italiae regio finitur. mediterranei bruttiorum aprustani tantum; lucanorum autem atinates, bantini, eburini, grumentini, potentini, sontini, sirini, tergilani, vrsentini, volcentani, quibus numestrani iunguntur. praeterea interisse thebas lucanas catto auctor est, et pandosiam lucanorum urbem fuisse theopompus, in qua alexander epirotes occubuerit.

conectitur secunda regio amplexa hirpinos, calabriam, apuliam, sallentinos, [ccl] sinu qui tarentinus appellatur ab oppido laconum - in recessu hoc intimo situm, contributa eo maritima colonia, quae ibi fuerat, abest [cxxxvi] a lacinio promunturio - , adversam ei calabriam in paeninsulam emittens. graeci messapiam a duce appellavere et ante peucetiam a peucetio oenotri fratre in sallentino agro. inter promunturia [c] intersunt. latitudo paeninsulae a tarento brundisium terreno itinere [xxxv] patet multoque brevius a portu sasine. oppida per continentem a tarento vria, cui cognomen ob apulam messapiae, aletium, in ora vero senum, callipolis, quae nunc est anxà, [lxxv] a tarento. inde [xxxiii] promunturium quod acran iapygiam vocant, quo longissime in maria excurrit italia. ab eo basta oppidum et hydruntum decem ac novem milia passuum, ad discrimen ionii et hadriatici maris, qua in graeciam brevissimus transitus, ex adverso apolloniatum oppidi latitudine intercurrentis

freti [I] non amplius. hoc intervallum pedestri continuare transitu pontibus iactis primum pyrrus epiro rex cogitavit, post eum M. Varro, cum classibus pompeii piratico bello praeesset; utrumque aliae inpedivere curae. ab hydrunte soletum desertum, dein fruentium, portus tarentinus, statio miltopes, lupia, balesium, caelia, brundisium [I] p. ab hydrunte, in primis italiae portu nobile ac velut certiore transitu sicuti longiore, excipiente illyrici urbe durrachio [ccxxv] traiectu. brundisio conterminus poediculorum ager. novem adulescentes totidemque virgines ab illyriis xii populos genuere. poediculorum oppida rudiae, gnatia, barium, amnes iapyx a daedali filio rege, a quo et iapygia amita, pactius, aufidus ex hirpinis montibus canusium praefluens. hinc apulia dauniorum cognomine a duce diomedis socero, in qua oppidum salapia Hannibalis meretricio amore inclutum, sipuntum, vria, amnis cerbalus, dauniorum finis, portus aggasus, promunturium montis gargani, a sallentino sive iapygio [ccxxxiii] ambitu gargani, portus garnae, lacus pantanus, flumen portuosum fertor. teanum apulorum itemque larinum, cliternia, tifernus amnis. inde regio frentana. ita apulorum genera tria: teani a duce e grais; lucani subacti a calchante, quae nunc loca tenent atinates; dauniorum praeter supra dicta coloniae luceria, venusia, oppida canusium, arpi, aliquando argos hippium diomede condente, mox argyripa dictum. diomedes ibi delevit gentes monadorum dardorumque et urbes duas, quae in proverbii ludicrum vertere, apinam et tricam. cetera intus in secunda regione hirpinorum colonia una beneventum auspicatius mutato nomine, quae quondam appellata maleventum, aeculani, aquiloni, abellinates cognomine protropi, compsans, caudini, ligures qui cognominantur corneliani et qui baebiani, vescellani. ausculani, aletrini, abellinates cognominati marsi, atrani, aecani, alfellani, atinates, arpani, borcani, collatini, corinenses et nobiles clade romana cannenses, dirini, forentani, genusini, herdonienses, irini, larinates cognomine frentani, metinates ex gargano, mateolani, neretini, natini, rubustini, silvini, strapellini, turnantini, vibinates, venusini, vlurtini. - calabrorum mediterranei aezetini, apamestini, argetini, butuntinenses, deciani, grumbestini, norbanenses, palionenses, stulnini, tutini. - sallentinorum aletini, basterbini, neretini, vzentini, veretini.

sequitur regio quarta gentium vel fortissimarum italiae. in ora frentanorum a tiferno flumen trinium portuosum, oppida histonium, buca, hortona, aternus amnis. intus anxani cognomine frentani, carecini supernates et infernates, iuanenses. - marrucinorum teatini. - paelignorum corfinienses, superaequani, sulmonenses. - marsorum anxatini, antinates, fucentes, lucenses, marruvini. - albensium alba ad fucinum lacum. - aequiculorum cliternini, carseolani. - vestinorum angulani, pennienses, peltuinates, quibus iunguntur aufinates cismontani. - samniti, quos sabellos et graeci saunitas dixere, coloniae boianum vetus et alterum cognomine vndecumanorum, aufidenates, aesernini, fagifulani, ficolenses, saepinates, tereventinates. - sabinorum amitermini, curenses, forum deci, forum novum, fidenates, interamnates, nursini, nomentani, reatini, trebulani qui cognominantur mutuesci et qui

suffenates, tiburtes, tarinates. in hoc situ ex aequiculis interire comini, tadius, caedici, alfatini. gellianus auctor est lacu fucino haustum marsorum oppidum archippe, conditum a marsia duce lydorum; item vidicinorum in piceno deletum a romanis valerianus. sabini, ut quidam existimare, a religione et deum cultu sebini appellati, velinos accolunt lacus, roscidis collibus. nam amnis exhaurit illos sulphureis aquis tiberim ex his petens, replet e monte fiscello avens iuxta vacunae nemora et reate in eosdem conditus. at ex alia parte anio, in monte trebanorum ortus, lacus tris amoenitate nobiles, qui nomen dedere sublaqueo, defert in tiberim. in agro reatino cutiliae lacum, in quo fluctuetur insula, italiae umbilicum esse M. Varro tradit. infra sabinos latium est, a latere picenum, a tergo vmbria, appennini iugis sabinos utrimque vallantibus.

quinta regio piceni est, quondam uberrimae multitudinis. [ccclx] picentium in fidem p. r. venire. orti sunt a sabinis voto vere sacro. tenere ab aeterno amne, ubi nunc ager hadrianus et hadria colonia a mari [vi]. flumen vomani, ager praetutianus palmensisque, item castrum novum, flumen batium, truentum cum amne, quod solum liburnorum in italia relicum est, flumina albula, tessinum, helvinum, quo finitur praetutiana regio et picentium incipit. cupra oppidum, castellum firmanorum et super id colonia asculum, piceni nobilissima intus, novana. in ora cluana, potentia, numana a siculis condita, ab iisdem colonia ancona, adposita promunturio cunero in ipso flectentis se orae cubito, a gargano [clxxxiii]. intus auximates, beregrani, cingulani, cupresnes cognomine montani, falerienses, pausulani, planinenses, ricinenses, septempedani, tolentini, traianenses, vrbescia pollentini.

inuenitur his sexta regio vmbriam complexa agrumque gallicum citra ariminum. ab ancona gallica ora incipit togatae galliae cognomine. siculi et liburni plurima eius tractus tenere, in primis palmensem, praetutianum hadrianumque agrum. vmbri eos expulere, hos eturia, hanc galli. vmbriorum gens antiquissima italiae existimatur, ut quos ombrios a graecis putent dictos, quod in inundatione terrarum imbris superfuissent. trecenta eorum oppida tusci debellasse reperiuntur. nunc in ora flumen aesis, senagallia, metaurus fluvius, coloniae fanum fortunae, pisaurum cum amne et intus hispellum, tuder. de cetero amerini, attidates, asinates, arnates, asinates, camertes, casuentillani, carsulani, dolates cognomine sallentini, fulginiates, foroflaminenses, foroiulienses cognomine concupiensis, forobrentani, forosempronenses, iguini, interamnates cognomine nartes, mevanates, mevanolenses, matilicates, narnienses, quod oppidum nequinum antea vocitatum est, nucerini cognomine favonienses et camellani, ocriculani, ostrani, pitinates cognomine pisuertes et alii mergentini, plestini, sentinates, sarsinates, spoletini, suasani, sestinates, suillates, tadinates, trebiates, tuficani, tifernates cognomine tiberini et alii metaurenses, vesinicates, vrvinates cognomine metaurenses et alii hortenses, vettonenses, vindinates, visuentani. in hoc situ interire feliginates et qui clusiolum tenere supra interamnem et sarranates cum oppidis acerris quae vafriae cognominabantur, tuorocaelo quod

vettiolium, item solinates, curiates, falinates, sapinates. interiere et arinates cum crinivolo et vsidicani et plangenses, paesinates, caelestini. ameriam supra scriptam cato ante persei bellum conditam annis dcccclxiii prodit.

octava regio determinatur arimino, pado, appennino. in ora fluvius crustumium, ariminum colonia cum amnibus arimino et aprusa, fluvius rubico, quondam finis italiae. ab eo sapis et vtis et anemo, ravenna sabinorum oppidum cum amne bedese, ab ancona [cv], nec procul a mari vmbro- rum butrium. intus coloniae bononia, felsina vocitata tum cum princeps etru- riae esset, brixillum, mutina, parma, placentia. oppida caesena, claterna, fora clodi, livi, popili, druentinorum, corneli, licini, faventini, fidentini, otesini, padinates, regienses a lepidio, solonates saltusque galliani qui cognominantur aquinates, tannetani, veleiates cognomine vetti regiates, vrbana- tes. in hoc tractu interierunt boi, quorum tribus cxii fuisse auctor est cato, item senones, qui ceperunt romam.

padus, e gremio vesuli montis celsissimum in cacumen alpi- um elati finibus ligurum bagiennorum visendo fonte profluens condensque se cuniculo et in forovibiensium agro iterum exor- iens, nullo amnium claritate inferior, graecis dictus eridanus ac poena phaethontis inlustratus, augetur ad canis ortus liquatis nivibus, agris quam navigiis torrentior, nihil tamen ex rapto sibi vindicans atque, ubi linquit, ubertate largitor. [ccc] p. a fonte addens meatu duo de lxxx nec amnes tantum appenninos alpinosque navigabiles capi- ens, sed lacus quoque immensos in eum sese exonerantes, omni numero xxx flumina in mare hadriaticum defert, celeberrima ex iis appennini latere iactum, tanarum, trebiam placentinum, tarum, inciam, gabellum, scultennam, rhenum, alpi- um vero sturam, orgum, durias duas, sesitem, ticinum, lambrum, adduam, ollium, mincium. nec alius amnium tam brevi spatio maioris incrementi est. urguetur quippe aquarum mole et in profundum agitur, gravis terrae, quamquam diductus in flumina et fossas inter ravennam altinumque per [cxx], tamen, qua largius vomit, septem maria dictus facere. augusta fossa ravennam trahitur, ubi padusa vocatur, quondam messanicus appellatus. proximum inde ostium magnitudinem portus habet qui vatreni dicitur, qua claudius caesar e britannia triumphans praegrandi illa domo verius quam nave intravit hadriam. hoc ante eridanum ostium dictum est, ab aliis spineticum ab urbe spina, quae fuit iuxta, praevalens, ut delphicis creditum est thesauris, condita a diomede. auget ibi padum vatrenus amnis ex forocorneliensi agro. proximum inde ostium caprasiae, dein sagis, dein volane, quod ante olane vocabatur, omnia ea fossa flavia, quam primi a sagi fecere tusci egesto amnis impetu per transversum in atrianorum paludes quae septem maria appellantur, nobili portu oppidi tuscorum atriae, a quo atriatum mare ante appellabatur quod nunc hadriaticum. inde ostia plena carbonaria, fossiones ac philistina, quod alii tartarum vocant, omnia ex philistinae fossae abundatione nascentia, accedentibus atesi ex tridentinis alpi- bus et togisono ex patavinorum agris. pars eorum et proximum portum facit brundulum, sicut aedronem meduaci duo ac fossa clodia. his se padus miscet ac per haec effundit, plerisque, ut in aegypto

nilus quod vocant delta, triquetram figuram inter alpes atque oram maris facere proditus, stadiorum ii circuitu. pudet a graecis italiae rationem mutuari, metrodorus tamen sceansius dicit, quoniam circa fontem arbor multa sit picea, quales gallice vocentur padi, hoc nomen accepisse, ligurum quidem lingua amnem ipsum bodincum vocari, quod significet fundo carentem. cui argumento adest oppidum iuxta industria vetusto nomine bodincomagum, ubi praecipua altitudo incipit.

transpadana appellatur ab eo regio undecima, tota in mediterraneo, cui marina cuncta fructuoso alveo inportat. oppida vibi forum, segusio, coloniae ab alpium radicibus augusta taurinorum - inde navigabili pado - antiqua ligurum stirpe, dein salassorum augusta praetoria iuxta geminas alpium fores, graias atque poeninas - his poenos, grais herculem transisse memorant - , oppidum eporedia sibyllinis a populo romano conditum iussis. eporedias galli bonos equorum domitores vocant. vercellae libiciorum ex salluis ortae, novaria ex vertamocoris, vocontiorum hodieque pago, non, ut cato existimat, ligurum, ex quibus laevi et marici condidere ticinum non procul a pado, sicut boi transalpibus profecti laudem pompeiam, insubres mediolanum. oromobiorum stirpis esse comum atque bergomum et licini forum aliquotque circa populos auctor est cato, sed originem gentis ignorare se fatetur, quam docet cornelius alexander ortam a graecia interpretatione etiam nominis vitam in montibus degentium. in hoc situ interiit oppidum oromobiorum parra, unde bergomates cato dixit ortos, etiamnum prodente se altius quam fortunatus situm. interiere et caturiges, insubrum exsules, et spina supra dicta, item melpum opulencia praecipuum, quod ab insubribus et bois et senonibus deletum eo die, quo camillus veios ceperit, nepos cornelius tradidit.

sequitur decima regio italiae, hadriatico mari adposita, cuius venetia, fluvius silis ex montibus tarvisanis, oppidum altinum, flumen liquentia ex montibus opiterginis et portus eodem nomine, colonia concordia, flumina et portus reatinum, tiliaventum maius minusque, anaxum, quo varamus defluit, alsa, natiso cum turro, praefluentes aquileiam coloniam [xv] p. a mari sitam. carnorum haec regio iunctaque iapudum, amnis timavus, castellum nobile vino pucinum, tergestinus sinus, colonia tergeste, [xxxiii] ab aquileia. ultra quam sex milia p. formio amnis, ab ravenna [clxxxviii], anticus auctae italiae terminus, nunc vero histriae. quam cognominatam a flumine histro, in hadriam effluente e danuvio amne eodemque histro exadversum padi fauces, contrario eorum percussu mari interiecto dulcescente, plerique dixere falso, et nepos etiam padi accola; nullus enim ex danuvio amnis in mare hadriaticum effunditur. deceptos credo, quoniam argo navis flumine in mare hadriaticum descendit non procul tergeste, nec iam constat quo flumine. umeris travectam alpis diligentiores tradunt, subisse autem histro, dein savo, dein nauporto, cui nomen ex ea causa est inter emonam alpisque exorienti.

histria ut paeninsula excurrit. latitudinem eius [xl], circuitum [cxxv] prodidere quidam, item adhaerentis liburniae et flaticus sinus, alii [ccxxv], alii liburniae [clxxx]. nonnulli in flaticum sinum iapudiam promovere a

tergo histriae [cxxx], dein liburniam [cl] fecere. tuditanus, qui domuit histros, in statua sua ibi inscripsit: “ab aqvileia ad titivm flvmen stadia mm”. oppida histriae civium romanorum agida, parentium, colonia pola, quae nunc pietas iulia, quondam a colchis condita; abest a tergeste [cv]. mox oppidum nesactium et - nunc finis italiae - fluvius arsia. ad polam ab ancona traiectus [cxx] p. est.

in mediterraneo regionis decimae coloniae cremona, brixia cenomanorum agro, venetorum autem ateste et oppida acelum, patavium, opitergium, belunum, vicetia. mantua tuscorum trans padum sola reliqua. venetos troiana stirpe ortos auctor est cato, cenomanos iuxta massiliam habitasse in volcis. feltrini et tridentini et beruenses raetica oppida, raetorum et euganeorum verona, iulienses carnorum. dein, quos scrupulosius dicere non attineat, alutrenses, asseriates, flamonienes vanienses et alii cognomine carici, foro iulienses cognomine transpadani, foretani, nedinates, quarqueni, tarvisani, togienses, varvari. in hoc situ interiere per oram irmene, pellaon, palsicium, ex venetis atina et caelina, carnis segesta et ocrea, tauriscis noreia. et ab aquileia ad xii lapidem deletum oppidum etiam invito senatu a m. claudio marcello l. piso auctor est.

in hac regione et undecuma lacus incluti sunt amnesque eorum partus aut alumni, si modo acceptos reddunt, ut adduam larius, ticinum verbannus, mincium benacus, ollium sebinnus, lambrum eupilis, omnes incolas padi.

alpis in longitudinem [30x]30 p. patere a supero mari ad inferum caelius tradit, timagenes [xxv] p. deductis, in latitudinem autem cornelius nepos [c], t. livius [iii] stadiorum, uterque diversis in locis. namque et centum milia excedunt aliquando, ubi germaniam ab italia summovent, nec [lxx] inplent reliqua sui parte graciles, veluti naturae providentia. latitudo italiae subter radices earum a varo per vada sabatia, taurinos, comum, brixiam, veronam, vicetiam, opitergium, aquileiam, tergeste, polam, arsiam [dcccxlvi] p. colligit.

incolae alpium multi populi, sed inlustres a pola ad tergestis regionem fecusses, subocrini, catali, menoncaleni iuxtaque carnos quondam taurisci appellati, nunc norici. his contermini raeti et vindelici, omnes in multas civitates divisi. raetos tuscorum prolem arbitrantur a gallis pulsos duce raeto. verso deinde in italiam pectore alpium latini iuris euganeae gentes, quarum oppida xxxiiii enumerat cato. ex iis trumplini, venalis cum agris suis populus, dein camunni conpluresque similes finitimis adtributi municipis. lepontios et salassos tauriscae gentis idem cato arbitratur; ceteri fere lepontios relictos ex comitatu herculis interpretatione graeci nominis credunt, praeustis in transitu alpium nive membris. eiusdem exercitus et graios fuisse graiarum alpium incolas praestantesque genere euganeos, inde tracto nomine. caput eorum stoenos. raetorum vennonenses sarunetesque ortus rheni amnis accolunt, lepontiorum qui vberi vocantur fontem rhodani eodem alpium tractu. sunt praeterea latio donati incolae, ut octodurenses et finitimi ceutrones, cottianae civitates et turi liguribus orti, bagienni ligures et qui montani vocantur capillatorumque plura genera ad confinium ligustici maris.

non alienum videtur hoc loco subicere inscriptionem e tropaeo alpium, quae talis est:

non sunt adiectae cottianae civitates xv, quae non fuerant hostiles, item adtributae municipiis lege pompeia.

haec est italia diis sacra, hae gentes eius, haec oppida populorum. super haec italia, quae l. aemilio paulo c. atilio regulo cos. nuntiato gallico tumultu sola sine externis ullis auxiliis atque etiam tunc sine transpadanis equitum [lxxx], peditum [dcc] armavit, metallorum omnium fertilitate nullis cedit terris; sed interdictum id vetere consulto patrum italiae parci iubentium.

arsiae gens liburnorum iungitur usque ad flumen titium. pars eius fuere mentores, himani, encheleae, bulini et quos callimachus peucetios appellat, nunc totum uno nomine illyricum vocatur generatim. populorum pauca effatu digna aut facilia nomina. conventum scardonitanum petunt iapudes et liburnorum civitates xliii, ex quibus lacinienses, stulpinos, burnistas, olbonenses nominare non pigeat. ius italicum habent ex eo conventu alutae, flantes, a quibus sinus nominatur, lopsi, varvarini immunesque asseriates, et ex insulis fertinates, curictae. cetero per oram oppida a nesactio alvona, flanova, tarsatica, senia, lopsica, ortoplinia, vegium, argyrum, corinium, aenona, civitas pasini. flumen telavium, quo finitur iapudia. insulae eius sinus cum oppidis praeter supra significatas absortium, arba, crexi, gissa, fortunata. rursus in continente colonia iader, quae a pola [clx] abest, inde [xxx] colentum insula, [xliii] ostium titii fluminis.

liburniae finis et initium delmatiae scardona in amne eo [xii] passuum a mari. dein tariotarum antiqua regio et castellum tariona, promunturium diomedis vel, ut alii, paeninsula hyllis circuitu [c], tragurium civium romanorum, marmore notum, siculi, in quem locum divus claudius veteranos misit, salona colonia ab iader [cxii]. petunt in eam iura viribus discriptis in decurias cccxlii delmatae, xxv deuri, ccxxxviii ditiones, cclxviii maezei, lii sardeates. in hoc tractu sunt burnum, andetrium, tribulium, nobilitata proeliis castella. petunt et ex insulis issaei, solentini, separi, epetini. ab his castella petuntium, narestae, oneum. narona colonia tertii conventus a salona [lxxxv] p., adposita cognominis sui fluvio a mari [xx] p. M. Varro lxxxviii civitates eo ventitasse auctor est; nunc soli prope noscuntur cerauni decuriis xxiiii, daversi xvii, desitantes ciii, docleatae xxxiii, deretini xiiii, deraemistae xxx, dindari xxxiii, glinditiones xliii, melcumani xxiiii, naresi cii, scirtari lxxii, siculotae xxiiii populatoresque quondam italiae vardaei non amplius quam xx decuriis. praeter hos tenere tractum eum ozuae, partheni, cavi, haemasi, masthitae, arinistae. a narone amne [c] p. abest epidaurum colonia. ab epidauro sunt oppida civium romanorum rhizinium, acruium, butuanum, olcinium, quod antea colchinium dictum est, a colchis conditum, amnis drino superque eum oppidum civium romanorum scodra ab mari [xviii], praeterea multorum graeciae oppidorum deficiens memoria nec non et civitatum validarum: eo namque tractu fuere labeatae, senedi, rudini, sasaei, grabaei; proprieque dicti illyri et taulanti et pyraei retinent nomen. in ora nymphaeum promunturium.

lissum oppidum civium romanorum ab epidauro [c] p. a lisso macedonia provincia. gentes partheni et a tergo eorum dassaretæ, montes candaviæ a dyrrachio [lxxviii] p., in ora vero denda civium romanorum, epidamnium colonia, propter inauspicatum nomen a romanis dyrrachium appellata, flumen aous, a quibusdam aeas nominatum, apollonia, quondam corinthiorum colonia, [iiii] p. a mari recedens, cuius in finibus celebre nymphæum accolunt barbari amantes et buliones. at in ora oppidum oricum, a colchis conditum. inde initium epiro, montes acroceraunia, quibus hunc europæ determinavimus sinum. oricum a sallentino italiæ promunturio distat [lxxx].

a tergo carnorum et iapudum, qua se fert magnus hister, rætis iunguntur norici. oppida eorum virunum, celeia, teurnia, aguntum, iuvaum, omnia claudia, flavium solvense. noricis iunguntur lacus pelso, deserta boiorum; iam tamen colonia divi claudi savaria et oppido scarabantia iulia habitantur.

inde glandifera pannoniæ, qua mitescentia alpium iuga per medium illyricum a septentrione ad meridiem versa molli in dextra ac laeva devexitate considunt. quæ pars ad mare hadriaticum spectat, appellatur delmatia et illyricum supra dictum; ad septentriones pannonia vergit. finitur inde danuvio. in ea coloniæ emona, siscia. amnes clari et navigabiles in danuvium defluunt draus et noricis violentior, saus ex alpihus carniciis placidior, [cxx] intervallo: draus per serretes, serapillos, iasos, andizetes, saus per colapianos breucosque. populorum hæc capita; præterea arviates, azali, amantini, belgites, catari, cornacates, eravisci, hercuniates, latovici, oseriates, varciani. mons claudius, cuius in fronte scordisci, in tergo taurisci. insula in sao metubarbis, amnicarum maxima. præterea amnes memorandi: colapis in saum influens iuxta sisciam gemino alveo insulam ibi efficit quæ segestica appellatur; alter amnis bacuntius in saum ... sirmio oppido influit, ubi civitas sirmiensium et amantinorum. inde [xlv] taurunum, ubi danuvio miscetur saus. supra influunt valdasus, urpanus, et ipsi non ignobiles.

pannoniæ iungitur provincia quæ moesia appellatur, ad pontum usque cum danuvio decurrens. incipit a confluyente supra dicto. in ea dardani, celegeri, triballi, timachi, moesi, thraces pontoque contermini scythæ. flumina clara et dardanis margus, pingus, timachus, ex rhodope oescus, ex hæmo vtus, asamus, ieterus.

illyrici latitudo qua maxima est [cccxxv] p. colligit, longitudo a flumine arsia ad flumen drinium [dxxx]. a drinio ad promunturium acroceraunium [clxxv] agrippa prodidit, universum autem sinum italiæ et illyrici ambitu [30xvii]30. in eo duo maria quo distinximus fine, ionium in prima parte, interius hadriaticum, quod superum vocant.

insulæ in ausonio mari præter iam dictas memoratu dignæ nullæ, in ionio paucae calabro litore ante brundisium, quarum obiectu portus efficitur, contra apulum litus diomedea, conspicua monumento diomedis, et altera eodem nomine, a quibusdam teutria appellata. illyrici ora mille amplius insulis frequentatur, natura vadoso mari aestuariisque tenui alveo intercurrentibus. claræ ante ostia timavi calidorum fontium cum aestu maris crescentium, iuxta

histrorum agrum cissa, pullariae et absyrtides grais dictae a fratre medeae ibi interfecto. iuxta eas electrudas vocavere in quibus proveniret sucinum, quod illi electrum appellant, vanitatis graecae certissimum documentum, adeo ut quas earum designent haut umquam constiterit. contra iader est lissa et quae appellata est, contra liburnos crateae aliquot nec pauciores liburnicae, celadussae, contra tragurium bova et capris laudata brattia, issa civium romanorum et cum oppido pharia. ab issa corcyra melaena cognominata cum cnidiorum oppido distat [xxv], inter quam et illyricum melite, unde catulos melitaeos appellari callimachus auctor est. [xv] ab ea vii elaphites, in ionio autem mari ab orico mm p. sasonis, piratica statione nota.

LIBER IV

tertius europae sinus acrocerauniis incipit montibus, finitur hellesponto, amplectitur praeter minores sinus [30xix]30 [xxv] passuum. in eo epiros, acarnania, aetolia, phocis, locris, achaia, messenia, laconica, argolis, megaris, attice, boeotia iterumque ab alio mari eadem phocis et locris, doris, phthiotis, thessalia, magnesia, macedonia, thracia. omnis graeciae fabulositas sicut et litterarum claritas ex hoc primum sinu effulsit, quapropter paululum in eo conmorabimur.

epiros in universum appellata a cerauniis incipit montibus. in ea primi chaones, a quibus chaonia, dein thesproti, antigonenses, locus aornos et pestifera avibus exhalatio, cestrini, perhaebi, quorum mons pindus, cassopaei, dryopes, selloe, hellopes, molossi, apud quos dodonaei iovis templum oraculo inlustre, talarus mons, centum fontibus circa radices theopompo celebratus. epiros ipsa, ad magnesiam macedoniamque tendens, a tergo suo dassaretas supra dictos, liberam gentem, mox feram dardanos habet. dardanis laevo triballi praetenduntur latere et moesicae gentes, a fronte iunguntur maedi ac denselatae, quibus threes ad pontum usque pertinentes. ita succincta rhodopes, mox et haemi, vallatur excelsitas. in epiro ora castellum in acrocerauniis chimera, sub eo aquae regiae fons, oppida maeandria, cestria, flumen thesprotiae thyamis, colonia buthrotum, maximeque nobilitatus ambracius sinus, d passuum faucibus spatiosum aequor accipiens, longitudinis [xxxvii], latitudinis [xv]. in eum deferitur amnis acheron, e lacu thesprotiae acherusia profluens [xxxv] passuum inde et mille pedum ponte mirabilis omnia sua mirantibus. in sinu oppidum ambracia. molossorum flumina aphas, aratthus, civitas anactorica, locus pandosia.

acarnaniae, quae antea curetis vocabatur, oppida heraclia, echinus et in ore ipso colonia Augusti actium cum templo apollinis nobili ac civitate libera nicopolitana. egressos sinu ambracio in ionium excipit leucadium litus, promunturium leucates, dein sinus et leucadia ipsa paeninsula, quondam neritis appellata, opere accolarum abscisa continenti ac reddita ventorum flatu congeriem harenae adtumulantium, qui locus vocatur dioryctos stadiorum longitudine trium. oppidum in ea leucas, quondam neritum dictum. deinde acarnanum urbes alyzia, stratos, argos amphiloichicum cognominatum. amnis achelous e pindo fluens atque acarnaniam ab aetolia dirimens et artemitam insulam adsiduo terrae invectu continenti adnectens.

aetolorum populi athamanes, tymphaei, ephyri, aenienses, perhaebi, dolopes, maraces, atraces, a quibus atrax amnis ionio mari infunditur. aetoliae oppidum calydon est [vii] d passuum a mari iuxta euenum amnem. dein macynia, molyceria, cuius a tergo chalcis mons et taphiassus. at in ora promunturium antirrhium, ubi ostium corinthiaci sinus minus m p. latitudine influentis aetolosque dirimentis a peloponneso. promunturium quod contra procedit appellatur rhion. sed in corinthio sinu oppida aetoliae naupactos,

eupalimna et in mediterraneo pleuron, halicarna. montes clari in dodone tomarus, in ambracia crania, in acarnania aracynthus, in aetolia achaton, panaetolium, macynium.

proximi aetolis locri cognominantur ozolae, immunes. oppidum oeanthe, portus apollinis phaesti, sinus crisaus. intus oppida argyna, eupalia, phaestum, calamisus. ultra cirrhaei phocidis campi, oppidum cirrha, portus chalaeon, a quo [vii] p. introrsus liberum oppidum delphi sub monte parnaso, clarissimi in terris oraculi apollinis. fons castalius, amnis cephisus praefluens delphos, ortus in lilaia urbe. quondam praeterea oppidum crisa et cum bulensibus anticyra, naulochum, pyrrha, amphisa immunis, tithrone, tithorea, ambrysus, mirana, quae regio daulis appellatur. deinde in intimo sinu angulus boeotiae adluitur cum oppidis siphis, thebis quae corsiae cognominatae sunt iuxta heliconem montem. tertium ab hoc mari boeotiae oppidum pagae, unde peloponnesi prosilit cervix.

peloponnesus, apia antea appellata et pelasgia, paeninsula haut ulli terrae nobilitate postferenda, inter duo maria aegaeum et ionium, platani folio similis propter angulosos recessus, circuitu [dlxiii] p. colligit auctore isidoro; eadem per sinus paene tantundem adicit. angustiae, unde procedit, isthmus appellatur. in eo loco inrumpentia e diverso quae dicta sunt maria a septentrione et exortu eius omnem ibi latitudinem vorant, donec contrario incursu tantorum aequorum v milium passuum intervallo exesis utrimque lateribus angusta cervice peloponnesum contineat hellas. corinthiacus hinc, illinc saronicus appellatur sinus; lecheae hinc, cenchreae illinc angustiarum termini, longo et ancipiti navium ambitu quas magnitudo plaustri transvehi prohibet. quam ob causam perfodere navigabili alveo angustias eas temptavere demetrius rex, dictator caesar, gaius princeps, domitius nero, nefasto, ut omnium exitu patuit, incepto. in medio hoc intervallo, quod isthmon appellavimus, adplicata colli habitatur colonia corinthus, antea ephyra dicta, sexagenis ab utroque litore stadiis, e summa sua arce, quae vocatur acrocorinthos, in qua fons pirene, diversa duo maria prospectans. [lxxxviii] p. ad corinthiacum sinum traiectus est patras a leucade. patrae, colonia in longissimo promunturio peloponnesi condita ex adverso aetoliae et fluminis eueni minus m p., ut dictum est, intervallo in ipsis faucibus, sinum corinthiacum [lxxxv] in longitudinem usque ad isthmon transmittunt.

achaiae nomen provinciae ab isthmo incipit. antea aegialos vocabatur propter urbes in litore per ordinem dispositas. primae ibi quas diximus lecheae, corinthiorum portus, mox olyros, pellenaeorum castellum, oppida helice, bura, in quae refugere haustis prioribus, sicyon, aegira, aegium, erineos. intus cleonae, hysiae. panhormus portus demonstratumque iam rhium, a quo promunturio [v] absunt patrae, quas supra memoravimus. locus pherae. in achaia novem montium scioessa notissimus, fons cymothoe. ultra patras oppidum olenum, colonia dyme, loca buprasium, hyrmine, promunturium araxus, cyllenius sinus, promunturium chelonates, unde cyllenen [xv] p., castellum phlius, quae regio ab homero araethyrea dicta est, postea asopis.

inde eliorum ager, qui antea epioe vocabantur. ipsa elis in mediterraneo et a pylo [xiii] intus delubrum olympii iovis, ludorum claritate fastos graeciae complexum, pisaeorum quondam oppidum, praefluente alpheo amne. at in ora promunturium ichthys, amnis alpheus - navigatur [vi] p. - , oppida aulon, leprum, promunturium platanodes. omnia haec ad occasum versa, ad meridiem autem cyparissius sinus cum urbe cyparisso [lxxv] circuitu, oppida pylos, mothone, locus helos, promunturium acritas, sinus asinaeus ab oppido asine, coronaeus a corone. finiuntur taenaro promunturio. ibi regio messenia duodeviginti montium, amnis pamisus, intus autem ipsa messene, ithome, oechalia, arene, pteleon, thryon, dorion, zancle, variis quaeque clara temporibus. huius sinus circuitus [lxxx], traiectus vero [xxx].

dehinc a taenaro ager laconicus liberae gentis et sinus circuitu [cvi], traiectu [xxxviii]. oppida taenarum, amyclae, pherae, leuctra et intus sparta, therapne atque ubi fuere cardamyle, pitane, anthia, locus thyraeae, gerania. mons taygetus, amnis eurotas. sinus aegilodes, oppidum psamathus. sinus gytheates ab oppido, ex quo cretam in insulam certissimus cursus. omnes autem maleo promunturio includuntur.

qui sequitur sinus ad scyllaeum argolicus appellatur, traiectu [l], idem ambitu [clxii]. oppida boea, epidaureus limera cognomine, zarax, cyphans portus. amnes inachus, erasinus, inter quos argos hippium cognominatum supra locum lerne a mari mm, novemque additis milibus mycenae et ubi fuisse tiryntia tradunt et locus mantinea. montes artemisius, apesantus, asterion, parparus alique xi numero. fontes niobe, amymone, psamathe. a scyllaeo ad isthmon [lxxx] p. oppida hermione, troezen, coryphasium appellatumque alias inachium, alias dipsium argos, portus schoenitas. sinus saronicus, olim querno nemore redimitus, unde nomen, ita graecia antiqua appellante quercum; in eo epidaureum oppidum, aesculapi delubro celebre, spiraeum promunturium, portus anhedus et bucephalus et quas supra dixeramus cenchreae, isthmi pars altera cum delubro neptuni quinquennialibus incluto ludis. tot sinus peloponnesi oram lancinant, tot maria adlurant, siquidem a septentrione ionium inrumpit, ab occidente siculo pulsatur, a meridie cretico urgetur, ab oriente brumali aegaeo, ab oriente solstitiali myrtoo, quod a megarico incipiens sinu totam atticen adluit.

mediterranea eius arcadia maxime tenet undique a mari remota, initio drymodes, mox pelasgis appellata. oppida eius psophis, mantinea, stymphalum, tegea, antigonea, orchomenum, pheneum, pallantium, unde palatium romae, megalepolis, gortyna, bucolium, carnion, parrhasie, thelpusa, melaenae, heraea, pylae, pallene, agrae, epium, cynaethae, lepreon arcadiae, parthenium, alea, methydrium, enispe, macistum, lampia, clitorium, cleonae. inter quae duo oppida regio nemea est, et bembinadia vocitata. montes in arcadia pholoe+ cum oppido, item cyllene, lycaeus, in quo lycaeii iovis delubrum, maenalus, artemisius, parthenius, lampeus, nonacris praeterque ignobiles viii. amnes ladon e paludibus phenei, erymanthus e monte eiusdem nominis in alpheum defluens. reliquae civitates in achaia dicendae alipheraei,

abeatae, pyrgenses, paroreatae, pharygenitae, tortuni, typanei, thrusi, tritienses. universae achaeiae libertatem domitius nero dedit. peloponnesus in latitudinem a promunturio maleae ad oppidum aegium corinthiaci sinus [cxc] patet, at in transversum ab elide epidaurum [cxxv], ab olympia argos per arcadiam [lxviii]; ab eodem loco ad pylum iam dicta mensura est. universa autem, velut pensante aequorum incursus natura, in montes sex atque lxx attollitur.

ab isthmi angustii hellas incipit, nostris graecia appellata. in ea prima attice, antiquitus acte vocata. attingit isthmum parte sui quae appellatur megaris ab colonia megara, e regione pagarum. duo haec oppida excurrente peloponneso sita sunt, utraque ex parte velut in umeris helladis, pagaei et amplius aegosthenenses contributi megarensibus. in ora autem portus schoenos, oppida sidous, cremmyon, scironia saxa [vi] longitudine, gerania, megara, eleusin. fuere et oenoe et probalinthos. nunc sunt ab isthmo [lv] piraeus et phalera portus, [v] muro recedentibus athenis iuncti. libera haec civitas nec indiga ullius praeconii amplius: tanta claritas superfluit. in attica fontes cephisia, larine, callirroee enneacrunos, montes brilessus, aegialeus, icarius, hymettus, lycabettus, locus ilisos. a piraeo [xlv] sunium promunturium, thoricos promunturium, potamos, steria, brauron, quondam oppida, rhamnus pagus, locus marathos, campus thriasius, oppidum melita et opus in confinio boeotiae.

cuius anthedon, onchestos, thespiae liberum oppidum, lebadea nec cedentes athenis claritate quae cognominantur boeotiae thebae, duorum numinum liberi atque herculis, ut volunt, patria. et musis natalem in nemore heliconis adsignant. datur et his thebis saltus cithaeron, amnis ismenus. praeterea fontes in boeotia oedipodia, psamathe, dirce, epicrane, arethusa, hippocrene, aganippe, gargaphie. montes extra praedictos mycalesus, hadylius, acontius. reliqua oppida inter megaricam et thebas eleutherae, haliartus, plataeae, pherae, aspledon, hyle, thisbe, erythrae, glissa, copae, iuxta cephisum amnem lamiae et anichiae, medeon, phlygone, acraephia, coronea, chaeronea. in ora autem infra thebas ocalee, eteonos, scolos, schoenos, peteon, hyrie, mycalesos, ireseum et eleon, ollarum, tanagra, liber populus, et in ipsis faucibus euripi, quem facit obiecta insula euboea, aulis capaci nobilis portus. boeotos hyantas antiquitus dixere. locri deinde epicnemidii cognominantur, olim leleges appellati, per quos amnis cephisus defertur in mare. oppida opus, unde et sinus opuntius, cynus. phocidis in litore unum daphnus, introrsus autem larisa, elatea et in ripa cephisi, ut diximus, lilaea delphosque versae cnemis et hyampolis. rursus locrorum ora, in qua larumna, thronium, iuxta quod boagrius amnis defertur in mare. oppida narycum, alope, scarphia. postea maliacus sinus ab incolis dictus, in quo oppida halcyone, aegonia, phalara. doris deinde, in qua sparthos, erineon, boion, pindus, cytinum. doridis a tergo mons oeta est.

sequitur mutatis saepe nominibus haemonia, eadem pelasgis et pelasgicon argos, hellas, eadem thessalia et dryopis, semper a regibus cognominata. ibi

genitus rex nomine graecus, a quo graecia; ibi hellen, a quo hellenes. hos eosdem homerus tribus nominibus appellavit myrmidonas et hellenas et achaeos. ex his phthiotae nominantur dorida accolentes. eorum oppida echinus, in faucibus sperchii fluminis thermopylarum angustiae, quo argumento [iiii] inde heraclea trechin dicta est. mons ibi callidromus; oppida celebrata hellas, halos, lamia, phthia, arne.

in thessalia autem orchomenus, minyus antea dictus, et oppidum alimon, ab aliis holmon, atrax, palamna, fons hyperia, oppida pherae, quarum a tergo pieria ad macedoniam protenditur, larisa, gomphi, thebae thessalae, nemus pteleon, sinus pagasicus, oppidum pagasa, idem postea demetrias dictum, tricca, pharsali campi cum civitate libera, crannon, iletia. montes phthiotidis nymphaeus, quodam topiario naturae opere spectabilis, buzygaeus, donacoessa, bromiaeus, daphusa, chimarone, athamas, stephane. in thessalia quattuor atque triginta, quorum nobilissimi cercetii, olympus pierius, ossa, cuius ex adverso pindus et othrys, lapitharum sedes, hi ad occasum vergentes, ad ortus pelius, omnes theatri modo inflexi, caveatis ante eos lxxv urbibus. flumina thessaliae apidanus, phoenix, enipeus, onochonus, pamisus, fons messeis, lacus boebeis et ante cunctos claritate penius, ortus iuxta gomphos interque ossam et olympum nemorosa convalle defluens d stadiis, dimidio eius spatii navigabilis. in eo cursu tempe vocant, [v] passuum longitudine et ferme sesquiugeri latitudine, ultra visum hominis attollentibus se dextra laevaue leniter convexis iugis, intus silva late viridante, ac labitur penius viridis calculo, amoenus circa ripas gramine, canorus avium concentu. accipit amnem horcon nec recipit, sed olei modo supernatantem, ut dictum est homero, brevi spatio portatum abdicat, poenales aquas dirisque genitas argenteis suis misceri recusans.

thessaliae adnexa magnesia est, cuius fons libethra, oppida iolcus, ormenium, pyrra, methone, olizon, promunturium sepias, oppida castana, spalathra, promunturium aeantium, oppida meliboea, rhizus, erymnae, ostium penii, oppida homolium, orthe, iresiae, pelinna, thaumacie, gyrton, crannon, acharne, dotion, melite, phylace, potniae.

epiri, achaiae, atticae, thessaliae in porrectum longitudo [cccclxxxx] traditur, latitudo [cclxxxvii].

macedonia postea cl populorum, duobus incluta regibus quondamque terrarum imperio, emathia antea dicta. haec ad epiroticas gentes in solis occasum recedens post terga magnesiae atque thessaliae infestatur a dardanis; partem eius septentrionalem paeonia ac pelagonia protegunt a triballis. oppida aegae, in quo sepeliri mos reges, beroea et in regione, quae pieria appellatur a nemore, aeginium. in ora heraclea, flumen apilas, oppida pydna, aloros, amnis haliacmon. intus aloritae, vallaei, phylacaei, cyrrestae, tyrissaei, pella colonia, oppidum stobi civium romanorum, mox antigonea, europus ad axium amnem, eodemque nomine per quod rhoedias fluit, scydra, eordaea, mieza, gordyniae. mox in ora ichnae, fluvijs axius. ad hunc finem dardani, treres, pieres macedoniam accolunt. ab hoc amne paeoniae gentes paraxiae, eordenses,

almopi, pelagones, mygdones. montes rhodope, scopius, orbelus. dein praeiacente gremio terrarum arethusii, antiochienses, idomenenses, doberi, aestrienses, allantenses, audaristenses, morylli, garresci, lyncestae, othryonei et liberi amantini atque orestae, coloniae bullidenses et dienses, xylopolitae, scotusaei liberi, heraclea sintica, tymphaei, toronaei.

in ora sinus macedonica oppidum chalastra et intus piloros, lete medioque litoris flexu thessalonice liberae condicionis - ad hanc a dyrrhachio [ccxlv] - , therme in thermaico sinu, oppida dicaea, palinandrea, scione, promunturium canastraeum, oppida pallene, phlegra. qua in regione montes hypsizonus, epytus, alcyon, elaeuomne, oppida nissos, phryxelon, mendae et in pallenensi isthmo quondam potidaea, nunc cassandrea colonia, anthemus, olophyxus, sinus mecyberna, oppida myscella, ampelos, torone, siggos, stolos, fretum, quo montem atho xerxes persarum rex continenti abscidit in longitudinem passuum md. mons ipse a planitie excurrit in maria [lxxv] passuum, ambitus radicis [cl] colligit. oppidum in cacumine fuit acrothoon; nunc sunt vranopolis, palaehorium, thyssus, cleonae, apollonia, cuius incolae macrobii cognominantur. oppidum cassera faucesque alterae isthmi, acanthus, stagira, sithone, heraclea et regio mygdoniae subiacens, in qua recedentes a mari apollonia, arethusa. in ora rursus posidium et sinus cum oppido cermoro, amphipolis liberum, gens bisaltae. dein macedoniae terminus amnis strymon, ortus in haemo. memorandum in septem lacus eum fundi, priusquam derigat cursum.

haec est macedonia terrarum imperio potita quondam, haec asiam, armeniam, hiberiam, albaniam, cappadociam, syriam, aegyptum, taurum, caucasum transgressa, haec in bactris, medis, persis dominata toto oriente possesso, haec etiam indiae victrix per vestigia liberi patris atque herculis vagata. haec eadem est macedonia, cuius uno die paulus aemilius imperator noster lxxii urbes direptas vendidit. tantam differentiam sortis praestitere duo homines!

thracia sequitur, inter validissimas europae gentes, in strategias I divisa. populorum eius, quos nominare non pigeat, amnem strymonem accolunt dextro latere denseletae et maedi ad bisaltas usque supra dictos, laevo digerri bessorumque multa nomina ad mestum amnem ima pangaei montis ambientem inter haletos, diobessos, carbilesos, inde brigas, sapaeos, odomantos. odrysarum gens fundit hebrum accolentibus carbiletis, pyrogeris, drugeris, caenicis, hypsaltis, benis, corpilis, bottiaeis, edonis. eodem sunt in tractu sialetae, priantae, dolongae, thyni, coelaetae maiores haemo, minores rhodopae subditi. inter quos hebrus amnis, oppidum sub rhodope poneropolis antea, mox a conditore philippopolis, nunc a situ trimontium dicta. haemi excelsitas [vi] passuum subitur. aversa eius et in histrum devexa moesi, getae, aedi, scaugdae clariaeque et sub iis arraei sarmatae, quos areatas vocant, scythaeque et circa ponti litora moriseni sitonique, orphei vatis genitores, optinent. ita finit hister a septentrione, ab ortu pontus ac propontis, a meridie aegaeum mare. cuius in ora a strymone apollonia, oesyma, neapolis, datos.

intus philippi colonia - absunt a dyrrhachio [cccxxv] - , scotusa, topiros civitas. mesti amnis ostium, mons pangaeus. heraclea, olynthos, abdera libera civitas. stagnum bistonum et gens. oppidum fuit tirida, diomedis equorum stabulis dirum; nunc sunt dicaea, ismaron, locus parthenion, phalesina, maronea, prius orthagurea dicta. mons serrium, zone, tum locus doriscum, [x] hominum capax - ita xerxes ibi dinumeravit exercitum - , os hebri, portus stentoris, oppidum aenos liberum cum Polydori tumulo, ciconum quondam regio. a dorisco incurvatur ora ad macron tichos [cxii] p., circa quem locum fluvius melas, a quo sinus appellatur. oppida cypsela, bisanthe, macron tichos, dictum quia a propontide ad melanem sinum inter duo maria porrectus murus procurrentem excludit cherronesum. namque thracia altero latere a pontico litore incipiens, ubi hister amnis inmergitur, vel pulcherrimas in ea parte urbes habet, histropolin milesiorum, tomos, callatim, quae antea cerbatis vocabatur, heracleam. habuit et bizonen terrae hiatu raptam; nunc habet dionysopolim, crunon antea dictam; adluit zyras amnis. totum eum tractum scythae aroteres cognominati tenuere. eorum oppida aphrodisias, libistos, zygere, rhocobae, eumenia, parthenopolis, gerania, ubi pygmaeorum gens fuisse proditur; catizos barbari vocabant, creduntque a gruibus fugatos. in ora a dionysopoli est odessus milesiorum, flumen pannysis, oppidum ereta, naulochus. mons haemus, vasto iugo procumbens in pontum, oppidum habuit in vertice aristaeum; nunc in ora mesembria, anchialum, ubi messa fuerat. astice regio habuit oppidum anthium; nunc est apollonia. flumina panisos, iuras, tearus, orosines; oppida thynias, halmydesos, develton cum stagno, quod nunc deultum vocatur veteranorum, phinopolis, iuxta quam bosporos. ab histri ostio ad os ponti passuum [d] alii fecere, agrippa [lx] adiecit; inde ad murum supra dictum [cl], ab eo cherronesi [cxxxvi]. - sed a bosporo sinus lasthenes, portus senum et alter qui mulierum cognominatur. promunturium chryseon ceras, in quo oppidum byzantium liberae condicionis, antea lygos dictum; abest a dyrrhachio [dccxi] p.: tantum patet longitudo terrarum inter hadriaticum mare et propontidem. amnes bathynias, pidaras sive athyras. oppida selymbria, perinthus, latitudine cc pedum continenti adnexa. intus bizye, arx regum thraciae, a terei nefasto invisa hirundinibus, regio caenica, colonia flaviopoli, ubi antea caela oppidum vocabatur, et a bizye [l] p. apros colonia, quae a philippis abest [clxxxviii]. at in ora amnis erginus; oppidum fuit ganos. deseritur et lysimachea iam in cherroneso. alius namque ibi isthmus angustias similes eodem nomine et pari latitudine inlustrat. duae urbes utrimque litora haut dissimili modo tenere, pactye a propontide, cardia a melane sinu, haec ex facie loci nomine accepto, utraeque comprehensae postea lysimachea [v] p. a longis muris. cherronesos a propontide habuit tiristasin, crithoten, cissam flumini aegos adpositam; nunc habet a colonia apro [xxii] p. resisthon, ex adverso coloniae parianae. et hellespontus vii, ut diximus, stadiis europam ab asia dividens, iiii inter se contrarias urbes habet, in europa callipolim et seston, in asia lampsacon et abydon. dein promunturium cherronesi mastusia adversum sigeo, cuius in fronte obliqua cynossema - ita appellatur hecubae

tumulus - , statio achaeorum et turris, delubrum protesilai et in extrema cherronesi fronte, quae vocatur aeolium, oppidum elaeus. dein petenti melana sinum portus coelos et panhormus et supra dicta cardia.

tertius europae sinus ad hunc modum clauditur. montes extra praedictos thraciae edonus, gygemeros, meritus, melamphyllos. flumina in hebrum cadentia bargus, syrmus. macedoniae, thraciae, hellesponti longitudo est supra dicta; quidam [dcccxx] faciunt. latitudo [cccclxxxiii] est. aegaeo mari nomen dedit scopulus inter tenedum et chium verius quam insula, aex nomine a specie caprae, quae ita graecis appellatur, repente e medio mari exiliens. cernunt eum ab dextera parte antandrum navigantes ab achaia, dirum ac pestiferum. aegaei pars myrtoo datur. appellatur ab insula parva, quae cernitur macedoniam a geraesto petentibus haut procul euboeae carysto. romani omnia haec maria duobus nominibus appellant, macedonicum quacumque macedoniam aut thraciam attingit, graeciense qua graeciam adluit. nam graeci et ionium dividunt in siculum ac creticum ab insulis, item icarium, quod est inter samum et myconum. cetera nomina sinus dedere quod diximus.

et maria quidem gentesque in tertio europae sinu ad hunc modum se habent; insulae autem ex adverso thesprotiae a buthroto [xii] p., eadem ab acrocerauniis [I], cum urbe eiusdem nominis corcyra liberae civitatis et oppido cassiope temploque cassi iovis, [xcvii] in longitudinem patens, homero dicta scheria et phaeacia, callimacho etiam drepane. circa eam aliquot, sed ad italiam vergens othronos, ad leucadiam paxos, subotae duae, [v] discretae a corcyra. nec procul ab iis ante corcyram ericusa, marathe, elaphusa, malthace, trachie, pythionia, ptychia, tarachie et a phalacro, corcyrae promunturio, scopulus in quem mutatam vlixis navem a simili specie fabula est. ante leucadiam autem et aetoliam permultae, quarum teleboides eademque taphiae ab incolis ante leucadiam appellantur taphias, carnos, oxia, prinoessa, ante aetoliam echinades aegialia, cotonis, thyatira, geoaris, dionysia, cynrus, chalcis, pinara, nystrus. ante eas in alto cephallania, zacynthus, utraque libera, ithaca, dulichium, same, crocyle. a paxo cephallania, quondam melaena dicta, [x] p. abest, circuitu patet [xciii]. same diruta a romanis adhuc tamen oppida tria habet. inter hanc et achaiam cum oppido magnifica et fertilitate praecipua zacynthus, aliquando appellata hyrie, a cephallaniae meridiana parte [xxv] abest. mons elatus ibi nobilis; ipsa circuitu colligit [xxxvi]. ab ea ithaca [xv] distat, in qua mons neritus; tota vero circuitu patet [xxv]. ab ea araxum, peloponnesi promunturium, [xv]. ante hanc in alto asteris, prote, ante zacynthum [xxxv] in eurum ventum strophades duae, ab aliis plotae dictae, ante cephallaniam letoia, ante pylum iii sphagiae, totidem ante messenen oenussae. in asinaeo sinu tres thyrides, in laconico theganusa, cothon, cythera cum oppido, antea porphyris appellata. haec sita est a maleae promunturio [v] passuum, ancipiti propter angustias ibi navium ambitu. in argolico pityusa, arine, ephyre. contra hermionium agrum tricarenus, aperopia, colonis, aristera, contra troezenium calauria, [I] distans plateis, belbina, lasia, baucidias, contra epidaurum cecryphalos, pityonesos [vi] a continente. ab hac aegina liberae

condicionis [xv], cuius [xviii] prae navigatio est; eadem autem a piraeo atheniensium portu [xx] abest, ante oenone vocitata. spiraeo promunturio obiacent eleusa, adendros, craugiae duae, caeciae duae, selacosa; et a cenchreis aspis [vii] et in megarico sinu methurides [iiii], aegila autem [xv] a cythera, eademque a cretae phalasarna oppido [xxv].

ipsa creta, altero latere ad austrum, altero ad septentrionem versa, inter ortum occasumque porrigitur centum urbium clara fama. dosiades eam a crete nympa, hesperidis filia, anaximander a rege curetum, philistides mallotes et crates primum ae+riam dictam, deinde postea curetim; et macaron nonnulli a temperie caeli appellatam existimavere. latitudine nusquam [l] excedens et circa mediam sui partem maxime patens longitudine implet [cclxx], circuitu [dlxxviii], flectensque se in creticum pelagus ab ea dictum, qua longissima est, ad orientem promunturium samonium adversum rhodo, ad occidentem criu metopon cyrenas versus expellit. oppida eius insignia phalasarna, elaea, cisamon, pergamum, cydonea, minoium apteron, pantomatrium, amphimala, rhithymna, panhormum, cytaeum, apollonia, matium, heraclea, miletos, ampelos, hierapytna, lebena, hierapolis, et in mediterraneo gortyna, phaestum, gnusus, polyrrhenum, myrina, lycastos, rhamnus, lyctus, dium, asium, pyloros, rhytion, elatos, pherae, olopyxos, lasos, eleuthernae, therapnae, marathusa, tylisos; et aliorum circiter lx oppidorum memoria extat. montes cadistus, ideo, dictynnaeus, corycus. ipsa abest promunturio suo, quod vocatur criu metopon, ut prodit agrippa, a cyrenarum promunturio phycunte [cxxxv], item cadisto ... a malea peloponnesi [lxxx], a carpatho insula promunturio samonio [lx] in favonium ventum. haec inter eam et rhodum interiacet; reliquae circa eam ante peloponnesum duae corycoe, totidem mylae, et latere septentrionali dextra cretam habenti contra cydoneam leuce et duae budroe, contra matium dia, contra itanum promunturium onysia, leuce, contra hierapytnam chrysea, gaudos. eodem tractu ophiussa, butoa, rhamnus circumvectisque criu metopon tres acusagorus appellatae. ante samonium promunturium phocoe, platiae, syrnydes, nauarchos, harmedon, zephyre.

at in hellade, etiamnum in aegaeo, lichades, scarphia, corese, phocasia compluresque aliae ex adverso atticae, sine oppidis et ideo ignobiles. sed contra eleusina clara salamis. ante eam psyttalia, a sunio vero helene [v] distans. dein ceos ab ea totidem, quam nostri quidam dixerunt ceam, graeci et hydrusam, avolsam euboeae. quingentos longa stadios fuit quondam, mox quattuor fere partibus, quae ad boeotiam vergebant, eodem mari devoratis oppida habet reliqua iulida, carthaeam; interciderunt coresus, poeeessa. ex hac profectam delictiorem feminis vestem auctor est Varro.

euboea, et ipsa avolsa boeotiae, tam modico interfluente euripo, ut ponte iungantur, ad meridiem promunturiis duobus, geraesto ad atticam vergente et ad hellespontum caphereo, insignis, a septentrione ceneae, nusquam latitudinem ultra [xl] extendit, nusquam intra mm contrahit, sed in longitudinem universae boeotiae ab attica ad thessaliam usque praetenta in [cl], circuitu vero [ccclxv]. abest ab hellesponto parte capherei [ccxxv],

urbibus quondam pyrrha, porthmo, neso, cerintho, oreo, dio, aedepso, oechalia, nunc chalcide, cuius ex adverso in continente aulis est, geraesto, eretria, carysto, oritano, artemisio, fonte arethusa, flumine lelanto aquisque calidis quae ellopiae vocantur nobilis, notior tamen marmore carystio. antea vocitata est chalcodontis aut macris, ut dionysius et ephorus tradunt, ut aristides, macra, ut callidemus, chalcis aere ibi primum reperto, ut menaechmus, abantias, ut poetae vulgo, asopis.

extra eam in myrtoo multae, sed maxime inlustres glauconnesos et aegilia et a promunturio geraesto circa delum in orbem sitae, unde et nomen traxere, cyclades. prima earum andrus cum oppido abest a geraesto [x], a ceo [xxxviii]. ipsam myrsilus cauron, deinde antandron cognominatam tradit, callimachus lasiam, alii nonagiam, hydrusam, epagrim; patet circuitu [lxxxix]. ab eadem andro passus mille et a delo [xv] tenos cum oppido in [xv] porrecta, quam propter aquarum abundantiam aristoteles hydrusam appellatam ait, aliqui ophiusam. ceterae myconus cum monte dimasto a delo [xv], siphnus, ante meropia et acis appellata, circuitu [xxviii], seriphus [xv] prepesinthus, cythnos ipsaque longe clarissima et cycladum media ac templo apollinis et mercatu celebrata delos, quae diu fluctuata, ut proditur, sola motum terrae non sensit ad M. Varronis aetatem; mucianus prodidit bis concussam. hanc aristoteles ita appellatam tradit, quoniam repente apparuerit enata, aglaosthenes cynthiam, alii ortygiam, asteriam, lagiam, chlamydiam, cynethum, pyrpylen igne ibi primum reperto. cingitur [v] passuum, adsurgit cynthio monte. proxima ei rhene, quam anticlides celadusam vocat, item artemiten, celadinen. syros, quam circuitu patere [xx] prodiderunt veteres, mucianus [clx], olearos, paros cum oppido, ab delo [xxxviii], marmore nobilis, quam primo platean, postea minoida vocarunt. ab ea [vii] d naxus, a delo [xviii], cum oppido, quam strongylen, deinde dian, mox dionysiada a vinearum fertilitate, alii siciliam minorem aut callipolim appellarunt. patet circuitu [lxxv] p. dimidioque maior est quam parus.

et hactenus quidem cycladas servant, ceteras quae secuntur sporadas. sunt autem helene, phacusa, nicasia, schinusa, pholegandros et a naxo [xxxviii] p. icaros, quae nomen mari dedit, tantundem ipsa in longitudinem patens, cum oppidis duobus tertio amisso, antea vocitata doliche et macris et ichthyusa. sita est ab exortu solstitiali deli [l] eademque a samo [xxxv], inter euboeam et andrum [x] passuum freto, ab ea geraestum [cxii] d passuum. nec deinde servari potest ordo; acervatim ergo ponentur reliquae. scyros, ios a naxo [xviii], homeri sepulchro veneranda, longitudine [xxii], antea phoenice appellata, odia, oletandros. gyara cum oppido, circuitu [xv] p., abest ab andro [lxii], ab ea syrnos [lxxx], cynethus, telos unguento nobilis, a callimacho agathusa appellata, donusa, patmus circuitu [xxx], corassiae, lebinthus, gyrus, cinara, sicinus quae antea oenoe, heraclia quae onus, casos quae astrabe, cimolos quae echinusa, melos cum oppido, quam aristides mimblida appellat, aristoteles zephyriam, callimachus mimallida, heraclides siphin et acytan; haec insularum rotundissima est. buporthmos, machia, hypere, quondam

patage, ut alii, platage, nunc amorgos, polyaeas, sapyle, thera, cum primum emersit, calliste dicta. ex ea avolsa postea therasia, atque inter duas enata mox automate, eadem hiera, et in nostro aevo thia iuxta easdem enata. distat ius a thera [xxv] p. secuntur lea, ascania, anaphe, hippuris. astypalaea, liberae civitatis, circuitus [lxxxviii], abest a cadisto cretae [cxxv], ab ea platea [lx], unde caminia [xxxviii], azibintha, lamse, atragia, pharmacusa, thetaedia, chalcia, calymna, in qua oppidum, coos, eulimna, a qua carpathum, quae nomen carpathio mari dedit, [xxv]. inde rhodum africo vento [l], a carpatho casum [vii], a caso samonium, cretae promunturium, [xxx]. in euripo autem euboico primo fere introitu petaliae iiii insulae et in exitu atalante. cyclades et sporades ab oriente litoribus icariis asiae, ab occidente myrtois atticae, a septentrione aegaeo mari, a meridie cretico et carpathio inclusae per [dcc] in longitudinem et per [cc] in latitudinem iacent.

pagasicus sinus ante se habet euthiam, cicynethum, scyrum supra dictam, sed cycladum et sporadum extimam, gerontiam, scandiram, thermaeus iresiam, solymniam, eudemiam, neam, quae minervae sacra est, athos ante se iiii, peparethum cum oppido, quondam euoenon dictam, novem milia, sciathum [xv], imbrum cum oppido [lxxxviii]. eadem abest a mastusia cherronesi [xxii] p., ipsa circuitur [lxii] d; perfunditur amne ilisso. ab ea lemnos [xxii], quae ab atho [lxxxvii]; circuitu patet [cxv] d p., oppida habet hephaestiam et myrinam, in cuius forum solstitio athos eiacularum umbram. ab ea thasos libera [vi] p., olim ae+ria vel aethria dicta. inde abdera continentis [xxii], athos [lxii] d, tantundem insula samothrace libera ante hebrum, ab imbro [xxxii], a lemno [xxii] d p., a thraciae ora [xxxviii]; circuitur [xxxv], attollitur monte saoe [x] p. altitudinis, vel inportuosissima omnium. callimachus eam antiquo nomine dardaniam vocat. inter cherronesum et samothracen, utrimque fere [xv], halonesos, ultra gethone, lamponia, alopeconnesus haud procul a coelo, cherronesi portu, et quaedam ignobiles. desertis quoque reddantur in hoc sinu quarum modo inveniri potuere nomina: avesticos, sarnos, cissyros, charbrusa, calathusa, scyllia, dialeon, dictaea, melanthia, dracanon, arconesos, diethusa, ascapos, capheris, mesate, aeantion, pateronnesos, pateria, calathe, neriphus, pelendos.

quartus e magnis europae sinus ab hellesponto incipiens maeotis ostio finitur. sed totius ponti forma breviter complectenda est, ut facilius partes noscantur. vastum mare, praeiacens asiae et ab europa porrecto cherronesi litore expulsum, angusto meatu inrumpit in terras, vii stadiorum, ut dictum est, intervallo europam auferens asiae. primas angustias hellespontum vocant; hac xerxes persarum rex constrato in navibus ponte duxit exercitum. porrigitur deinde tenuis euripus [lxxxvi] spatio ad priapum urbem asiae, qua magnus alexander transcendit. inde exspatiatur aequor rursusque in artum coit. laxitas propontis appellatur, angustiae thracius bosporus, latitudine quingentorum passuum, qua darius pater xerxis copias ponte transvexit. tota ab hellesponto longitudo [ccxxxix]. dein vastum mare pontus euxinus, qui quondam axenus, longe refugientes occupat terras magnoque litorum flexu retro curvatus in

cornua ab iis utrimque porrigitur, ut sit plane arcus scythici forma. medio flexu iungitur ostio maeotii lacus. cimmerius bosporus id os vocatur, [ii] quingentorum passuum latitudine. at inter duos bosporos thracium et cimmerium directo cursu, ut auctor est polybius, [d] intersunt. circuitus vero totius ponti viciens semel l, ut auctor est Varro et fere veteres. nepos cornelius [cccl] adicit, artemidorus vices novies decem novem milia facit, agrippa [30xxv]30 [xl], mucianus [30xxiii]30 [xxv]. simili modo de europae latere mensuram alii [30xiii]30 [lxxviii] determinavere, alii [30xi]30. M. Varro ad hunc modum metitur: ab ostio ponti apolloniam [clxxxvii] d p., callatim tantundem, ad ostium histri [cxxv], ad borysthenem [ccl], cherronesum heracleotarum oppidum [ccclxxv] p., ad panticapaeum, quod aliqui bosporum vocant, extremum in europae ora, [ccxii] d, quae summa efficit [30xiii]30 [xxxvii] d. agrippa a byzantio ad flumen histrum [dlx], inde panticapaeum [dcxxxviii]. lacus ipse maeotis, tanain amnem ex ripaeis montibus defluentem accipiens, novissimum inter europam asiamque finem, [30xiii]30 [vi] circuitu patere traditur, ab aliis [30xi]30 [xxv]. ab ostio eius ad tanais ostium directo cursu [cclxxv] esse constat. accolae sinus eius in mentione thraciae dicti sunt histropolin usque. inde ostia histri.

ortus hic in germania iugis montis abnouae ex adverso raurici galliae oppidi, multis ultra alpes milibus ac per innumeras lapsus gentes danuvi nomine, inmenso aquarum auctu et unde primum illyricum adluit hister appellatus, lx amnibus receptis, medio ferme eorum numero navigabili, in pontum vastis sex fluminibus evolvitur. primum ostium peuces, mox ipsa peuce insula, in qua proximus alveus appellatus [xix] p. magna palude sorbetur. ex eodem alveo et super histropolim lacus gignitur [lxiii] passuum ambitu; halmyrin vocant. secundum ostium naracustoma appellatur, tertium calon stoma iuxta insulam sarmaticam, quartum pseudostomon et insula conopon diabasis, postea borion stoma et psilon stoma. singula autem ora sunt tanta, ut prodatur in [xl] passuum longitudinis vinci mare dulcemque intellegi haustum.

ab eo in plenum quidem omnes scytharum sunt gentes, varie tamen litori adposita tenere, alias getae, daci romanis dicti, alias sarmatae, graecis sauromatae, eorumque hamaxobii aut aorsi, alias scythae degeneres et a servis orti aut trogodytae, mox alani et rhoxolani; superiora autem inter danuvium et hercynium saltum usque ad pannonica hiberna carnunti germanorumque ibi confinium, campos et plana iazyges sarmatae, montes vero et saltus pulsi ab iis daci ad pathissum amnem, a maro, sive duria est a suebis regnoque vanniano dirimens eos, aversa basternae tenent aliique inde germani. agrippa totum eum tractum ab histro ad oceanum bis ad decies centenum milium passuum in longitudinem, quattuor milibus minus [cccc] in latitudinem, ad flumen vistlam a desertis sarmatae prodidit. scytharum nomen usquequaque transiit in sarmatas atque germanos. nec aliis prisca illa duravit appellatio quam qui extremi gentium harum, ignoti prope ceteris mortalibus, degunt.

verum ab histro oppida cremniscoe, aepolium, montes macrocremni, clarus

amnis tyra, oppido nomen inponens ubi antea ophiusa dicebatur. in eodem insulam spatiosam incolunt tyragetae; abest a pseudostomo histri ostio [cxxx]. mox axiacae cognomines flumini, ultra quos crobyzi, flumen rhode, sinus saggarius, portus ordesos et a tyra [cxx] flumen borysthenes lacusque et gens eodem nomine et oppidum ab mari recedens [xv] passuum, olbiopolis et miletopolis antiquis nominibus. rursus litore portus achaeorum, insula achillis, tumulo eius viri clara, et ab ea [cxxv] passuum paeninsula ad formam gladii in transversum porrecta, exercitatione eiusdem cognominata dromos achilleos, cuius longitudinem [lxxx] tradidit agrippa. totum eum tractum tenent sardi scythae et siraci. inde silvestris regio hylaeum mare, quo adluitur, cognominavit; enoecadioe vocantur incolae. ultra panticapae amnis, qui nomadas et georgos determinat, mox acesinus. quidam panticapen confluere intra olbiam cum borysthene tradunt, diligentiores hypanim, tanto errore eorum, qui illum in asiae parte prodidere.

mare subit magno recessu, donec [v] passuum intervallo absit a maeotide, vasta ambiens spatia multasque gentes. sinus carcinites appellatur. flumen pacyris; oppida navarum, carcine. a tergo lacus buces, fossa emissus in mare. ipse buces a coreto, maeoti lacus sinu, petroso discluditur dorso. recipit amnes bucem, gerrhum. hypanim, ex diverso venientes tractu. nam gerrhus basilidas et nomadas separat, hypanis per nomadas et hylaeos fluit, manu facto alveo in bucen, naturali in coretum. regio scythiae sindica nominatur.

sed a carcinite taurica incipit, quondam mari circumfusa et ipsa qua nunc campi iacent; dein vastis attollitur iugis. triginta sunt eorum populi, ex iis mediterranei xliii; vi oppida orgocini, characeni, assyrani, stactari, acisalitae, caliodi. iugum ipsum scythotauri tenent; cluduntur ab occidente cherroneso nea, ab ortu scythis satarcis. in ora a carcine oppida taphrae in ipsis angustiis paeninsulae, mox heraclea cherronesus, libertate a romanis donatum; megarice vocabatur antea, praecipui nitoris, in toto eo tractu custoditis graeciae moribus, [v] passuum ambiente muro. inde parthenium promunturium, taurorum civitas placia, symbolum portus, promunturium criu metopon adversum carambico asiae promunturio, per medium euxinum procurrens [clxx] intervallo, quae maxime ratio scythici arcus formam efficit. ab eo taurorum portus multi et lacus. oppidum theodosia a criu metopo [cxxv] p., a cherroneso vero [clxv]. ultra fuere oppida cytae, zephyrium, acrae, nymphaeum, dia. restat longe validissimum in ipso bospori introitu panticapaeum milesiorum, a theodosia [lxxxvii] d p., a cimmerico vero oppido trans fretum sito mm d, ut diximus, passuum. haec ibi latitudo asiam ab europa separat, eaque ipsa pedibus plerumque pervia glaciato freto. bospori cimmerici longitudo [xii] d passuum. oppida habet hermisium, myrmecium et intus insulam alopecen. per maeotim autem ab extremo isthmo, qui locus taphrae vocatur, ad os bospori [cclx] longitudo colligit.

a taphris per continentem introrsus tenent auchetae, apud quos hypanis oritur, neuroe, apud quos borysthenes, geloni, thyssagetae, budini, basilidae et caeruleo capillo agathyrsi. super eos nomades, deinde anthropophagi, a buce

vero super maeotim sauromatae et essedones. at per oram ad tanain usque maeotae, a quibus lacus nomen accepit, ultimique a tergo eorum arimaspi. mox ripaei montes et adsiduo nivis casu pinnarum similitudine pterophoros appellata regio, pars mundi damnata a rerum natura et densa mersa caligine neque in alio quam rigoris opere gelidisque aquilonis conceptaculis.

pone eos montes ultraque aquilonem gens felix, si credimus, quos hyperboreos appellavere, annoso degit aevo, fabulosis celebrata miraculis. ibi creduntur esse cardines mundi extremique siderum ambitus semenstri luce et una die solis adversi, non, ut imperiti dixere, ab aequinoctio verno in autumnum: semel in anno solstitio oriuntur iis soles brumaeque semel occidunt. regio aprica, felici temperie, omni adflatu noxio carens. domus iis nemora lucique, et deorum cultus viritim gregatimque, discordia ignota et aegritudo omnis. mors non nisi satietate vitae epulatis delibutoque senio luxu e quadam rupe in mare salientibus; hoc genus sepulturae beatissimum. quidam eos in prima parte asiae litorum posuere, non in europa, quia sunt ibi similitudine et situs attacorum nomine. alii medios fecere eos inter utrumque solem, antipodum occasus exorientemque nostrum, quod fieri nullo modo potest tam vasto mari interveniente. qui alibi quam in semenstri luce constituere eos, serere matutinis, meridie metere, occidente fetus arborum decerpere, noctibus in specus condi tradiderunt. nec licet dubitare de gente ea: tot auctores produnt frugum primitias solitos delum mittere apollini, quem praecipue colunt. virgines ferebant eas, hospitibus gentium per annos aliquot venerabiles, donec violata fide in proximis accolarum finibus deponere sacra ea instituere iique ad conterminos deferre atque ita delum usque. mox et hoc ipsum exolevit. sarmatae, scythiae, tauricae omnisque a borysthene amne tractus longitudo [dccccxxx], latitudo [dcccvi] a m. agrippa tradita est. ego incertam in hac terrarum parte mensuram arbitror.

verum instituto ordine reliqua huius sinus dicantur, et maria quidem eius nuncupavimus.

hellespontus insulas non habet in europa dicendas. in ponto duae, m d ab europa, [xiiii] ab ostio, cyaneae, ab aliis symplegades appellatae traditaeque fabulis inter se concucurrisse, quoniam parvo discretas intervallo ex adverso intrantibus geminae cernebantur paulumque deflexa acie coeuntium speciem praebebant. citra histrum apolloniatarum una, [lxxx] p. a bosporo thracio, ex qua m. lucullus capitolinum apollinem advexit. inter ostia histri quae essent diximus. ante borysthenen achillea est supra dicta, eadem leuce et macaron appellata. hanc temporum horum demonstratio a borysthene [cxl] ponit, a tyra [cxx], a peuce insula [l]; cingitur circiter [x] p. reliquae in carcinite sinu cephalonesos, spodusa, macra. non est omittenda multorum opinio, priusquam digrediamur a ponto, qui maria omnia interiora illo capite nasci, non gaditano freto, existimavere, haut inprobabili argumento, quoniam aestus semper e ponto profluens numquam reciprocet.

exeundum deinde est, ut extera europae dicantur, transgressisque ripaeos montes litus oceani septentrionalis in laeva, donec perveniatur gadis,

legendum. insulae complures sine nominibus eo situ traduntur, ex quibus ante scythiam quae appellatur baunonia unam abesse diei cursu, in quam veris tempore fluctibus electrum eiciatur, timaeus prodidit. reliqua litora incerta. signata fama septentrionalis oceani. amalchium eum hecataeus appellat a parapaniso amne, qua scythiam adluit, quod nomen eius gentis lingua significat congelatum. philemon morimarusam a cimbris vocari, hoc est mortuum mare, inde usque ad promunturium rusbeas, ultra deinde cronium. xenophon lampsacenus a litore scytharum tridui navigatione insulam esse immensae magnitudinis balciam tradit, eandem pytheas basiliam nominat. feruntur et oeonae, in quibus ovis avium et avenis incolae vivant, aliae, in quibus equinis pedibus homines nascantur, hippopodes appellati, phanesiorum aliae, in quibus nuda alioqui corpora praegrandes ipsorum aures tota contegant.

incipit deinde clarior aperiri fama ab gente inguaeonum, quae est prima in germania. mons saevo ibi, inmensus nec ripaeis iugis minor, inmanem ad cimbrorum usque promunturium efficit sinum, qui codanus vocatur, refertus insulis, quarum clarissima est scatinavia, inconperta magnitudinis, portionem tantum eius, quod notum sit, hillevionum gente quingentis incolente pagis: quare alterum orbem terrarum eam appellant. nec minor est opinione aeningia. quidam haec habitari ad vistlam usque fluvium a sarmatis, venedis, sciris, hiris tradunt, sinum cylipenum vocari et in ostio eius insulam latrim, mox alterum sinum lagnum, conterminum cimbris. promunturium cimbrorum excurrens in maria longe paeninsulam efficit, quae tastris appellatur. xxiii inde insulae romanis armis cognitae. earum nobilissimae burcana, fabaria nostris dicta a frugis multitudine sponte provenientis, item glaesaria a sucino militiae appellata, barbaris austeravia, praeterque actania.

toto autem mari ad scaldim usque fluvium germaniae accolunt gentes, haud explicabili mensura: tam inmodica prodentium discordia est. graeci et quidam nostri [30xxv]30 oram germaniae tradiderunt, agrippa cum raetia et norico longitudinem [dcxxxvi], latitudinem [ccxlviii], raetiae prope unius maiore latitudine, sane circa excessum eius subactae; nam germania multis postea annis nec tota percognita est. si coniectare permittitur, haut multum ora deerit graecorum opinioni et longitudini ab agrippa proditae. germanorum genera quinque: vandili, quorum pars burgodiones, varinnae, charini, gutones. alterum genus inguaeones, quorum pars cimbri, teutoni ac chaucorum gentes. proximi autem rheno istuaeones, quorum ... mediterranei hermiones, quorum suebi, hermunduri, chatti, cherusci. quinta pars peucini, basternae, supra dictis contermini dacis. amnes clari in oceanum defluunt guthalus, visculus sive vistla, albis, visurgis, amisis, rhenus, mosa. introrsus vero nullo inferius nobilitate hercynium iugum praetenditur. in rheno autem ipso, prope [c] in longitudinem, nobilissima batavorum insula et cannenefatium et aliae frisorum, chaucorum, frisiavonum, sturiorum, marsaciorum, quae sternuntur inter helinium ac flevum. ita appellantur ostia, in quae effusus rhenus a septentrione in lacus, ab occidente in amnem mosam se spargit, medio inter

haec ore modicum nomini suo custodiens alveum.

ex adverso huius situs britannia insula, clara graecis nostrisque monimentis, inter septentrionem et occidentem iacet, germaniae, galliae, hispaniae, multo maximis europae partibus, magno intervallo adversa. albion ipsi nomen fuit, cum britanniae vocarentur omnes de quibus mox paulo dicemus. haec abest a gesoriaco morinorum gentis litore proximo traiectu [I]. circuitu patere [30xxxxviii]30 [lxxv] pytheas et isidorus tradunt, xxx prope iam annis notitiam eius romanis armis non ultra vicinitatem silvae calidoniae propagantibus. agrippa longitudinem [dccc] esse, latitudinem [ccc] credit, eandem hiberniae, sed longitudinem [cc] minorem. super eam haec sita abest brevissimo transitu a silurum gente [xxx]. reliquarum nulla [cxxv] amplior circuitu proditur. sunt autem xl orcaes, modicis inter se discretas spatiis, vii haemodae, xxx hebudes et inter hiberniam ac britanniam mona, monapia, riginia, vectis, silumnus, andros, infra vero samnis et axanthos et ab adversa in germanicum mare sparsae glaesiae, quas electridas graeci recentiores appellavere, quod ibi electrum nasceretur. ultima omnium quae memorantur tyle, in qua solstitio nullas esse noctes indicavimus, cancri signum sole transeunte, nullosque contra per brumam dies. hoc quidam senis mensibus continuis fieri arbitrantur. timaeus historicus a britannia introrsus sex dierum navigatione abesse dicit insulam ictim, in qua candidum plumbum proveniat; ad eam britannos vitilibus navigiis corio circumscutis navigare. sunt qui et alias prodant, scandias, dumnas, bergos maximamque omnium berricen, ex qua in tylen navigetur. a tyle unius diei navigatione mare concretum a nonnullis cronium appellatur.

gallia omnis comata uno nomine appellata in tria populorum genera dividitur, omnibus maxime distincta. a scalde ad sequanam belgica, ab eo ad garunnam celtica eademque lugdunensis, inde ad pyrenaei montis excursum aquitanica, aremorica antea dicta. universam oram [30xvii]30 [I] agrippa, galliarum inter rhenum et pyrenaeum atque oceanum ac montes cebennam et iures, quibus narbonensem galliam excludit, longitudinem [ccccxx], latitudinem [cccxviii] computavit. a scaldi incolunt texero texuandri pluribus nominibus, dein menapi, morini ora marsacis iuncti pago qui gesoriacus vocatur, britanni, ambiani, bellovaci, bassi. introrsus catoslugi, atrebates, nervi liberi, veromandui, suaueconi, suessiones liberi, vlmactes liberi, tungri, sunuci, frisiavones, baetasi, leuci liberi, treveri liberi antea et lingones foederati, remi foederati, mediomatrici, sequani, raurici, helveti, coloniae equestris et raurica. rhenum autem accolentes germaniae gentium in eadem provincia nemetes, triboci, vangiones, in vbi colonia agrippinensis, guberni, batavi et quos in insulis diximus rheni.

lugdunensis gallia habet lexovios, veliocasses, caletos, venetos, abrincauos, ossismos, flumen clarum ligerem, sed paeninsulam spectatiorem excurrentem in oceanum a fine ossismorum circuitu [dcxxv], cervice in latitudinem [cxxv]. ultra eum namnetes, intus autem aedui foederati, carnuteni foederati, boi, senones, aulerci qui cognominantur eburovices et qui

cenomani, meldi liberi, parisi, tricasses, andecavi, viducasses, bodiocasses, venelli, coriosvelites, diablinti, riedones, turones, atesui, segusiavi liberi, in quorum agro colonia lugudunum.

aquitanae sunt ambilatri, anagnutes, pictones, santoni liberi, bituriges liberi cognomine vivisci, aquitani, unde nomen provinciae, sediboviates. mox in oppidum contributi convenae, begerri, tarbelli quattuorsignani, cocosates sexsignani, venami, onobrisates, belendi, saltus pyrenaeus infraque monesi, oscidates montani, sybillates, camponi, bercorcates, pinpedunni, lassunni, vellates, toruates, consoranni, ausci, elusates, sottiates, oscidates campestris, succasses, latusates, basaboiates, vassei, sennates, cambolectri agessinates. pictonibus iuncti autem bituriges liberi qui cubi appellantur, dein lemovices, arverni liberi, vellavi liberi, gabales. rursus narbonensi provinciae contermini ruteni, cadurci, nitiobroges tarneque amne discreti a tolosanis petrocori.

maria circa oram ad rhenum septentrionalis oceanus. inter rhenum et sequanam britannicus, inter id et pyrenaeum gallicus. insulae conplures venestorum et quae veneticae appellantur et in aquitanico sinu vliaros.

a pyrenaei promunturio hispania incipit, angustior non gallia modo, verum etiam semet ipsa, ut diximus, inmensum quantum hinc oceano, illinc hiberico mari comprimentibus. ipsa pyrenaei iuga ab exortu aequinoctiali in occasum brumalem breviores quam latere meridiano hispanias faciunt. proxima ora citerioris est eiusdemque tarraconensis situs. a pyrenaeo per oceanum vasconum saltus, olarso, vardulorum oppida, morogi, menosca, vesperies, amanum portus, ubi nunc flaviobrica colonia. civitatum novem regio cantabrorum. flumen sauga. portus victoriae iuliobrigensium; ab eo loco fontes hiberi [xl] p. portus blendium. organomesci e cantabris; portus eorum veseiasueca. regio asturum, noega oppidum. in paeninsula paesici et deinde conventus lucensis a flumine navia albiones, cibarci, egi, varri cognomine namarini, adovi, arroni, arrotrebae. promunturium celticum, amnes flurius, nelo. celtici cognomine neri et super tamarci, quorum in paeninsula tres arae sestianae Augusto dicatae, copori, oppidum noeta, celtici cognomine praestamarci, cileni. ex insulis nominandae corticata et aunios. a cilenis conventus bracarum helleni, grovi, castellum tyde, graecorum subolis omnia. insulae siccae, oppidum abobrica. minius amnis, [iiii] ore spatiosus, leuni, seurbi, bracarum oppidum augusta, quos super gallaecia. flumen limia, durius amnis e maximis hispaniae, ortus in pelendonibus et iuxta numantiam lapsus, dein per arevacos vaccaeosque, determinatis ab asturia vettonibus, a lusitania gallaecis, ibi quoque turdulos a bracarum arcens. omnis, quae dicta regio a pyrenaeo, metallis referta auri, argenti, ferri, plumbi nigri albique.

a durio lusitania incipit. turduli veteres, paesuri, flumen vagia, oppidum talabrica, oppidum et flumen aeminium, oppida conimbriga, collippo, eburobritium. excurrit deinde in altum vasto cornu promunturium, quod aliqui artabrum appellavere, alii magnum, multi olisiponense ab oppido, terras, maria, caelum discriminans. illo finitur hispaniae latus et a circuitu eius incipit frons. septentrio hinc oceanusque gallicus, occasus illinc, oceanus

atlanticus. promunturi excursum [lx] prodidere, alii [xc], ad pyrenaeum inde non pauci [30xii]30 [l], et ibi gentem artabrum, quae numquam fuit, manifesto errore. arrotrebas enim, quos ante celticum diximus promunturium, hoc in loco posuere litteris permutatis. erratum et in omnibus inclutis. ab minio, quem supra diximus, [cc], ut auctor est Varro, abest aeminius, quem alibi quidam intellegunt et limaeam vocant, oblivionis antiquis dictus multumque fabulosus, ab durio tagus [cc] interveniente munda. tagus auriferis harenis celebratur. ab eo [clx] promunturium sacrum e media prope hispaniae fronte prosilit. [30xiiii]30 inde ad pyrenaeum medium colligi Varro tradit, ad anam vero, quo lusitaniam a baetica discevimus, [cxxvi], a gadibus [cii] additis. gentes celtici turduli et circa tagum vettones, ab ana ad sacrum lusitani. oppida a tago memorabilia in ora olisipo, equarum e favonio vento conceptu nobile, salacia cognominata vrbs imperatoria, merobrica. promunturium sacrum et alterum cuneus. oppida ossonoba, balsa, myrtilis.

vniversa provincia dividitur in conventus tres, emeritensem, pacensem, scalabitanum, tota populorum xlv, in quibus coloniae sunt quinque, municipium civium romanorum, latii antiqui iii, stipendiaria xxxvi. coloniae augusta emerita, anae fluvio adposita, metellinensis, pacensis, norbensis caesarina cognomine; contributa sunt in eam castra servilia, castra caecilia. quinta est scalabis quae praesidium iulium vocatur. municipium civium romanorum olisipo, felicitas iulia cognominatum. oppida veteris latii ebora, quod item liberalitas iulia, et myrtilis ac salacia, quae diximus. stipendiariorum quos nominare non pigeat, praeter iam dictos in baeticae cognominibus, augustobrigenses, aeminienses, aranditani, arabricenses, balsenses, caesarobrigenses, caperenses, caurienses, colarni, cibilitani, concordenses, elbocori, interannienses, lancienses, mirobrigenses qui celtici cognominantur, medubrigenses qui plumbari, ocelenses, turduli qui bardili et tapori.

lusitaniam cum asturia et gallaecia patere longitudine [dxl], latitudine [dxxxvi], agrippa prodidit. omnes autem hispaniae a duobus pyrenaei promunturiis per maria totius orae circuitu [30xxviii]30 [xxiii] colligere existimantur, ab aliis [30xxvi]30.

ex adverso celtiberiae conplures sunt insulae, cassiterides dictae graecis a fertilitate plumbi, et e regione arrotrebarum promunturi deorum vi, quas aliqui fortunatas appellavere. in ipso vero capite baeticae ab ostio freti p. [xxv] gadis, longa, ut polybius scribit, [xii], lata [iii]. abest a continente proxima parte minus pedes dcc, reliqua plus [vii]. ipsius spatium [xv] est. habet oppidum civium romanorum, qui appellantur augustani vrbe iulia gaditana. ab eo latere, quo hispaniam spectat, passibus fere c altera insula est, longa m passus, m lata, in qua prius oppidum gadium fuit. vocatur ab ephoro et philistide erythea, a timaeo et sileno aphrodisias, ab indigenis iunonis. maiorem timaeus cotinusam aput eos vocitatam ait; nostri tarteson appellant, poeni gadir, ita punica lingua saepem significante. erythea dicta est, quoniam tyri aborigines earum orti ab erythro mari ferebantur. in hac geryones

habitasse a quibusdam existimatur, cuius armenta hercules abduxerit. sunt qui aliam esse eam et contra lusitaniam arbitrentur, eodemque nomine quandam ibi appellant.

peracto ambitu europae reddenda consummatio est, ne quid non in expedito sit noscere volentibus. longitudinem eius artemidorus atque isidorus a tanai gades [30lxxxvii]30 [xliv] prodiderunt. polybius latitudinem europae ab italia ad oceanum scripsit [30xii]30 [l] esse, etiam tum incomperta magnitudine. est autem ipsius italiae, ut diximus, [30x]30 xx ad alpes, unde lugdunum et ad portum morinorum britannicum, qua videtur mensuram agere polybius, [30xi]30 [lxviii]. sed certior mensura ac longior ad occasum solis aestivi ostiumque rheni per castra legionum germaniae ab iisdem alpibus derigitur, [30xii]30 [xlv].

hinc deinde africa atque asia dicentur.

LIBER V

africam graeci libyam appellavere et mare ante eam libycum; aegyptio finitur, nec alia pars terrarum pauciores recipit sinus, longe ab occidente litorum obliquo spatio. populorum eius oppidorumque nomina vel maxime sunt ineffabilia praeterquam ipsorum linguis, et alias castella ferme inhabitant.

principio terrarum mauretaniae appellantur, usque ad c. caesarem germanici filium regna, saevitia eius in duas divisae provincias. promunturium oceani extumum ampelusiam nominatur a graecis. oppida fuere lissa et cottae ultra columnas herculis, nunc est tingi, quondam ab antaeo conditum, postea a claudio caesare, cum coloniam faceret, appellatum traducta iulia. abest a baelone oppido baeticae proximo traiectu [xxx]. ab eo [xxv] in ora oceani colonia Augusti iulia constantia zulil, regum ditioni exempta et iura in baeticam petere iussa. ab ea [xxxv] colonia a claudio caesare facta lixos, vel fabulosissime antiquis narrata: ibi regia antaei certamenque cum hercule et hesperidum horti. adfunditur autem aestuarium e mari flexuoso meatu, in quo dracones custodiae instar fuisse nunc interpretantur. amplectitur intra se insulam, quam solam e vicino tractu aliquanto excelsiore non tamen aestus maris inundant. exstat in ea et ara herculis nec praeter oleastros aliud ex narrato illo aurifero nemore. minus profecto mirentur portentosa graeciae mendacia de his et amne lixo prodita qui cogitent nostros nuperque paulo minus monstrifica quaedam de iisdem tradidisse, praevalidam hanc urbem maioremque magna carthagine, praeterea ex adverso eius sitam et prope inmenso tractu ab tingi, quaeque alia cornelius nepos avidissime credidit. ab lixo [xl] in mediterraneo altera Augusti colonia est babba, iulia campestris appellata, et tertia banasa [lxxv] p., valentia cognominata. ab ea [xxxv] volubile oppidum, tantundem a mari utroque distans. at in ora a lixo [l] amnis sububus, praeter banasam coloniam defluens, magnificus et navigabilis. ab eo totidem milibus oppidum sala, eiusdem nominis fluvio inpositum, iam solitudinibus vicinum elephantorumque gregibus infestum, multo tamen magis autololum gente, per quam iter est ad montem africae vel fabulosissimum atlantem.

e mediis hunc harenis in caelum attolli prodidere, asperum, squalentem qua vergat ad litora oceani, cui cognomen inposuit, eundem opacum nemorosumque et scatebris fontium riguum qua spectet africanam, fructibus omnium generum sponte ita subnascentibus, ut numquam satias voluptatibus desit. incolarum neminem interdum cerni; silere omnia haut alio quam solitudinum horrore; subire tacitam religionem animos propius accedentium praeterque horrorem elati super nubila atque in vicina lunaris circuli. eundem noctibus micare crebris ignibus, aegipanum satyrorumque lascivia inpleri, tibiarum ac fistulae cantu tympanorumque et cymbalorum sonitu strepere. haec celebrati auctores prodidere praeter herculi et perseo laborata ibi. spatium ad eum inmensum incertumque. fuere et hannonis carthaginensium

ducis commentarii punicis rebus florentissimis explorare ambitum africae iussi, quem secuti plerique e graecis nostrisque et alia quidem fabulosa et urbes multas ab eo conditas ibi prodidere, quarum nec memoria ulla nec vestigium exstat.

scipione aemiliano res in africa gerente polybius annalium conditor, ab eo accepta classe scrutandi illius orbis gratia circumvectus, prodidit a monte eo ad occasum versus saltus plenos feris, quas generat africa; ad flumen anatum [ccccxxxxvi], ab eo lixum [ccv]. agrippa lixum a gaditano freto [cxii] abesse; inde sinum qui vocetur sagigi, oppidum in promunturio mulelacha, flumina sububam et salat, portum rutubis a lixo [ccxxiiii], inde promunturium solis, portum rhyasaddir, gaetulos autoteles, flumen quosenum, gentes selatitos et masatos, flumen masathat, flumen darat, in quo crocodilos gigni. dein sinum [dcxvi] includi montis bracae promunturio excurrente in occasum, quod appelletur surrentium. postea flumen salsum, ultra quod aethiopas perorsos, quorum a tergo pharusios. his iungi in mediterraneo gaetulos daras, at in ora aethiopas daratitas, flumen bambotum, crocodilis et hippopotamis refertum. ab eo montes perpetuos usque ad eum, quem theon ochema dicemus. inde ad promunturium hesperu navigationem dierum ac noctium decem. in medio eo spatio atlantem locavit, ceteris omnibus in extremis mauretaniae proditum.

romana arma primum claudio principe in mauretania bellavere, ptolemaeum regem a gaio caesare interemptum ulciscente liberto aedemone, refugientibusque barbaris ventum constat ad montem atlantem. nec solum consulatu perfunctis atque e senatu ducibus, qui tum res gessere, sed equitibus quoque romanis, qui ex eo praeferre ibi, atlantem penetrasse in gloria fuit. quinque sunt, ut diximus, romanae coloniae in ea provincia, perviumque famae videri potest, sed id plerumque fallacissimum experimento deprehenditur, quia dignitates, si indagare vera pigeat, ignorantiae pudore mentiri non piget, haut alio fidei praeiore lapsu quam ubi falsae rei gravis auctor existit. equidem minus miror inconperta quaedam esse equestris ordinis viris, iam vero et senatum inde intransibis, quam luxuriae, cuius efficacissima vis sentitur atque maxima, cum ebori, citro silvae exquirantur, omnes scopuli gaetuli muricibus, purpuris. indigenae tamen tradunt in ora ab salat [cl] flumen asanam, marino haustu, sed portu spectabile, mox amnem, quem vocant fut, ab eo ad dirim - hoc enim atlanti nomen esse eorum lingua convenit - [cc], interveniente flumine, cui nomen est ivor. ibi pauca extare circa vestigia habitati quondam soli, vinearum palmetorumque reliquias. suetonijs paulinus, quem consulem vidimus, primus romanorum ducum transgressus quoque atlantem aliquot milium spatio, prodidit de excelsitate quidem eius quae ceteri, imas radices densis altisque repletas silvis incognito genere arborum, proceritatem spectabilem esse enodi nitore, frondes cupressi similes praeterquam gravitate odoris, tenui eas obduci lanugine, quibus addita arte posse quales e bombyce vestes confici. verticem altis etiam aestate operiri nivibus. decumis se eo pervenisse castris et ultra ad fluvium, qui ger vocatur, per solitudines nigri pulveris, eminentibus interdum velut exustis cautibus,

loca inhabitabilia fervore, quamquam hiberno tempore, experto. qui proximos inhabitent saltus, refertos elephantorum ferarumque et serpentium omni genere, canarios appellari, quippe victum eius animalis promiscuum iis esse et dividua ferarum viscera. iunctam aethiopum gentem, quos perorsos vocant, satis constat. iuba ptolemaei pater, qui primus utrique mauretaniae imperitavit, studiorum claritate memorabilior etiam quam regno, similia prodidit de atlante, praeterque gigni herbam ibi euphorbeam nomine, ab inventore medico suo appellatam. cuius lacteum sucum miris laudibus celebrat in claritate visus contraque serpentes et venena omnia privatim dicato volumine. et satis superque de atlante.

tingitanae provinciae longitudo [clxx] est. gentes in ea: quondam praecipua maurorum - unde nomen - quos plerique maurusios dixerunt, attenuata bellis ad paucas recidit familias. proxima illi masaesylorum fuerat; simili modo extincta est. gaetulae nunc tenent gentes, baniurae multoque validissimi autololes et horum pars quondam nesimi, qui avolsi iis propriam fecere gentem versi ad aethiopas. ipsa provincia ab oriente montuosa fert elephantos, in abila quoque monte et quos septem fratres a simili altitudine appellant. freto imminent iuncti abilae. ab iis ora interni maris, flumen tamuda navigabile, quondam et oppidum, flumen laud, et ipsum navigiorum capax. rhyssaddir oppidum et portus, malvane fluvius navigabilis. siga oppidum ex adverso malacae in hispania siti, syphacis regia, alterius iam mauretaniae. namque diu regum nomina obtinuerunt, ut bogutiana appellaretur extuma, itemque bocchi quae nunc caesariensis. ab ea portus magnus, a spatio appellatus, civium romanorum oppido. amnis mulucha, bocchi masaesylorumque finis. quiza cenitana peregrinorum oppidum, arsennaria latinorum, [iii] a mari; cartenna, colonia Augusti legione secunda, item colonia eiusdem deducta cohorte praetoria gunugu. promunturium apollinis oppidumque ibi celeberrimum caesarea, ante vocitatum iol, iubae regia a divo claudio coloniae iure donata; eiusdem iussu deductis veteranis oppidum novum et latio dato tipasa, itemque a vespasiano imperatore eodem munere donatum icosium; colonia Augusti rusguniae, rusucurium civitate honoratum a claudio, rusazus colonia Augusti, saldae colonia eiusdem, item igilgili; oppidum tucça, inpositum mari et flumini ampsagae. intus colonia Augusti aquae, item succhabar, item tubusuptu, civitates timici, tigavae. flumina sardabal, aves, nabar. gens macurebi, flumen vsar, gens nababes. flumen ampsaga abest a caesarea [cccxxii]. utriusque mauretaniae longitudo [30x]30 [xxxviii], latitudo [cccclxvii].

ab ampsaga numidia est, masinissae clara nomine, metagonitis terra a graecis appellata, numidae vero nomades a permutandis pabulis, mapalia sua, hoc est domos, plaustres circumferentes. oppida chullu, rusicade, et ab eo ad [xlvi] in mediterraneo colonia cirta sittianorum cognomine, et alia intus sicca liberumque oppidum bulla regia. at in ora tacatua, hippo regius, flumen armua, oppidum thabraca civium romanorum, tusca fluvius, numidiae finis. nec praeter marmoris numidici ferarumque proventum aliud insigne ei.

a tusca zeugitana regio et quae proprie vocetur africa est. tria promunturia, candidum, mox apollinis adversum sardiniae, mercuri adversum siciliae, in altum procurrentia duos efficiunt sinus, hipponiensem proximum ab oppido quod hipponem dirutum vocant, diarrhytum graecis dictum propter aquarum rigua. cui finitimum theudalis immune oppidum, longius a litore. dein promunturium apollinis et in altero sinu vtica civium romanorum, catonis morte nobilis, flumen bagrada, locus castra cornelia, colonia carthago magnae in vestigiis carthaginis, colonia maxula, oppida carpi, missua et liberum clypea in promunturio mercuri, item libera curubis, neapolis. mox africae ipsius alia distinctio. libyphoenices vocantur qui byzantium incolunt. ita appellatur regio [ccl] p. circuitu, fertilitatis eximiae, cum centesima fruge agricolis faenus reddente terra. hic oppida libera leptis, hadrumetum, ruspina, thapsus. inde thenae, aves, macomades, tacape, sabrata, contingens syrtim minorem, ad quam numidiae et africae ab ampsaga longitudo [dlxxx], latitudo, qua cognitum est, [cc]. ea pars, quam africanam appellavimus, dividitur in duas provincias, veterem et novam, discretas fossa inter africanum sequentem et reges thenas usque perducta, quod oppidum a carthagine abest [ccxvi].

tertius sinus dividitur in geminos, duarum syrtium vadoso ac reciproco mari diros. ad proximam, quae minor est, a carthagine [ccc] polybius tradit, ipsam centum milium passuum aditu, trecentorum ambitu. et terra autem siderum observatione ad eam per deserta harenis perque serpentes iter est. excipiunt saltus repleti ferarum multitudine et introrsus elephantonum solitudines, mox deserta vasta utraque garamantes, ab augilis dierum xii itinere distantes. super illos fuere gens psylli, super quos lacus lycomedis, desertis circumdatus. augilae ipsi medio fere spatio locantur, ab aethiopia, quae ad occidentem vergit, et a regione, quae inter duas syrtis interiacet, pari utrimque intervallo, sed litore inter duas syrtis [ccl]. ibi civitas oensis, cinyps fluvius ac regio, oppida neapolis, taphra, habrotonum, leptis altera, quae cognominatur magna. inde syrtis maior, circuitu [dcxxv], aditu autem [cccxi], inde accolit gens cisippadum. in intimo sinu fuit ora lotophagon, quos quidam machroas dixere, ad philaeorum aras; ex harena sunt hae. ab iis non procul a continente palus vasta amnem tritonem nomenque ab eo accipit, pallantias appellata callimacho et citra minorem syrtim esse dicta, multis vero inter duas syrtis. promunturium, quod maiorem cludit, borion appellatur. ultra cyrenaica provincia.

ad hunc finem africa a fluvio ampsaga populos dxvi habet, qui romano pareant imperio, in his colonias sex, praeter iam dictas vthinam, thuburbi. oppida civium romanorum xv, ex quibus in mediterraneo dicenda absuritanum, abutucense, aboriense, canopicum, chiniavense, simithuense, thunusidense, thuburnicense, thinidrumense, tibigense, vcitana duo, maius et minus, vagense. oppidum latinum unum vzalitanum. oppidum stipendiarium unum castris corneliis. oppida libera xxx, ex quibus dicenda intus achollitanum, accaritanum, avittense, abziritanum, canopitanum, melizitanum,

materense, salaphitanum, tusdritanum, thisicense, tunisense, theudense, tagesense, tigiense, vlusubburitanum, vagenſe aliud, ... enſe, zamense. ex reliquo numero non civitates tantum, sed plerique etiam nationes iure dici possunt, ut natabutes, capsitani, musulami, sabarbares, massyli, nicives, vamacures, cinithi, musuni, marchubi et tota gaetulia ad flumen nigrum, qui africanam ab aethiopia dirimit.

cyrenaica, eadem pentapolitana regio, illustratur hammonis oraculo, quod a cyrenis abest [cccc] p., fonte solis, urbibus maxime quinque, berenice, arsinoe, ptolemaide, apollonia ipsaque cyrene. berenice in syrtis extimo cornu est, quondam vocata hesperidum supra dictarum, vagantibus graeciae fabulis. nec procul ante oppidum fluvius lethos, lucus sacer, ubi horti memorantur. abest ab lepti [ccclxxv]. ab ea arsinoe, teuchira vocitata, [xliii] et deinde ptolemais, antiquo nomine barce, [xxii]. mox [xl] promunturium phycus per creticum mare excurrit, distans [cccl] p. a taenaro laconicae promunturio, a creta vero ipsa [cxxxv]. post id cyrene, ab mari [xi] passuum, a phycunte apolloniam [xxiii], ad cherronesum [lxxxviii], unde catabathmus [ccxvi]. accolunt marmaridae, a paraetoni ferme regione ad syrtim maiorem usque porrecti. post eos acrauceles ac iam in ora syrtis nasamones, quos antea mesamones graeci appellare ab argumento loci, medios inter harenas sitos. cyrenaeus ager [xv] p. latitudine a litore et arboribus fertilis habetur, intus eodem spatio frugibus tantum, mox [xxx] latitudine et [ccl] longitudine laesere modo. post nasamonas asbytae et macae vivunt; ultra eos amantes xi dierum itinere a syrtibus maioribus ad occidentem et ipsi versus harenis circumdati, puteos tamen haut difficile binum ferme cubitorum altitudine inveniunt ibi stagnantibus mauretaniae aquis. domos sale montibus suis exciso seu lapide construunt. ab iis ad trogodytas hiberni occasus plaga dierum septem iter, cum quibus commercium gemmae tantum, quam carbunculum vocamus, ex aethiopia invectae. intervenit ad solitudines africae super minorem syrtim dictas versa phazania, ubi gentem phazaniorum urbesque alalen et cillibam subegimus, item cidamum e regione sabratae. ab iis mons longo spatio in occasum ab ortu tendit, ater nostris dictus a natura, adusto similis aut solis percussu accenso. ultra eum deserta, mathelgae oppidum garamantum itemque debris adfuso fonte a medio die ad mediam noctem aquis ferventibus totidemque horis ad medium diem rigentibus, clarissimumque garama, caput garamantum, omnia armis romanis superata et a cornelio balbo triumphata, unius omnium curru externo et quiritorium iure donato; quippe gadibus genita civitas romana cum maiore balbo patruo data est. et hoc mirum, supra dicta oppida ab eo capta auctores nostros prodidisse, ipsum in triumpho praeter cidamum et garamam omnium aliarum gentium urbiumque nomina ac simulacra duxisse, quae iere hoc ordine: tabudium oppidum, niteris natio, miglis gemella oppidum, bubeium natio vel oppidum, enipi natio, thuben oppidum, mons nomine niger, nitibrum, rapsa oppida, viscera natio, decri oppidum, flumen nathabur, thapsagum oppidum, tamiagi natio, boin oppidum, pege oppidum, flumen dasibari, mox oppida continua baracum, buluba, alasis,

galsa, balla, maxalla, cizania, mons gyri, in quo gemmas nasci titulus praecessit. ad garamantas iter inexplicabile adhuc fuit, latronibus gentis eius puteos - qui sunt non alte fodiendi, si locorum notitia adsit - harenis operientibus. proxumo bello, quod cum oeensibus gessere initiis vespasiani imperatoris, compendium viae quadridui deprehensum est. hoc iter vocatur praeter caput saxi. finis cyrenaicus catabathmos appellatur, oppidum et vallis repente convexa. ad eum terminum cyrenaica africa a syrti minore [30x]30 [lx] in longitudinem patet, in latitudinem, qua cognitum est, [dccccx].

quae sequitur regio mareotis libya appellatur, aegypto contermina. tenent marmarides, adyrmachidae, dein mareotae. mensura a catabathmo paraetonium [lxxxvi]. in eo tractu intus apis interest, nobilis religione aegypti locus. ab eo paraetonium [lxii] d, inde alexandriam [cc]. latitudo [clxviii] est. eratosthenes a cyrenis alexandriam terrestri itinere [dxxv] prodit. agrippa totius africae a mari atlantico cum inferiore aegypto [30xxx]30 [xxxx] longitudinem, polybius et eratosthenes, diligentissimi existimati, ab oceano ad carthaginem magnam [30xi]30, ab ea canopum, nili proximum ostium, [30xvi]30 [lxxxviii] fecerunt, isidorus a tingi canopum [30xxxvi]30 [xcvii], artemidorus xl m minus quam isidorus.

insulas non ita multas complectuntur haec maria. clarissima est meninx, longitudine [xxv], latitudine [xxii], ab eratosthene lotophagitis appellata; oppida habet duo, meningen ab africae latere et altero thoar, ipsa a dextro syrtis minoris promunturio passibus md sita. ab ea [c] p. contra laevum cercina cum urbe eiusdem nominis libera, longa [xxv], lata dimidium eius, ubi plurimum, at in extremo non plus [v]. huic perparva carthaginem versus cercinitis ponte iungitur. ab iis [l] fere passuum lepadusa, longa [vi]; mox gaulos, galata, cuius terra scorpiones, dirum animal africae, necat. dicuntur et in clupea emori, cuius ex adverso cossyra cum oppido. at contra carthaginis sinum duae aegimoeroe, arae autem scopuli verius quam insulae, inter siciliam maxime et sardiniam. auctores sunt et has quondam habitatas subsedissee.

interiore autem ambitu africae ad meridiem versus superque gaetulos, intervenientibus desertis, primi omnium libyes aegyptii, deinde leucoe aethiopes habitant. super eos aethiopum gentes nigritae a quo dictum est flumine, gymnetes pharusi, iam oceanum attingentes quos in mauretaniae fine diximus perorsi. ab his omnibus vastae solitudines orientem versus usque ad garamantas augilasque et trogodytas, verissima opinione eorum, qui desertis africae duas aethiopias superponunt, et ante omnes homeri, qui bipertitos tradit aethiopas, ad orientem occasumque versos. nigri fluvio eadem natura quae nilo. calamum ac papyrus et easdem gignit animantes isdemque temporibus augescit. oritur inter tarraelios aethiopas et oechalicas. horum oppidum magium. quidam solitudinibus interposuerunt atlantas, iuxta eas aegipanas semiferos et blemmyas et gamphasantas et satyros et himantopodas. atlantes degeneres sunt humani ritus, si credimus. nam neque nominum ullorum inter ipsos appellatio est et solem orientem occidentemque dira

inprecatione contuentur ut exitialem ipsis agrisque, neque in somno visunt qualia reliqui mortales. trogydae specus excavant; hae illis domus, victus serpentium carnes, stridorque, non vox: adeo sermonis commercio carent. garrantes matrimoniorum exortes passim cum feminis degunt. augilae inferos tantum colunt. gamphasantes, nudi proeliorumque expertes, nulli externo congregantur. blemmyis traduntur capita abesse, ore et oculis pectori adfixis; satyris praeter figuram nihil moris humani; aegipanum qualis vulgo pingitur forma; himantopodes loripedes quidam, quibus serpendo ingredi natura sit; pharusi, quondam persae, comites fuisse herculis ad hesperidas tendentis. nec de africa plura quae memorentur occurrunt.

adhaeret asia, quam patere a canopico ostio ad ponti ostium timosthenes [30xxvi]30 [xxxviii] p. tradit, ab ore autem ponti ad os maeotis eratosthenes [30xv]30 [xlvi], universam vero cum aegypto ad tanain artemidorus et isidorus [30l]30 [xiii] dcl. maria eius conplura ab accolis traxere nomina: quare simul indicabuntur.

proxima africae incolitur aegyptus, introrsus ad meridiem recedens, donec a tergo praetendantur aethiopes. inferiorem eius partem nilus dextera laevaue divisus amplexu suo determinat, canopico ostio ab africa, ab asia pelusiaco, [clxx] passuum intervallo. quam ob causam inter insulas quidam aegyptum retulere, ita se findente nilo, ut triquetram terrae figuram efficiat, ideoque multi graecae litterae vocabulo delta appellavere aegyptum. mensura ab unitate alvei, unde se primum findit in latera, ad canopicum ostium [cxlvi], ad pelusiacum [clvi] est. summa pars contermina aethiopiae thebais vocatur. dividitur in praefecturas oppidorum, quas νόμους vocant: ombiten, apollonopoliten, hermonthiten, thiniten, phaturiten, coptiten, tentyriten, diospoliten, antaeopoliten, aphroditopoliten, lycopoliten. quae iuxta pelusium est regio nomos habet pharbaethiten, bubastiten, sethroiten, taniten. reliqua autem arabicum, hammoniacum tendentem ad hammonis iovis oraculum, oxyrynchiten, leontopoliten, athribiten, cynopoliten, hermopoliten, xoiten, mendesium, sebennyten, cabasiten, latopoliten, heliopoliten, prosopiten, panopoliten, busiriten, onuphiten, saiten, ptenethum, ptemphum, naucratiten, meteliten, gynaecopoliten, menelaiten, alexandriae regionem, item libyae, mareotis. heracleopolites est in insula nili longa p. [l], in qua et oppidum, herculis appellatum. arsinoitae duo sunt; hi et memphites usque ad summum delta perveniunt, cui sunt contermini ex africa duo oasis. quidam ex iis aliqua nomina permutant et substituunt alios nomos, ut heroopoliten et crocodilopoliten. inter arsinaiten autem ac memphiten lacus fuit circuitu [ccl] aut, ut mucianus tradit, [cccc] et altitudinis quinquaginta passuum, manu factus, a rege qui fecerat moeridis appellatus. inde [lxii] p. abest memphis, quondam arx aegypti regum, unde ad hammonis oraculum xii dierum iter, ad scissuram autem nili, quod appellavimus delta, [xv].

nilus incertis ortus fontibus, ut per deserta et ardentia et inmenso longitudinis spatio ambulans famaue tantum inermi quaesitus sine bellis, quae ceteras omnes terras invenere, originem, ut iuba rex potuit exquirere, in

monte inferioris mauretaniae non procul oceano habet lacu protinus stagnante, quem vocant nilidem. ibi pisces reperiuntur alabetae, coracini, siluri. crocodilus quoque inde ob argumentum hoc caesareae in iseo dicatus ab eo spectatur hodie. praeterea observatum est, prout in mauretania nives imbresve satiaverint, ita nilum increscere. ex hoc lacu profusus indignatur fluere per harenosa et squalentia conditque se aliquot dierum itinere, mox alio lacu maiore in caesariensis mauretaniae gente masaesylum erumpit et hominum coetus veluti circumspicit, isdem animalium argumentis. iterum harenis receptus conditur rursus xx dierum desertis ad proximos aethiopas atque, ubi iterum sensit hominem, prosilit, fonte, ut verisimile est, illo quem nigrim vocare. inde africanam ab aethiopia dispescens, etiamsi non protinus populis, feris tamen et beluis frequens silvarumque opifex, medios aethiopas secat, cognominatus astapus, quod illarum gentium lingua significat aquam e tenebris profluentem. insulas ita innumeras spargit quasdamque tam vastae magnitudinis, quamquam rapida celeritate, ut tamen dierum v cursu, non brevior, transvolet, circa clarissimam earum meroen astabores laevo alveo dictus, hoc est ramus aquae venientis e tenebris, dextra vero astosapes, quod alteris significationem adicit, nec ante nilus quam se totum aquis rursus concordibus iunxit, sic quoque etiamnum giris ante nominatus per aliquot milia et in totum homero aegyptus aliisque triton. subinde insulis impactus, totidem incitatus inritamentis, postremo inclusus montibus, nec aliunde torrentior, vectus aquis properantibus ad locum aethiopum, qui catadupi vocantur, novissimo catarracte inter occurrentes scopulos non fluere inmenso fragore creditur, sed ruere. postea lenis et confractis aquis domitaque violentia, aliquid et spatio fessus, multis quamvis faucibus in aegyptium mare se evomat, certis tamen diebus auctu magno per totam spatiatum aegyptum fecundus innatat terrae.

causas huius incrementi varias prodidere, sed maxime probabiles etesiarum eo tempore ex adverso flantium percussus, ultra in ora acto mari, aut imbres aethiopiae aestivos, isdem etesiis nubila illo ferentibus e reliquo orbe. timaeus mathematicus occultam protulit rationem: phialam appellari fontem eius, mergique in cuniculos ipsum amnem vapore anhelantem, fumidis cautibus ubi conditur. verum sole per eos dies comminus facto extrahi ardoris vi et suspensum abundare ac, ne devoretur, abscondi. id evenire a canis ortu per introitum solis in leonem, contra perpendicularum fontis sidere stante, cum eo tractu absumantur umbrae, plerisque e diverso opinatis largiorem fluere ad septentriones sole discedente, quod in cancro et leone evenit, ideoque tunc minus siccari, rursus in capricornum et austrinum polum reverso sorberi et ob id parcius fluere. sed timaeo si quis extrahi posse credat, umbrarum defectus iis diebus et locis sine fine adest.

incipit crescere luna nova, quaecumque post solstitium est, sensim modiceque cancrum sole transeunte, abundantissime autem leonem, et residit in virgine isdem quibus adcrevit modis. in totum autem revocatur intra ripas in libra, ut tradit herodotus, centesimo die. cum crescit, reges aut praefectos

navigare eo nefas iudicatum est. auctus per puteos mensurae notis deprehenduntur. iustum incrementum est cubitorum xvi. minores aquae non omnia rigant, ampliores detinent tardius recedendo. hae serendi tempora absumunt solo madente, illae non dant sitiente. utrumque reputat provincia. in xii cubitis famem sentit, in xiii etiamnum esurit, xiiii cubita hilaritatem adferunt, xv securitatem, xvi delicias. maximum incrementum ad hoc aevi fuit cubitorum xviii claudio principe, minimum v pharsalico bello, veluti necem magni prodigio quodam flumine aversante. cum stetere aquae, apertis molibus admittuntur. ut quaeque liberata est terra, seritur. idem amnis unus omnium nullas exspirat auras.

dicionis aegyptiae esse incipit a fine aethiopiae syene; ita vocatur paeninsula in passuum ambitu, in qua castra sunt, latere arabiae, et ex adverso insula est [iiii], philae, [dc] p. a nili fissura, unde appellari diximus delta. hoc spatium edidit artemidorus et in eo ccl oppida fuisse, iuba [cccc] p., aristocreon ab elephantide ad mare [dccl]. elephantis insula intra novissimum catarracten [iiii] p. et supra syenen [xvi] habitatur, navigationis aegyptiae finis, ab alexandria [dlxxxv] p.: in tantum errare supra scripti. ibi aethiopicae veneunt naves; namque eas plicatiles umeris transferunt, quotiens ad catarractas ventum est.

aegyptus super ceteram antiquitatis gloriam [xx] urbium sibi amase regnante habitata praefert, nunc quoque multis etiamsi ignobilibus frequens. celebrantur tamen apollinis, mox leucotheae, diospolis magna, eadem thebe portarum centum nobilis fama, coptos, indicarum arabicarumque mercium nilo proximum emporium, mox veneris oppidum et iterum iovis ac tentyris, infra quod abydus, memnonis regia et osiris templo inclutum, [vii] d p. in libyam remotum a flumine. dein ptolemais et panopolis ac veneris iterum et in libyco lycon, ubi montes finiunt thebaidem. ab iis oppida mercuri, alabastron, canum et supra dictum herculis. deinde arsinoes ac iam dicta memphis, inter quam et arsinoiten nomon in libyco turres quae pyramides vocantur, et labyrinthus, in moeridis lacu nullo addito ligno exaedificatus, et oppidum crialon. unum praeterea intus et arabiae conterminum claritatis magnae, solis oppidum.

sed iure laudetur in litore aegyptii maris alexandria, a magno alexandro condita in africae parte ab ostio canopico [xii] p. iuxta mareotim lacum, qui locus antea rhacotes nominabatur. metatus est eam dinochares architectus pluribus modis memorabili ingenio, [xv] p. laxitate insessa ad effigiem macedonicae chlamydis orbe gyrato laciniosam, dextra laevaue anguloso procurso, iam tum tamen quinta situs parte regiae dicata. mareotis lacus a meridiana urbis parte euripo e canopico ostio mittit ex mediterraneo commercia, insulas quoque plures amplexus, [xxx] traiectu, [ccl] ambitu, ut tradit claudius caesar. alii schoenos in longitudinem patere xl faciunt schoenumque stadia xxx: ita fieri longitudinis [cl] p., tantundem et latitudinis. sunt in honore et intra decursus nili multa oppida, praecipue quae nomina ostiis dedere, non omnibus - xii enim reperiuntur superque quattuor, quae ipsi

falsa ora appellans -, sed celeberrimis vii, proximo alexandriae canopico, dein bolbitino, sebennytico, phatmitico, mendesico, tanitico ultimoque pelusiaco. praeterea butos, pharbaethos, leontopolis, athribis, isidis oppidum, busiris, cynopolis, aphrodites, sais, naucratis, unde ostium quidam naucratiticum nominant quod alii heracleoticum, canopico, cui proximum est, praeferentes.

ultra pelusiacum arabia est, ad rubrum mare pertinens et odoriferam illam ac divitem terram et beatae cognomine inclutam. haec catabanum et esbonitarum et scenitarum arabum vocatur, sterilis, praeterquam ubi syriae confinia attingit, nec nisi casio monte nobilis. his arabes iunguntur, ab oriente canchlei, a meridie cedrei, qui deinde ambo nabataeis. heroopoliticus vocatur alterque laeaniticus vel aelaniticus sinus rubri maris in aegyptum vergentis, [cl] intervallo inter duo oppida, laeana et in nostro mari gazam. agrippa a pelusio arsinoen, rubri maris oppidum, per deserta [cxxxv] p. tradit: tam parvo distat ibi tanta rerum naturae diversitas.

iuxta syria litus occupat, quondam terrarum maxuma et plurimis distincta nominibus. namque palaestine vocabatur qua contingit arabas, et iudaea et coele, dein phoenice et qua recedit intus damascena, ac magis etiamnum meridiana babylonia, eadem mesopotamia inter euphraten et tigrin quaque transit taurum sophene, citra vero eam commagene et ultra armeniam adiabene, assyria ante dicta, et ubi ciliciam attingit antiochia. longitudo eius inter ciliciam et arabiam [ccccclxx] p. est, latitudo a seleucia pieria ad oppidum in euphrate zeugma [clxxv]. qui subtilius dividunt, circumfundi syria phoenicen volunt et esse oram maritimam syriae, cuius pars sit idumaea et iudaea, dein phoenicen, dein syriam. id quod praeiacet mare totum phoenicium appellatur. ipsa gens phoenicum in magna gloria litterarum inventionis et siderum navaliumque ac bellicarum artium.

a pelusio chabriae castra, casius mons, delubrum iovis casii, tumulus magni pompeii. ostracine arabia finitur, a pelusio [lxv] p. mox idumaea incipit et palaestina ab emersu sirbonis lacus, quem quidam [cl] circuitu tradidere. herodotus casio monti adplicuit, nunc est palus modica. oppida rhinocolura et intus rhapsa, gaza et intus anthedon, mons argaris. regio per oram samaria; oppidum ascalo liberum, azotos, iamneae duae, altera intus. iope phoenicum, antiquior terrarum inundatione, ut ferunt, insidet collem, praeiacente saxo, in quo vinculorum andromedae vestigia ostendit. colitur illic fabulosa ceto. inde apollonia, stratonis turris, eadem caesarea ab herode rege condita, nunc colonia prima flavia a vespasiano imperatore deducta, finis palaestines, [clxxxviii] p. a confinio arabiae. dein phoenice; intus autem samariae oppida neapolis, quod antea mamortha dicebatur, sebaste in monte, et altiore gamala.

supra idumaeam et samariam iudaea longe lateque funditur. pars eius syriae iuncta galilaea vocatur, arabiae vero et aegypto proxima peraea, asperis dispersa montibus et a ceteris iudaeis iordane amne discreta. reliqua iudaea dividitur in toparchias decem quo dicemus ordine: hiericuntem palmetis consitam, fontibus riguam, emmaum, lyddam, iopicam, acrabatenam, gophaniticam, thamniticam, betholeptephenen, orinen, in qua fuere

hierosolyma, longe clarissima urbium orientis, non iudaeae modo, herodium cum oppido inlustri eiusdem nominis.

iordanes amnis oritur e fonte paneade, qui cognomen dedit caesareae, de qua dicemus. amnis amoenus et, quatenus locorum situs patitur, ambitiosus accolisque se praebens velut invitus asphaltiten lacum dirum natura petit, a quo postremo ebibitur aquasque laudatas perdit, pestilentibus mixtas. ergo ubi prima convallium fuit occasio, in lacum se fundit, quem plures genesaram vocant, [xvi] p. longitudinis, [vi] latitudinis, amoenis circumsaeptum oppidis, ab oriente iuliade et hippo, a meridie tarichea, quo nomine aliqui et lacum appellant, ab occidente tiberiade, aquis calidis salubri.

asphaltites nihil praeter bitumen gignit, unde et nomen. nullum corpus animalium recipit, tauri camelique fluitant; inde fama nihil in eo mergi. longitudine excedit [c] p., latitudine maxima [lxxv] implet, minima [vi]. prospicit eum ab oriente arabia nomadum, a meridie machaerus, secunda quondam arx iudaeae ab hierosolymis. eodem latere est calidus fons medicae salubritatis callirrhoe, aquarum gloriam ipso nomine praeferens.

ab occidente litora essenii fugiunt usque qua nocent, gens sola et in toto orbe praeter ceteras mira, sine ulla femina, omni venere abdicata, sine pecunia, socia palmarum. in diem ex aequo convenarum turba renascitur, large frequentantibus quos vita fessos ad mores eorum fortuna fluctibus agit. ita per saeculorum milia - incredibile dictu - gens aeterna est, in qua nemo nascitur. tam fecunda illis aliorum vitae paenitentia est! infra hos engada oppidum fuit, secundum ab hierosolymis fertilitate palmetorumque nemoribus, nunc alterum bustum. inde masada castellum in rupe, et ipsum haut procul asphaltite. et hactenus iudaea est.

iungitur ei latere syriae decapolitana regio, a numero oppidorum, in quo non omnes eadem observant, primum tamen damascum epoto riguis amne chrysorroa fertilem, philadelphiam, raphaniam, omnia in arabiam recedentia, scythopolim, antea nysam, a libero patre sepulta nutrice ibi scythias deductis, gadara, hieromice praefluente, et iam dictum hippon, dion, pellam aquis divitem, garasam, canatham. intercursant cinguntque has urbes tetrarchiae - regnorum instar singulae, et regna contribuuntur - trachonitis, paneas, in qua caesarea cum supra dicto fonte, abila, arca, ampeleossa, gabe.

hinc redeundum est ad oram atque phoenicem. fuit oppidum crocodilon, est flumen. memoria urbium dorum, sycaminum. promunturium carmelum et in monte oppidum eodem nomine, quondam acbatana dictum. iuxta getta, geba, rivus pacida sive belus, vitri fertiles harenas parvo litori miscens; ipse e palude cendebia a radicibus carmeli profluit. iuxta colonia claudi caesaris ptolemais, quae quondam acce. oppidum ecdippa, promunturium album. tyros, quondam insula praealto mari dcc passibus divisa, nunc vero alexandri oppugnantis operibus continens; olim partu clara, urbibus genitis lepti, vtica et illa aemula terrarumque orbis avida carthagine, etiam gadibus extra orbem conditis: nunc omnis eius nobilitas conchylio atque purpura constat. circuitus [xviii] est, intra palaetyro inclusa; oppidum ipsum xxii stadia optinet. inde

sarepta et ornithon oppida et sidon, artifex vitri thebarumque boeotiarum parens. a tergo eius libanus mons orsus md stadiis zimyram usque porrigitur, quae coeles syriae cognominatur. huic par, interiacente valle, mons adversus antilbanus obtenditur, quondam muro coniunctus. post eum introrsus decapolitana regio praedictaeque cum ea tetrarchiae et palaestines tota laxitas. at in ora item subiecta libano fluvius magoras, berytus colonia, quae felix iulia appellatur, leontos oppidum, flumen lycos, palaebyblos, flumen adonis, oppida byblos, botrys, gigarta, trieris, calamos, tripolis, quoniam tyrii et sidonii et aradii optinent, orthosia, eleutheros flumen, oppida zimyra, marathos contraque arados, septem stadiorum oppidum et insula ducentis passibus a continente distans, regio, in qua supradicti desinunt montes, et interiacentibus campis bargylus mons.

incipit hinc rursus syria, desinente phoenice. oppida carne, balanea, paltos, gabala, promunturium, in quo laodicea libera, dipolis, heraclea, charadrus, posidium. dein promunturium syriae antiochiae. intus ipsa antiochia libera, epi daphnes cognominata; oronte amne dividitur. in promunturio autem seleucia libera, pieria appellata. super eam mons eodem quo alius nomine, casius. cuius excelsa altitudo quarta vigilia orientem per tenebras solem aspicit, brevi circumactu corporis diem noctemque pariter ostendens. ambitus ad cacumen [xviii] p. est, altitudo per directum [iiii]. at in ora amnis orontes, natus inter libanum et antilbanum iuxta heliopolim. oppida rhosos et a tergo portae, quae syriae appellantur, intervallo rhosiorum montium et tauri. in ora oppidum myriandros, mons amanus, in quo oppidum bomitae. ipse ab syris ciliciam separat.

nunc interiora dicantur. coele habet apameam, marsya amne divisam a nazerinorum tetrarchia, bambycen, quae alio nomine hierapolis vocatur, syris vero mabog - ibi prodigiosa atargatis, graecis autem derceto dicta, colitur - , chalcidem cognominatam ad belum, unde regio chalcidena fertilissima syriae, et inde cyresticae cyrrum, gazetas, gindarenos, gabenos, tetrarchias duas quae granucomatitae vocantur, hemesenos, hylatas, ituraeorum gentem et qui ex iis baethaemi vocantur, mariamnitanos, tetrarchiam quae mammisea appellatur, paradisum, pagras, penelenitas, seleucias praeter iam dictam duas, quae ad euphraten et quae ad belum vocantur, tardytenses. reliqua autem syria habet, exceptis quae cum euphrate dicuntur, arethusios, beroeenses, epiphanenses ad orontem, laodiceos, qui ad libanum cognominantur, leucadios, larisaeos, praeter tetrarchias in regna discriptas barbaris nominibus xvii.

et de euphrate hoc in loco dixisse aptissimum fuerit. oritur in praefectura armeniae maioris caranitide, ut prodidere ex iis, qui proxime viderunt, domitius corbulo, in monte aga, licinius mucianus, sub radicibus montis, quem capoten appellant, supra zimaram [xii] p., initio pyxurates nominatus. fuit derzenen primum, mox anaeticam, armeniae regiones a cappadocia excludens. dascusa abest a zimara [lxxv] p.; inde navigatur sartonam [I], melitenen cappadociae [xxiii], elegeam armeniae x, acceptis fluminibus lyco, arsaniam, arsano. apud elegeam occurrit ei taurus mons nec resistit, quamquam

[xii] p. latitudine praevalens. ommam vocant inrumpentem, mox ubi perfregit, euphraten, ultra quoque saxosum et violentum. arabiam inde laeva, orroeon dictam regionem, trischoena mensura, dextraque commagenen disternit, pontis tamen, etiam ubi taurum expugnat, patiens. apud claudiopolim cappadociae cursum ad occasum solis agit. primo hunc illic in pugna taurus aufert victusque et abscisus sibimet alio modo vincit ac fractum expellit in meridiem. ita naturae dimicatio illa aequatur, hoc eunte quo vult, illo prohibente ire qua velit. a catarractis iterum navigatur. [xi] p. inde commagenes caput samosata.

arabia supra dicta habet oppida edessam, quae quondam antiochia dicebatur, callirrhoen, a fonte nominatam, carrhas, crassi clade nobile. iungitur praefectura mesopotamiae, ab assyriis originem trahens, in qua anthemusia et nicephorium oppida. mox arabes qui praetavi vocantur; horum caput singara. a samosatis autem latere syriae marsyas amnis influit. cingilla commagenen finit, imeneorum civitas incipit. oppida adluuntur epiphania et antiochia, quae ad euphraten vocantur, item zeugma [lxxii] p. a samosatis, transitu euphratis nobile. ex adverso apameam seleucus, idem utriusque conditor, ponte iunxerat. qui cohaerent mesopotamiae, rhoali vocantur. at in syria oppida europum, thapsacum quondam, nunc amphipolis; arabes scenitae. ita fertur usque suram locum, in quo conversus ad orientem relinquit syriae palmyrenas solitudines, quae usque ad petram urbem et regionem arabiae felicitis appellatae pertinent.

palmyra, urbs nobilis situ, divitiis soli et aquis amoenis, vasto undique ambitu harenis includit agros ac, velut terris exempta a rerum natura, privata sorte inter duo imperia summa romanorum parthorumque est, prima in discordia semper utrimque cura. abest ab seleucia parthorum, quae vocatur ad tigrim, [cccxxxvii] p., a proximo vero syriae litore [cciii] et a damasco [xxvii] propius.

infra palmyrae solitudines telendena regio est dictaeque iam hierapolis ac beroea et chalcis. ultra palmyram quoque ex solitudinibus his aliquid obtinet hemesa, item elatium, dimidio propior petrae quam damascus. a sura autem proxime est philiscum, oppidum parthorum ad euphraten. ab eo seleuciam dierum decem navigatio, totidemque fere babylonem. scinditur enim euphrates a zeugmate [dlxxxxiiii] p. circa vicum masicen et parte laeva in mesopotamiam vadit, per ipsam seleuciam circaque eam praefluerit infusus tigri, dexteriore autem alveo babylonem, quondam chaldaee caput, petit mediamque permeans, item quam mothrim vocant, distrahitur in paludes. increscit autem et ipse nili modo statis diebus, paulum differens, ac mesopotamiam inundat sole optinente xx partem cancri. minui incipit in virginem e leone transgresso, in totum vero remeat in xxviii parte virginis.

sed redeamus ad oram syriae, cui proxima est cilicia. flumen diaphanes, mons crocodilus, portae amani montis, flumina androclus, pinarus, lycus, sinus issicus, oppidum issos, item alexandria, flumen chlorus, oppidum aegaeae liberum, amnis pyramus, portae ciliciae, oppida mallos, magirsos et intus

tarsos. campi alei, oppida casyponis, mopsos liberum, pyramo inpositum, tyros, zephyrium, anchiale. amnes saros, cydnos, tarsum liberam urbem procul a mari secans. regio celenderitis cum oppido, locus nymphaeum, soloe cilicii, nunc pompeiopolis, adana, cibyra, pinare, pedalie, alae, selinus, arsinoe, iotape, dorion iuxtaque mare corycos, eodem nomine oppidum et portus et specus. mox flumen calycadnus, promunturium sarpedon, oppida holmoe, myle, promunturium et oppidum veneris, a quo proxime cyprus insula. sed in continente oppida mysanda, anemurium, coracesium, finisque antiquus ciliciae melas amnis. intus autem dicendi anazarbeni, qui nunc caesarea, augusta, castabala, epiphania, quae ante oeniandos, ele+usa, iconium, seleucia supra amnem calycadnum, tracheotis cognomine, ab mari relata ubi vocabatur hermia. praeterea intus flumina liparis, bombos, paradisus, mons imbarus.

ciliciae pamphyliam omnes iunxere neglecta gente isaurica. oppida eius intus isaura, clibanus, lalasis; decurrit autem ad mare anemuri e regione supra dicti. simili modo omnibus, qui eadem composuere, ignorata est contermina illi gens omanadum, quorum intus oppidum omana. cetera castella xliiii inter asperas convalles latent.

insident verticem pisidae, quondam appellati solymi, quorum colonia caesarea, eadem antiochia. oppida oroanda, sagalessos.

hos includit lycaonia, in asiaticam iurisdictionem versa, cum qua conveniunt philomelienses, tymbriani, leucolithi, peltēni, tyrienses. datur et tetrarchia ex lycaonia, qua parte galatiae contermina est, civitatum xliiii, urbe celeberrima iconio. ipsius lycaoniae celebrantur thebasa in tauro, ide in confinio galatiae atque cappadociae. a latere autem eius super pamphyliam veniunt thracum suboles milyae, quorum arycanda oppidum.

pamphyliā ante mopsopia appellata est. mare pamphylium cilicio iungitur. oppida side et in monte aspendum, plantanistum, perga. promunturium leucolla, mons sardemisus. amnes eurymedon, iuxta aspendum fluens, catarractes, iuxta quem lynesus et olbia ultimaque eius orae phaelis.

iunctum mare lycium est gensque lycia, unde vastus sinus. taurus mons, ab eo veniens litoribus, chelidonio promunturio determinat, immensus ipse et innumerarum gentium arbiter, dextro latere septentrionalis, ubi primum ab indico mari exsurgit, laevo meridianus et ad occasum tendens mediamque distrahens asiam, nisi opprimenti terras occurrerent maria. resilit ergo ad septentriones flexusque inmensum iter quaerit, velut de industria rerum natura subinde aequora opponente, hinc phoenicium, hinc ponticum, illinc caspium et hyrcanium contraque maeotium lacum. torquetur itaque collisus inter haec claustra et tamen victor flexuosus evadit usque ad cognata ripaeorum montium iuga, numerosis nominibus et novis, quacumque incedit, insignis: imaus prima parte dictus, mox emodus, paropanisus, circius, cambades, pariades, choatras, oreges, oroandes, niphates, taurus atque, ubi se quoque exuperat, caucasus, ubi brachia emittit subinde temptanti maria similis, sarpedon, coracesius, cragus, iterumque taurus, etiam ubi dehiscit seque populis aperit, portarum tamen nomine unitatem sibi vindicans, quae aliubi armeniae, aliubi caspiae,

aliubi ciliciae vocantur. quin etiam confractus, effugiens quoque maria, plurimis se gentium nominibus hinc et illinc implet, a dextra hyrcanius, caspius, a laeva parihedrus, moschicus, amazonicus, coraxicus, scythicus appellatus, in universum vero graece ceraunius.

in lycia igitur a promunturio eius oppidum simena, mons chimaera, noctibus flagrans, hephaestium civitas, et ipsa saepe flagrantibus iugis. oppidum olympus ibi fuit, nunc sunt montana gagae, corydalla, rhodiopolis. iuxta mare limyra cum amne, in quem alycandus influit, mons masicytus, andria civitas, myra, oppida aperlae et antiphellos, quae quondam habesos, atque in recessu phellos. dein pyrrha, item xanthus, a mari [xv], flumenque eodem nomine. deinde patara, quae prius pataros, et in monte sidyma, promunturium cragus. ultra par sinus prior; ibi pinara et quae lyciam finit telmesus. lycia lxx quondam oppida habuit, nunc xxxvi habet. ex his celeberrima praeter supra dicta canas, candyba, ubi laudatur eunias nemus, podalia, choma praefluente aedesa, cyaneae, ascandiandalis, amelas, noscopium, tlos, telandrus. comprehendit in mediterraneis et cabaliam, cuius tres urbes oenianda, balbura, bubon. a telmeso asiaticum mare sive carpathium et quae proprie vocatur asia. in duas eam partes agrippa divisit: unam inclusit ab oriente phrygia et lycaonia, ab occidente aegaeo mari, a meridie aegyptio, a septentrione paphlagonia; huius longitudinem [cccclxx], latitudinem [cccxx] fecit. alteram determinavit ab oriente armenia minore, ab occidente phrygia, lycaonia, pamphylia, a septentrione provincia pontica, a meridie mari pamphylio, longam [dlxxv], latam [cccxxv].

in proxima ora caria est, mox ionia, ultra eam aeolis. caria mediae doridi circumfunditur, ad mare utroque latere ambiens. in ea promunturium pedalium, amnis glaucus, deferens telmedium, oppida daedala, crya fugitivorum, flumen axon, oppidum calynda. amnis indus, in cibyratarum iugis ortus, recipit lx perennes fluvios, torrentes vero amplius centum. oppidum caunos liberum, dein pyrnos. portus cressa, a quo rhodus insula passuum [xx]. locus loryma, oppida tisanusa, paridon, larymna, sinus thymnias, promunturium aphrodisias, oppidum hydas, sinus schoenus, regio bubassus. oppidum fuit acanthus, alio nomine dulopolis. est in promunturio cnidos libera, triopia, dein pegusa et stadia appellata. ab ea doris incipit.

sed prius terga et mediterraneas iurisdictiones indicasse conveniat. una appellatur cibyratica; ipsum oppidum phrygiae est. conveniunt eo xxv civitates, celeberrima urbe laodicea. imposita est lyco flumini, latera adluentibus asopo et capro, appellata primo diospolis, dein rhoas. reliqui in eo conventu, quos nominare non pigeat, hydrelitae, themisones, hierapolitae. alter conventus a synnade accepit nomen; conveniunt lycaones, appiani, corpeni, dorylaei, midaei, iulienses et reliqui ignobiles populi xv. tertius apameam vadit, ante appellatam celaenas, deinde ciboton. sita est in radice montis signiae, circumfusa marsya, obrima, orba fluminibus in maeandrum cadentibus. marsyas ibi redditur, ortus ac paulo mox conditus. ubi certavit tibiarum cantu cum apolline, aulocrene est; ita vocatur convallis, [x] p. ab

apamea phrygiam petentibus. ex hoc conventu deceat nominare metropolitas, dionysopolitas, euphorbenos, acmonenses, peltenos, silbianos. reliqui ignobiles viiii.

doridis in sinu leucopolis, hamaxitos, eleus, etene. dein cariae oppida pitaium, eutane, halicarnasus. sex oppida contributa ei sunt a magno alexandro, theangela, side, medmassa, vranium, pedasum, telmisum. habitatur inter duos sinus, ceramicum et iasium. inde myndos et ubi fuit palaemyndus, nariandos, neapolis, caryanda, termera libera, bargylia et, a quo sinus iasius, oppidum iasus. caria interiorum nominum fama praenitet. quippe ibi sunt oppida mylasa libera, antiochia, ubi fuere symmaethos et cranaos oppida; nunc eam circumfluunt maeander et morsynus. fuit in eo tractu et maeandropolis, est eumenia, cludro flumini adposita, glaucus amnis, lysias oppidum et orthosia, berecynthius tractus, nysa, trallis, eadem euanthia et seleucia et antiochia dicta; adluitur eudone amne, perfunditur thebaite. quidam ibi pygmaeos habitasse tradunt. praeterea sunt thydonos, pyrrha, eurome, heraclea, amyzon, alabanda libera, quae conventum eum cognominavit, stratonicea libera, labrayndos, ceramus, troezene, phorontis. longinquiores eodem foro disceptant orthronienses, alindienses, euhippini, xystiani, hydissenses, apolloniatae, trapezopolitae, aphrodisienses liberi. praeter haec sunt coscinus, harpasa, adposita fluvio harpaso, quo et trallicon, cum fuit, adluebatur.

lydia autem perfusa flexuosis maeandri amnis recursibus super ioniam procedit, phrygiae ab exortu solis vicina, ad septentrionem mysiae, meridiana parte cariam amplectens, maeonia ante appellata. celebratur maxime sardibus in latere tmoli montis, qui ante timolus appellabatur, conditis; ex quo profluente pactolo eodemque chrysorroa ac fonte tarni a maeonis civitas ipsa hyde vocitata est, clara stagno gygaeo. sardiana nunc appellatur ea iurisdictio, conveniuntque in eam extra praedictos macedones cadieni, philadelphini et ipsi in radice tmoli cogamo flumini adpositi maeonii, tripolitani, iidem et antoniopolitae - maeandro adluuntur - , apollonhieritae, mysotimolitae et alii ignobiles.

ionia, ab iasio sinu incipiens, numerosiore ambitu litorum flectitur. in ea primus sinus basilicus, posideum promunturium et oppidum, oraculum branchidarum appellatum, nunc didymeis apollinis, a litore stadiis xx, et inde clxxx miletus, ioniae caput, lelegeis ante et pityusa et anactoria nominata, super lxxxx urbium per cuncta maria genetrix nec fraudanda cive cadmo, qui primus prorsam orationem condere instituit. amnis maeander, ortus e lacu in monte aulocrene plurimisque adfusus oppidis et repletus fluminibus crebris, ita sinuosus flexibus, ut saepe credatur reverti, apamenam primum pervagatur regionem, mox eumeneticam ac deinde hyrgaeticos campos, postremo cariam, placidus omnesque eos agros fertilissimo rigans limo, ad decumum a mileto stadium lenis inlabitur mari. inde mons latmus, oppida heraclea, montis eius cognominis carice, myuus, quod primo condidisse ionες narrantur athenis profecti, naulochum, priene, in ora, quae troglea appellatur, gaesus amnis,

regio omnibus ionibus sacra et ideo panonia appellata; iuxta fugitivis conditum, uti nomen indicio est, phygela fuit et marathesium oppidum. supra haec magnesia maeandri cognomine insignis, thessalica magnesia orta. abest epheso [xv] p., trallibus eo amplius mmm. antea thessaloche et mandrolytia nominata et litori adposita derasidas insulas secum abstulit mari. intus et thyatira adluitur lyco, pelopia aliquando et euhippia cognominata. in ora autem matium, ephesus, amazonum opus, multis antea expetita nominibus, alopes, cum pugnatum apud troiam est, mox ortygiae, amorges. vocata et smyrna est, cognomine trachia, et haemonion et ptelea. attollitur monte pione, adluitur caystro, in cilbianis iugis orto multosque amnes deferente et stagnum pegaseum, quod phyrices amnis expellit. ab iis multitudo limi est, qua terras propagat mediisque iam campis syrien insulam adiecit. fons in urbe callippia et templum dianaе complexi e diversis regionibus duo selenuntes. ab epheso matium aliud colophoniorum et intus ipsa colophon, haleso adfluente. inde apollinis clarii fanum, lebedos - fuit et notium oppidum - , promunturium cyrenaeum, mons mimas [cl] p. excurrrens atque in continentibus campis residens. quo in loco magnus alexander intercidi planitiem eam iusserat [vii] d p. longitudine, ut duos sinus iungeret erythrasque cum mimante circumfunderet. iuxta eas fuerunt oppida pteleon, helos, dorion, nunc est aleon fluvius, corynaeum, mimantis promunturium, clazomenae, parthenie et hippi, chytrophoria appellatae, cum insulae essent. iusserat alexander idem per duo stadia continenti adnecti. interiere intus daphnus et herместа et sipylum, quod ante tantalis vocabatur, caput maeoniae, ubi nunc est stagnum sale. obiit et archaeopolis, substituta sipylo, et inde illi colpe et huic libade. regredientibus inde abest [xii] p., ab amazone condita, restituta ab alexandro, in ora zmyrna, amne melete gaudens non procul orto. montes asiae nobilissimi in hoc tractu fere explicant se: mastusia a tergo zmyrnae et termetis olympi radicibus iunctus in dracone desinit, draco in tmolo, tmolus in cadmo, ille in tauro. a zmyrna hermus amnis campos secat et nomini suo adoptat. oritur iuxta dorylaum, phrygiae civitatem, multosque colligit fluvios, inter quos phrygem, qui nomine genti dato a caria eam determinat, hyllum et cryon, ipsos phrygiae, mysiae, lydiae amnibus repletos. fuit in ore eius oppidum temnos, nunc in extremo sinu myrmeces scopuli, oppidum leucae in promunturio, quod insula fuit, finisque ioniae phocaea. zmyrnaeum conventum magna pars et aeoliae, quae mox dicetur, frequentat praeterque macedones hyrcani cognominati et magnetes a sipylo. verum ephesum, alterum lumen asiae, remotiores conveniunt caesarienses, metropolitae, cilbiani inferiores et superiores, mysomacedones, mastauraenses, briullitae, hypaepeni, dioshieritae.

aeolis proxima est, quondam mysia appellata, et quae hellesponto adiacet troas. ibi a phocaea ascanius portus. dein fuerat larisa, sunt cyme, myrina quae sebastopolim se vocat, et intus aegaeae, itale, posidea, neon tichos, temnos. in ora autem titanus amnis et civitas ab eo cognominata - fuit et grynia, nunc tantum portus, olim insula adprehensa - , oppidum elaea et ex mysia veniens caicus amnis, oppidum pitane, canaitis amnis. intercidere canae, lysimachea,

atarnea, carene, cisthene, cilla, cocylium, thebe, astyre, chrysa, palaescepsis, gergitha, neandros; nunc est perperene civitas, heracleotes tractus, coryphas oppidum, amnes grylios, olliis, regio aphrodisias quae antea politice orgas, regio scepsis, flumen euenus, cuius in ripis interciderunt lynesos, miletos. in hoc tractu idem mons et in ora, quae sinum cognominavit et conventum, adramytteos, olim pedasus dicta, flumina astron, cormalos, crianos, alabastros, hieros ex ida; intus mons gargara eodemque nomine oppidum. rursus in litore antandros, edonis prius vocata, dein cimmeris, assos, eadem apollonia - fuit et palamedium oppidum - , promunturium lectum determinans aeolida et troada. fuit et polymedia civitas, chrysa et larisa alia. zminthium templum durat. intus colone intercidit. deportant adramytteum negotia apolloniatae a rhyndaco amne, eresi, miletopolitae, poemaneni, macedones asculacae, polichnaei, pionitae, cilices mandacandeni, mysii abretteni et hellespontii appellati et alii ignobiles.

troadis primus locus hamaxitus, dein cebrenia ipsaque troas, antigonida dicta, nunc alexandria colonia romana, oppidum nea, scamander amnis navigabilis et in promunturio quondam sigeum oppidum; dein portus achaeorum, in quem influit xanthus simoenti iunctus stagnumque prius faciens palaescamander; ceteri homero celebrati, rhesus, heptaporus, caresus, rhodius, vestigia non habent. granicus diverso tractu in propontida fluit. est tamen, ut prius, scamandria civitas parva ac m. d. p. remotum a portu ilium immune, unde omnis rerum claritas. extra sinum sunt rhoetea litora, rhoeteo et dardanio et arisbe oppidis habitata. fuit et achilleon oppidum, iuxta tumulum achillis conditum a mytilenaeis et mox atheniensibus, ubi classis eius steterat in sigeo. fuit et aeantion, a rhodiis conditum in altero cornu, aiace ibi sepulto xxx stadiorum intervallo a sigeo, et ipso in statione classis suae. supra aeolida et partem troadis in mediterraneo est quae vocatur teuthrania, quam mysii antiquitus tenuere. ibi caicus amnis iam dictus oritur. gens ampla per se, etiam cum totum mysia appellaretur. in ea pioniae, andera, idale, stabulum, conisium, teium, balce, tiare, teuthranie, sarnaca, haliserna, lycide, parthenium, cambre, oxyopum, lygdamum, apollonia longeque clarissimum asiae pergamum, quod intermeat selinus, praefluit cetius profusus pindaso monte. abest haud procul elaea, quam in litore diximus. pergamena vocatur eius tractus iurisdictio. ad eam conveniunt thyatireni, mossyni, mygdones, bregmeni, hierocometae, perpereni, tiareni, hierolophiensis, hermocapelitae, attalenses, panteenses, apollonidienses aliaeque inhonoraee civitates. a rhoeteo dardanium oppidum parvum abest stadia lxx. inde [xviii] promunturium trapeza, unde primum concitat se hellespontus.

ex asia interisse gentes tradit eratosthenes solymorum, lelegum, bebrycum, colycantiorum, tripsedorum, isidorus arieneos et capreatas, ubi sit apamea condita a seleuco rege inter ciliciam, cappadociam, cataoniam, armeniam, et quoniam ferocissimas gentes domuisset, initio dameam vocatam.

insularum ante asiam prima est in canopico ostio nili, a canopo, menelai gubernatore, ut ferunt, dicta; altera iuncta ponte alexandriae, colonia caesaris

dictatoris, pharos, quondam diei navigatione distans ab aegypto, nunc e turri nocturnis ignibus cursum navium regens: namque fallacibus vadis alexandria tribus omnino aditur alveis mari, stegano, posideo, tauro. in phoenicio deinde mari est ante iopen paria, tota oppidum, in qua obiectam beluae andromedam ferunt, et iam dicta arados, inter quam et continentem l cubita alto mari, ut auctor est mucianus, e fonte dulcis aqua tubo coriis facto usque a vado trahitur.

pamphylium mare ignobiles insulas habet, cilicium ex quinque maximis cyprum, ad ortum occasumque ciliciae ac syriae obiectam, quondam novem regnorum sedem. huius circuitum timosthenes [ccccxxvii] d p. prodidit, isidorus [ccclxxv]. longitudinem inter duo promunturia, clidas et acamanta, quod est ab occasu, artemidorus [clxii] d, timosthenes [cc]; vocatam ante acamantida philonides, cerastim xenagoras et aspeliam et amathusiam et macariam, astynomus crypton et colinian. oppida in ea xv, nea paphos, palaepaphos, curias, citium, corinaeum, salamis, amathus, lapethos, soloe, tamosos, epidaurum, chytri, arsinoe, carpasium, golgoe. fuere et cinyria, mareum, idalium. abest ab anemurio ciliciae [l]. mare quod praetenditur vocant aulona cilicium. in eodem situ elaeusa insula est et quattuor ante promunturium ex adverso syriae clides rursusque ab altero capite stiria, contra neam paphum hiera cepia, contra salamina salaminiae. in lycio autem mari idyris, telendos, attelebussa, cypriae tres steriles et dionysia, prius charaeta dicta, dein contra tauri promunturium pestiferae navigantibus chelidoniae totidem, ab iis cum oppido leucolla, pactyae, lasia, nymphais, macris, megista, cuius civitas interiit. multae deinde ignobiles, sed contra chimaeram dolichiste, choerogylon, crambusa, rhoge, xenagora viii, daedaleon duae, cryeon tres, strongyle et contra sidyma antiochi glaucumque versus amnem lagusa, macris, didymae, helbo, scope, aspis et, in qua oppidum interiit, telandria proximaque cauno rhodusa.

sed pulcherrima est libera rhodos, circuitu [cxxv] aut, si potius isidoro credimus, [ciii], habitata urbibus lindo, camiro, ialyso, nunc rhodo. distat ab alexandria aegypti [dlxxxiii], ut isidorus tradit, ut eratosthenes, [cccclxviii], ut mucianus [d], a cypro [clxxvi]. vocitata est antea ophiusa, asteria, aethria, trinacrie, corymbia, poeeessa, atabyria ab rege, dein macaria et oloessa. rhodiorum insulae carpathus, quae mari nomen dedit, casos, hagne, eulimna, nisyros, distans a cnido [xv] d, porphyris antea dicta, et eodem tractu media inter rhodum cnidumque syme; cingitur [xxxvii] d, portus benigne praebet viii. praeter eas circa rhodum cyclopi, teganon, cordylusa, diabatae iiii, hymos, chalce cum oppido, teutlusa, narthecusa, dimastos, progne et a cnido cisserusa, therionarcia, calydne cum tribus oppidis, notio, nisyro, mendetero, et in arconneso oppidum ceramus. in cariae ora quae vocantur argiae numero xx et hyetusa, lepsia, leros. nobilissima autem in eo sinu coos, ab halicarnaso [xv] distans, circuitu [c], ut plures existimant, merope vocata, cea, ut staphylus, meropis, ut dionysius, dein nymphaea. mons ibi prion; et nisyron abruptam illi putant, quae porphyris antea dicta est. caryanda cum oppido, nec

procul ab halicarnaso pidossus; in ceramico autem sinu priaponesos, hipponesos, pserima, lampa, aemyndus, passala, crusa, pyrraethusa, sepiusa, melano paulumque a continente distans quae vocata est cinaedopolis, probrosis ibi relictis a rege alexandro.

ioniae ora aegeas et corseas habet et icaron, de qua dictum est, laden, quae prius late vocabatur, atque inter ignobiles aliquot duas camelitas mileto vicinas, mycalae trogiliae tres, philion, argennon, sandalion, samon liberam, circuitu [lxxxvii] d aut, ut isidorus, [c]. partheniam primum appellatam aristoteles tradit, postea dryusam, deinde anthemusam; aristocritus adicit melamphyllum, dein cyparissiam, alii parthenoarrhusam, stephanen. amnes in ea imbrasus, chesius, hibiethes, fontes gigartha, leucothea, mons cercetius. adiacent insulae rhypara, nymphaea, achillea.

par claritate ab ea distat [xciiii] cum oppido chios libera, quam aethaliam ephorus prisco nomine appellat, metrodorus et cleobulus chiam a chione nympa, aliqui a nive, et macrim et pityusam. montem habet pelinnaeum, marmor chium. circuitu [cxxv] colligit, ut veteres tradidere, isidorus [viii] adicit. posita est inter samum et lesbum, ex adverso maxime erythrarum. finitimae sunt tellusa, quam alii daphnusam scribunt, oenusa, elaphitis, euryanassa, arginusa cum oppido. iam haec circa ephesum et quae pisistrati vocantur anthinae, myonnesos, diarrheusa - in utraque oppida interciderunt - , poroselene cum oppido, cerciae, halone, commune, illetia, lepra, aethre, sphaeria, procusae, bolbulae, pheate, priapos, syce, melane, aenare, sidusa, pele, drymus, anhydros, scopelos, sycusa, marathusa, psile, perirrheusa multaeque ignobiles. clara vero in alto teos cum oppido, a chio [lxxii] d, tantundem ab erythris. iuxta zmyrnam sunt peristerides, carteria, alopece, elaeusa, bacchina, pystira, crommyonesos, megale, ante troada ascaniae, plateae tres, dein lamiae, plitaniae duae, plate, scopelos, getone, arthodon, coele, lagusae, didymae.

clarissima autem lesbos, a chio [lxv], himerte et lasia, pelasgia, aegira, aethiope, macaria appellata. fuit viii oppidis incluta: ex his pyrrha hausta est mari, arisbe terrarum motu subversa, antissam methymna traxit in se, ipsa viii urbibus asiae in [xxxvii] p. vicina. et agamede obiit et hiera; restant eresos, pyrrha et libera mytilene, annis md potens. tota insula circuitur, ut isidorus, [clxviii], ut veteres, [cxcv]. montes habet lepetymnum, ordymnum, macistum, creonem, olympum. a proxima continente abest [vii] d p. insulae adpositae sandalium, leucae v, ex iis cydonea cum fonte calido. arginusae ab aege [iiii] p. distant. dein phellusa, pedna. extra hellespontum adversa sigeo litori iacet tenedus, leucophrys dicta et phoenice et lynesos; abest a lesbo [lvi], a sigeo [xii] d.

impetum deinde sumit hellepontus, et mare incumbit, verticibus limitem fodiens, donec asiam abrumpat europae. promunturium id appellavimus trapezam. ab eo [x] p. abydum oppidum, ubi angustiae vii stadiorum. deinde percote oppidum et lampsacum, antea pityussa dictum, parium colonia quam homerus adrastiam appellavit, oppidum priapos, amnis aeseopus, zelia,

propontis - ita appellatur ubi se dilatat mare - , flumen granicum, artace portus ubi oppidum fuit. ultra insulam continenti iunxit alexander, in qua oppidum milesiorum cyzicum, ante vocitatum arctonnesus et dolionis et didymis, cuius a vertice mons didymus. mox oppida placia, ariace, scylace, quorum a tergo mons olympus, mysius dictus, civitas olympea, amnes horisius et rhyndacus, ante lycus vocatus; oritur in stagno artynia iuxta miletopolim, recipit maceston et plerosque alios, asiam bithyniamque distermians. ea appellata est cronis, dein thessalis, dein malianda et strymonis. hos homerus halizonas dixit, quando praecingitur gens mari. urbs fuit immensa atossa nomine, nunc sunt xii civitates, inter quas gordiu come, quae iuliopolis vocatur. in ora dascylos, dein flumen gelbes et intus helgas oppidum, quae germanicopolis, alio nomine booscoete, sicut apamea, quae nunc myrlea colophoniorum, flumen echeleos, anticus troadis finis et mysiae initium. postea sinus in quo flumen ascanium, oppidum bryalium, amnes hylas et cios cum oppido eiusdem nominis, quod fuit emporium non procul accolentis phrygiae, a milesiis quidem conditum, in loco tamen qui ascania phrygiae vocabatur. quapropter non aliubi aptius de ea dicatur.

phrygia, troadi superiecta populisque a promunturio lecto ad flumen echeleum praedictis, septentrionali sui parte galatiae contermina, meridiana lycaoniae, pisidiae, mygdoniae, ab oriente cappadociam attingit. oppida ibi celeberrima praeter iam dicta ancyra, andria, celaenae, colossae, carina, cotiai +on, cerai+ne, conium, midai+um. sunt auctores transisse ex europa moesos et brygos et thynos, a quibus appellantur mysii, phryges, bithyni.

simul dicendum videtur et de galatia, quae superposita agros maiore ex parte phrygiae tenet caputque quondam eius gordium. qui partem eam insedere gallorum tolostobogi et voturi et ambitouti vocantur; qui maeoniae et paphlagoniae regionem, trogmii. praetenditur cappadocia a septentrione et solis ortu, cuius uberrimam partem occupavere tectosages. ac toto tractu gentes quidem hae, populi vero ac tetrarchiae omnes numero cxcv. oppida tectosagum ancyra, trogmorum taviu, tolostobogiorum pisiniu. praeter hos celebres attalenses, arassenses, comenses, dictienses, hierorenses, lystreni, neapolitani, oeandenses, seleucenses, sebasteni, timoniacenses, thebaseni. attingit galatia et pamphyliae cabaliam et milyas qui circa barim sunt et cyllanicum et oroandicum pisidiae tractum, item lycaoniae partem obizenen. flumina sunt in ea praeter iam dicta saggarium et gallus, a quo nomen traxere matris deum sacerdotes.

nunc reliqua in ora. a cio intus in bithynia prusa, ab Hannibale sub olympo condita - inde nicaeam [xxv] p. interveniente ascanio lacu - , dein nicaea in ultimo ascanio sinu, quae prius olbia et prusias, item altera sub hypio monte. fuere pythopolis, parthenopolis, coryphanta. sunt in ora amnes aesiis, bryazon, plataneus, areus, aesyros, geudos, qui et chrysorroas, promunturium in quo megarice oppidum fuit. inde craspedites sinus vocabatur, quoniam id oppidum velut in lacinia erat. fuit et astacum, unde et ex eo astacenus idem sinus; fuit et libyssa oppidum, ubi nunc Hannibalis tantum tumulus. est in

intimo sinu nicomedia bithyniae praeclara. leucatas promunturium, quo includitur astacenus sinus, a nicomedia [xxxvii] d p., rursusque coeuntibus terris angustiae pertinentes usque ad bosporum thracium. in his calchadon libera, a nicomedia [lxii] d p., procerastis ante dicta, dein colpusa, postea caecorum oppidum, quod locum eligere nescissent, vii stadiis distante byzantio, tanto feliciore omnibus modis sede. ceterum intus in bithynia colonia apamena, agrippenses, iuliopolitae, bithynion. flumina syrium, laphias, pharnacias, alces, serinis, lilaeus, Scopas, hieros, qui bithyniam et galatiam disternat. ultra calchadon chrysopolis fuit, dein nicopolis, a qua nomen etiamnum sinus retinet, in quo portus amyci. dein naulochum promunturium, estiae, templum neptuni. bosporus, d p. intervallo asiam europae iterum auferens, abest a calchadone [xii] d p., inde fauces primae [viii] dccl p., ubi spiropolis oppidum fuit. tenent oram omnem thyni, interiora bithyni. is finis asiae est populorumque cclxxxii, qui ad eum locum a fine lyciae numerantur. spatium hellesponti et propontidis ad bosporum thracium [ccxxxviii] p. diximus. a calchadone sigeum isidorus [cccxxii] d p. tradit.

insulae in propontide ante cyzicum elaphonnesus, unde cyzicenum marmor, eadem neuris et proconnesus dicta. secuntur ophiusa, acanthus, phoebe, scopelos, porphyrione, halone cum oppido, delphacie, polydora, artacaeon cum oppido. est et contra nicomediam demonzesos, item ultra heracleam adversa bithyniae thynias, quam barbari bithyniam vocant. est et antiochia et contra fauces rhyndaci besbicos, [xviii] p. circuitu. est et elaea et duae rhodusae, erebinthote, megale, chalcitis, pityodes.

LIBER VI

pontus euxinus, antea ab inhospitali feritate axinus appellatus, peculiari invidia naturae sine ulla fine indulgentis aviditati maris et ipse inter europam asiamque funditur. non fuerat satis oceano ambisse terras et partem earum aucta inanitate abstulisse, non inrupisse fractis montibus calpeque africae avolsa tanto maiora absorbuisset quam reliquerit spatia, non per hellespontum propontida infudisse iterum terris devoratis: a bosporo quoque in aliam vastitatem panditur nulla satietate, donec exspatianti lacus maeotii rapinam suam iungant. invitis hoc accidisse terris indicio sunt tot angustiae atque tam parva naturae repugnantis intervalla, ad hellespontum dcccclxxv p., ad bosporos duos vel bubus meabili transitu - unde nomen ambobus - , etiam quaedam in dissociatione germanitas concors: alitum quippe cantus canumque latratus invicem audiuntur, vocis etiam humanae commercia, inter duos orbes manente conloquio, nisi cum id ipsum auferunt venti. mensuram ponti a bosporo ad maeotium lacum quidam fecere [30xiii]30 [xxxviii] d, eratosthenes [c] minorem. agrippa a calchadone ad phasim [30x]30, inde bosporum cimmericum [ccclx]. nos intervalla generatim ponimus conperta in aevo nostro, quando etiam in ipso ore cimmerico pugnatum est.

ergo a faucibus bospori est amnis rebas, quem aliqui rhesum dixerunt. dein syris, portus calpas, sangaris fluvius ex inclutis. oritur in phrygia, accipit vastos amnes, inter quos tembrogium et gallum, idem sagiarius plerisque dictus, coralius, a quo incipiunt mariandyni, sinus oppidumque heraclea, lyco flumini adpositum - abest a ponti ore [cc] - , portus acone, veneno aconito dirus, specus acherusia, flumina paedopides, callichorum, sonautes, oppidum tium, ab heraclea [xxxviii] p., fluvius billis. ultra quem gens paphlagonia, quam pylaemeniam aliqui dixerunt, inclusam a tergo galatia, oppidum mastya milesiorum, dein cromna, quo loco enetos adicit nepos cornelius, a quibus in italia ortos cognomines eorum venetos credi debere putat, sesamon oppidum, quod nunc amastris, mons cytorus, a tio [lxiii] p., oppida cimolis, stephane, amnis parthenius. promunturium carambis vasto excursu abest a ponti ostio [cccxxv] aut, ut aliis placuit, [cccl], tantundem a cimmerico aut, ut aliqui maluere, [cccxi] d. fuit et oppidum eodem nomine et aliud inde armine, nunc est colonia sinope, a cytoro [clxiii], flumen varecum, gens cappadocum, oppidum caturia gazelum, amnis halys, a radicibus tauri per cataoniam cappadociamque decurrens, oppida gangre, carusa, amisum liberum, a sinope [cxxx], eiusdemque nominis sinus tanti recessus, ut asiam paene insulam faciat, [cc] haut amplius per continentem ad issicum ciliciae sinum. quo in omni tractu proditur tres tantum gentes graecas iure dici, doricam, ionicam, aeolicam, ceteras barbarorum esse. amiso iunctum fuit oppidum eupatoria, a mithridate conditum; victo eo utrumque pompeiopoli appellatum est.

cappadocia intus habet coloniam claudi caesaris archelaidem, quam praefluit amnis halys, oppida comana, quod salius, neocaesaream, quod lycus,

amasiam, quod iris, in regione hoc gazacena, in colopene vero sebastiam et sebastopolim - haec parva, sed paria supra dictis -, reliqua sui parte melitam, a samiramide conditam haud procul euphrate, diocaesaream, tyana, castabala, magnopolim, zelam et sub monte argaeo mazacum, quae nunc caesarea nominatur. cappadociae pars praetenta armeniae maiori melitene vocatur, commagenis cataonia, phrygiae garsauritis, sargaurasana, cammaneni, galatiae morimene, ubi disternit eas cappadox amnis, a quo nomen traxere antea leucosyri dicti. a neocaesarea supra dicta minorem armeniam lycus amnis disternit. est et coeranus intus clarus, in ora autem ab amiso oppidum et flumen chadisia, lycastum, a quo themiscyrena regio, iris flumen deferens lycum. civitas ziela intus, nobilis clade triarii et victoria c. caesaris. in ora amnis thermodon, ortus ad castellum quod vocant phanorian, praeterque radices amazoni montis lapsus. fuit oppidum eodem nomine et alia quinque, amazonium, themiscyra, sotira, amasia, comana, nunc matium. gentes genetarum, chalybum, oppidum cotyrorum, gentes tibareni, mossyni notis signantes corpora, gens macrocephali, oppidum cerasus, portus cordule, gentes bechires, buxeri, flumen melas, gens machorones, sideni flumenque sidenum, quo alluitur oppidum polemonium, ab amiso [cxx]. inde flumina iasionium, melanthium et ab amiso [lxxx] pharnacea oppidum, tripolis castellum et fluvius, item philocalia et sine fluvio liviopolis, et a pharnacea [c] trapezus liberum, monte vasto clausum. ultra quod gens armenochalybes et maior armenia, [xxx] p. distans. in ora ante trapezunta flumen est pyxites, ultra vero gens sannorum heniochorum, flumen absarrum cum castello cognomine in faucibus, a trapezunte [cxl]. eius loci a tergo montium hiberia est, in ora vero heniochi, ampreutae, lazi, flumina acampseon, isis, nogrus, bathys, gentes colchorum, oppidum matium, flumen heracleum et promunturium eodem nomine clarissimusque ponti phasis. oritur in moschis, navigatur quamlibet magnis navigiis [xxxviii] d p., inde minoribus longo spatio, pontibus cxx pervius. oppida in ripis habuit conplura, celeberrima tyndarida, circaeum, cygnum et in faucibus phasim. maxime autem inclaruit aea, [xv] p. a mari, ubi hippos et cyaneos vasti amnes e diverso in eum confluunt; nunc habet surium tantum, et ipsum ab amne influente ibi cognominatum usque quo magnarum navium capacem esse diximus. et alios accipit fluvios magnitudine numeroque mirabiles, inter quos glaucum. in ore eius insula est sine nomine, ab absarro [lxx]. inde aliud flumen charien, gens saltiae, antiquis phthirophagi dicti, et alia sannii, flumen chobum, e caucaso per suanos fluens, dein rhoan, regio egritice, amnes sigama, thersos, astelephus, chrysorrhoeas, gens absilae, castellum sebastopolis, a phaside [c], gens sanigarum, oppidum cygnus, flumen et oppidum penius. deinde multis nominibus heniochorum gentes.

subicitur ponti regio colica, in qua iuga caucasi ad ripaeos montes torquentur, ut dictum est, altero latere in euxinum et maeotium devexa, altero in caspium et hyrcanium mare. reliqua litora ferae nationes tenent melanchlaeni, coraxi, urbe colchorum dioscuriade iuxta fluvium anthemunta

nunc deserta, quondam adeo clara, ut timosthenes in eam ccc nationes dissimilibus linguis descendere prodiderit; et postea a nostris cxxx interpretibus negotia gesta ibi. sunt qui conditam eam ab amphito et telchio, castoris ac pollucis aurigis, putent, a quibus ortam heniochorum gentem fere constat. [c] a dioscuriade oppidum heracleum distat, a sebastopoli [lxx]. achaei, mardi, cercetae, post eos seraci, cephalotomi. in intimo eo tractu pityus oppidum opulentissimum ab heniochis direptum est. a tergo eius epagerritae, sarmatarum populus in caucasi iugis, post quae sauromatae. ad hos profugerat mithridates claudio principe narravitque thalos iis esse confines, qui ab oriente caspii maris fauces attingerent; siccari eas aestu recedente. in ora autem iuxta cercetas flumen icarus, achaei cum oppido hiero et flumine, ab heracleo [cxxxvi]. inde promunturium crunoe, a quo supercilium arduum tenent toretae, civitas sindica, ab hiero [lxvii] d, flumen setheries. inde ad bospori cimmerii introitum [lxxxviii] d.

sed ipsius paeninsulae inter pontum et maeotium lacum excurrentis non amplior [lxvii] d p. longitudo est, latitudo nusquam infra duo iugera; eonem vocant. ora ipsa bospori utrimque ex asia atque europa curvatur in maeotim. oppida in aditu bospori primo hermonasa, dein cepoe milesiorum, mox stratoclia et phanagoria ac paene desertum apaturos ultumoque in ostio cimmerium, quod antea chimerion vocabatur. inde maeotis lacus, in europa dictus.

a cimmerio accolunt maeotici, vali, serbi, serrei, scizi, gnissi. dein tanain amnem gemino ore influentem incolunt sarmatae, medorum, ut ferunt, suboles, et ipsi in multa genera divisi. primi sauromatae gynaecocratumenoe, amazonum conubia; dein naevazae, coitae, cizici, messeniani, costoboci, zecetae, zigae, tindari, thussagetae, tyrcae usque ad solitudines saltuosius convallibus asperas, ultra quas arimphaei, qui ad ripaeos pertinent montes. tanaim ipsum scythae silim vocant, maeotim temarundam, quo significant matrem maris. oppidum in tanais quoque ostio. tenuere finitima primo cares, dein clazomeni et maeones, postea panticapaeenses. sunt qui circa maeotim ad ceraunios montes has tradant gentes: a litore napitas supraque essedonas colchis iunctos montium cacuminibus, dein camacas, oranos, autacas, mazamacas, cantioaptas, agamathas, picos, rymosolos, acascomarcos et ad iuga caucasi icatalas, imadochos, ramos, anclacas, tydios, carastaseos, authiandas; lagoum amnem ex montibus catheis, in quem defluat opharus, ibi gentes cauthadas, opharitas; amnes menotharum, imityen ex montibus cissiis; infra acdeos, carnas, vscardeos, accisos, gabros, gegaros circaque fontem imityis imityos et apartaeos. alii influxisse eo scythas auchetas, atherneos, asampatas, ab iis tanaitas et napaeos viritim deletos. aliqui flumen ocharium labi per canticos et sapaeos, tanain vero transisse satharcheos herticheos, spondolicos, synhietas, anasos, issos, cataeetas, tagoras, caronos, neripos, agandaeos, meandaraeos, satharcheos spalaeos.

peracta est interior ora ac loca amnesque, accolae: nunc reddatur ingens in mediterraneo situs, in quo multa aliter ac veteres proditurum me non eo

infitias, anxia perquisita cura rebus nuper in eo situ gestis a domitio corbulone regibusque inde missis supplicibus aut regum liberis obsidibus. ordiemur autem a cappadocum gente. longissime haec ponticarum omnium introrsus recedens minorem armeniam maioremque et commagenen laevo suo latere transit, dextro vero omnes in asia dictas gentes, plurimis superfusa populis, magnoque impetu scandens ad ortum solis et tauri iuga transit lycaoniam, pisidiam, ciliciam, vadit super antiochiaae tractum et usque ad cyrresticam eius regionem parte sua quae vocatur cataonia contendit. itaque ibi longitudo asiae [30xii]30 [l] efficit, latitudo [dcx]l.

armenia autem maior incipit a parihedris montibus, euphrate amne, ut dictum est, aufertur cappadociae et, qua discedit euphrates, mesopotamiaae haut minus claro amne tigri. utrumque fundit ipsa et initium mesopotamiaae facit inter duos amnes exiturae; quod interest ibi, tenent arabes orroeii. sic finem usque in adiabenen perfert, ab ea transversis iugis inclusa latitudinem in laeva pandit ad cyrum amnem transversa araxen, longitudinem vero ad minorem usque armeniam, absarro amne in pontum defluente et parihedris montibus, qui fundunt absarrum, discreta ab illa.

cyrus oritur in heniochis montibus, quos alii coraxicos vocavere, araxos eodem monte quo euphrates, [vi] p. intervallo, auctusque amne vsi et ipse, ut plures existimavere, cyro defertur in caspium mare. oppida celebrantur in minore caesarea, aza, nicopolis, in maiore arsamosata euphrati proximum, tigri carcathiocerta, in excelso autem tigranocerta, at in campis iuxta araxen artaxata. universae magnitudinem aufidius quinquagiens centena milia prodidit, claudius caesar longitudinem a dascusa ad confinium caspii maris [30xiii]30 p., latitudinem dimidium eius tigranocerta ad hiberiam. dividitur, quod certum est, in praefecturas, quas strategias vocant, quasdam ex his vel singula regna quondam, barbaris nominibus cxx. claudunt eam montes ab oriente, sed non statim cerauni nec adiabene regio. quod interest spatii, cepheni tenent; ab his iuga ultra adiabeni tenent, per convalles autem proximi armeniae sunt menobardi et moscheni. adiabenen tigris et montes invii cingunt. ab laeva eius regio medorum est ad prospectum caspii maris. ex oceano hoc, ut suo loco dicemus, infunditur, totumque caucasis montibus cingitur. incolae per confinium armeniae nunc dicentur.

planitiem omnem a cyro usque albanorum gens tenet, mox hiberum, discreta ab iis amne ocazane in cyrum caucasis montibus defluente. praevalent oppida albaniae cabalaca, hiberiae harmastus iuxta flumen, neoris. regio thasie et thriare usque ad parihedros montes. ultra sunt colchicae solitudines, quarum a latere ad ceraunios verso armenochalybes habitant et moschorum tractus ad hiberum amnem in cyrum defluentem et infra eos sacasani et deinde macerones ad flumen absarrum. sic plana aut devexa optinentur. rursus ab albaniae confinio tota montium fronte gentes silvorum ferae et infra lupeniorum, mox diduri et sodi.

ab iis sunt portae caucasiae, magno errore multis caspiaae dictae, ingens naturae opus montibus interruptis repente, ubi fores additae ferratis trabibus,

subter medias amne diri odoris fluente citraque in rupe castello, quod vocatur cumania, communito ad arcendas transitu gentes innumeras, ibi loci terrarum orbe portis discluso, ex adverso maxime harmasti oppidi hiberum. a portis caucasis per montes gurdinios valli, suani, indomitae gentes, auri tamen metalla fodiunt. ab his ad pontum usque heniochorum plurima genera, mox achaeorum. ita se habet haec terrarum e clarissimis. aliqui inter pontum et caspium mare [ccclxxv] p. non amplius interesse tradiderunt, cornelius nepos [ccl]: tantis iterum angustiis infestatur asia. claudius caesar a cimmerico bosporo ad caspium mare [cl] prodidit eaque perfodere cogitasse nicatorem seleucum quo tempore sit ab ptolemaeo cerauno interfectus. a portis caucasiis ad pontum [cc] esse constat fere.

insulae in ponto planctae sive cyanaeae sive symplegades; deinde apollonia thynias dicta, ut distingueretur ab ea quae est in europa - distat a continente p. m, cingitur [iii] - et contra pharnaceam chalceritis, quam graeci ariam dixerunt martique sacram et in ea volucres cum advenis pugnasse pinnarum ictu.

nunc omnibus quae sunt asiae interiora dictis ripaeos montes transcendat animus extraque litore oceani incedat. tribus hic partibus caeli adluens asiam scythicus a septentrione, ab oriente eous, a meridie indicus vocatur varieque per sinus et accolarum conplura nomina dividitur. verum asiae quoque magna portio adposita septentrioni iniuria sideris rigens vastas solitudines habet. ab extremo aquilone ad initium orientis aestivi scythae sunt. extra eos ultraque aquilonis initia hyperboreos aliqui posuere, pluribus in europa dictos. primum inde noscitur promunturium celticae lytharmis, fluvius carambucis, ubi lassata cum siderum vi ripaeorum montium deficiunt iuga, ibique arimphaeos quosdam accepimus, haut dissimilem hyperboreis gentem. sedes illis nemora, alimenta bacae, capillus iuxta feminis virisque in probro existimatus, ritus clementes. itaque sacros haberi narrant inviolatosque esse etiam feris accolarum populis, nec ipsos modo, sed illos quoque qui ad eos profugerint. ultra eos plane iam scythae, cimmerici, cissi, anthi, georgi et amazonum gens, haec usque ad caspium et hyrcanium mare.

nam et inrumpit e scythico oceano in aversa asiae; pluribus nominibus accolarum appellatum celeberrimum est duobus, caspium et hyrcanium. non minus hoc esse quam pontum euxinum clitarchus putat, eratosthenes ponit et mensuram ab exortu et meridie per cadusiae et albaniae oram [v] cccc stadia, inde per anariacos, amardos, hyrcanos ad ostium zoni fluminis [iiii] dccc, ab eo ad ostium iaxartis mm cccc, quae summa efficit [30xxv]30 [lxxv] p. artemidorus hinc detrahit [xxv] p. agrippa caspium mare gentesque quae circa sunt et cum iis armeniam, determinatas ab oriente oceano serico, ab occidente caucasi iugis, a meridie tauri, a septentrione oceano scythico, patere qua cognitum est [cccclxxx] in longitudinem, in latitudinem [ccxc] prodidit. non desunt vero qui eius maris universum circuitum a freto [30xxv]30 p. tradunt.

inrumpit autem artis faucibus et in longitudinem spatiosis atque, ubi coepit in latitudinem pandi, lunatis obliquatur cornibus, velut ad maeotium lacum ab ore descendens, sicilis, ut auctor est M. Varro, similitudine. primus sinus

appellatur scythicus; utrimque enim accolunt scythae angustias et inter se commeant, hinc nomades et sauromatae multis nominibus, illinc abzoae non paucioribus. ab introitu dextra mucronem ipsum faucium tenent vdini, scytharum populus, dein per oram albanī, ut ferunt, ab iasone orti, unde quod mare ibi est albanum nominatur. haec gens superfusa montibus caucasis ad cyrum amnem, armeniae confinium atque hiberiae, descendit, ut dictum est. supra maritima eius vdinorumque gentem sarmatae, vti, aorsi, aroteres praetenduntur, quorum a tergo indicatae iam amazones sauromatides. flumina per albaniam decurrunt in mare casus et albanus, dein cambyses, in caucasis ortus montibus, mox cyrus, in coraxicis, uti diximus. oram omnem a caso praealtis rupibus accessum negare per [ccccxxv] p. auctor est agrippa. a cyro caspium mare vocari incipit; accolunt caspi.

corrigendus est in hoc loco error multorum, etiam qui in armenia res proxime cum corbulone gessere. namque ii caspias appellavere portas hiberiae, quas caucasias diximus vocari, situsque depicti et inde missi hoc nomen inscriptum habent. et neronis principis comminatio ad caspias portas tendere dicebatur, cum peteret illas, quae per hiberiam in sarmatas tendunt, vix ullo propter oppositos montes aditu ad caspium mare. sunt autem aliae caspiis gentibus iunctae, quod dinosci non potest nisi comitatu rerum alexandri magni.

namque persarum regna, quae nunc parthorum intellegimus, inter duo maria persicum et hyrcanium caucasi iugis attolluntur. utrimque per devexa laterum armeniae maiori a frontis parte, quae vergit in commagenen, cephenia, ut diximus, copulatur eique adiabene, assyriorum initium, cuius pars est arbilitis, ubi darium alexander debellavit, proxime syriae. totam eam macedones mygdoniam cognominaverunt a similitudine. oppida alexandria, item antiochia quam nesebin vocant; abest ab artaxatis [dccl] p. fuit et ninos, inposita tigri, ad solis occasum spectans, quondam clarissima. reliqua vero fronte, quae tendit ad caspium mare, atrapatene, ab armeniae otene regione discreta araxe. oppidum eius gazeae, ab artaxatis [cccccl] p., totidem ab ecbatanis medorum, quorum pars sunt atrapateni.

ecbatana, caput mediae, seleucus rex condidit, a seleucia magna [dccl] p., a portis vero caspiis [xx]. reliqua medorum oppida phisganzaga, apamea, rhagiane cognominata. causa portarum nominis eadem quae supra, interruptis angusto transitu iugis ita ut vix singula meent plaustra, longitudine [viii] p., toto opere manu facto. dextra laevaue ambustis similes independent scopuli sitiente tractu per [xxviii] p. angustias impedit corrivatus salis e cautibus liquor atque eadem emissus; praeterea serpentium multitudo nisi hieme transitum non sinit.

adiabenis conectuntur carduchi quondam dicti, nunc cordueni, praefluence tigri, his pratitae παρ' ὁδὸν appellati, qui tenent caspias portas. iis ab latere altero occurrunt deserta parthiae et citheni iuga. mox eiusdem parthiae amoenissimus situs, qui vocatur choara. duae urbes ibi parthorum oppositae quondam medis, calliope et alia in rupe issatis; ipsum vero parthiae caput

hecatompylos; abest a portis [cxxxiii] p. ita parthorum quoque regna foribus discluduntur. egressos portis excipit protinus gens caspia ad litora usque, quae nomen portis et mari dedit. laeva montuosa. ab ea gente retrorsus ad cyrum amnem produntur [ccxxv] p., ab eodem amne si subeatur ad portas, [dcc]. hunc enim cardinem alexandri magni itinerum fecere ab iis portis ad indiae principium stadia [xv] dclxxxx prodendo, ad bactra oppidum, quod appellant zariasta, mmm dcc, inde ad iaxartem amnem [v].

a caspiis ad orientem versus regio est apavortene dicta et in ea fertilitatis inclutae locus dareium, mox gentes tapyri, anariaci, staures, hyrcani, a quorum litoribus idem mare hyrcanium vocari incipit a flumine sideri. citra id amnes maziris, strator, omnia ex caucaso. sequitur regio margiane apricitatis inclutae, sola in eo tractu vitifera, undique inclusa montibus amoenis, ambitu stadiorum m d, difficilis aditu propter harenosas solitudines per [cxx] p., et ipsa contra parthiae tractum sita. in qua alexander alexandriam condiderat, qua diruta a barbaris antiochus seleuci filius eodem loco restituit syrianam interfluente margo, qui corrivatur in zotha lacu; maluerat illam antiochiam appellari. urbis amplitudo circumitur stadiis lxx. in hanc orodes romanos crassiana clade captos deduxit. ab huius excelsis per iuga caucasi protenditur ad bactros usque gens mardorum fera, sui iuris. sub eo tractu gentes orciani, commori, berdrigae, pharmacotrophi, chomarae, choamani, murrasariae, mandruani, flumina mandrum, chindrum, ultraque chorasmi, gandari, pariani, zarangae, arasmi, marotiani, arsi, gaeli, quos graeci cadusios appellavere, matiani, oppidum heraclea, ab alexandro conditum, quod deinde subversum ac restitutum antiochus achaida appellavit, dribyces, quorum medios fines secat oxus amnis, ortus in lacu oaxo, syrmatae, oxyttgae, moci, bateni, saraparae, bactri, quorum oppidum zariastes, quod postea bactrum a flumine appellatum est. gens haec optinet aversa montis paropanisi exadversus fontes indi; includitur flumine ocho. ultra sogdiani, oppidum panda et in ultimis eorum finibus alexandria, ab alexandro magno conditum. arae ibi sunt ab hercule ac libero patre constitutae, item Cyro et samiramide atque alexandro, finis omnium eorum ductus ab illa parte terrarum, includente flumine iaxarte, quod scythae silim vocant, alexander militesque eius tanain putavere esse. transcendit eum amnem demodamas, seleuci et antiochi regum dux, quem maxime sequimur in his, arasque apollini didymaeo statuit.

vltra sunt scytharum populi. persae illos sacas universos appellavere a proxima gente, antiqui aramios, scythae ipsi persas chorsaros et caucasum montem croucasim, hoc est nive candidum. multitudo populorum innumera et quae cum parthis ex aequo degat. celeberrimi eorum sacae, massagetae, dahae, essedones, astacae, rumnici, pestici, homodoti, histi, edones, camae, camacae, euchatae, cotieri, authusiani, psacae, arimaspi, antacati, chroasai, oetaei. ibi napaei interisse dicuntur a palaeis. nobilia apud eos flumina mandragaeum et caspasum. nec in alia parte maior auctorum inconstantia, credo propter innumeras vagasque gentes. haustum ipsius maris dulcem esse et alexander magnus prodidit et M. Varro talem perlatum pompeio iuxta res

gerenti mithridatico bello, magnitudine haut dubie influentium amnium victo sale. adicit idem pompeii ductu exploratum, in bactros septem diebus ex india perveniri ad bactrum flumen quod in oxum influat, et ex eo per caspium in cyrum subvectos, et v non amplius dierum terreno itinere ad phasim in pontum indicas posse devehī merces.

insulae toto eo mari multae, volgata una maxime zazata.

a caspio mari scythicoque oceano in eorum cursus inflectitur, ad orientem conversa litorum fronte. inhabitabilis eius prima pars a scythico promunturio ob nives; proxima inculta saevitia gentium. anthropophagi scythae insident humanis corporibus vescentes; ideo iuxta vastae solitudines ferarumque multitudo, haut dissimilem hominum inmanitatem obsidens. iterum deinde scythae iterumque deserta cum beluis usque ad iugum incubans mari quod vocant tabim. nec ante dimidiam ferme longitudinem eius orae, quae spectat aestivum orientem, inhabitatur illa regio. primi sunt hominum qui noscantur seres, lanicio silvarum nobiles, perfusam aqua depectentes frondium canitiem, unde geminus feminis nostris labos redordiendi fila rursusque texendi: tam multiplici opere, tam longinquo orbe petitur ut in publico matrona traluceat. seres mites quidem, sed et ipsi feris similes coetum reliquorum mortalium fugiunt, commercia exspectant. primum eorum noscitur flumen psitharas, proximum cambari, tertium lanos, a quo promunturium chryse, sinus cirnaba, flumen atianos, sinus et gens hominum attacorum, apricis ab omni noxio adflatu seclusa collibus, eadem, qua hyperborei degunt, temperie. de iis privatim condidit volumen amometus, sicut hecataeus de hyperboreis. ab attacoris gentes phuni et thocari et, iam indorum, casiri introrsus ad scythas versi - humanis corporibus vescuntur - , nomades quoque indiae vagantur. sunt qui ab aquilone contingi ab ipsis ciconas dixere et brisaros.

sed unde plane constent gentes, hemodi montes adsurgunt indorumque gens incipit, non eorum tantum mari adiacens, verum et meridiano quod indicum appellavimus. quae pars orienti est adversa, recto praetenditur spatio ad flexum et initio indici maris [30xviii]30 [lxxv] colligit, deinde quae se flexit in meridiem, [30xxiii]30 [lxxv], ut eratosthenes tradit, usque ad indum amnem, qui est ab occidente finis indiae. complures autem totam eius longitudinem xl dierum noctiumque velifico navium cursu determinavere et a septentrione ad meridiem [30xxviii]30 [l], agrippa longitudinis [30xxxiii]30, latitudinis [30xiii]30 prodidit. posidonius ab aestivo solis ortu ad hibernum exortum metatus est eam, adversam galliam statuens, quam ab occidente aestivo ad occidentem hibernum metabatur, totam a favonio; itaque adversum eius venti adflatum iuvare indiam salubremque fieri haut dubia ratione docuit. alia illi caeli facies, alii siderum ortus; binae aestates in anno, binae messes, media inter illas hieme etesiarum flatus, nostra vero bruma lenes ibi aerae, mare navigabile. gentes ei urbesque innumerae, si quis omnes persequi velit. etenim patefacta est non modo alexandri magni armis regumque qui successere ei, circumvectis etiam in hyrcanium mare et caspium seleuco et antiocho praefectoque classis eorum patrocle, verum et aliis auctoribus graecis, qui

cum regibus indicis morati, sicut megasthenes et dionysius a philadelpho missus, ex ea causa vires quoque gentium prodidere. non tamen est diligentiae locus: adeo diversa et incredibilia traduntur. alexandri magni comites in eo tractu indiae, quem is subegerit, scripserunt [v] oppidorum fuisse, nullum coo minus, gentium [viii], indiamque tertiam partem esse terrarum omnium, multitudinem populorum innumeram, probabili sane ratione: indi enim gentium prope soli numquam migravere finibus suis. colliguntur a libero patre ad alexandrum magnum reges eorum clii annis [vi] ccccli; adiciunt et menses iii. annium mira vastitas; proditur alexandrum nullo die minus stadia de navigasse indo nec potuisse ante menses v enavigare adiectis paucis diebus, et tamen minorem gange esse constat. seneca, etiam apud nos temptata indiae commentatione, lx amnes eius prodidit, gentes duodeviginti centumque. par labos sit montes enumerare. iunguntur inter se imavus, hemodus, paropanisus, caucasus, a quibus tota decurrit in planitiem immensam et aegypto similem.

verum ut terrena demonstratio intellegatur, alexandri magni vestigiis insistimus. diognetus et baeton, itinerum eius mensores, scripsere a portis caspiis hecatompylon parthorum quot diximus milia esse, inde alexandriam arion, quam urbem is rex condidit, [dlxxv], prophthasiam drangarum [cxcviii], arachosiorum oppidum [dlxv], ortospanum [clxxv], inde ad alexandri oppidum [l] - in quibusdam exemplaribus diversi numeri reperiuntur - ; hanc urbem sub ipso caucaso esse positam; ab ea ad flumen copheta et oppidum indorum peucolatim [ccxxxvii], unde ad flumen indum et oppidum taxilla [lx], ad hydaspen fluvium clarum [cxx], ad hypasim non ignobiliorem [30xxv]30 [iiii] [ccclxxxx], qui fuit alexandri itinerum terminus, exuperato tamen amne arisque in adversa ripa dicatis. epistulae quoque regis ipsius consentiunt his. reliqua inde seleuco nicatori peragrata sunt: ad sydrum [clxviii], iomanem amnem tantundem - aliqua exemplaria adiciunt [v] passuum - , inde ad gangen [cxii] d, ad rhodaphan [dlxviii] - alii [cccxxv] in hoc spatio produnt - , ad callinipaza oppidum [clxvii] d - alii [cclxv] - , inde ad confluentem iomanis et gangis [dcxxv] - plerique adiciunt [xiii] d - , ad oppidum palibothra [ccccxxv], ad ostium gangis [dcxxxvii] d. gentes, quas memorare non pigeat, a montibus hemodis, quorum promunturium imaus vocatur incolarum lingua nivolum sic significante, isari, cosiri, izi et per iuga chirotosagi multarumque gentium cognomen bragmanae, quorum mactocalingae; flumina prinas et cainnas, quod in gangen influit, ambo navigabilia; gentes calingae mari proximi et supra mandaei, malli quorum mons mallus, finisque tractus eius ganges.

hunc alii incertis fontibus ut nilum riganthemque vicina eodem modo, alii in scythicis montibus nasci dixerunt; influere in eum xviii amnes, ex iis navigabiles praeter iam dictos crenaccam, rhamnumbovam, casuagum, sonum. alii cum magno fragore ipsius statim fontes erumpere, deiectumque per scopulosa et abrupta, ubi primum molles planities contingat, in quodam lacu hospitari, inde lenem fluere, ubi minimum, [viii] p. latitudine, ubi modicum, stadiorum c, altitudine nusquam minore passuum xx, novissima

gente gangaridum calingarum. regia pertalis vocatur; regi [lx] peditum, equites m, elephantum dcc in procinctu bellorum excubant. namque vita mitioribus populis indorum multipertita degitur: tellurem exercent, militiam alii capessunt, merces alii suas evehunt, externas invehunt, res publicas optumi ditissimique temperant, iudicia reddunt, regibus adsident. quintum genus, celebratae ibi et prope in religionem versae sapientiae deditum, voluntaria semper morte vitam accenso prius rogo finit. unum super haec est semiferum ac plenum laboris inmensi - a quo supra dicta continentur - venandi elephantos domandique: his arant, his vehuntur, haec maxime novere pecuaria, his militant dimicantque pro finibus; dilectum in bella vires et aetas atque magnitudo faciunt. insula in gange est magnae amplitudinis, gentem continens unam, nomine modogalingam. ultra siti sunt modubae, molindae, vberae cum oppido eiusdem nominis magnifico, modressae, praeti, calissae, sasuri, passalae, colebae, orumcolae, abali, thalutae. rex horum peditum [l], equitum [liii], elephantorum [liii] in armis habet. validior deinde gens andarae, plurimis vicis, xxx oppidis quae muris turribusque muniuntur, regi praebet peditum [c], equitum [ii], elephantos m. fertilissimi sunt auri dardae, setae vero et argenti. sed omnium in india prope, non modo in hoc tractu, potentiam claritatemque antecedunt prasi amplissima urbe ditissimaque palibothra, unde quidam ipsam gentem palibothros vocant, immo vero tractum universum a gange. regi eorum peditum [dc], equitum [xxx], elephantorum [viii] per omnes dies stipendiantur, unde coniectatio ingens opum est. ab his in interiore situ monaedes et suari, quorum mons maleus, in quo umbrae ad septentrionem cadunt hieme, aestate in austrum, per senos menses. septentriones eo tractu semel anno adparere, nec nisi quindecim diebus, baeton auctor est; hoc idem pluribus locis indiae fieri megasthenes. austrinum polum indi diamasas vocant. amnis iomanes in gangem per palibothros decurrit inter oppida methora et chrysobora. a gange versa ad meridiem plaga tinguntur sole populi, iam quidem infecti, nondum tamen aethiopum modo exusti; quantum ad indum accedunt, tantum colore praeferunt. indus statim a prasiarum gente, quorum in montanis pygmaei traduntur. artemidorus inter duos annos [30xxi]30 interesse tradit.

indus, incolis sindus appellatus, in iugo caucasi montis quod vocatur paropanis adversus solis ortum effusus, et ipse undeviginti recipit annos, sed clarissimos hydaspen quattuor alios adferentem, cantabam tris, per se vero navigabiles acesinum et hypasim, quadam tamen aquarum modestia nusquam latior l stadiis aut altior xv passibus, amplissimam insulam efficiens, quae prasiane nominatur, et aliam minorem, quae patale. ipse per [30xii]30 [cl] passuum, parcissimis auctoribus, navigatur et quodam solis comitatu in occasum versus oceano infunditur. mensuram orae ad eum ponam, ut invenio, generatim, quamquam inter se nullae congruunt. ab ostio gangis ad promunturium calingon et oppidum dandaguda [dcxxv], ad tropina [30xii]30 [xxv], ad perimulae promunturium, ubi est celeberrimum indiae emporium, [dcll], ad oppidum in insula quam supra diximus patalam [dcxx].

gentes montanae inter eum et iomanem caesi, caetriboni silvestres, dein megallae, quorum regi d elephanti, peditum equitumque numerus incertus, chrysei, parasangae, asmagi, tigri fera scatentes; armant peditum [xxx], elephantos ccc, equites dccc. hos indus includit montium corona circumdatos et solitudinibus. [dcxxv] infra solitudines dari, surae, iterumque solitudines per [clxxxvii], plerumque harenis ambientibus haut alio modo quam insulas mari. infra deserta haec malthaecorae, singae, maroae, rarungae, moruni. hi montium, qui perpetuo tractu oceani in ora pertinent, incolae liberi et regum expertes multis urbibus montanos optinent colles. narae deinde, quos claudit mons altissimus indicorum capitalia; huius incolae alio latere late auri et argenti metalla fodiunt. ab his oratae, quorum regi elephanti quidem x, sed amplae vires peditum, suarattaratae - et hi sub rege elephantos non alunt fiducia equitum peditumque - odonbaeorae, sarabastrae thorace urbe pulchra, fossis palustribus munita, per quas crocodili humani corporis avidissimi aditum nisi ponte non dant. et aliud apud illos laudatur oppidum automula, inpositum litori quinque amnium in unum confluente concursu, emporio nobili. regi eorum elephanti m dc, peditum [cl], equitum [v]. pauperior charmarum rex elephantos lx parvasque reliquas vires habet. ab his gens pandae, sola indorum regnata feminis. unam herculi sexus eius genitam ferunt ob idque gratiorem, praecipuo regno donatam; ab ea deducentes originem imperitant ccc oppidis, peditum [cl], elephantis d. post hanc trecentarum urbium seriem derangae, posingae, butae, gogaraei, vmbrae, nereae, brangosi, nobundae, cocondae, nesei, palatitae, salobriasae, orostrae patalam insulam attingentes, a cuius extremo litore ad caspias portas [30xviii]30 [xxv] produntur.

hinc deinde accolunt indum, adverso eo scandente demonstratione, mathoae, bolingae, gallitalutae, dimuri, megari, ardabae, mesae, abisari, silae; mox deserta in [cc], quibus exuperatis organagae, abortae, brasuertae, et ab his solitudines prioribus pares. dein sorofages, arbae, marogomatrae, vmbritae ceaeque, quorum xii nationes singulisque binae urbes, asini, trium urbium incolae; caput eorum bucephala, alexandri regis equo, cui fuerat hoc nomen, ibi sepulto conditum. montani super hos caucaso subiecti sosaeadae, sondrae transgressisque indum et cum eo decurrentibus samarabiae, sambraceni, bisambritae, orsi, andiseni, taxilae cum urbe celebri. iam in plana demisso tractu, cui universo nomen amendae, populi quattuor, peucolitae, arsagalitae, geretae, assoi. etenim plerique ab occidente non indo amne determinant, sed adiciunt quattuor satrapias, gedrosos, arachotas, arios, paropanidas, ultimo fine cophete fluvio, quae omnia ariorum esse aliis placet. nec non et nysam urbem plerique indiae adscribunt montemque merum, libero patri sacrum, unde origo fabulae, iovis femine editum; item aspaganos gentem, vitis et lauri et buxi pomorumque omnium in graecia nascentium fertilem. quae memoranda ac prope fabulosa de fertilitate terrae et genere frugum arborumque aut ferarum ac volucrum et aliorum animalium traduntur, suis quaeque locis in reliqua parte operis commemorabuntur, quattuor satrapiae

mox paulo, ad taprobanen insulam festinante animo.

sed ante sunt aliae: patale, quam significavimus in ipsis faucibus indi, triquetra figura, [ccxx] p. latitudine; extra ostium indi chryse et argyre, fertilis metallis, ut credo: nam quod aliqui tradidere, aureum argenteumque his solum esse, haut facile crediderim. ab his [xx] p. crocala et ab ea [xii] bibaga, ostreis ac conchyliis referta, dein coralliba, [viii] a supra dicta, multaeque ignobiles.

taprobanen alterum orbem terrarum esse diu existimatum est antichthonum appellatione. ut insulam liqueret esse alexandri magni aetas resque praestitere. onesicritus, classis eius praefectus, elephantos ibi maiores bellicosioresque quam in india gigni scripsit, megasthenes flumine dividi, incolasque palaeogonos appellari, auri margaritarumque grandium fertiliores quam indos. eratosthenes et mensuram prodidit, longitudinis [vii] stadium, latitudinis [v], nec urbes esse, sed vicos dccl. incipit ab eoo mari inter ortum occasumque solis indiae praetenta et quondam credita xx dierum navigatione a prasiana gente distare, mox, quia papyraceis navibus armamentisque nili peteretur, ad nostrarum navium cursus vii dierum intervallo taxata. mare interest vadosum, senis non amplius altitudinis passibus, sed certis canalibus ita profundum, ut nullae anchorae sidant. ob id navibus utrimque prorae, ne per angustias alvei circumagi sit necesse; magnitudo ad terna milia amphorum. siderum in navigando nulla observatio; septentrio non cernitur. volucres secum vehunt emittentes saepius meatumque earum terram petentium comitantur. nec plus quaternis mensibus anno navigant. cavent a solstitio maxime centum dies, tunc illo mari hiberno.

hactenus a priscis memorata. nobis diligentior notitia claudi principatu contigit legatis etiam ex ea insula advectis. id accidit hoc modo. anni plocami, qui maris rubri vectigal a fisco redemerat, libertus circa arabiam navigans aquilonibus raptus praeter carmaniam, xv die hippuros portum eius invectus, hospitali regis clementia sex mensum tempore inbutus adloquio percunctanti postea narravit romanos et caesarem. mirum in modum in auditis iustitiam ille suspexit, quod pari pondere denarii essent in captiva pecunia, cum diversae imagines indicarent a pluribus factos, et hoc maxime sollicitatus ad amicitiam legatos quattuor misit principe eorum rachia. ex iis cognitum, d esse oppida, portum contra meridiem adpositum oppido palaesimundo, omnium ibi clarissimo ac regio, [cc] plebis. stagnum intus megisba [ccclxxv] p. ambitu, insulas pabuli tantum fertiles complexum; ex eo duos amnes erumpere, palaesimundum iuxta oppidum eiusdem nominis influentem in portum tribus alveis, quinque stadiorum artissimo, xv amplissimo, alterum ad septentriones indiamque versum, cydara nomine. proximum esse indiae promunturium quod vocetur coliacum, quadridui navigatione, medio in cursu solis insula occurrente. mare id colore perviridi, praeterea fruticosum arboribus, iubas earum gubernaculis deterentibus. septentriones vergiliasque apud nos veluti in novo caelo mirabantur, ne lunam quidem apud ipsos nisi ab octava in xvi supra terram aspici fatentes; canopum lucere noctibus, sidus ingens et clarum. sed maxime mirum iis erat umbras suas in nostrum caelum cadere, non in

suum, solemque a laeva oriri et in dexteram occidere potius quam e diverso. iidem narravere latus insulae quod praetenderetur indiae [x] stadiorum esse ab oriente hiberno; ultra montes hemodos seras quoque ab ipsis aspici, notos etiam commercio; patrem rachiae commeasse eo; advenis ibi feras occurrere, ipsos vero excedere hominum magnitudinem, rutilis comis, caeruleis oculis, oris sono truci, nullo commercio linguae. cetera eadem quae nostri negotiatores: fluminis ulteriore ripa merces positas iuxta venalia tolli ab iis, si placeat permutatio, non aliter odio iustiore luxuriae quam si perducta mens illuc usque cogitet, quid et quo petatur et quare. sed ne taprobane quidem, quamvis extra orbem a natura relegata, nostris vitiis caret. aurum argentumque et ibi in pretio; marmor testudini simile, margaritae gemmaeque in honore; multo praestantior est totus luxuriae nostrae cumulus. ipsorum opes maiores esse dicebant, sed apud nos opulentiae maiorem usum. servum nemini, non in diem aut interdiu somnum, aedificia modice ab humo exstantia, annonam numquam augeri, non fora litesve esse, coli herculem, eligi regem a populo senecta clementiaque, liberos non habentem, et, si postea gignat, abdicari, ne fiat hereditarium regnum. rectores ei a populo xxx dari, nec nisi plurium sententia quemquam capitis damnari; sic quoque appellationem esse ad populum et lxx iudices dari: si liberent ii reum, amplius xxx iis nullam esse dignationem, gravissimo probro. regi cultum liberi patris, ceteris arabum. regem, si quid delinquat, morte multari, nullo interemente, aversantibus cunctis et commercia etiam sermonis negantibus. festa venatione absumi; gratissimam eam tigribus elephantisque constare. agros diligenter coli, vitis usum non esse, pomis abundare. esse et in piscatu voluptatem, testudinum maxime, quarum superficie familias habitantium contegi: tanta reperiri magnitudine. vitam hominum centum annis modicam.

haec conperta de taprobane. quattuor satrapiae, quas in hunc locum distulimus, ita se habent. a proximis indo gentibus montana. capisene habuit capisam urbem, quam diruit Cyrus. arachosia cum flumine et oppido eiusdem nominis, quod quidam cufim dixere, a samiramide conditum. amnis erymandus, praefluens parabesten arachosiorum. proximos his a meridie ad partem arachotarum faciunt dexendrusos, a septentrione paropanisidas, cartana oppidum sub caucaso, quod postea tetragonis dictum. haec regio est ex adverso bactriae, ariorum deinde cuius oppidum alexandria, a conditore dictum, sydraci, dangalae, parapinae, cataces, mazi; ad caucasum cadrusi, oppidum ab alexandro conditum. infra haec omnia planiora. ab indo ariana regio, ambusta fervoribus desertisque circumdata, multa tamen interfusa opacitate cultores congregat circa duos maxime fluvios, tonberon et arosapen. oppidum artacoana, arius amnis, qui praefluit alexandriam ab alexandro conditam. patet oppidum stadia xxx multoque pulchrius sicut antiquius artacabene, iterum ab antiocho munitum, stadia quinquaginta. dorsigi gens; amnes pharnacotis, ophradus; prophthasia, oppidum zarasparum, drangae, euergetae, zarangae, gedrusi, oppida peucolis, lyphorta, methorcum; deserta; amnis manain, acutri gens, flumen eorum, gens orbi, flumen navigabile

pomanus pandarum finibus, item cabirus suarorum, ostio portuosum, oppidum condigramma, flumen cophes. influunt in eum navigabilia saddaros, parospus, sodamus. arianæ partem esse daritim aliqui volunt mensuramque produnt utriusque longitudinem [30xviii]30, latitudinem dimidio minorem quam indiae. alii gedrusos et sires posuere per [cxxxviii] p., mox ichthyophagos oritas propria, non indorum, lingua loquentes per [cc] p. ichthyophagos omnes alexander vetuit piscibus vivere. deinde posuere arbiorum gentem per [cc] p. ultra deserta; dein carmania ac persis atque arabia.

sed priusquam generatim haec persequamur, indicari convenit quae prodidit onesicritus classe alexandri circumvectus in mediterranea persidis ex india, enarrata proxime a iuba, deinde eam navigationem, quae his annis comperta servatur hodie.

onesicriti et nearchi navigatio nec nomina omnia habet mansionum nec spatia, primumque xylene polis ab alexandro condita, unde ceperunt exordium, iuxta quod flumen aut ubi fuerit non satis explanatur. haec tamen digna memoratu produntur ab iis; oppidum a nearcho conditum in navigatione et flumen arbium navium capax; contra insula, distans lxx stadiis, alexandria condita a leonnato iussu alexandri in finibus gentis, argeruus portu salubri, flumen tonberum navigabile, circa quod pasirae; deinde ichthyophagi tam longo tractu, ut xxx dierum spatio praenavigaverint; insula quae solis appellatur et eadem nympharum cubile, rubens, in qua nullum non animal absumitur incertis causis; ori gens, flumen carmaniae hyctanis, portuosum et auro fertile. ab eo primum septentriones apparuisse adnotavere, arcturum neque omnibus cerni noctibus nec totis umquam. achaemenidas usque illo tenuisse. aeris et ferri metalla et arrenici ac mini exerceri. inde promunturium carmaniae est, ex quo in adversam oram ad gentem arabiae macas traiectus distat [I] p.; insulae tres, quarum oracta tantum habitatur aquosa, a continente [xxv] p., insulae quattuor iam in sinu ante persida - circa has hydri marini vicenum cubitorum adnatantes terruere classem - , insula athotadrus, item gauratae, in quibus gyani gens; flumen hyperis in medio sinu persico, onerariarum navium capax, flumen sitioganus, quo pasargadas septimo die navigatur, flumen navigabile phrstimus, insula sine nomine, flumen granis modicarum navium - per susianen fluit, dextra eius accolunt dexi montani, qui bitumen perficiunt - , flumen zarotis, ostio difficili nisi peritis, insulae duae parvae; inde vadosa navigatio, palustri similis, per euripos tamen quosdam peragitur; ostium euphratis, lacus quem faciunt eulaeus et tigris iuxta characen, inde tigri susa. festos dies ibi agentem alexandrum invenerunt septimo mense post quam digressus ab iis fuerat patalis, tertio navigationis. sic alexandri classis navigavit; postea ab syagro arabiae promunturio patalen favonio, quem hippalum ibi vocant, peti certissimum videbatur, [30xiii]30 [xxxii] p. aestimatione.

secula aetas propiorem cursum tutioremque iudicavit, si ab eodem promunturio sigerum portum indiae peteret, diuque ita navigatum est, donec compendia invenit mercator lucroque india admota est: quippe omnibus annis

navigatur, sagittariorum cohortibus inpositis; etenim piratae maxime infestabant. nec pigebit totum cursum ab aegypto exponere, nunc primum certa notitia patescente: digna res, nullo anno minus hs [30d]30 imperii nostri exhauriente india et merces remittente, quae apud nos centiplicato veneant. mm p. ab alexandria abest oppidum iuliopolis; inde navigant nilo coptum [cccviii] p., qui cursus etesiis flantibus peragitur xii diebus. a copto camelis itur, aquationum ratione mansionibus dispositis: prima appellatur hydreuma [xxxii], secunda in monte diei itinere, tertia in altero hydreumate a copto [lxxxv], deinde in monte; mox ad hydreuma apollinis a copto [clxxxiii], rursus in monte; mox ad novum hydreuma a copto [ccxxvi]. est et aliud hydreuma vetus - trogodyticum nominatur - , ubi praesidium excubat deverticulo duum milium; distat a novo hydreumate [vii]. inde berenice oppidum, ubi portus rubri maris, a copto [cclvii] p. sed quia maior pars itineris conficitur noctibus propter aestus et stativis dies absumuntur, totum a copto berenicen iter duodecimo die peragitur. navigare incipiunt aestate media ante canis ortum aut ab exortu protinus veniuntque tricesimo circiter die ocelim arabiae aut canen turiferae regionis. est et tertius portus qui vocatur muza, quem indica navigatio non petit nec nisi turis odorumque arabicorum mercatores. intus oppidum, regia eius, appellatur sapphar, aliudque save. indos autem petentibus utilissimum est ab oceli egredi; inde vento hippalo navigant diebus xl ad primum emporium indiae muzirim. non expetendum propter vicinos piratas, qui optinent locum nomine nitrias, neque est abundans mercibus; praeterea longe a terra abest navium statio, lintribusque adferuntur onera et egeruntur. regnabat ibi, cum proderem haec, caelobothras. alius utilior portus gentis neacyndon, qui vocatur became. ibi regnabat pandion, longe ab emporio in mediterraneo distante oppido quod vocatur modura. regio autem, ex qua piper monoxylis lintribus becaren convehunt, vocatur cottonara. quae omnia gentium portuumve aut oppidorum nomina apud neminem priorum reperiuntur, quo apparet mutari locorum status. ex india renavigant mense aegyptio tybi incipiente, nostro decembri, aut utique mechiris aegyptii intra diem sextum, quod fit intra idus ianuarias nostras: ita evenit ut eodem anno remeant. navigant autem ex india vento volturmo et, cum intravere rubrum mare, africo vel austro. nunc revertemur ad propositum.

carmaniae oram patere duodeciens quinquaginta milia passuum nearchus scripsit. ab initio eius ad flumen sabim [c] p.; inde vineas coli et arva ad flumen ananim xxv milium spatium; regio vocatur armuzia. oppida carmaniae zetis et alexandria.

inrumpit deinde et in hac parte geminum mare in terras, quod rubrum dixere nostri, graeci erythrum a rege erythra aut, ut alii, solis re percussu talem reddi existimantes colorem, alii ab harena terraque, alii tali aquae ipsius natura. sed in duos dividitur sinus. is qui ab oriente est persicus appellatur, [30xxv]30 circuitu, ut eratosthenes tradit; ex adverso est arabia, cuius [30xv]30 longitudo. rursus altero ambitur sinu arabico nominato. oceanum qui influit azanium appellant. persicum introitu [v] latitudinis, alii [iiii] fecerunt.

ab eo ad intimum sinum recto cursu [30xi]30 [xxv] propemodum constat esse et situm eius humani capitis effigie. onesicritus et nearchus ab indo amne in sinum persicum atque illinc babylonem euphratis paludibus scripserunt [30xvii]30 esse.

in carmaniae angulo chelonophagi, testudinum superficie casas tegentes, carne vescentes. a flumine arabi promunturium ipsum inhabitant, praeter capita toto corpore hirti coriisque piscium vestiti. ab horum tractu indiam versus caecandrus, deserta insula, in oceano [l] p. traditur iuxtaque eam freto interfluente stoidis, quaestuosa margaritis. a promunturio carmanis iunguntur harmozaei. quidam interponunt arbios, [ccccxxi] p. toto litore. ibi portus macedonum et arae alexandri in promunturio. amnes siccanas, dein dratinus et salsum. ab eo promunturium themistea; insula aphrodisias habitatur. inde persidis initium ad flumen oratim, quo dividitur ab elymaide. contra persidem insulae psilos, cassandra, aracha cum monte praealto neptuno sacra. ipsa persis adversus occasum sita optinet litore [dl] p., etiam in luxum dives, in parthorum iam pridem translata nomen. horum de imperio nunc in paucis.

regna parthorum duodeviginti sunt omnia; ita enim dividunt provincias circa duo, ut diximus, maria, rubrum a meridie, hyrcanium a septentrione. ex his xi, quae superiora dicuntur, incipiunt a confinio armeniae caspiisque litoribus, pertinent ad scythas, cum quibus ex aequo degunt; reliqua vii regna inferiora appellantur. quod ad parthos attinet, semper fuit parthyaea in radicibus montium saepius dictorum, qui omnes eas gentes praetexunt. habet ab ortu arios, a meridie carmaniam et arianos, ab occasu pratitas medos, a septentrione hyrcanos, undique desertis cincta. ultiores parthi nomades appellantur. citra deserta ab occasu urbes eorum quas diximus, issatis et calliope, ab oriente aestivo pyropum, ab hiberno maria, in medio hecatompylos, arsace, regio nisiae parthyenes nobilis, ubi alexandropolis a conditore.

necessarium est hoc in loco signare et medorum situm terrarumque faciem circumagere ad persicum mare, quo facilius dein reliqua noscantur. namque media, ab occasu transversa oblique parthiae occurrens, utraque regna praecludit. habet ergo ipsa ab ortu caspios et parthos, a meridie sittacenem et susianem, persida, ab occasu adiabenen, ab septentrione armeniam. persae rubrum mare semper accollere, propter quod is sinus persicus vocatur. regio ibi maritima ceribobus; qua vero ipsa subit ad medos, climax megale appellatur locus arduo montis ascensu per gradus, introitu angusto, ad persepolim, caput regni, dirutam ab alexandro. praeterea habet in extremis finibus laodiceam ab antiocho conditam. inde ad orientem magi optinent phrasargida castellum, in quo cyri sepulchrum; est et horum ecbatana oppidum, translatum ab dario rege ad montes. inter parthos et arianos excurrunt paraetaceni. his gentibus et euphrate inferiora regna cluduntur. reliqua dicemus a mesopotamia, excepto mucrone eius arabumque populis in priore dictis volumine.

mesopotamia tota assyriorum fuit, vicatim dispersa praeter babylona et

num. macedones eam in urbes congregavere propter ubertatem soli. oppida praeter iam dicta habet seleuciam, laodiceam, artemitam; item in arabum gente qui orroei vocantur et mardani antiochiam, quae a praefecto mesopotamiae nicanore condita arabis vocatur. iunguntur his arabes introrsus eldamari, supra quos ad pallacontam flumen bura oppidum, salmani et masei arabes; gordyaeis vero iuncti azoni, per quos zerbis fluvius in tigrim cadit, azonis silices montani et orontes, quorum ad occidentem oppidum gaugamela, item suae in rupibus. supra silicas sitrae, per quos lycus ex armenia fertur; ab sitris ad hibernum exortum azochis oppidum, mox in campestribus oppida diospege, polytelia, stratonicea, anthemus. in vicinia euphratis nicephorion, quod diximus, alexander iussit condi propter loci opportunitatem. dicta est et in zeugmate apamea, ex qua orientem petentes excipit oppidum caphrena munitum, quondam stadiorum lxx amplitudine et satraparum regia appellatum, quo tributa conferebantur, nunc in arcem redactum. durant, ut fuere, thebata et, ductu pompeii magni terminus romani imperii, oruros, a zeugmate [l] cc. sunt qui tradunt euphraten gobaris praefecti opere diductum esse ubi diximus findi, ne praecipiti cursu babylona infestaret, ab assyriis vero universis appellatum narmalchan, quod significat regium flumen. qua dirivatur, oppidum fuit agranis e maximis, quod diruere persae. babylon, chaldaicarum gentium caput, diu summam claritatem inter urbes obtinuit toto orbe, propter quod reliqua pars mesopotamiae assyriaeque babylonia appellata est, [lx] p. amplexa ii muris ducenos pedes altis, quinquagenos latis, in singulos pedes ternis digitis mensura ampliore quam nostra, interfluo euphrate, mirabili opere utroque. durat adhuc ibi iovis belli templum; inventor hic fuit sideralis scientiae. cetero ad solitudinem rediit exhausta vicinitate seleucia, ob id conditae a nicatore intra xl lapidem in confluente euphratis fossa perducti atque tigris, quae tamen babylonia cognominatur, libera hodie ac sui iuris macedonumque moris. ferunt ei plebis urbanae [dc] esse, situm vero moenium aquilae pendentis alas, agrum totius orientis fertilissimum. invicem ad hanc exhauriendam ctesiphontem iuxta tertium ab ea lapidem in chalonitide condidere parthi, quod nunc caput est regnorum, et postquam nihil proficiebatur, nuper vologes rex aliud oppidum vologesocertam in vicino condidit. sunt etiamnum in mesopotamia oppida hipparenorum, chaldaeorum doctrina et hoc, sicut babylon, iuxta fluvium narragam qui cadit in narragam, unde civitati nomen. muros hipparenorum persae diruere. orcheni quoque, tertia chaldaeorum doctrina, in eodem situ locantur ad meridiem versi. ab his notitiae et orothophanitae et gnesiochartae.

euphrate navigari babylonem e persico mari [ccccxii] p. tradunt nearchus et onesicritus; qui vero postea scripsere, ad seleuciam [ccccxl]; iuba a babylone characen [clxxv] d. fluere aliqui ultra babylona continuo alveo, prius quam distrahitur ad rigua, [lxxxvii], universo autem cursu [30xii]30 p. inconstantiam mensurae diversitas auctorum facit, cum persae quoque schoenos et parasangas alii alia mensura determinent. ubi desiit alveo munire, ad confinium characis accedente tractu, statim infestant attali latrones, arabum

gens, ultra quos scenitae, ambitu vero euphratis nomades arabiae usque ad deserta syriae, unde in meridiem flecti eum diximus, solitudines palmyrenas relinquentem. seleucia abest a capite mesopotamiae euphrate navigantibus [30xi]30 [xxv] p., a mari rubro, si tigri navigetur, [cccxx], a zeugmate [dccxxiii], zeugma ab seleucia syriae ad nostrum litus [clxxv]. haec est ibi latitudo terrarum inter duo maria, parthici vero regni [dccccxliiii].

est etiamnum oppidum mesopotamiae in ripa tigris circa confluentes, quod vocant digbam. sed et de tigri ipso dixisse conveniat.

oritur in regione armeniae maioris, fonte conspicuo in planitie. loco nomen elegosine est; ipsi qua tardior fluit diglito; unde concitatur, a celeritate tigris incipit vocari: ita appellant medi sagittam. influit in lacum aretissam, omnia inlata pondera sustinentem et nitrum nebulis exhalantem. unum genus ei piscium est, idque transcurrentis non miscetur alveo, sicut neque e tigri pisces in lacum transnatare. fertur autem et cursu et colore dissimilis transvectusque occurrente tauro monte in specum mergitur subterque lapsus a latere altero eius erumpit. locus vocatur zoaranda; eundem esse manifestum, quod demersa perfert. alterum deinde transit lacum, qui thospites appellatur, rursusque in cuniculos mergitur, post [xxii] p. circa nymphaeum redditur. tam vicinum arsaniae fluere eum in regione arrhene claudius caesar auctor est, ut, cum intumescere, confluant nec tamen misceantur leviorque arsanias innatet mmm ferme spatio, mox divisus in euphraten mergatur. tigris autem, ex armenia acceptis fluminibus claris parthenia ac nicephorione, arabas orroeos adiabenosque disternens et quam diximus mesopotamiam faciens, lustratis montibus gordyaeorum circa apameam mesenes oppidum, citra seleuciam babyloniam [cxxv] p. divisus in alveos duos, altero meridiem ac seleuciam petit mesenen perfundens, altero ad septentrionem flexus eiusdem gentis tergo campos cauchas secat. ubi remeare aquae, pasitigris appellatur, postea recipit ex media choaspen atque, ut diximus, inter seleuciam et ctesiphontem vectus in lacus chaldaicos se fundit eosque [lxii] p. amplitudine implet; mox vasto alveo profusus dextra characis oppidi infertur mari persico [x] p. ore. inter duorum amnium ostia [xxv] p. fuere, ut alii tradunt, [vii], utroque navigabili. sed longo tempore euphraten praecusere orcheni et accolae agros gigantes, nec nisi per tigrim deferitur in mare.

proxima tigri regio parapotamia appellatur. in ea dictum est de mesene; oppidum eius dabitha. cui iungitur chalonitis cum ctesiphonte, non palmetis modo, verum et olea pomisque arbusta. ad eam pervenit zagrus mons, ex armenia inter medos adiabenosque veniens supra paraetacenem et persida. chalonitis abest a perside [ccclxxx] p.; tantum a caspio mari et a syria abesse compendio itineris aliqui tradunt. inter has gentes atque mesenen sittacene est, eadem arbelitis et palaestine dicta. oppidum eius sittace graecorum, ab ortu et sabdata, ab occasu autem antiochia inter duo flumina tigrim et tornadotum, item apamea, cui nomen antiochus matris suae inposuit; tigri circumfunditur haec, dividitur archoo. infra est susiane, in qua vetus regia persarum susa, a dario hystaspis filio condita; abest ab seleucia babylonia [cccl] p., tantundem

ab ecbatanis medorum per montem carbantum. in septentrionali tigris alveo oppidum est barbitace; abest a susis cxxxv p. ibi mortalium soli auri miro odio contrahunt id defodiuntque, ne cui sit in usu. susianis ad orientem versus iunguntur oxii latrones et mizaeorum xl populi, liberae feritatis. supra eos parent parthis mardî et saitae ii qui praetenduntur supra elymaida, quam persidi in ora iunximus. susa a persico mari absunt [ccl] p. qua subiit ad eam classis alexandri pasitigri, vicus ad lacum chaldaicum vocatur aple, unde susa navigatione [lxii] d p. absunt. susianis ab oriente proximi sunt cossiaei, supra cossiaeos ad septentrionem massabatene sub monte cambalido, qui est caucasi ramus, inde mollissimo transitu in bactros.

susianen ab elymaide disternit amnis eulaeus, ortus in medis modicoque spatio cuniculo conditus ac rursus exortus et per massabatenen lapsus. circumit arcem susorum ac dianaē templum augustissimum illis gentibus, et ipse in magna caerimonia, siquidem reges non ex alio bibunt et ob id in longinqua portant. recipit amnes hedyphon praeter asylum persarum venientem, adunam ex susianis. oppidum iuxta eum magoa, a charace [xv] p.; quidam hoc in extrema susiane ponunt solitudinibus proximum. infra eulaeum elymais est in ora iuncta persidi, a flumine orati ad characem [ccxl] p. oppida eius seleucia et sostrate, adposita monti chasiro. oram, quae praeiacet, minorum syrtium vice diximus inaccessam caeno, plurimum limi deferentibus brixâ et ortacia amnibus, madente et ipsa elymaide in tantum, ut nullus sit nisi circuitu eius ad persidem aditus. infestatur et serpentibus, quos flumina deportant. pars eius maxime invia characene vocatur ab oppido arabiae claudente regna ea, de quo dicemus exposita prius m. agrippae sententia. namque is mediam et parthiam et persidem ab oriente indo, ab occidente tigri, a septentrione tauro caucasio, a meridie rubro mari terminatas patere in longitudinem [30xiii]30 [xx] p., in latitudinem [dcccxl] prodidit, praeterea per se mesopotamiam, ab oriente tigri, ab occasu euphrate, a septentrione tauro, a meridie mari persico inclusam, longitudine [dccc] p., latitudine [ccclx].

charax, oppidum persici sinus intimum, a quo arabia eudaemon cognominata excurrit, habitatur in colle manu facto inter confluentes dextra tigrim, laeva eulaeum, [ii] p. laxitate. conditum est primum ab alexandro magno, colonis ex urbe regia durine, quae tum interiit, deductis, militum inutilibus ibi relictis; alexandriam appellari iusserat pagumque pellaeum a patria sua, quem proprie macedonum fecerat. flumina id oppidum expugnare; postea restituit antiochus quintus regum et suo nomine appellavit, iterumque infestatum spaosines sagdodonaci filius, rex finitimorum arabum, quem iuba satrapen antiochi fuisse falso tradit, oppositis molibus restituit nomenque suum dedit, emunito situ iuxta in longitudinem [vi] p., in latitudinem paulo minus. prius fuit a litore stadiis x - maritimum etiam vipsania porticus habet - , iuba vero prodente [l] p.; nunc abesse a litore [cxx] legati arabum nostrique negotiatores, qui inde venere, adfirmant. nec ulla in parte plus aut celerius proficere terrae fluminibus invectae. magis id mirum est, aestu longe ultra id accedente non repercussas. hoc in loco genitum esse

dionysium, terrarum orbis situs recentissimum auctorem, quem ad commentanda omnia in orientem praemiserit Divus Augustus ituro in armeniam ad parthicas arabicasque res maiore filio, non me praeterit nec sum oblitus sui quemque situs diligentissimum auctorem visum nobis introitu operis: in hac tamen parte arma romana sequi placet nobis iubamque regem, ad eundem gaium caesarem scriptis voluminibus de eadem expeditione arabica.

arabia, gentium nulli postferenda amplitudine, longissime a monte amano e regione ciliciae commagenesque descendit, ut diximus, multis gentibus eorum deductis illo a tigrane magno, sponte vero ad mare nostrum litusque aegyptium, ut docuimus, nec non et in media syriae ad libanum montem penetrantibus nubaeis, quibus iunguntur ramisi, dein teranei, dein patami. ipsa vero paeninsula arabia, inter duo maria rubrum persicumque procurrens, quodam naturae artificio ad similitudinem atque magnitudinem italiae mari circumfusa, in eandem etiam caeli partem nulla differentia spectat, haec quoque in illo situ felix. populos eius a nostro mari usque ad palmyrenae solitudines diximus: reliqua nunc inde peragemus.

nomadas infestatoresque chaldaeorum scenitae, ut diximus, cludunt, et ipsi vagi, sed a tabernaculis cognominati, quae ciliciis metantur ubi libuit. deinde nabataei oppidum incolunt, petram nomine, in convalle paulo minus [ii] p. amplitudinis, circumdatum montibus inaccessis, amne interfluente. abest ab gaza oppido litoris nostri [dc], a sinu persico [cxxxv]. huc convenit utrumque bivium, eorum qui ex syria palmyram petiere et eorum qui a gaza venerunt. a petra incoluere omani ad characen usque, oppidis quondam claris ab samiramide conditis abaesamide et soractia; nunc sunt solitudines. deinde est oppidum quod characenorum regi paret in pasitigris ripa, forat nomine, in quod a petra conveniunt, characenque inde [xii] p. secundo aestu navigant, e parthico autem regno navigantibus vicus teredon. infra confluentem euphratis et tigris laeva fluminis chaldaei optinent, dextra nomades scenitae. quidam et alia duo oppida longis intervallis tigri praenavigari tradunt, barbatiam, mox dumatham, quod abesse a petra dierum x navigatione. nostri negotiatores dicunt characenorum regi parere et apameam, sitam ubi restagnatio euphratis cum tigri confluat; itaque molientes incursionem parthos operibus obiectis inundatione arceri.

nunc a charace dicemus oram, epiphani primum exquisitam. locus ubi euphratis ostium fuit, flumen salsum, promunturium caldone, voragini similis quam mari aestuarium per [l] orae, flumen achenum, deserta [c] p. usque ad insulam icarum, sinus capeus, quem accolunt gaulopes et gattaei, sinus gerrhaicus, oppidum gerrha, [v] p. amplitudine; turres habet ex salis quadratis molibus. a litore [l] regio attene, ex adverso tylos insula, totidem milibus a litore, plurimis margaritis celeberrima cum oppido eiusdem nominis, iuxtaque altera minor, a promunturio eius [xii] d p. ultra magnas aspici insulas tradunt, ad quas non sit perventum; huius ambitum [cxii] d p., a perside longius abesse, adiri uno alveo angusto. insula ascliae, gentes

nochaeti, zurazi, borgodi, catharraei, nomades, flumen cynos. ultra navigationem inconpertam ab eo latere propter scopulos tradit iuba praetermissa mentione oppidi omanorum batrasavaves et omanae, quod priores celebrem portum carmaniae fecere, item homnae et attanae, quae nunc oppida maxime celebrari a persico mari nostri negotiatores dicunt. a flumine canis, ut iuba, mons adusto similis, gentes epimaranitae, mox ichthyophagi, insula deserta, gentes bathymi ... eblythaei montes, insula omoemus, portus mochorbae, insulae etaxalos, inchobriche, gens cadaei, insulae sine nominibus multae, celebres vero isura, rhinnea et proxima, in qua scriptae sunt stelae lapideae litteris incognitis, coboea portus, bragae insulae desertae, gens taludaei, dabanegoris regio, mons orsa cum portu, sinus duatas, insulae multae, mons tricoryphos, regio chardaleon, insulae solanades, cachina, item ichthyophagorum. dein clari, litus mamaeum, ubi auri metalla, regio canauna, gentes apitami, casani, insula devade, fons coralis, carphati, insulae alaea, amnamethus, gens darae, insulae chelonitis, ichthyophagon multae, odanda deserta, basa, multae sabaeorum. flumina thanar, amnum, insulae doricae, fontes daulotos, dora, insulae pteros, labatanis, coboris, sambrachate et oppidum eodem nomine in continente. a meridie insulae multae, maxima camari, flumen musecros, portus laupas, scenitae sabaei, insulae multae, emporium eorum acila, ex quo in indiam navigatur, regio amithoscatta, damnia, mizi maiores et minores, drymatina, macae; horum promunturium contra carmaniam distat [1] p. mira res ibi traditur; numenium, ab antiocho rege mesenae praepositum, ibi vicisse eodem die classe aestuque reverso iterum equitatu contra persas dimicantem et gemina tropaea eodem in loco iovi ac neptuno statuisse. insula in alto obiacet ogyris, clara erythra rege ibi sepulto; distat a continente [cxxv] p., circumitur [cxii] d. nec minus altera clara in azanio mari dioscuridu, distans a syagro extumo promunturio [cclxxx]. reliqui in continente a noto etiamnum autaridae, in montes viii dierum transitus, gens larendani et catabani, gebbanitae pluribus oppidis, sed maximis nagia et thomna, templorum lxv; haec est amplitudinis significatio. promunturium, a quo ad continentem trogodytarum [1], thoani, actaei, chatramotitae, tonabaei, antiadalaei, lexianae, agraei, cerbani, sabaei, arabum propter tura clarissimi, ad utraque maria porrectis gentibus. oppida eorum in rubro litore merme, marma, corolia, sabbatha; intus oppida nascus, cardava, carnus et, quo merces odorum deferunt, thomala. pars eorum atramitae, quorum caput sabota lx templa muris includens; regia tamen est omnium marebbata. sinum optinent [xciiii], refertum insulis odoriferis. atramitis in mediterraneo iunguntur minaei. mare accolunt et aelamitae oppido eiusdem nominis, iis iuncti chaculatae, oppidum sibi, quod graeci apaten vocant, arsi, codani, vadaei oppido magno, barasasaei, lechieni, sygaros insula, quam canes non intrant expositique circa litora errando moriuntur. sinus intimus, in quo laeanitae, qui nomen ei dedere; regia eorum agra et in sinu laeana vel, ut alii, aelana: nam et ipsum sinum nostri laeaniticum scripsere, alii aelaniticum, artemidorus alaeniticum, iuba leaniticum. circuitus arabiae a charace laeana

colligere proditur [30xlvi]30 [lxv] p., iuba paulo minus [30xl]30 putat. latissima est a septentrione inter oppida heroum et characem. nam et reliqua mediterranea eius dicantur. nabataeis thimaneos iunxerunt veteres, nunc sunt taveni, suelleni, araceni, arreni oppido in quod negotiatio omnis convenit, hemnatae, avalitae, oppida domata, haegra, thamudaei, oppidum baclanaza, chariattaei, toali, oppidum phodaca, minaei, a rege cretae minoe, ut existimant, originem trahentes, quorum carmei; oppidum [xiiii] p. maribba, paramalacum, et ipsum non spernendum, item canon. rhadamaei - et horum origo rhadamanthus putatur, frater minois - , homeritae mesala oppido, hamiroei, gedranitae, amphryaei, lysanitae, bachylitae, samnaei, amaitaei oppidis nessa et chenneseri, zamareni oppidis sagiatta, canthace, bacaschami riphearina oppido, quo vocabulo hordeum appellant, autaei, ethravi, cyrei elmataeis oppido, chodae aiathuri in montibus oppido [xxv] p., in quo fons aenuscabales, quod significat camelorum, oppidum ampelome, colonia milesiorum, athrida oppidum, calingi, quorum mariba oppidum significat dominos omnium, oppida pallon, murannal iuxta flumen, per quod euphraten emergere putant, gentes agraei, ammoni, oppidum athenae, caunaravi, quod significat ditissimos armento, chorrantitae, cesani, choani. fuerunt et graeca oppida arethusa, larisa, chalcis, deleta variis bellis.

romana arma solus in eam terram adhuc intulit aelius gallus ex equestri ordine, nam c. caesar Augusti filius prospexit tantum arabiam. gallus oppida diruit, non nominata auctoribus qui ante scripserunt, negranam, nestum, nescam, magusum, caminacum, labatiam et supra dictam maribam circuitu [vi], item caripetam, quo longissime processit. cetera explorata retulit: nomadas lacte et ferina carne vesci, reliquos vinum ut indos palmis exprimere, oleam sesamae. numerosissimos esse homeritas, minaeis fertiles agros palmetis arbutos, in pecore divitias. cerbanos et agraeos armis praestare, maxime chatramotitas. carreis latissimos et fertilissimos agros, sabaeos ditissimos silvarum fertilitate odorifera, auri metallis, agrorum riguis, mellis ceraeque proventu. de odoribus suo dicemus volumine. arabes mitrati degunt aut intonso crine; barba abraditur praeterquam in superiore labro; aliis et haec intonsa. mirumque dictu, ex innumeris populis pars aequa in commerciis aut latrociniis degit. in universum gentes ditissimae, ut apud quas maximae opes romanorum parthorumque subsidant, vendentibus quae e mari aut silvis capiunt nihilque invicem redimentibus.

nunc reliquam oram arabiae contrariam persequemur. timosthenes totum sinum quadridui navigatione in longitudinem taxavit, bidui in latitudinem, angustias [vii] d p.; eratosthenes ab ostio [30xii]30 in quamque partem; artemidorus arabiae latere [30xvii]30 [I], trogodytico vero [30xi]30 [lxxxvii] d p. ptolemaida usque; agrippa [30xvii]30 [xxxii] sine differentia laterum. plerique latitudinem [cccclxxv] prodiderunt, faucesque hiberno orienti obversas alii [iiii], alii [vii] d, alii [xii] patere.

situs autem ita se habet: a sinu laeanitico alter sinus quem arabes aean vocant, in quo heroon oppidum est. fuit et cambysu inter nelos et marchadas,

deductis eo aegris exercitus. gens tyro, daneon portus, ex quo navigabilem alveum perducere in nilum, qua parte ad delta dictum decurrit, [lxii] d intervallo, quod inter flumen et rubrum mare interest, primus omnium sesostris aegypti rex cogitavit, mox darius persarum, deinde ptolemaeus sequens, qui et duxit fossam latitudine pedum c, altitudine xxx, in longitudinem [xxxvii] d p. usque ad fontes amarus; ultra deterruit inundationis metus, excelsiore tribus cubitis rubro mari conperto quam terra aegypti. aliqui non eam adferunt causam, sed ne inmisso mari corrumperetur aqua nili, quae sola potus praebet. nihilo minus iter totum terreno frequentatur a mari aegyptio, quod est triplex; unum a pelusio per harenas, in quo, nisi calami defixi regant, via non reperitur, subinde aura vestigia operiente; alterum ultra casium montem, quod a [lx] p. redit in pelusiacam viam - accolunt arabes autaei - ; tertium a gerrho, quod agipsum vocant, per eosdem arabas [lx] propius, sed asperum montibus et inops aquarum. eae omnes viae arsinoen ducunt, conditam sororis nomine in sinu carandra a ptolemaeo philadelpho, qui primus trogodytice excussit; amnem qui arsinoen praefluit ptolemaeum appellavit. mox oppidum parvum est aenum - alii pro hoc philoterias scribunt - , deinde sunt asaraei, ex trogodytarum conubiis arabes feri, insulae sapirine, scytala, mox deserta ad myos hormon, ubi fons tatnos, mons aeas, insula iambe, portus multi, berenice oppidum, matris philadelphia nomine, ad quod iter a copto diximus, arabes autaei et gebadaei. trogodytice, quam prisci midoen, alii midioen dixere, mons pentedactylos, insulae stenae dirae aliquot, halonesi non pauciores, cardamine, topazos, quae gemmae nomen dedit. sinus insulis refertus: ex his quae mareu vocantur, aquosae, quae eratonos, sitientes; regum hi praefecti fuere. introrsus candaei, quos ophiophagos vocant, serpentibus vesci adsueti; neque alia regio fertilior est earum. iuba, qui videtur diligentissime persecutus haec, omisit in hoc tractu - nisi exemplarium vitium est - berenicen alteram, quae panchrysos cognominata est, et tertiam, quae epi dires, insignem loco: est enim sita in cervice longe procurrente, ubi fauces rubri maris [vii] d p. ab arabia distant. insula ibi citis, topazum ferens et ipsa. ultra silvae, ubi ptolemais, a philadelpho condita ad venatus elephantorum, ob id epi theras cognominata, iuxta lacum monoleum. haec est regio secundo volumine a nobis significata, in qua xlv diebus ante solstitium totidemque postea hora sexta consumuntur umbrae et in meridiem reliquis horis cadunt, ceteris diebus in septentrionem, cum in berenice quam primam posuimus ipso die solstitii sexta hora umbrae in totum absumantur nihilque adnotetur aliud novi, [dcii] p. intervallo a ptolemaide: res ingentis exempli locusque subtilitatis immensae, mundo ibi deprehenso, cum indubitata ratione umbrarum eratosthenes mensuram terrae prodere inde conceperit. hinc azanium mare, promunturium quod aliqui hippalum scripsere, lacus mandalum, insula colocasitis et in alto multae, in quibus testudo plurima. oppidum sace, insula daphnidis, oppidum aduliton; aegyptiorum hoc servi profugi a dominis condidere. maximum hic emporium trogodytarum, etiam aethiopum; abest a ptolemaide v dierum navigatione. deferunt plurimum ebur,

rhinocerotum cornua, hippopotamiorum coria, chelium testudinum, sphingia, mancipia. supra aethiopas aroteras insulae quae aliae vocantur, item bacchias et antibacchias et stratioton. hinc in ora aethiopiae sinus incognitus, quod miremur, cum ulteriora mercatores scrutentur, promunturium in quo fons cucios, expetitus navigantibus; ultra isidis portus, decem dierum remigio ab oppido adulitarum distans; in eum trogodytis myrra confertur. insulae ante portum duae pseudopylae vocantur, interiores totidem pylae; in altera stelae lapideae litteris ignotis. ultra sinus avalitu, dein insula diodori et aliae desertae, per continentem quoque deserta, oppidum gaza, promunturium et portus mossylites, quo cinnamum devehitur. hucusque sesostris exercitum duxit. aliqui unum aethiopiae oppidum ultra ponunt in litore baragaza.

a mossylico promunturio atlanticum mare incipere vult iuba praeter mauretanias suas gadis usque navigandum coro, cuius tota sententia hoc in loco subtrahenda non est. a promunturio indorum quod vocetur lepte acra, ab aliis drepanum, proponit recto cursu praeter exustam ad malichu insulam [30xv]30 p. esse, inde ad locum quem vocant sceneos [ccxxv] p., inde ad insulas adanu [cl]: sic fieri ad apertum mare [30xviii]30 [lxxv] p. reliqui omnes propter ardorem solis navigari posse non putaverunt. quin et commercia ipsa infestant ex insulis arabes, ascitae appellati, quoniam bubulos utres binos insternentes ponte piraticam exercent sagittis venenatis. gentes trogodytarum idem iuba tradit therotoas a venatu dictos, mirae velocitatis, sicut ichthyophagos, natantes ceu maris animalia, bangenos, zangenas, thalibas, saxinas, sirechas, daremas, domazenes. quin et accolae nili a syene non aethiopum populos, sed arabum esse dicit usque meroen; solis quoque oppidum, quod non procul memphi in aegypti situ diximus, arabas conditores habere. sunt qui et ulteriorem ripam aethiopiae auferant adnectantque africae. ripas autem incoluere propter aquam. nos relicto cuique intellegendi arbitrio oppida quo traduntur ordine utrimque ponemus a syene.

et prius arabiae latere gens catadupi, deinde syenitae, oppida tacompson, quam quidam appellarunt thaticen, aramum, sesamos, andura, nasarduma, aindoma come cum arabeta et boggia, leupitorga, tantarene, emeae, chindita, noa, goploa, gistate, megadale, premni, nups, direa, patigga, bacata, dumana, radata, in quo felis aurea pro deo colebatur, boron, in mediterraneo mallo proximum meroae. sic prodidit bion. iuba aliter: oppidum munitum megatichos inter aegyptum et aethiopiam, quod arabes mirsion vocaverunt, dein tacompson, aramum, sesamum, pide, mamuda, orambim iuxta bituminis fontem, amodata, prosda, parenta, mania, tessata, gallas, zoton, grau comen, emeum, pidibotas, aendondacometas, nomadas in tabernaculis viventes, cistaepen, magadalen, parvam primin, nups, direlin, patingan, breves, magasneos, egasmala, cramda, denna, cadeum, atthema, batta, alanam, macua, scammos, goram in insula, ab iis abale, androgolim, serem, mallos, agocem.

ex africae latere tradita sunt eodem nomine tacompsos altera sive pars prioris, mogore, saea, aedosa, penariae, primis, magassa, buma, linthuma, spintum, sidop, censoe. pindicitor, acug, orsum, suara, maumarum, vrbim,

mulon, quod oppidum graeci hypaton vocarunt, pagoarca, zamnes, unde elephantii incipiant, mambli, berressa, coetum. fuit quondam et epis oppidum contra meroen, antequam bion scriberet deletum.

haec sunt prodita usque meroen, ex quibus hoc tempore nullum prope utroque latere exstat. certe solitudines nuper renuntiavere principi neroni missi ab eo milites praetoriani cum tribuno ad explorandum, inter reliqua bella et aethiopicum cogitanti. intravere autem et eo arma romana Divi Augusti temporibus duce p. petronio, et ipso equestris ordinis praefecto aegypti. is oppida expugnavit, quae sola invenimus quo dicemus ordine, pscelin, primi, bocchin, forum cambusis, attenam, stadissim, ubi nilus praecipitans se fragore auditum accolis aufert. diripuit et napata. longissime autem a syene progressus est [dccc] p. nec tamen arma romana ibi solitudinem fecerunt: aegyptiorum bellis attrita est aethiopia vicissim imperitando serviendoque, clara et potens etiam usque ad troiana bella memnone regnante. et syriae imperitasse eam nostroque litori aetate regis cephei patet andromedae fabulis.

simili modo et de mensura eius varia prodidere, primus dalion ultra meroen longe subvectus, mox aristocreon et bion et basilis, simonides minor etiam quinquennio in meroe moratus, cum de aethiopia scriberet. nam timosthenes, classium philadelphi praefectus, sine mensura dierum lx a syene meroen iter prodidit, eratosthenes [dcxxv], artemidorus [dc], sebosus ab aegypti extremis [30xvi]30 [lxxv], unde proxime dicti [30xii]30 [l]. verum omnis haec finita nuper disputatio est, quoniam a syene [dccc] lxxv neronis exploratores renuntiavere his modis: a syene hieran sycaminon [liiii] p., inde tama [lxxii] regione euonymiton aethiopum, primi [cxx], acinam [lxiii], pitaram [xxv], tergedum [cvi]. insulam gagaudentem esse in medio eo tractu; inde primum visas aves psittacos et ab altera, quae vocetur artigula, animal sphingion, a tergedo cynocephalos. inde nabata [lxxx]; oppidum id parvum inter praedicta solum. ab eo ad insulam meroen [ccclx]. herbas circa meroen demum viridiores, silvarumque aliquid apparuisse et rhinocerotum elephantorumque vestigia. ipsum oppidum meroen ab introitu insulae abesse [lxx] p., iuxtaque aliam insulam tadu dextro subeuntibus alveo, quae portum faceret. aedificia oppidi pauca; regnare feminam candacen, quod nomen multis iam annis ad reginas transiit; delubrum hammonis et ibi religiosum et toto tractu sacella. cetero cum potirentur rerum aethiopes, insula ea magnae claritatis fuit. tradunt armatorum [ccl] dare solitam, artificum [iii]. alii reges aethiopum xlv esse hodie traduntur. universa vero gens aethiopia appellata est, deinde atlantia, mox a vulcani filio aethiope. animalium hominumque monstrificas effigies circa extremitates eius gigni minime mirum, artificum ad formanda corpora effigiesque caelandas mobilitate ignea. ferunt certe ab orientis parte intima gentes esse sine naribus, aequali totius oris planitie, alias superiore labro orbas, alias sine linguis. pars etiam ore concreto et naribus carens uno tantum foramine spirat potumque calamis avenae trahit et grana eiusdem avenae sponte provenientis ad vescendum. quibusdam pro sermone nutus motusque membrorum est. quibusdam ante ptolemaeum lathyrum regem aegypti ignotus

fuit usus ignium. quidam et pygmaeorum gentem prodiderunt inter paludes ex quibus nilus oriretur. in ora autem ubi dicemus continui montes ardentibus similes rubent.

trogodytis et rubro mari a meroe tractus omnis superponitur, a napata tridui itinere ad rubrum litus, aqua pluvia ad usum conpluribus locis servata, fertilissima regione quae interest auri. ulteriora atabuli, aethiopum gens, tenent. dein contra meroen megabarri, quos aliqui adiabaros nominavere; oppidum habent apollinis. pars eorum nomades quae elephantis vescitur. ex adverso in africae parte macrobii, rursus a megabarris memnones et dabelli dierumque xx intervallo critensi. ultra eos dochii, dein gymnetes, semper nudi, mox anderae, mattitae, mesaches; hi pudore atrii coloris tota corpora rubrica inlinunt. at ex africae parte medimni, dein nomades, cynocephalorum lacte viventes, alabi, syrbotae, qui octonum cubitorum esse dicuntur. aristocreon libyae latere a meroe oppidum tollen dierum v itinere tradit; inde dierum xii esar oppidum aegyptiorum qui psammetichum fugerint; in eo prodente se [ccc] habitasse; contra in arabico latere diaron oppidum esse eorum. bion autem sapen vocat quod ille esar; et ipso nomine advenas significari. caput eorum in insula sembobotin, et tertium in arabia sinat. inter montes autem et nilum simbarri sunt, phalliges, in ipsis vero montibus asachae multis nationibus. abesse a mari dicuntur dierum v itinere; vivunt elephantorum venatu. insula in nilo sembritarum reginae paret. ab ea nubaei aethiopes dierum viii itinere; oppidum eorum nilo inpositum tenupsis. sesambri, apud quos quadrupedes omnes sine auribus, etiam elephantii. at ex africae parte ptoemphani, qui canem pro rege habent, motu eius imperia augurantes, harusbi oppido longe ab nilo sito, postea archisarmi, phalliges, marigarri, chasamari. bion et alia oppida in insulis tradit: a semboboti meroen versus dierum toto itinere xx proximae insulae oppidum seberitarum sub regina et aliud asara, alterius oppidum darden; tertiam medoen vocant, in qua oppidum asel, quartam eodem quo oppidum nomine garroen. inde per ripas oppida nautis, modum, demadatin, secundum, collocat, secande, navectabe cum agro psegipta, candragori, arabam, summaram. regio supra sirbitum, ubi desinunt montes, traditur a quibusdam habere maritimos aethiops, niscathas, nisitas, quod significat ternum et quaternum oculorum viros, non quia sic sint, sed quia sagittis praecipua contemplatione utantur. ab ea vero parte nili, quae supra syrtis maiores oceanumque meridianum protendatur, dalion vacathos esse dicit, pluvia tantum aqua utentes, cisoros, logonporos ab oecalibus dierum v itinere, vsibalchos, isbelos, perusios, ballios, cisprios. reliqua deserta, dein fabulosa: ad occidentem versus nigroe, quorum rex unum oculum in fronte habeat, agriophagi, pantherarum leonumque maxime carnibus viventes, pamphagi, omni mandentes, anthropophagi, humana carne vescentes, cynamolgi caninis capitibus, artabatitae quadrupedes, ferarum modo vagi, deinde hesperioe, perorsi et quos in mauretaniae confinio diximus. pars quaedam aethiopum locustis tantum vivit fumo et sale duratis in annua alimenta; hi quadragesimum vitae annum non excedunt.

aethiopum terram universam cum mari rubro patere in longitudinem [30xxi]30 [lxx] p., in latitudinem cum superiore aegypto [30xii]30 [xcvi] agrippa existimavit. quidam longitudinem ita diviserunt: a meroe sirbitum xii dierum navigationem, ab ea xv ad dabellos, ab his ad oceanum aethiopicum vi dierum iter. in totum ab oceano ad meroen [dcxxv] p. esse inter auctores fere convenit, inde syenen quantum diximus. sita est aethiopia ab oriente hiberno ad occidentem hibernum. meridiano cardine silvae, hebeno maxime, virent. a media eius parte imminens mari mons excelsus aeternis ardet ignibus, theon ochema dictus graecis. a quo navigatione quadridui promunturium quod hesperu ceras vocatur, confine africae iuxta aethiopas hesperios. quidam et in eo tractu modicos colles amoena opacitate vestitos aegipanum satyrorumque produunt.

insulas toto eo mari et ephorus conplures esse tradidit et eudoxus et timosthenes, clitarchus vero alexandro regi renuntiatam adeo divitem, ut equos incolae talentis auri permutarent, alteram ubi sacer mons opacus silva repertus esset, destillante arboribus odore mirae suavitatis. contra sinum persicum cerne nominatur insula adversa aethiopiae, cuius neque magnitudo neque intervallum a continente constat; aethiopas tantum populos habere proditur. ephorus auctor est a rubro mari navigantes in eam non posse propter ardores ultra quasdam columnas - ita appellantur parvae insulae - provehi. polybius in extrema mauretania contra montem atlantem a terra stadia viii abesse prodidit cernen, nepos cornelius ex adverso maxime carthaginis a continente p. m, non ampliorem circuitu [ii]. traditur et alia insula contra montem atlantem, et ipsa atlantis appellata. ab ea v dierum praenavigatione solitudines ad aethiopas hesperios et promunturium quod vocavimus hesperu ceras, inde primum circumagente se terrarum fronte in occasum ac mare atlanticum. contra hoc quoque promunturium gorgades insulae narrantur, gorgonum quondam domus, bidui navigatione distantes a continente, ut tradit xenophon lampsacenus. penetravit in eas hanno poenorum imperator prodiditque hirta feminarum corpora, viros pernecitate evasisse; duarum gorgadam cutes argumenti et miraculi gratia in iunonis templo posuit, spectatas usque ad carthaginem captam. ultra has etiamnum duae hesperidum insulae narrantur, adeoque omnia circa hoc incerta sunt, ut statius sebosus a gorgonum insulis praenavigatione atlantis dierum xl ad hesperidum insulas cursum prodiderit, ab his ad hesperu ceras unius. nec mauretaniae insularum certior fama est. paucas modo constat esse ex adverso autololum a iuba repertas, in quibus gaetulicam purpuram tinguere instituerat.

sunt qui ultra eas fortunatas putent esse quasdamque alias, quo in numero idem sebosus etiam spatia complexus iunoniam abesse a gadibus [dccl] p. tradit, ab ea tantundem ad occasum versus pluvialiam caprariamque; in pluvialia non esse aquam nisi ex imbri. ab iis [ccl] fortunatas contra laevam mauretaniae in viii horam solis; vocari invallem a convexitate et planasiam a specie, invallis circuitu [ccc] p.; arborum ibi proceritatem ad cxl pedes adulescere. iuba de fortunatis ita inquisivit: sub meridiem quoque positas esse

prope occasum, a purpurariis [dcxxv] p., sic ut [ccl] supra occasum navigetur, dein per [ccclxxv] ortus petatur. primam vocari ombrion, nullis aedificiorum vestigiis; habere in montibus stagnum, arbores similes ferulae, ex quibus aqua exprimatur, e nigris amara, ex candidioribus potui iucunda. alteram insulam iunoniam appellari; in ea aediculam esse tantum lapide exstructam. ab ea in vicino eodem nomine minorem, deinde caprariam, lacertis grandibus refertam. in conspectu earum esse ninguariam, quae hoc nomen acceperit a perpetua nive, nebulosam. proximam ei canariam vocari a multitudine canum ingentis magnitudinis - ex quibus perducti sunt iubae duo - ; apparere ibi vestigia aedificiorum. cum omnes autem copia pomorum et avium omnis generis abundant, hanc et palmetis caryotas ferentibus ac nuce pinea abundare; esse copiam et mellis, papyrum quoque et siluros in amnibus gigni. infestari eas beluis, quae expellantur adsidue, putrescentibus.

et abunde orbe terrae extra intra indicato colligenda in artum mensura aequorum videtur. polybius a gaditano freto longitudinem directo cursu ad os maeotis [30xxxiii]30 [xxxvii] d prodidit, ab eodem initio siciliam [30xii]30 [l], cretam [ccclxxv], rhodum [clxxxvii] d, chelidonias tantundem, cyprum [cccxxv], inde syriae seleuciam pieriam [cxv], quae computatio efficit [30xxiii]30 [xl]. agrippa hoc idem intervallum a freto gaditano ad sinum issicum per longitudinem directam [30xxxiii]30 [xl] taxat, in quo haud scio an sit error numeri, quoniam idem a siculo freto alexandriam cursus [30xiii]30 [l] tradidit. universus autem circuitus per sinus dictos ab eodem exordio colligit intra maeotim lacum [30clv]30 [viii], artemidorus adicit [dclvi], idem cum maeotide [30clxxiii]30 [xc] p. esse tradidit. haec est mensura inermium et pacata audacia fortunam provocantium hominum.

nunc ipsarum partium magnitudo comparabitur, utcumque difficultatem adferet auctorum diversitas, aptissime tamen spectabitur ad longitudinem latitudine addita. est ergo ad hoc praescriptum europae magnitudo ... longitudo [30lxxxvii]30 [xiii]. africae - ut media ex omni varietate prodentium sumatur computatio - efficit longitudo [30xxxvii]30 [xcviii]; latitudo, qua colitur, nusquam [ccl] excedit. sed quoniam in cyrenaica eius parte [dccccx] eam fecit agrippa, deserta eius ad garamantas usque, qua noscebantur, complectens, universa mensura, quae veniet in comparisonem, [30xlvi]30 [viii] efficit. asiae longitudo in confesso est [30l]30 [xiii] dcl; latitudo sane computetur ab aethiopico mari alexandriam iuxta nilum sitam, ut per meroen et syenen mensura currat, [30xviii]30 [lxxv]. apparet ergo europam paulo minus dimidia asiae parte maiorem esse quam asiam, eandem altero tanto et sexta parte africae ampliolem quam africanam. quod si misceantur omnes summae, liquido patebit europam totius terrae tertiam esse partem et octavam paulo amplius, asiam vero quartam et quartam decimam, africanam autem quintam et insuper sexagesimam.

his addemus etiamnum unam graecae inventionis scientiam vel exquisitissimae subtilitatis, ut nihil desit in spectando terrarum situ indicatisque regionibus noscatur et cum qua cuique siderum societas sit sive

cognatio dierum ac noctium quibusque inter se pares umbrae et aequa mundi convexitas. ergo reddetur hoc etiam, terraeque universae in membra caeli digerentur. plura sunt autem segmenta mundi, quae nostri circulos appellavere, graeci parallelos.

principium habet indiae pars versa ad austrum. patet usque arabiam et rubri maris accolae. continentur gedrosi, carmani, persae, elymaei, parthyene, aria, susiane, mesopotamia, seleucia cognominata babylonia, arabia ad petras usque, syria coele, pelusium, aegypti inferiora, quae chora vocatur, alexandria, africae maritima, cyrenaica oppida omnia, thapsus, hadrumetum, clupea, carthago, vtica, uterque hippo, numidia, mauretania utraque, atlanticum mare, columnae herculis. in hoc caeli circumplexu aequinoctii die medio umbilicus, quem gnomonem vocant, vii pedes longus umbram non amplius iiii pedes longam reddit, noctis vero dieique longissima spatia xiiii horas aequinoctiales habent, brevissima ex contrario x.

sequens circulus incipit ab india vergente ad occasum, vadit per medios parthos, persepolim, citima persidis, arabiam citeriorem, iudaeam, libani montis accolae, amplectitur babylonem, idumaeam, samariam, hierosolyma, ascalonem, iopen, caesaream, phoenicen, ptolemaidem, sidonem, tyrum, berytum, botryn, tripolim, byblum, antiochiam, laodiceam, seleuciam, ciliciae maritima, cypri austrina, cretam, lilybaeum in sicilia, septentrionalia africae et numidia. umbilicus, aequinoctio xxxv pedum, umbram xxiiii pedes longam facit, dies autem noxque maxima xiiii horarum aequinoctialium est accedente bis quinta parte unius horae.

tertius circulus ab indis imavo proximis oritur. tendit per caspias portas, mediae proxima, cataoniam, cappadociam, taurum, amanum, issum, cilicias portas, solos, tarsum, cyprum, pisidiam, pamphyliam, siden, lycaoniam, lyciam, patara, xanthum, caunum, rhodum, coum, halicarnassum, cnidum, dorida, chium, delum, cycladas medias, gythium, malean, argos, laconicam, elim, olympiam, messaniam peloponnesi, syracusas, catinam, siliciam mediam, sardiniae austrina, carteiam, gadis. gnomonis c unciae umbram lxxvii unciarum faciunt. longissimus dies est aequinoctialium horarum xiiii atque dimidia cum tricesima unius horae.

quarto subiacent circulo quae sunt ab altero latere imavi, cappadociae austrina, galatia, mysia, sardis, zmyrna, sipylus, tmolus mons, lydia, caria, ionia, trallis, colophon, ephesus, miletus, chios, samos, icarium mare, cycladum septentrio, athenae, megara, corinthus, sicyon, achaia, patrae, isthmus, epirus, septentrionalia siciliae, narbonensis galliae exortiva, hispaniae maritima a carthagine nova et inde ad occasum. gnomoni xxi pedum respondent umbrae xvi pedum. longissimus dies habet aequinoctiales horas xiiii et tertias duas unius horae.

quinto continentur segmento ab introitu caspii maris bactri, hiberia, armenia, mysia, phrygia, hellespontus, troas, tenedus, abydos, scepsis, ilium, ida mons, cyzicum, lampsacum, sinope, amisum, heraclea in ponto, paphlagonia, lemnus, imbrus, thasus, cassandria, thessalia, macedonia, larisa,

amphipolis, thessalonice, pella, edesus, beroea, pharsalia, carystum, euboea boeotum, chalcis, delphi, acarnania, aetolia, apollonia, brundisium, tarentum, thurii, locri, regium, lucani, neapolis, puteoli, tuscum mare, corsica, baliaries, hispania media. gnomoni septem pedes, umbris sex. magnitudo diei summa horarum aequinoctialium xv.

sexta comprehensio, qua continetur urbs roma, amplectitur caspias gentes, caucasm, septentrionalia armeniae, apolloniam supra rhyndacum, nicomediam, nicaeam, calchedonem, byzantium, lysimacheam, cherronesum, melanem sinum, abderam, samothraciam, maroneam, aenum, bessicam, thraciam, maedicam, paeoniam, illyrios, durrachium, canusium, apuliae extuma, campaniam, etruriam, pisas, lunam, lucam, genuam, liguriam, antipolim, massiliam, narbonem, tarraconem, hispaniam tarraconensem mediam et inde per lusitaniam. gnomoni pedes viiii, umbrae viiii. longissima diei spatia horarum aequinoctialium xv addita viiii parte unius horae aut, ut nigidio placuit, quinta.

septima divisio ab altera caspii maris ora incipit, vadit super callatim, bosporum, borysthenen, tomos, thraciae aversa, triballos, illyrici reliqua, hadriaticum mare, aquileiam, altinum, venetiam, vicetiam, patavium, veronam, cremonam, ravennam, anconam, picenum, marsos, paelignos, sabinos, vmbriam, ariminum, bononiam, placentiam, mediolanum omniaque ab appennino, transque alpis galliam aquitanicam, viennam, pyrenaeum, celtiberiam. umbilico xxxv pedum umbrae xxxvi, ut tamen in parte venetiae exaequetur umbra gnomoni. amplissima diei spatia horarum aequinoctialium xv et quintarum partium horae trium.

hactenus antiquorum exacta celebravimus. sequentium diligentissimi quod superest terrarum supra tribus adsignavere segmentis, a tanai per maeotim lacum et sarmatas usque borysthenen atque ita per dacos partemque germaniae, gallias oceani litora amplexi, quod esset horarum xvi, alterum per hyperboreos et britanniam horarum xvii, postremum scythicum a ripaeis iugis in thylen, in quo dies continuarentur, ut diximus, noctesque per vices. iidem et ante principia quae fecimus posuere circulos duos: primum per insulam meroen et ptolemaidem in rubro mari ad elephantorum venatus conditam, ubi longissimus dies xii horarum esset dimidia hora amplior, secundum per syenen aegypti euntem, qui esset horarum xiii, iidemque singulis dimidia horarum spatia usque ad ultimum adiecere circulis.

et hactenus de terris.

LIBER VII

mundus et in eo terrae, gentes, maria, ... insignia, insulae, urbes ad hunc modum se habent, animantium in eodem natura nullius prope partis contemplatione minore, etsi ne hic quidem omnia exsequi humanus animus queat.

principium iure tribuetur homini, cuius causa videtur cuncta alia genuisse natura, magna, saeva mercede contra tanta sua munera, non ut sit satis aestimare, parens melior homini an tristior noverca fuerit. ante omnia unum animantium cunctorum alienis velat opibus. ceteris sua varie tegimenta tribuit, testas, cortices, coria, spinas, villos, saetas, pilos, plumam, pinnas, squamas, vellera; truncos etiam arboresque cortice, interdum gemino, a frigoribus et calore tutata est: hominem tantum nudum et in nuda humo natali die abicit ad vagitus statim et ploratum, nullumque tot animalium aliud ad lacrimas, et has protinus vitae principio; at hercule risus praecox ille et celerrimus ante xl diem nulli datur. ab hoc lucis rudimento quae ne feras quidem inter nos genitas vincula excipiunt et omnium membrorum nexus; itaque feliciter natus iacet manibus pedibusque devinctis, flens animal ceteris imperaturum, et a suppliciis vitam auspicatur unam tantum ob culpam, qua natum est. heu dementia ab his initiis existimantium ad superbiam se genitos! prima roboris spes primumque temporis munus quadripedi similem facit. quando homini incessus! quando vox! quando firmum cibus os! quam diu palpitans vertex, summae inter cuncta animalia inbecillitatis iudicium! iam morbi totque medicinae contra mala excogitatae, et hae quoque subinde novitatibus victae! et cetera sentire naturam suam, alia pernicitatem usurpare, alia praepetes volatus, alia nare: hominem nihil scire, nihil sine doctrina, non fari, non ingredi, non vesci, breviterque non aliud naturae sponte quam flere! itaque multi extitere qui non nasci optimum censerent aut quam ocissime aboleri. uni animantium luctus est datus, uni luxuria et quidem innumerabilibus modis ac per singula membra, uni ambitio, uni avaritia, uni immensa vivendi cupido, uni superstitio, uni sepulturae cura atque etiam post se de futuro. nulli vita fragilior, nulli rerum omnium libido maior, nulli pavor confusior, nulli rabies acrior. denique cetera animantia in suo genere probe degunt. congregari videmus et stare contra dissimilia: leonum feritas inter se non dimicat, serpentium morsus non petit serpentes, ne maris quidem beluae ac pisces nisi in diversa genera saeviunt. at hercule homini plurima ex homine sunt mala.

et de universitate quidem generis humani magna ex parte in relatione gentium diximus. neque enim ritus moresque nunc tractabimus innumeros ac totidem paene quot sunt coetus hominum, quaedam tamen haut omittenda duco maximeque longius ab mari degentium, in quibus prodigiosa aliqua et incredibilia multis visum iri haud dubito. quis enim aethiopas ante quam cerneret credidit aut quid non miraculo est, cum primum in notitiam venit quam multa fieri non posse prius quam sunt facta iudicantur naturae vero

rerum vis atque maiestas in omnibus momentis fide caret, si quis modo partes eius ac non totam complectatur animo. ne pavonis ac tigrum pantherarumque maculas et tot animalium picturas commemorem, parvum dictu, sed immensum aestimatione, tot gentium sermones, tot linguae, tanta loquendi varietas, ut externus alieno paene non sit hominis vice! iam in facie vultuque nostro cum sint decem aut paulo plura membra, nullas duas in tot milibus hominum indiscretas effigies existere, quod ars nulla in paucis numero praestet adfectando! nec tamen ego in plerisque eorum obstringam fidem meam potiusque ad auctores relegabo, qui dubiis reddentur omnibus, modo ne sit fastidio graecos sequi, tanto maiore eorum diligentia vel cura vetustiore.

esse scytharum genera et quidem plura, quae corporibus humanis vrescerentur, indicavimus. id ipsum incredibile fortasse, ni cogitemus in medio orbe terrarum ac sicilia et italia fuisse gentes huius monstri, cyclopas et laestrygonas, et nuperrime trans alpis hominem immolari gentium earum more solitum, quod paulum a mandendo abest. sed iuxta eos, qui sunt ad septentrionem versi, haut procul ab ipso aquilonis exortu specuque eius dicto, quem locum ges clithron appellant, produntur arimaspi, quos diximus, uno oculo in fronte media insignes. quibus adsidue bellum esse circa metalla cum grypis, ferarum volucris genere, quale vulgo traditur, eruente ex cuniculis aurum, mira cupiditate et feris custodientibus et arimaspis rapientibus, multi, sed maxime inlustres herodotus et aristaeas proconnesius scribunt. super alios autem anthropophagos scythas in quadam convalle magna imavi montis regio est quae vocatur abarimon, in qua silvestres vivunt homines aversis post crura plantis, eximiae velocitatis, passim cum feris vagantes. hos in alio non spirare caelo ideoque ad finitimos reges non pertrahi neque ad alexandrum magnum pertractos baeton itinerum eius mensor prodidit. priores anthropophagos, quos ad septentrionem esse diximus, decem dierum itinere supra borysthenen amnem ossibus humanorum capitum bibere cutibusque cum capillo pro mantelibus ante pectora uti isigonus nicaeensis. idem in albania gigni quosdam glauca oculorum acie, a pueritia statim canos, qui noctu plus quam interdiu cernant. idem itinere dierum xiii supra borysthenen sauromatas tertio die cibum capere semper.

crates pergamenus in hellesponto circa parium genus hominum fuisse, quos ophiogenes vocat, serpentium ictus contactu levare solitos et manu inposita venena extrahere corpori. Varro etiamnum esse paucos ibi, quorum salivae contra ictus serpentium medeantur. similis et in africa psyllorum gens fuit, ut agatharchides scribit, a psyllo rege dicta, cuius sepulcrum in parte syrtium maiorum est. horum corpori ingenitum fuit virus exitiale serpentibus et cuius odore sopirent eas; mos vero liberos genitos protinus obiciendi saevissimis earum eoque genere pudicitiam coniugum experiendi, non profugientibus adulterino sanguine natos serpentibus. haec gens ipsa quidem prope internicione sublata est a nasamonibus, qui nunc eas tenent sedes. genus tamen hominum ex iis, qui profugerant aut cum pugnatum est afuerant, hodieque remanet in paucis. simile et in italia marsorum genus durat, quos a

circae filio ortos ferunt et ideo inesse iis vim naturalem eam. et tamen omnibus hominibus contra serpentes inest venenum: ferunt ictas saliva ut ferventis aquae contactu fugere; quod si in fauces penetraverit, etiam mori, idque maxime humani ieiuni oris.

supra nasamonas confinesque illis machlyas androgynos esse utriusque naturae, inter se vicibus coeuntes, calliphanes tradit. aristoteles adicit dextram mammam iis virilem, laevam muliebrem esse. in eadem africa familias quasdam effascinantium isigonus et nymphodorus, quorum laudatione intereant probata, arescant arbores, emoriantur infantes. esse eiusdem generis in triballis et illyris adicit isigonus, qui visu quoque effascinent interemantque quos diutius intueantur, iratis praecipue oculis, quod eorum malum facilius sentire puberes; notabilius esse quod pupillas binas in oculis singulis habeant. huius generis et feminas in scythia, quae bitiae vocantur, prodit apollonides. phylarchus et in ponto thibiorum genus multosque alios eiusdem naturae, quorum notas tradit in altero oculo geminam pupillam, in altero equi effigiem; eosdem praeterea non posse mergi, ne veste quidem degravatos. haut dissimile iis genus pharmacum in aethiopia damon, quorum sudor tabem contactis corporibus afferat. feminas quidem omnes ubique visu nocere quae duplices pupillas habeant, cicero quoque apud nos auctor est. adeo naturae, cum ferarum morem vescendi humanis visceribus in homine genuisset, gignere etiam in toto corpore et in quorundam oculis quoque venena placuit, ne quid usquam mali esset quod in homine non esset.

haut procul urbe roma in faliscorum agro familiae sunt paucae quae vocantur hirpi. hae sacrificio annuo, quod fit ad montem soractem apollini, super ambustam ligni struem ambulantes non aduruntur et ob id perpetuo senatus consulto militiae omniumque aliorum munerum vacationem habent. quorundam corpori partes nascuntur ad aliqua mirabiles, sicut pyrro regi pollex in dextro pede, cuius tactu lienosis medebatur. hunc cremari cum reliquo corpore non potuisse tradunt conditumque loculo in templo.

praecipue india aethiopumque tractus miraculis scatent. maxima in india gignuntur animalia. indicio sunt canes grandiores ceteris. arbores quidem tantae proceritatis traduntur, ut sagittis superiaci nequeant - et facit ubertas soli, temperies caeli, aquarum abundantia, si libeat credere, ut sub una fico turmae condantur equitum - , harundines vero tantae proceritatis, ut singula internodia alveo navigabili ternos interdum homines ferant. multos ibi quina cubita constat longitudine excedere, non expuere, non capitis aut dentium aut oculorum ullo dolore adfici, raro aliarum corporis partium: tam moderato solis vapore durari. philosophos eorum, quos gymnosophistas vocant, ab exortu ad occasum perstare contuentes solem immobilibus oculis, ferventibus harenis toto die alternis pedibus insistere. in monte, cui nomen est nulo, homines esse aversis plantis octonos digitos in singulis habentes auctor est megasthenes; in multis autem montibus genus hominum capitibus caninis ferarum pellibus velari, pro voce latratum edere, unguibus armatum venatu et aucupio vesci; horum supra centum viginti milia fuisse prodente se ctesias scribit, et in

quadam gente indiae feminas semel in vita parere genitosque confestim canescere. idem hominum genus, qui monocoli vocarentur, singulis cruribus, mirae pernecitatis ad saltum; eosdem sciapodas vocari, quod in maiore aestu humi iacentes resupini umbra se pedum protegant. non longe eos a trogydis abesse, rursusque ab his occidentem versus quosdam sine cervice oculos in umeris habentes. sunt et satyri subsolanis indorum montibus (catarchlorum dicitur regio), perniciosissimum animal, iam quadrupes, iam recte currentes humana effigie; propter velocitatem nisi senes aut aegri non capiuntur. choromandarum gentem vocat tauron silvestrem, sine voce, stridoris horrendi, hirtis corporibus, oculis glaucis, dentibus caninis. eudoxus in meridianis indiae viris plantas esse cubitales, feminis adeo parvas, ut struthopodes appellentur. megasthenes gentem inter nomadas indos narium loco foramina tantum habentem, anguium modo loripedem, vocari sciratas. ad extremos fines indiae ab oriente circa fontem gangis astomorum gentem sine ore, corpore toto hirtam vestiri frondium lanugine, habitu tantum viventem et odore, quem naribus trahant. nullum illis cibum nullumque potum, radicum tantum florumque varios odores et silvestrium malorum, quae secum portant longiore itinere, ne desit olfactus; graviore paulo odore haut difficulter exanimari. super hos extrema in parte montium trispithami pygmaeique narrantur, ternas spithamas longitudine, hoc est ternos dodrantes, non excedentes, salubri caelo semperque vernante montibus ab aquilone oppositis, quos a gruibus infestari homerus quoque prodidit. fama est insidentes arietum caprarumque dorsis armatos sagittis veris tempore universo agmine ad mare descendere et ova pullosque earum alitum consumere; ternis expeditionem eam mensibus confici; aliter futuris gregibus non resisti. casas eorum luto pinnisque et ovorum putaminibus construi. aristoteles in cavernis vivere pygmaeos tradit, cetera de iis ut reliqui. cyrnos indorum genus isigonus annis centenis quadragenis vivere, item aethiopas macrobios et seras existimat et qui athon montem incolant, hos quidem, quia viperinis carnibus alantur; itaque nec capiti nec vestibis eorum noxia corpori inesse animalia. onesicritus, quibus locis indiae umbrae non sint, corpora hominum cubitorum quinum et binorum palmorum existere, et vivere annos cxxx nec senescere, sed ut medio aevo mori. crates pergamenus indos, qui centenos annos excedant, gymnetas appellat, non pauci macrobios. ctesias gentem ex his, quae appelletur pandae, in convallibus sitam annos ducenos vivere, in iuventa candido capillo, qui in senectute nigrescat, contra alios quadagenos non excedere annos, iunctos macrobiis, quorum feminae semel pariant. idque et agatharchides tradit, praeterea locustis eos ali et esse pernice. mandorum nomen iis dedit clitarchus, et megasthenes trecentos quoque eorum vicos adnumerat. feminas septimo aetatis anno parere, senectam quadagesimo accidere. artemidorus in taprobane insula longissimam vitam sine ullo corporis languore traduci. duris indorum quosdam cum feris coire mixtosque et semiferos esse partus. in calingis eiusdem indiae gente quinquennes concipere feminas, octavum vitae annum non excedere. et alibi cauda villosa

homines nasci pernicitatis eximiae, alios auribus totos contegi.

oritas ab indis arabis fluvius disternit. hi nullum alium cibum novere quam piscium, quos unguibus dissectos sole torreant atque ita panem ex iis faciant, ut refert clitarhus. trogodytes super aethiopiam velocius equis esse pergamenus crates, item aethiops octona cubita longitudine excedere; syrbotas vocari gentem eam. nomadum aethiopum secundum flumen astragum ad septentrionem vergentium gens menisminorum appellata abest ab oceano dierum itinere viginti. animalium, quae cynocephalos vocamus, lacte vivit, quorum armenta pascit maribus interemptis praeterquam subolis causa. in africae solitudinibus hominum species obviae subinde fiunt momentoque evanescent.

haec atque talia ex hominum genere ludibria sibi, nobis miracula ingeniosa fecit natura. ex singulis quidem quae facit in dies ac prope horas, quis enumerare valeat ad detegendam eius potentiam satis sit inter prodigia posuisse gentes. hinc ad confessa in homine pauca.

tergeminos nasci certum est horatorum curiatorumque exemplo. super inter ostenta ducitur praeterquam in aegypto, ubi fetifer potu nilus amnis. proxime supremis Divi Augusti fausta quaedam e plebe ostiae duos mares, totidem feminas enixa famem, quae consecuta est, portendit haud dubie. reperitur et in peloponneso quinos quater enixa, maioremque partem ex omni eius vixisse partu. et in aegypto septenos uno utero simul gigni auctor est trogus.

gignuntur et utriusque sexus quos hermaphroditos vocamus, olim androgynos vocatos et in prodigiis habitos, nunc vero in deliciis. pompeius magnus in ornamentis theatri mirabiles fama posuit effigies, ob id diligentius magnorum artificum ingeniis elaboratas, inter quas legitur eutyche a xx liberis rogo inlata trallibus, enixa xxx partus, alcippe elephantum. quamquam id inter ostenta est. namque et serpentem peperit inter initia marsici belli ancilla, et multiformes pluribus modis inter monstra partus eduntur. claudius caesar scribit hippocentaurum in thessalia natum eodem die interisse, et nos principatu eius adlatum illi ex aegypto in melle vidimus. est inter exempla in utero protinus reversus infans sagunti quo anno deleta ab Hannibale est.

ex feminis mutari in mares non est fabulosum. invenimus in annalibus P. Licinio Crasso c. cassio longino cos. casini puerum factum ex virgine sub parentibus iussuque haruspicum deportatum in insulam desertam. licinius mucianus prodidit visum a se argis arescontem, cui nomen arescusae fuisse, nupsisse etiam, mox barbam et virilitatem provenisse uxoremque duxisse; eiusdem sortis et zmyrnae puerum a se visum. ipse in africa vidi mutatum in marem nuptiarum die I. consitium civem thysdritanum, vivebatque cum proderem haec.

* ... editis geminis raram esse aut puerperae aut puerperio praeterquam alteri vitam; si vero utriusque sexus editi sint gemini, rariorem utrique salutem. feminas celerius gigni quam mares, sicuti celerius senescere. saepius in utero moveri mares et in dextera fere geri parte, in laeva feminas.

ceteris animantibus statum et pariendi et partus gerendi tempus est; homo toto anno et incerto gignitur spatio, alius septimo mense, alius octavo et usque ad initia undecimi. ante septimum mensem haut umquam vitalis est. septimo non nisi pridie posterove pleniluni die aut interlunio concepti nascuntur. tralaticium in aegypto est et octavo gigni, iam quidem et in italia tales partus esse vitales, contra priscorum opiniones. variant haec pluribus modis. vistilia, gliti ac postea pomponi atque orfiti clarissimorum civium coniunx, ex iis quattuor partus enixa septimo semper mense, genuit suillum rufum undecimo, corbulonem septimo, utrumque consulem, postea caesoniam, gai principis coniugem, octavo. in quo mensum numero genitis intra quadragesimum diem maximus labor, gravidis autem quarto et octavo mense, letalesque in iis abortus. masurius auctor est l. papirium praetorem secundo herede lege agente bonorum possessionem contra eum dedisse, cum mater partum se tredecim mensibus diceret tulisse, quoniam nullum certum tempus pariendi statutum videretur.

a conceptu decimo die dolores capitis, oculorum vertigines tenebraeque, fastidium in cibus, redundatio stomachi indices sunt hominis inchoati. melior color marem ferenti et facilius partus, motus in utero quadragesimo die. contraria omnia in altero sexu, ingestabile onus, crurum et inguinis levis tumor, primus autem xc die motus. sed plurimum languoris in utroque sexu capillum germinante partu et in plenilunio, quod tempus editos quoque infantes praecipue infestat. adeoque incessus atque omne quicquid dici potest in gravida refert, ut salsioribus cibus usae carentem unguiculis partum edant et, si respirare, difficilius enitantur. oscitatio quidem in enixu letalis est, sicut sternuisse a coitu abortivum.

miseret atque etiam pudet aestimantem quam sit frivola animalium superbissimi origo, cum plerisque abortus causa odor a lucernarum fiat extinctu. his principiis nascuntur tyranni, his carnifex animus! tu qui corporis viribus fidis, tu qui fortunae munera amplexaris et te ne alumnum quidem eius existimas, sed partum, tu cuius imperatoria est mens, tu qui te deum credis aliquo successu tumens, tanti perire potuisti! atque etiam hodie minoris potes, quantulo serpentis ictus dente aut etiam, ut anacreon poeta, acino uvae passae, ut fabius senator praetor, in lactis haustu uno pilo strangulatus. is demum profecto vitam aequa lance pensabit, qui semper fragilitatis humanae memor fuerit.

in pedes procidere nascentem contra naturam est, quo argumento eos appellavere agrippas ut aegri partus, qualiter et m. agrippam ferunt genitum, unico prope felicitatis exemplo in omnibus ad hunc modum genitis. quamquam is quoque adversa pedum validudine, misera iuventa, exercito aevo inter arma mortisque ac noxia accessu, infelici terris stirpe omni, sed per utrasque agrippinas maxime, quae gaium, quae domitium neronem principes genuere totidem faces generis humani, praeterea brevitate aevi, quinquagesimo uno raptus anno in tormentis adulteriorum coniugis socerique praegravi servitio, luisse augurium praeposteri natalis existimatur. neronem

quoque, paulo ante principem et toto principatu suo hostem generis humani, pedibus genitum scribit parens eius agrippina. ritus naturae hominem capite gigni, mos est pedibus efferri.

auspiciatus enecta parente gignuntur, sicut scipio africanus prior natus primusque caesarum a caeso matris utero dictus, qua de causa et caesones appellati. simili modo natus et manilius, qui carthaginem cum exercitu intravit. vopiscos appellabant e geminis qui retenti utero nascerentur altero interempto abortu. namque maxima, etsi rara, circa hoc miracula existunt.

praeter mulierem pauca animalia coitum novere gravida; unum quidem omnino aut alterum superfetat. extat in monumentis et medicorum et quibus talia consecrari curae fuit uno abortu duodecim puerperia egesta. sed ubi paululum temporis inter duos conceptus intercessit, utrumque perfertur, ut in hercule et iphicle fratre eius apparuit et in ea quae gemino partu alterum marito similem alterumque adultero genuit, item in proconnesia ancilla, quae eiusdem diei coitu alterum domino similem, alterum procuratori eius, et in alia, quae iusto partu quinque mensum alterum edidit, rursus in alia, quae septem mensum edito puerperio insecutis in mensibus geminos enixa est.

iam illa vulgata sunt: varie ex integris truncos gigni, ex truncis integros; eadem parte truncos, signa quaedam naevosque et cicatrices etiam regenerari, quarto partu dacorum originis nota in brachio reddita (in lepidorum gente tres, intermisso ordine, obducto membrana oculo genitos accepimus); similes quidem alios avo, et ex geminis quoque alterum patri, alterum matri, annoque post genitum maiori similem fuisse ut geminum; quasdam sibi similes semper parere, quasdam viro, quasdam nulli, quasdam feminam patri, marem sibi. indubitatum exemplum est nicaei nobilis pyctae byzanti geniti, qui, adulterio aethiopis nata matre nihil a ceteris colore differente, ipse avum regeneravit aethiopem.

similitudinum quidem immensa reputatio est et in qua credantur multa fortuita pollere, visus, auditus, memoria haustaeque imagines sub ipso conceptu. cogitatio etiam utriuslibet animum subito transvolans effingere similitudinem aut miscere existimatur, ideoque plures in homine quam in ceteris omnibus animalibus differentiae, quoniam velocitas cogitationum animique celeritas et ingenii varietas multiformes notas inprimit, cum ceteris animantibus immobiles sint animi et similes omnibus singulis in suo cuique genere. antiocho regi syriae e plebe nomine artemo in tantum similis fuit, ut laodice coniunx regia necato iam antiocho mimus per eum commendationis regnique successionis peregerit. magno pompeio vibius quidam e plebe et publicius etiam servitute liberatus indiscreta prope specie fuere similes, illud os probum reddentes ipsumque honorem eximiae frontis. qualis causa patri quoque eius menogenis coci sui cognomen inposuit, iam strabonis a specie oculorum habentis vitium imitato item servo; scipioni serapionis indiderat suarii negotiatoris vile mancipium. eiusdem familiae scipioni post eum nomen salvitto mimus dedit, sicut spinther secundarum tertiarumque pamphilus collegio lentuli et metelli consulum, in quo perquam inopportune fortuitum hoc

quoque fuit, duorum simul consulum in scaena imagines cerni. e diverso l. plancus orator histrioni rubrio cognomen inposuit, rursus curioni patri burbuleius itemque messalae censorio menogenes, perinde histriones. surae quidem proconsulis etiam rictum in loquendo intractionemque linguae et sermonis tumultum, non imaginem modo, piscator quidam in sicilia reddidit. cassio severo, celebri oratori, armentari murmillonis obiecta similitudo est. modo in iunia domo gallionem a castellano liberto non discernebat, nec a sannio mimo paride cognominato agrippinum senatorem. toranius mango antonio iam triumviro eximios forma pueros, alterum in asia genitum, alterum trans alpis, ut geminos vendidit: tanta unitas erat. postquam deinde sermone puerorum detecta fraude a furente increpitus antonio est, inter alia magnitudinem preti conquerente (nam ducentis erat mercatus sestertiis), respondit versutus ingenii mango, id ipsum se tanti vendidisse, quoniam non esset mira similitudo in ullis eodem utero editis; diversarum quidem gentium natales tam concordia figura reperire super omnem esse taxationem; adeoque tempestivam admirationem intulit, ut ille proscriptor animus, modo et contumelia furens, non aliud in censu magis ex fortuna sua duceret.

est quaedam privatim dissociatio corporum, et inter se steriles, ubi cum aliis iunxere se, gignunt, sicut Augustus et livia. item alii aliaeque feminas tantum generant aut mares, plerumque et alternant, sicut gracchorum mater duodeciens et agrippina germanici noviensi. aliis sterilis est iuventa, aliis semel in vita datur gignere. quaedam non perferunt partus, quales, si quando medicina et cura vicere, feminam fere gignunt. Divus Augustus in reliqua exemplorum raritate neptis suae nepotem vidit genitum quo excessit anno, m. silanum, qui, cum asiam obtineret post consulatum neronis principis successionem, veneno eius interemptus est. q. metellus macedonicus, cum sex liberos relinqueret, xi nepotes reliquit, nurus vero generosque et omnes, qui se patris appellatione salutarent, xxvii. in actis temporum Divi Augusti invenitur duodecimo consulatu eius l. que sulla collega a. d. iiii. idus aprilis c. crispinium hilarum ex ingenua plebe faesulana cum liberis viii, in quo numero filiae duae fuere, nepotibus xxvii, pronepotibus xviii, neptibus viii, praelata pompa tum omnibus, in capitolio immolasse.

mulier post quinquagensimum annum non gignit, maiorque pars xl profluvium genitale sistit. nam in viris masinissam regem post lxxxvi annum generasse filium, quem methimannum appellaverit, clarum est, catonem censorium octogensimo exacto e filia salonis clientis sui. qua de causa aliorum eius liberum propago liciniani sunt cognominati, hi saloniani, ex quis uticensis fuit. nuper etiam l. volusio saturnino in urbis praefectura extincto notum est e cornelia scipionum gentis volusium saturninum, qui fuit consul, genitum post lxii annum. et usque ad lxxv apud ignobiles vulgaris reperitur generatio.

solum autem animal menstruale mulier est; inde unius utero quas appellaverunt molas. ea est caro informis, inanima, ferri ictum et aciem respuens. movetur sistitque et menses, ut partus, alias letalis, alias una senescens, aliquando alvo citatiore excidens. simile quiddam et viris in ventre

gignitur, quod vocant scirron, sicut oppio capitoni praetorio viro. sed nihil facile reperiatur mulierum profluvio magis monstrificum. acescunt superventu musta, sterilescent tactae fruges, moriuntur insita, exuruntur hortorum germina, fructus arborum, quibus insidere, decidunt, speculorum fulgor aspectu ipso hebetatur, acies ferri praestringitur, eboris nitor, alvi apium moriuntur, aes etiam ac ferrum robigo protinus corripit odorque dirus aera, et in rabiem aguntur gustato eo canes atque insanabili veneno morsus inficitur. quin et bituminum sequax alioqui ac lenta natura in lacu iudaeae, qui vocatur asphaltites, certo tempore anni supernatans non quit sibi avelli, ad omnem contactum adhaerens praeterquam filo ... , quem tale virus infecerit. etiam formicis, animali minimo, inesse sensum eius ferunt abique gustatas fruges nec postea repeti. et hoc tale tantumque omnibus tricenis diebus malum in muliere existit et trimenstri spatio largius, quibusdam vero saepius mense, sicut aliquis numquam. sed tales non gignunt, quando haec est generando homini materia, germine e maribus coaguli modo hoc in sese glomerante, quod deinde tempore ipso animatur corporaturque. ergo cum gravidis fluxit, invalidi aut non vitales partus eduntur aut saniosi, ut auctor est nigidius; - (idem lac feminae non corrumpi alenti partum, si ex eodem viro rursus conceperit, arbitratur) - incipiente autem hoc statu aut desinente conceptus facillimi traduntur. fecunditatis in feminis praerogativum accepimus inunctis medicamine oculis salivam infici.

ceterum editis primores septimo mense gigni dentes priusque in supra fere parte, haud dubium est, septimo eosdem decidere anno aliosque suffici, quosdam et cum dentibus nasci, sicut m'. curium, qui ob id dentatus cognominatus est, et cn. papirium carbonem, praeclaros viros. in feminis ea res inauspicati fuit exempli regum temporibus. cum ita nata esset valeria, exitio civitati in quam delata esset futuram responso haruspicum vaticinante, suessam pometiam illa tempestate florentissimam deportata est, veridico exitu consecuto. - (quasdam concreto genitali gigni infausto omine cornelia gracchorum mater indicio est) - aliqui vice dentium continuo osse gignuntur, sicuti prusiae regis bithynorum filius superna parte oris. dentes autem in tantum invicti sunt ignibus, ut nec crementur cum reliquo corpore, iidemque flammis indomiti cavantur tabe pituitae. candorem trahunt quodam medicamine. usu atteruntur multoque prius in aliquis deficiunt. nec cibo tantum et alimentis necessari, quippe vocis sermonisque regimen primores tenent, concentu quodam excipientes ictum linguae serieque structurae atque magnitudine mutilantes mollientesve aut hebetantes verba et, cum defuere, explanationem omnem adimentes. quin et augurium in hac esse creditur parte. triceni bini viris adtribuuntur excepta turdolorum gente: quibus plures fuere, longiora promitti vitae putant spatia. feminis minor numerus: quibus in dextra parte gemini superne a canibus cognominati, fortunae blandimenta pollicentur, sicut in agrippina domiti neronis matre; contra in laeva. - (hominem prius quam genito dente cremari mos gentium non est) - sed mox plura de hoc, cum membratim historia decurret.

risisse eodem die quo genitus esset unum hominum accepimus zoroastren; eidem cerebrum ita palpitasse, ut inpositam repelleret manum, futurae praesagio scientiae.

in trimatu suo cuique dimidiam esse mensuram futurae certum est. in plenum autem cuncto mortalium generi minorem in dies fieri propemodum observatur rarosque patribus proceriores, consumente ubertatem seminum exustione, in cuius vices nunc vergat aevum. in creta terrae motu rupto monte inventum est corpus stans xlii cubitorum, quod alii orionis, alii oti esse tradunt. orestis corpus oraculi iussu refossum vii cubitorum fuisse monumentis creditur. iam vero ante annos prope mille vates ille homerus non cessavit minora corpora mortalium quam prisca conqueri. naevii pollionis amplitudinem annales non tradunt, sed quia populi concursu paene sit interemptus, vice prodigii habitum. procerissimum hominum aetas nostra divo claudio principe gabbarum nomine ex arabia advectum novem pedum et totidem unciarum vidit. fuere sub Divo Augusto semipede addito, quorum corpora eius miraculi gratia in conditorio sallustianorum adservabantur hortorum; pusioni et secundillae erant nomina. eodem praeside minimus homo duos pedes et palmum conopas nomine in deliciis iuliae neptis eius fuit, et mulier andromeda, liberta iuliae augustae. manium maximum et m. tullium equites romanos binum cubitorum fuisse auctor est M. Varro, et ipsi vidimus in loculis adservatos. sesquipedales gigni, quosdam longiores, in trimatu implentes vitae cursum, haud ignotum est.

invenimus in monumentis salamine euthymenis filium in tria cubita triennio adcrevisse, incessu tardum, sensu hebetem, puberem etiam factum, voce robusta, absumptum contractione membrorum subita triennio circumacto. ipsi non pridem vidimus eadem ferme omnia praeter pubertatem in filio corneli taciti, equitis romani belgicae galliae rationes procurantis. ἑκτραπέλους graeci vocant eos; in latio non habent nomen.

quod sit homini spatium a vestigio ad verticem, id esse pansis manibus inter longissimos digitos observatum est, sicuti vires dextra parte maiores, quibusdam aequas utraque, aliquis laeva manu praecipuas, nec id umquam in feminis; mares praestare pondere et defuncta viventibus corpora omnium animalium et dormientia vigilantibus; virorum cadavera supina fluitare, feminarum prona, velut pudori defunctarum parcente natura.

concretis quosdam ossibus ac sine medullis vivere accepimus. signum eorum esse nec sitim sentire nec sudorem emittere, quamquam et voluntate scimus sitim victam equitemque romanum iulium viatorem e vocontiorum gente foederata in pupillaribus annis aquae subter cutem fusae morbo prohibitum umore a medicis naturam fecisse consuetudinem atque in senecta caruisse potu. nec non et alii multa sibi imperavere.

ferunt Crassum, avum Crassi in parthis interempti, numquam risisse, ob id agelastum vocatum, sicuti nec flesse multos. socratem clarum sapientia eodem semper visum vultu nec aut hilario magis aut turbato. exit hic animi tenor aliquando in rigorem quandam torvitatemque naturae duram et inflexibilem

affectusque humanos adimit, quales ἀπαθείς graeci vocant, multos eius generis experti, - quod mirum sit - auctores maxime sapientiae, diogenem cynicum, pyrrhonem, heraclitum, timonem, hunc quidem etiam in totius odium generis humani evectum. sed haec parva naturae insignia in multis varia cognoscuntur, ut in antonia drusi numquam expuisse, in pomponio consulari poeta non ructasse. - (quibus natura concreta sunt ossa, qui sunt rari admodum, cornei vocantur) -

corpore vesco, sed eximiis viribus tritanum, in gladiatorio ludo samnitium armatura celebrem, filiumque eius militem magni pompeii et rectos et transversos cancellatim toto corpore habuisse nervos, in brachiis etiam manibusque, auctor est Varro prodigiosa virium relatione atque etiam hostem ab eo ex provocatione dimicante inermi dextera superatum et postremo correptum uno digito in castra tralatum. at vinnius valens meruit in praetorio Divi Augusti centurio, vehicula vini culleis onusta, donec exinanirentur, sustinere solitus, carpenta adprehensa una manu retinere, obnixus contra nitentibus iumentis, et alia mirifica facere, quae insculpta monumento eius spectantur. idem M. Varro: “rusticelius”, inquit, “hercules appellatus mulum suum tollebat, fufius salvius duo centenaria pondera pedibus, totidem manibus et ducenaria duo umeris contra scalas ferebat.” nos quoque vidimus athanatum nomine prodigiosae ostentationis quingenario thorace plumbeo indutum cothurnisque quingentum pondo calciatum per scaenam ingredi. milonem athletam, cum constitisset, nemo vestigio educebat, malum tenenti modo digitum corriperebat.

cucurrisse mxxi stadia ab athenis lacedaemonem biduo philippidem magnum erat, donec anystis cursor lacedaemonius et philonides alexandri magni a sicyone elim uno die mcccv cucurrerunt. nunc quidem in circo quosdam [clx] passuum tolerare non ignoramus nuperque fonteio et vipstano cos. annos viii genitum a meridie ad vesperam [lxxv] passuum cucurrisse. cuius rei admiratio ita demum solida perveniat, si quis cogitet nocte ac die longissimum iter vehiculis tib. neronem emensum festinantem ad drusum fratrem aegrotum in germaniam. ea fuerunt [cc] passuum.

oculorum acies vel maxime fidem excedentia invenit exempla. in nuce inclusam iliadem homeri carmen in membrana scriptum tradit cicero. idem fuisse qui pervideret [cxxxv] passuum. huic et nomen M. Varro reddit: strabonem vocatum; solitum autem punico bello a lilybaeo siciliae promunturio, exeunte classe e carthaginis portu, etiam numerum navium dicere. callicrates ex ebore formicas et alia tam parva fecit animalia, ut partes eorum a ceteris cerni non possent. myrmecides quidem in eodem genere inclaruit quadriga ex eadem materia, quam musca integeret alis, fabricata et nave, quam apicula pinnis absconderet.

auditus unum exemplum habet mirabile proelium, quo sybaris deleta est, eo die quo gestum erat auditum olympiae. nam fama cimbricae victoriae castoresque, romam qui persicam victoriam ipso die quo contigit nuntiavere, visus et numinum fuere praesagia.

patientia corporis, ut est crebra sors calamitatum, innumera documenta peperit, clarissimum in feminis leaenae meretricis, quae torta non indicavit harmodium et aristogitonem tyrannicidas, in viris anaxarchi, qui, simili de causa cum torqueretur, praerosam dentibus linguam unamque spem indicii in tyranni os expuit.

memoria necessarium maxime vitae bonum cui praecipua fuerit, haut facile dictu est, tam multis eius gloriam adeptis. Cyrus rex omnibus in exercitu suo militibus nomina reddidit, l. scipio populo romano, cineas pyrrhi regis legatus senatui et equestri ordini romae postero die quam advenerat. mithridates, duarum et viginti gentium rex, totidem linguis iura dixit, pro contione singulas sine interprete adfatus. charmadas quidem in graecia quae quis exegerat volumina in bibliothecis legentis modo repraesentavit. ars postremo eius rei facta et inventa est a simonide melico, consummata a metrodoro sceprio, ut nihil non isdem verbis redderetur auditum. nec aliud est aequae fragile in homine: morborum et casus iniurias atque etiam metus sentit, alias particulatim, alias universa. ictus lapide oblitus est litteras tantum; ex praealto tecto lapsus matris et adfinium propinquorumque cepit oblivionem, alius aegrotus servorum, etiam sui vero nominis messala corvinus orator. itaque saepe deficere temptat ac meditatur vel quieto corpore et valido. somno quoque serpente amputatur, ut inanis mens quaerat ubi sit loci.

animi vigore praestantissimum arbitror genitum caesarem dictatorem, nec virtutem constantiamque nunc commemoro nec sublimitatem omnium capacem quae caelo continentur, sed proprium vigorem celeritatemque quodam igne volucrem. scribere aut legere, simul dictare et audire solitum accepimus, epistulas vero tantarum rerum quaternas pariter dictare librariis aut, si nihil aliud ageret, septenas. idem signis conlatis bis et quinquagens dimicavit, solus m. marcellum transgressus, qui undequadragens dimicavit. nam praeter civiles victorias undeciens centena et nonaginta duo milia hominum occisa proeliis ab eo non equidem in gloria posuerim, tantam etiam coactam humani generis iniuriam, quod ita esse confessus est ipse bellorum civilium stragem non prodendo.

iustius pompeio magno tribuatur dcccxlvi naves piratis ademisse: caesari proprium et peculiare sit praeter supra dicta clementiae insigne, qua usque ad paenitentiam omnes superavit. idem magnanimitatis perhibuit exemplum, cui comparari non possit aliud. spectacula enim edita effusasque opes aut operum magnificentiam in hac parte enumerare luxuriae faventis est: illa fuit vera et incomparabilis invicti animi sublimitas, captis apud pharsaliam pompeii magni scriniis epistularum iterumque apud thapsum scipionis concremasse ea optima fide atque non legisse.

verum ad decus imperii romani, non solum ad viri unius, pertinet victoriarum pompeii magni titulos omnes triumphosque hoc in loco nuncupari, aequato non modo alexandri magni rerum fulgore, sed etiam herculis prope ac liberi patris. igitur sicilia recuperata, unde primum sullanus in rei publicae causa exoriens auspatus est, africa vero tota subacta et in dicionem redacta

magnique nomine in spoliū inde capto, eques romanus, id quod antea nemo, curru triumphali reiectus et statim ad solis occasum transgressus, excitatis in pyrenaeo tropaeis, oppida dccclxxvi ab albis ad fines hispaniae ulterioris in dicionem redacta victoriae suae adscripsit et maiore animo sertorium tacuit, belloque civili, quod omnia externa conciebat, extincto iterum triumphales currus eques r. induxit, totiens imperator ante quam miles. postea ad tota maria et deinde solis ortus missus hos retulit patriae titulos more sacris certaminibus vincentium - neque enim ipsi coronantur, sed patrias suas coronant - , hos ergo honores urbi tribuit in delubro minervae, quod ex manubiis dicabat:

hoc est breviarium eius ab oriente. triumphī vero, quem duxit a. d. iiii kal. oct. m. pisone m. messala cos., praefatio haec fuit:

“cū oram maritimam praedonibus liberasset et imperium maris populo romano restitvisset ex asia ponto armenia paphlagonia cappadocia cilicia syria scythiis iudaeis albanis hiberia insula creta basternis et super haec de rege mithridate atque tigrane triumphavit”.

summa summarum in illa gloria fuit (ut ipse in contione dixit, cum de rebus suis disseret) asiam ultimam provinciarum accepisse eandemque mediam patriae reddidisse. si quis e contrario simili modo velit percensere caesaris res, qui maior illo apparuit, totum profecto terrarum orbem enumeret, quod infinitum esse conveniet.

ceteris virtutum generibus varie et multi fuere praestantes. cato primus porciae gentis tres summas in homine res praestitisse existimatur, ut esset optimus orator, optimus imperator, optimus senator, quae mihi omnia, etiamsi non prius, attamen clarius fulsisse in scipione aemiliano videntur, dempto praeterea plurimorum odio, quo cato laboravit. itaque sit proprium catonis quater et quadragiens causam dixisse, nec quemquam saepius postulatū et semper absolutum.

fortitudo in quo maxime exstiterit immensae quaestionis est, utique si poetica recipiatur fabulositas. q. ennius t. caecilium teucrum fratremque eius praecipue miratus propter eos sextum decimum adiecit annalem. l. siccius dentatus, qui tribunus plebei fuit sp. tarpeio a. aternio cos. haud multo post exactos reges, vel numerosissima suffragia habet centiens viciens proeliatas, octiens ex provocatione victor, quadraginta quinque cicatricibus adverso corpore insignis, nulla in tergo. idem spolia cepit xxxiiii, donatus hastis puris duodeviginti, phaleris viginti quinque, torquibus tribus et octoginta, armillis clx, coronis xxvi, in iis civicis xiiii, aureis octo, muralibus, tribus, obsidionali una, fisco aeris, x captivis et viginti simul bubus, imperatores novem ipsius maxime opera triumphantes secutus, praeterea (quod optimum in operibus eius reor) uno ex ducibus t. romilio ex consulatu ad populum convicto male imperatae rei militaris.

haut minora forent capitolini decora, ni perdidisset illa exitu vitae. ante decem et septem annos bina ceperat spolia. primus omnium eques muralem acceperat coronam, sex civicas, xxxvii dona, xxiii cicatrices adverso corpore

exceperat, p. servilium magistrum equitum servaverat, ipse vulneratus umerum, femur. super omnia capitolium summamque rem in eo solus a gallis servaverat, si non regno suo servasset.

verum in his sunt quidem virtutis opera magna, sed maiora fortunae. m. sergio, ut equidem arbitror, nemo quemquam hominum iure praetulerit, licet pronepos catilina gratiam nomini deroget. secundo stipendio dextram manum perdidit; stipendiis duobus ter et viciens vulneratus est, ob id neutra manu, neutro pede satis utilis, uno tantum salvus, plurimis postea stipendiis debilis miles. bis ab Hannibale captus - neque enim cum quolibet hoste res fuit - , bis vinculorum eius profugus, in viginti mensibus nullo non die in catenis aut compedibus custoditus. sinistra manu sola quater pugnavit, uno die duobus equis insidente eo suffossis. dextram sibi ferream fecit eaque religata proeliatus cremonam obsidione exemit, placentiam tutatus est, duodena castra hostium in gallia cepit, quae omnia ex oratione eius apparent habita cum in praetura sacris arceretur a collegis ut debilis, quos hic coronarum acervos constructurus hoste mutato! etenim plurimum refert, in quae cuiusque virtus tempora inciderit. quas trebia ticinusve aut trasimennus civicas dedere quae cannis corona merita, unde fugisse virtutis summum opus fuit ceteri profecto victores hominum fuere, sergius vicit etiam fortunam.

ingeniorum gloriae quis possit agere dilectum per tot disciplinarum genera et tantam rerum operumque varietatem, nisi forte homero vate graeco nullum felicius extitisse convenit, sive operis forma sive materie aestimetur itaque alexander magnus - etenim insignibus iudiciis optime citraque invidiam tam superba censura peragetur - inter spolia darii persarum regis unguentorum scrinio capto, quod erat auro, margaritis gemmisque pretiosum, varios eius usus amicis demonstrantibus, quando taedebat unguenti bellatorem et militia sordidum: "immo hercule," inquit, "librorum homeri custodiae detur," ut pretiosissimum humani animi opus quam maxime diviti opere servaretur. idem pindari vatis familiae penetibusque iussit parci, cum thebas raperet, aristotelis philosophi patriam suam credidit tantaeque rerum claritati tam benignum testimonium miscuit. archilochi poetae interfectores apollo arguit delphis. sophoclem tragici cothurni principem defunctum sepelire liber pater iussit, obsidentibus moenia lacedaemoniis, lysandro eorum rege in quiete saepius admonito ut pateretur humari delicias suas. requisivit rex, qui supremum diem athenis obissent, nec difficulter ex his quem deus significasset intellexit pacemque funeri dedit.

platonis sapientiae antistiti dionysius tyrannus, alias saevitiae superbiaeque natus, vittatam navem misit obviam, ipse quadrigis albis egredientem in litore excepit. viginti talentis unam orationem isocrates vendidit. aeschines atheniensis summus orator, cum accusationem, qua fuerat usus, rhodiis legisset, legit et defensionem demosthenis, qua in illud pulsus fuerat exilium, mirantibusque tum magis fuisse miraturos dixit, si ipsum orantem audivissent, calamitate testis ingens factus inimici. thucydiden imperatorem athenienses in exilium egere, rerum conditorem revocare, eloquentiam mirati cuius

virtutem damnaverant. magnum et menandro in comico socco testimonium regum aegypti et macedoniae contigit classe et per legatos petito, maius ex ipso, regiae fortunae praelata litterarum conscientia.

perhibuere et romani proceres etiam exteris testimonia. cn. pompeius confecto mithridatico bello intraturus posidonii sapientiae professione clari domum forem percuti de more a lictore vetuit et fasces litterarum ianuae summisit is cui se oriens occidensque summiserat. cato censorius in illa nobilitate sapientiae procerum ab athenis legatione audito carneade quam primum legatos eos censuit dimittendos, quoniam illo viro argumentante quid veri esset haut facile discerni posset. quanta morum commutatio! ille semper alioquin universos ex italia pellendos censuit graecos, at pronepos eius uticensis cato unum ex tribunatu militum philosophum, alterum ex cypria legatione deportavit, eandemque linguam ex duobus catonibus in illo abegisse, in hoc importasse memorabile est.

sed et nostrorum gloriam percenseamus. prior africanus q. ennii statuam sepulcro suo inponi iussit clarumque illud nomen, immo vero spoliū ex tertia orbis parte raptum, in cinere supremo cum poetae titulo legi. Divus Augustus carmina vergili cremari contra testamenti eius verecundiam vetuit, maiusque ita vati testimonium contigit quam si ipse sua probavisset. M. Varronis in bibliotheca, quae prima in orbe ab asinio pollione ex manubiis publicata romae est, unius viventis posita imago est, haut minore, ut equidem reor, gloria, principe oratore et cive ex illa ingeniorum quae tunc fuit multitudine uni hanc coronam dante quam cum eidem magnus pompeius piratico ex bello navalem dedit. innumerabilia deinde sunt exempla romana, si persequi libeat, cum plures una gens in quocumque genere eximios tulerit quam ceterae terrae. sed quo te, m. tullii, piaculo taceam, quove maxime excellentem insigni praedicem quo potius quam universi populi illius gentium amplissimi testimonio, e tota vita tua consulatus tantum operibus electis te dicente legem agrariam, hoc est alimenta sua, abdicarunt tribus; te suadente roscio theatralis auctori legis ignoverunt notatasque se discrimine sedis aequo animo tulerunt; te orante proscriptorum liberos honores petere puduit; tuum catilina fugit ingenium; tu m. antonium proscripsisti. salve primus omnium parens patriae appellate, primus in toga triumphum linguaeque lauream merite et facundiae latiarumque litterarum parens aequae (ut dictator caesar, hostis quondam tuus, de te scripsit) omnium triumphorum laurea maiorem, quanto plus est ingenii romani terminos in tantum promovisse quam imperii.

reliquis animi bonis praestitere ceteros mortales: sapientia ob id cati, corculi apud romanos cognominati, apud graecos socrates, oraculo apollinis pythii praelatus cunctis. rursus mortales oraculorum societatem dedere chiloni lacedaemonio tria praecepta eius delphis consecrando aureis litteris, quae sunt haec: “nosse se quemque,” et “nihil nimium cupere, comitemque aeris alieni atque litis esse miseriam.” quin et funus eius, cum victore filio olympiae expirasset gaudio, tota graecia prosecuta est.

divinitas et quaedam caelitus societas nobilissima ex feminis in sibylla

fuit, ex viris in melampode apud graecos, apud romanos in marcio.

vir optimus semel a condito aevo iudicatus est scipio nasica ab iurato senatu, idem in toga candida bis repulsa notatus a populo. in summa ei in patria mori non licuit, non hercule magis quam extra vincula illi sapientissimo ab apolline iudicato socrati.

pudivissima femina semel matronarum sententia iudicata est sulpicia paterculi filia, uxor fulvi flacci, electa ex centum praeceptis quae simulacrum veneris ex sibyllinis libris dedicaret, iterum religionis experimento claudia inducta romam deum matre.

pietatis exempla infinita quidem toto orbe extitere, sed romae unum, cui comparari cuncta non possint. humilis in plebe et ideo ignobilis puerpera, supplicii causa carcere inclusa matre cum impetrasset aditum, a ianitore semper excussa ante, ne quid inferret cibi, deprehensa est uberibus suis alens eam. quo miraculo matris salus donata pietati est, ambaeque perpetuis alimentis, et locus ille eidem consecratus deae, c. quintio m'. acilio cos. templo pietatis extructo in illius carceris sede, ubi nunc marcelli theatrum est. gracchorum pater anguibz prehensis in domo, cum responderetur ipsum victurum alterius sexus interempto: "immo vero," inquit, "meum necate, cornelia enim iuvenis est et parere adhuc potest." hoc erat uxori parcere et rei publicae consulere; idque mox consecutum est. m. lepidus appuleiae uxoris caritate post repudium obiit. p. rutilius morbo levi impeditus nuntiata fratris repulsa in consulatus petitione ilico expiravit. p. catienus philotimus patronum adeo dilexit, ut heres omnibus bonis institutus in rogum eius se iaceret.

variarum artium scientia innumerabiles enituere, quos tamen attingi par sit florem hominum libantibus: astrologia berossus, cui ob divinas praedictiones athenienses publice in gymnasio statuam inaurata lingua statuere; grammatica apollodorus, cui amphictyones graeciae honorem habuere; hippocrates medicina, qui venientem ab illyriis pestilentiam praedixit discipulosque ad auxiliandum circa urbes dimisit, quod ob meritum honores illi quos herculi decrevit graecia. eandem scientiam in cleombroto ceo ptolemaeus rex megalensibus sacris donavit centum talentis servato antiocho rege. magna et critobulo fama est extracta philippi regis oculo sagitta et citra deformitatem oris curata orbitate luminis, summa autem asclepiadi prusiensi condita nova secta, spretis legatis et pollicitationibus mithridatis regis, reperta ratione qua vinum aegris medetur, relato e funere homine et conservato, sed maxime sponsione facta cum fortuna, ne medicus crederetur, si umquam invalidus ullo modo fuisset ipse. et vicit suprema in senecta lapsu scalarum exanimatus.

grande et archimedi geometricae ac machinalis scientiae testimonium m. marcelli contigit interdicto, cum syracusae caperentur, ne violaretur unus, nisi fefellisset imperium militaris imprudentia. laudatus est et chersiphron gnosius aede ephesi dianae admirabili fabricata, philon athenis armamentario cd navium, ctesibius pneumatica ratione et hydraulicis organis repertis, dinochares metatus alexandro condente in aegypto alexandriam. idem hic imperator edixit ne quis ipsum alius quam Apelles pingeret, quam pyrgoteles

scalperet, quam lysippus ex aere duceret. quae artes pluribus inclaruere exemplis. aristidis thebani pictoris unam tabulam centum talentis rex attalus licitus est, octoginta emit duas caesar dictator, mediam et aiacem timomachi, in templo veneris genetricis dicaturus. candaules rex bularchi picturam magnetum exitii, haut mediocris spatii, rependit auro. rhodum non incendit rex demetrius expugnator cognominatus, ne tabulam protogenis cremaret a parte ea muri locatam. Praxiteles marmore nobilitatus est cnidiaque venere praecipue vesano amore cuiusdam iuvenis insigni et Nicomedis aestimatione regis grandi cnidiorum aere alieno permutare eam conati. Phidiae iuppiter olympius cotidie testimonium perhibet, mentori capitolinus et diana ephesia, quibus fuere consecrata artis eius vasa.

pretium hominis in servitio geniti maximum ad hanc diem, quod equidem conpererim, fuit grammaticae artis, daphnin attio pisaurense vendente et M. Scauro principe civitatis iii [dcc] licente. excessere hoc in nostro aevo, nec modice, histriones, sed hi libertatem suam mercati, quippe cum iam apud maiores roscius histrio iii [d] annua meritasse prodatur, nisi si quis in hoc loco desiderat armeniacy belli paulo ante propter tiridaten gesti dispensatorem, quem nero iii [30cxxx]30 manumisit. sed hoc pretium belli, non hominis, fuit tam hercules quam libidinis, non formae, paezontem e spadonibus seiani iii [30d]30 mercante clutorio prisco. quam quidem iniuriam lucri fecit ille mercatus in luctu civitatis, quoniam arguere nulli vacabat.

gentium in toto orbe praestantissima una omnium virtute haud dubie romana extitit. felicitas cui praecipua fuerit homini, non est humani iudicii, cum prosperitatem ipsam alius alio modo et suoapte ingenio quisque determinet. si verum facere iudicium volumus ac repudiata omni fortunae ambitione decernere, nemo mortalium est felix. abunde agitur atque indulgenter a fortuna deceditur cum eo, qui iure dici non infelix potest. quippe ut alia non sint, certe ne lassescat fortuna metus est, quo semel recepto solida felicitas non est. quid, quod nemo mortalium omnibus horis sapit utinamque falsum hoc et non ut a vate dictum quam plurimi iudicent! vana mortalitas et ad circumscribendam se ipsam ingeniosa computat more thraciae gentis, quae calculos colore distinctos pro experimento cuiusque diei in urnam condit ac supremo die separatos dinumerat atque ita de quoque pronuntiat. quid, quod iste calculi candore illo laudatus dies originem mali habuit quam multos accepta adflixere imperia! quam multos bona perdidere et ultimis mersere suppliciis, ista nimirum bona, cum interim illa hora in gaudio fuit! ita est profecto: alius de alio iudicat dies et tantum supremus de omnibus, ideoque nullis credendum est. quid, quod bona malis paria non sunt etiam pari numero, nec laetitia ulla minimo maerore pensanda heu vana et imprudens diligentia! numerus dierum comparatur, ubi quaeritur pondus!

una feminarum in omni aevo lampido lacedaemonia reperitur, quae regis filia, regis uxor, regis mater fuerit, una berenice, quae filia, soror, mater olympionicarum; una familia curionum, in qua tres continua serie oratores extiterint, una fabiorum, in qua tres continui principes senatus, m. fabius

ambustus, fabius rullianus filius, q. fabius gurgus nepos.

cetera exempla fortunae variantis innumera sunt. etenim quae facit magna gaudia nisi ex malis aut quae mala immensa nisi ex ingentibus gaudiis servavit proscriptum a Sulla M. Fidustium senatorem annis xxxvi, sed iterum proscriptura. superstes Sullae vixit, sed usque ad Antonium, constatque nulla alia de causa ab eo proscriptum quam quia proscriptus fuisset. triumphare P. Ventidium de Parthis voluit quidem solum, sed eundem in triumpho Asculano Cn. Pompei duxit puerum, quamquam Masurius auctor est bis in triumpho ductum, Cicero mulionem castrensis furnariae fuisse, plurimi iuventam inopem in caliga militari tolerasse. fuit et Balbus Cornelius maior consul, sed accusatus atque de iure virgarum in eum iudice in consilium misso, primus externorum atque etiam in oceano genitorum usus illo honore, quem maiores latio quoque negaverint. est et L. Fulvius inter insignia exempla, Tusculanorum rebellantium consul, eodemque honore, cum transisset, exornatus confestim a populo Romano, qui solus eodem anno, quo fuerat hostis, Romae triumphavit ex iis quorum consul fuerat. unus hominum ad hoc aevi felix sibi cognomen adseruit L. Sulla, civili nempe sanguine ac patriae oppugnatione adoptatus. et quibus felicitatis inductus argumentis quod proscribere tot milia civium ac trucidare potuisset o prava interpretatio et futuro tempore infelix! non melioris sortis tunc fuere pereuntes, quorum miseremur hodie, cum Sullam nemo non oderit age, non exitus vitae eius omnium proscriptorum ab illo calamitate crudelior fuit erodente se ipso corpore et supplicia sibi gignente quod ut dissimulaverit et supremo somnio eius, cui immortuus quodammodo est, credamus ab uno illo invidiam gloria victam, hoc tamen nempe felicitati suae defuisse confessus est quod Capitolium non dedicavisset.

q. Metellus in ea oratione, quam habuit supremis laudibus patris sui L. Metelli pontificis, bis consulis, dictatoris, magistri equitum, xv viri agris dandis, qui plurimos elephantos ex primo Punico bello duxit in triumpho, scriptum reliquit decem maximas res optimasque, in quibus quaerendis sapientes aetatem exigerent, consummasse eum: voluisse enim primum bellatorem esse, optimum oratorem, fortissimum imperatorem, auspicio suo maximas res geri, maximo honore uti, summa sapientia esse, summum senatorem haberi, pecuniam magnam bono modo invenire, multos liberos relinquere et clarissimum in civitate esse; haec contigisse ei nec ulli alii post Romam conditam. longum est refellere et supervacuum abunde uno casu refutante, siquidem is Metellus orbam luminibus exegit senectam, amissis incendio, cum Palladium raperet ex aede Vestae, memorabili causa, sed eventu misero. quo fit ut infelix quidem dici non debeat, felix tamen non possit. tribuit ei populus Romanus quod nulli alii ab condito aevo, ut, quotiens in senatum iret, curru veheretur ad Curiam: magnum ei et sublime, sed pro oculis datum.

huius quoque q. Metelli, qui illa de patre dixit, filius inter rara felicitatis humanae exempla numeratur: nam praeter honores amplissimos cognomenque Macedonici a quattuor filiis inlatus rogo, uno praetorio, tribus consularibus,

duobus triumphalibus, uno censorio, quae singula quoque paucis contingere. in ipso tamen flore dignationis suae ab c. atinio labeone, cui cognomen fuit macerioni, tribuno plebis, quem e senatu censor eiecerat, revertens e campo meridiano tempore vacuo foro et capitolio ad tarpeium raptus, ut praecipitaretur, convolante quidem tam numerosa illa cohorte, quae patrem eum appellabat, sed, ut necesse erat in subito, tarde et tamquam in exequias, cum resistendi sacroque sanctum repellendi ius non esset, virtutis suae opera et censurae periturus, aegre tribuno, qui intercederet, reperto a limine ipso mortis revocatus alieno beneficio postea vixit, bonis inde etiam consecratis a damnato suo, tamquam parum esset faucium reste intortarum, expressi per aures sanguinis poenam exactam esse. equidem et africani sequentis inimicum fuisse inter calamitates duxerim, ipso teste macedonico, siquidem dixit: “ite filii, celebrate exequias, numquam civis maioris funus videbitis.” et hoc dicebat iam baliaricis, diadematis, iam macedonicus ipse. verum ut illa sola iniuria aestimetur, quis hunc iure felicem dixerit, periclitatum ad libidinem inimici, nec africani saltem, perire quos hostes vicisse tanti fuit aut quos non honores currusque illa sua violentia fortuna retroegit, per mediam urbem censore tracto - etenim sola haec morandi ratio fuerat - , tracto in capitolium idem, in quod triumphans ipse deorum exuviis ne captivos quidem sic traxerat maius hoc scelus felicitate consecuta factum est, periclitato macedonico vel funus tantum tale perdere, in quo a triumphalibus liberis portaretur in rogam velut exequiis quoque triumphans. nulla est profecto solida felicitas, quam contumelia ulla vitae rupit, nedum tanta. quod superest, nescio morum gloriae an indignationis dolori accedat, inter tot metellos tam sceleratam c. atini audaciam semper fuisse inultam.

in Divo quoque Augusto, quem universa mortalitas in hac censura nuncupet, si diligenter aestimentur cuncta, magna sortis humanae reperiantur volumina: repulsa in magisterio equitum apud avunculum et contra petitionem eius praelatus lepidus, proscriptionis invidia ob collegium in triumviratu pessimorum civium, nec aequa saltem portione, sed praegravi antonio, philippensi proelio morbi, fuga et triduo in palude aegroti et (ut fatentur agrippa ac maecenas) aqua subter cutem fusa turgidi latebra, naufragia sicalia et alia ibi quoque in spelunca occultatio, iam in navali fuga urgente hostium manu preces proculeio mortis admotae, cura perusinae contentionis, sollicitudo martis actiaci, pannonicis bellis ruina e turri, tot seditiones militum, tot ancipites morbi corporis, suspecta marcelli vota, pudenda agrippae ablegatio, totiens petita insidiis vita, incusatae liberorum mortes luctusque non tantum orbitate tristis, adulterium filiae et consilia parricidae palam facta, contumeliosus privigni neronis secessus, aliud in nepte adulterium; iuncta deinde tot mala: inopia stipendi, rebellio illyrici, servitiorum dilectus iuventutis penuria, pestilentia urbis, fames italiae, destinatio expirandi et quadridui inedia maior pars mortis in corpus recepta; iuxta haec variana clades et maiestatis eius foeda suggillatio, abdicatio postumi agrippae post adoptionem, desiderium post relegationem, inde

suspicio in fabium arcanorumque proditorem, hinc uxoris et tiberii cogitationes, suprema eius cura. in summa deus ille caelumque nescio adeptus magis an meritis herede hostis sui filio excessit.

subeunt in hac reputatione delphica oracula velut ad castigandam hominum vanitatem ab deo emissa. duo sunt haec: “pedium felicissimum, qui pro patria proxime occubisset;” iterum a gyge rege tunc amplissimo terrarum consulti: “aglaum psophidium esse feliciorem.” senior hic in angustissimo arcadiae angulo parvum, sed annuis victibus large sufficiens praedium colebat, numquam ex eo egressus atque, ut e vitae genere manifestum est, minima cupidine minimum in vita mali expertus.

consecratus est vivus sentiensque eiusdem oraculi iussu et iovis deorum summi adstipulatu euthymus pycta, semper olympiae victor et semel victus. patria ei locri in italia; ibi imaginem eius et olympiae alteram eodem die tactam fulmine callimachum ut nihil aliud miratum video deumque iussisse sacrificare, quod et vivo factitatum et mortuo, nihilque de eo mirum aliud quam hoc placuisse dis.

de spatio atque longinquitate vitae hominum non locorum modo situs, verum et tempora ac sua cuique sors nascendi incertum fecere. hesiodus, qui primus aliqua de hoc prodidit, fabulose, ut reor, multa hominum aevo praeferens, cornici novem nostras attribuit aetates, quadruplum eius cervis, id triplicatum corvis, et reliqua fabulosius in phoenice ac nymphis. anacreon poeta arganthonio tartesiorum regi cl tribuit annos, cinyrae cypriorum decem annis amplius, aegimio cc, theopompus epimenidi gnosis clvii; hellanicus quosdam in aetolia epiorum gentis ducenos explere, cui adstipulatur damastes memorans pictorem ex his praecipuum corpore viribusque etiam ccc vixisse, ephorus arcadum reges tricenis annis, alexander cornelius dandonem quandam in illyrico d vixisse, xenophon in periplo lutmiorum insulae regem dc atque, ut parce mentitus, filium eius dccc. quae omnia inscitia temporum acciderunt. annum enim alii aestate determinabant et alterum hieme, alii quadripartitis temporibus, sicut arcades, quorum anni trimenstres fuere, quidam lunae senio, ut aegyptii. itaque apud eos et singula milia annorum vixisse produntur. sed ut ad confessa transeamus, arganthonium gaditanum lxxx annis regnasse prope certum est; putant quadragesimo coepisse. masinissam lx annis regnasse indubitatum est, gorgian siculum cviii vixisse. q. fabius maximus lxiii annis augur fuit. m. perpenna et nuper l. volusius saturninus omnium, quos in consulatu sententiam rogaverant, superstites fuere. perpenna septem reliquit ex iis quos censor legerat; vixit annos lxxxxviii. qua in re et illud adnotare succurrit, unum omnino quinquennium fuisse quo senator nullus moreretur, cum flaccus et albinus censores lustrum condidere, usque ad proximos censores, ab anno urbis dlxxviii. m. valerius corvinus centum annos inplevit, cuius inter primum et sextum consulatum xlvi anni fuere. idem sella curuli semel ac viciens sedit, quotiens nemo alius. aequavit eius vitae spatia metellus pontifex.

et ex feminis livia rutili lxxxxvii annos excessit, statilia claudio principe ex

nobili domo lxxxxviii, terentia ciceronis ciii, clodia ofili cxv, haec quidem etiam enixa quindecimens. lucceia mima c annis in scaena pronuntiavit. galeria copiola emboliaria reducta est in scaenam c. poppaeo q. sulphicio cos. ludis pro salute Divi Augusti votivis annum ciiii agens; producta fuerat tirocinio a m. pomponio aedile plebis c. mario cn. carbone cos. ante annos xci, a magno pompeio magni theatri dedicatione anus pro miraculo reducta. sammullam quoque cx annis vixisse auctor est pedianus asconius. minus miror stephanionem, qui primus togatus saltare instituit, utrisque saecularibus ludis saltivisse, Divi Augusti et quos claudius caesar consulatu suo quarto fecit, quando lxiii non amplius anni interfuere, quamquam et postea diu vixit. in tmoli montis cacumine, quod vocant tempsin, cl annis vivere mucianus auctor est, totidem annorum censum claudi caesaris censura t. fullonium bononiensem, idque collatis censibus, quos ante detulerat, vitaeque argumentis - etenim curae principi id erat - verum apparuit.

poscere videtur locus ipse sideralis scientiae sententiam. epigenes cxii annos impleri negavit posse, berosus excedi cxvi. durat et ea ratio, quam petosiris ac necepsos tradidere (tetartemorion appellant a trium signorum portione), qua posse in italiae tractu cxxiiii annos vitae contingere apparet. negavere illi quemquam lxxxx partium exortivam mensuram (quod anaphoras vocant) transgredi, et has ipsas incidi occurso maleficorum siderum aut etiam radiis eorum solisque. aesculapi rursus secta, quae stata vitae spatia a stellis accipi dicit, quantum plurimum tribuat, incertum est. rara autem esse dicunt longiora quidem tempora, quoniam momentis horarum insignibus lunae dierum, ut vii atque xv, quae nocte ac die observantur, ingens turba nascatur scansili annorum lege occidua, quam climacteras appellant, non fere ita genitis liiii annum excedentibus.

primum ergo ipsius artis inconstantia declarat quam incerta res sit. accedunt experimenta recentissimi census, quem intra quadriennium imperatores caesares vespasiani pater filiusque censores egerunt. nec sunt omnia vasaria excutienda; mediae tantum partis inter appenninum padumque ponemus exempla: cxx annos parmae tres edidere, brixilli unus, cxxv parmae duo, cxxx placentiae unus, faventiae una mulier, cxxxv bononiae l. terentius m. filius, arimini vero m. aponius cxi, tertulla cxxxvii. citra placentiam in collibus oppidum est veleiatium, in quo cx annos sex detulere, quattuor vero centenos videnos, unus cxi, m. mucius m. filius galeria felix. ac ne pluribus moremur in re confessa, in regione italiae octava centenum annorum censi sunt homines liiii, centenum denu homines xiiii, centenum videnum quinquem homines duo, centenum tricenum homines quattuor, centenum tricenum quinquem aut septenum totidem, centenum quadragenum homines tres.

alia mortalitatis inconstantia: homerus eadem nocte natos hectorem et polydamanta tradidit, tam diversae sortis viros. c. mario cn. carbone iii cos. a. d. v kal. iunias m. caelius rufus et c. licinius calvus eadem die geniti sunt, oratores quidem ambo, sed tam dispari eventu. hoc etiam isdem horis nascentibus in toto mundo cotidie evenit, pariterque domini ac servi

gignuntur, reges et inopes.

p. cornelius rufus, qui consul cum m'. curio fuit, dormiens oculorum visum amisit, cum id sibi accidere somniaret. e diverso pheraeus iason deploratus a medicis vomicae morbo, cum mortem in acie quaereret, vulnerato pectore medicinam invenit ex hoste. q. fabius maximus consul apud flumen isaram proelio commisso adversus allobrogum arvernorumque gentes a. d. vi idus augustas, [cxxx] perduellium caesis, febris quartana liberatus est in acie. incertum ac fragile nimirum est hoc munus naturae, quicquid datur nobis, malignum vero et breve etiam in iis quibus largissime contigit, universum utique aevi tempus intuentibus. quid, quod aestimatione nocturnae quietis dimidio quisque spatio vitae suae vivit, pars aequa morti similis exigitur aut poena est, nisi contigit quies nec reputantur infantiae anni, qui sensu carent, non senectae in poenam vivacis, tot periculorum genera, tot morbi, tot metus, tot curae, totiens invocata morte, ut nullum frequentius sit votum. natura vero nihil hominibus brevitate vitae praestitit melius. hebescent sensus, membra torpent, praemoritur visus, auditus, incessus, dentes etiam ac ciborum instrumenta, et tamen vitae hoc tempus adnumeratur. ergo pro miraculo et id solitarium reperitur exemplum xenophili musici, centum et quinque annis vixisse sine ullo corporis incommodo. at hercule reliquis omnibus per singulas membrorum partes, qualiter nullis aliis animalibus, certis pestifer calor remeat horis aut rigor, neque horis modo, sed et diebus noctibusque trinis quadrinisque, etiam anno toto. atque etiam morbus est aliquantis per sapientiam mori. morbis quoque enim quasdam leges natura posuit: quadrini circuitus febrem numquam bruma, numquam hibernis mensibus incipere, quosdam post sexagesimum vitae spatium non accedere; aliis pubertate deponi, feminis praecipue; senes minime sentire pestilentiam. namque et universis gentibus ingruunt morbi et generatim modo servitiis, modo procerum ordini aliosque per gradus. qua in re observatum a meridianis partibus ad occasum solis pestilentiam semper ire nec umquam aliter fere, non hieme, nec ut ternos excedat menses. iam signa letalia in furoris morbo risum, sapientiae vero aegritudine fimbriarum curam et stragulae vestis plicaturas, a somno moventium neglectum, praefandi umoris e corpore effluvium, in oculorum quidem et narium aspectu indubitata maxime atque etiam supino adsidue cubitu, venarum inaequabili aut formicante percussu, quaeque alia hippocrati principi medicinae observata sunt. et cum innumerabilia sint mortis signa, salutis securitatisque nulla sunt, quippe cum censorius cato ad filium de validis quoque observationem ut ex oraculo aliquo prodiderit, senilem iuventam praematurae mortis esse signum. morborum vero tam infinita est multitudo, ut pherecydes syrius serpentium multitudine ex corpore eius erumpente expiraverit. quibusdam perpetua febris est, sicut c. maecenati; eidem triennio supremo nullo horae momento contigit somnus. antipater sidonius poeta omnibus annis uno die tantum natali corripiebatur febre et eo consumptus est satis longa senecta.

aviola consularis in rogo revixit et, quoniam subveniri non potuerat

praevalente flamma, vivus crematus est. similis causa in l. lamia praetorio viro traditur. nam c. aelium tuberonem praetura functum a rogo relatum messala rufus et plerique tradunt. haec est condicio mortalium. ad has et eius modi occasiones fortunae gignimur, uti de homine ne morti quidem debeat credi. reperimus inter exempla hermotimi clazomenii animam relicto corpore errare solitam vagamque e longinquo multa adnuntiare, quae nisi a praesente nosci non possent, corpore interim semianimi, donec cremato eo inimici, qui cantharidae vocabantur, remeanti animae veluti vaginam ademerint; aristeae etiam visam evolantem ex ore in proconneso corvi effigie, magna quae sequitur hanc fabulositate. quam equidem et in gnosis epimenide simili modo accipio, puerum aestu et itinere fessum in specu septem et quinquaginta dormisse annis, rerum faciem mutationemque mirantem velut postero die expectatum, hinc pari numero dierum senio ingruente, ut tamen in septimum et quinquagesimum atque centesimum vitae duraret annum. feminarum sexus huic malo videtur maxime opportunus conversione vulvae, quae si corrigatur, spiritus restituitur, huc pertinet nobile illud apud graecos volumen heraclidis septem diebus feminae exanimis ad vitam revocatae. Varro quoque auctor est xxviro se agros dividente capuae quendam, qui efferretur foro, domum remeasse pedibus. hoc idem aquini accidisse. romae quoque confidium, materterae suae maritum, funere locato revixisse et locatorem funeris ab eo elatum. adicit miracula, quae tota indicasse conveniat: e duobus fratribus equestris ordinis confidiis maiori accidisse ut videretur expirasse, apertoque testamento recitatum heredem minorem funeri instituisse; interim eum, qui videbatur exstinctus, plaudendo concivisse ministeria et narrasse a fratre se venisse, commendatam sibi filiam ab eo, demonstratum praeterea quo in loco defodisset aurum nullo conscio, et rogasse ut iis funebribus, quae comparasset, efferretur. hoc eo narrante fratris domestici propere adnuntiavere exanimatum illum, et aurum ubi dixerat repertum est. plena praeterea vita est his vaticiniis, sed non conferenda, cum saepius falsa sint, sicut ingenti exemplo docebimus. bello siculo gabienus caesaris classium fortissimus, captus a sexto pompeio, iussu eius incisa cervice et vix cohaerente, iacuit in litore toto die. deinde, cum advesperavisset, gemitu precibusque congregata multitudo petiit uti pompeius ad se veniret aut aliquem ex arcanis mitteret; se enim ab inferis remissum habere quae nuntiaret. misit plures pompeius ex amicis, quibus gabienus dixit inferis dis placere pompeii causas et partes pias; proinde eventum futurum quem optaret: hoc se nuntiare iussum; argumentum fore veritatis quod peractis mandatis protinus expiraturus esset. idque ita evenit. post sepulturam quoque visorum exempla sunt, nisi quod naturae opera, non prodigia, consectamur.

in primis autem miraculo sunt summaque frequentia mortes repentinae - hoc est summa vitae felicitas - , quas esse naturales docebimus. plurimas prodidit verrius, nos cum dilectu modum servabimus. gaudio obiere praeter chilonem, de quo diximus, sophocles et dionysius siciliae tyrannus, uterque accepto tragicae victoriae nuntio, mater illa cannensi filio incolume viso

contra nuntium falsum; pudore diodorus sapientiae dialecticae professor, lusoria quaestione non protinus ab interrogatione stilponis dissoluta. nullis evidentibus causis obiere, dum calciantur matutino, duo caesares, praetor et praetura perfunctus dictatoris caesaris pater - hic pisis exanimatus est, ille romae - , q. fabius maximus in consulatu suo pridie kal. ian., in cuius locum c. rebilus paucissimarum horarum consulatum petiit, item c. volcatius gurgis senator, omnes adeo sani atque tempestivi, ut de progrediendo cogitarent, q. aemilius lepidus iam egrediens incusso pollice limini cubiculi, c. aufustius egressus, cum in senatum iret, offenso pede in comitio. legatus quoque, qui rhodiorum causam in senatu magna cum admiratione oraverat, in limine curiae protinus expiravit progredi volens, cn. baebius tamphilus, praetura et ipse functus, cum a puero quaesisset horas, aulus pompeius in capitolio, cum deos salutasset, m'. iuventius thalna consul, cum sacrificaret, c. servilius pansa, cum staret in foro ad tabernam hora diei secunda in p. fratrem innixus, baebius iudex, dum vadimonium differri iubet, m. terentius corax, dum tabellas scribit in foro. nec non et proximo anno, dum consulari viro in aurem dicit, eques romanus ante apollinem eboreum qui est in foro Augusti, super omnes c. iulius medicus, dum inunguit, specillum per oculum trahens, a. manlius torquatus consularis, cum in cena placentam adpeteret, l. tuccius medicus valla, dum mulsi potionem haurit, appius saufeius, e balneo reversus cum mulsum bibisset ovumque sorberet, p. quintius scapula, cum apud aquilium gallum cenaret, decimus saufeius scribea, cum domi suae pranderet. cornelius gallus praetorius et t. heterieus eques romanus in venere obiere et, quos nostra adnotavit aetas, duo equestris ordinis in eodem pantomimo mystico, tum forma praecellente. operosissima tamen securitas mortis in m. ofilio hilaro ab antiquis traditur. comoediarum histrio is, cum populo admodum placuisset natali die suo conviviumque haberet, edita cena calidam potionem in pultario poposcit simulque personam eius diei acceptam intuens coronam e capite suo in eam transtulit, tali habitu rigens nullo sentiente, donec adcubantium proximus tepescere potionem admoneret.

haec felicia exempla, at contra miseriarum innumera: l. domitius clarissimae gentis apud massiliam victus, corfinii captus ab eodem caesare, veneno poto propter taedium vitae, postquam biberat, omni opere ut viveret adnitus est. invenitur in actis, felice russei auriga elato, in rogom eius unum e faventibus iecisse se, frivolum dictu, ne hoc gloriae artificis daretur, adversis studiis copia odorum corruptum criminantibus. cum ante non multo m. lepidus nobilissimae stirpis, quem diverti anxietate diximus mortuum, flammae vi e rogo eiectus recondi propter ardorem non potuisset, iuxta sarmentis aliis nudus crematus est.

ipsum cremare apud romanos non fuit veteris instituti: terra condebantur. at postquam longinquis bellis obrutos erui cognovere, tunc institutum. et tamen multae familiae priscos servavere ritus, sicut in cornelia nemo ante sullam dictatorem traditur crematus, idque voluisse veritum talionem eruto c. mari cadavere. sepultus vero intellegatur quoquo modo conditus, humatus vero

humo contextus.

post sepulturam vanae manium ambages. omnibus a supremo die eadem quae ante primum, nec magis a morte sensus ullus aut corpori aut animae quam ante natalem. eadem enim vanitas in futurum etiam se propagat et in mortis quoque tempora ipsa sibi vitam mentitur, alias immortalitatem animae, alias transfigurationem, alias sensum inferis dando et manes colendo deumque faciendo qui iam etiam homo esse desierit, ceu vero ullo modo spirandi ratio ceteris animalibus distet aut non diuturniora in vita multa reperiantur, quibus nemo similem divinat immortalitatem. quod autem corpus animae per se quae materia ubi cogitatio illi quo modo visus, auditus aut qui tangit quis usus ex iis aut quod sine iis bonum quae deinde sedes quantave multitudo tot saeculis animarum velut umbrarum puerilium ista delenimentorum avidaeque numquam desinere mortalitatis commenta sunt. similis et de adservandis corporibus hominum ac revivescendi promisso democriti vanitas, qui non revixit ipse. quae, malum, ista dementia est iterari vitam morte quaeve genitis quies umquam, si in sublimi sensus animae manet, inter inferos umbrae perdit profecto ista dulcedo credulitasque praecipuum naturae bonum, mortem, ac duplicat obituri dolorem etiam post futuri aestimatione. etenim si dulce vivere est, cui potest esse vixisse at quanto facilius certiusque sibi quemque credere, specimen securitatis antegenitali sumere experimento!

consentaneum videtur, priusquam digrediamur a natura hominum, indicare quae cuiusque inventa sint. emere ac vendere mercurius, vindemiare instituit liber pater; idem diadema, regium insigne, et triumphum invenit; ceres frumenta, cum antea glande vescerentur, eadem molere et conficere in attica, ut alii, et in sicilia, ob id dea iudicata. eadem prima leges dedit, ut alii putavere, rhadamanthus.

litteras semper arbitror assyrias fuisse, sed alii apud aegyptios a mercurio, ut gellius, alii apud syros repertas volunt, utrique in graeciam attulisse e phoenice cadmum sedecim numero, quibus troiano bello palameden adiecisse quattuor hac figura ΖΥΦΧ, totidem post eum simoniden melicum ΨΞΩΘ, quarum omnium vis in nostris recognoscitur. aristoteles decem et octo priscas fuisse et duas ab epicharmo additas *x*z quam a palamede mavult. anticlides in aegypto invenisse quendam nomine menen tradit, [xv] annorum ante phoronea, antiquissimum graeciae regem, idque monumentis adprobare conatur. e diverso epigenes apud babylonios [dcccxx] annorum observationes siderum coctilibus laterculis inscriptas docet, gravis auctor in primis; qui minimum, berosus et critodemus, [ccccxc]. ex quo apparet aeternus litterarum usus. in latium eas attulerunt pelasgi.

laterarias ac domus constituerunt primi euryalus et hyperbius fratres athenis; antea specus erant pro domibus. gellio toxius caeli filius lutei aedificii inventor placet, exemplo sumpto ab hirundinum nidis. oppidum cecrops a se appellavit cecropiam, quae nunc est arx athenis. aliqui argos a phoroneo rege ante conditum volunt, quidam et sicyonem, aegyptii vero multo ante apud ipsos diospolin. tegulas invenit cinyra, agriopae filius, et metalla aeris,

utrumque in insula cypro, item forcipem, martulum, vectem, incudem; puteos danaus ex aegypto advectus in graeciam qua vocabatur argos dipsion; lapicidas cadmus thebis aut, ut theophrastus, in phoenice; thrason muros; turres, ut aristoteles, cyclopes, tiryntii, ut theophrastus; aegyptii textilia, inficere lanas sardibus lydi, fusos in lanificio closter, filius arachnae, linum et retia arachne, fulloniam artem nicias megarensis, sutrinam tychius boeotius. medicinam aegyptii apud ipsos volunt repertam, alii per arabum, babylonis et apollinis filium, herbariam et medicamentariam a chirone, saturni et philyrae filio. aes conflare et temperare aristoteles lydum scythen monstrasse, theophrastus delam phrygem putant, aerariam fabricam alii chalybas, alii cyclopas, ferrum hesiodus in creta eos qui vocati sunt dactyli idaei. argentum invenit erichthonius atheniensis, ut alii, aeacus; auri metalla et flaturam cadmus phoenix ad pangaeum montem, ut alii, thoas aut aeacus in panchaia aut sol oceani filius, cui gellius medicinae quoque inventionem ex metallis assignat. plumbum ex cassiteride insula primus adportavit midacritus. fabricam ferrariam invenerunt cyclopes, figlinas coroeus atheniensis, in iis orbem anarcharsis scythes, ut alii, hyperbius corinthius. fabricam materiariam daedalus et in ea serram, asciam, perpendiculum, terebram, glutinum, ichthyocollam; normam autem et libellam et tornum et clavem theodorus samius, mensuras et pondera phidon argivus aut palamedes, ut maluit gellius; ignem e silice pyrodes cilicis filius, eundem adservare ferula prometheus; vehiculum cum quattuor rotis phryges, mercaturas poeni, culturas vitium et arborum eumolpus atheniensis, vinum aquae misceri staphylus silenii filius, oleum et trapetas aristaeus atheniensis, idem mella; bovem et aratrum buzyges atheniensis, ut alii, triptolemus; regiam civitatem aegyptii, popularem attici post theseum. tyrannus primus fuit phalaris agraganti. servitium invenere lacedaemonii. iudicium capitis in areopago primum actum est.

proelium afri contra aegyptios primi fecere fustibus, quos vocant phalangas. clupeos invenerunt proetus et acrisius inter se bellantes sive chalcus athamantis filius, loricam midias messenius, galeam, gladium, hastam lacedaemonii, ocreas et cristas cares. arcum et sagittam scythen iovis filium, alii sagittas persen persei filium invenisse dicunt, lanceas aetolos, iaculum cum ammento aetolum martis filium, hastas velitares tyrrenum, eundem pilum, penthesileam amazonem securim, pisaeum venabula et in tormentis scorpionem, cretas catapultam, syrophoenicas ballistam et fundam, aeneam tubam pisaeum tyrreni, testudines artemonem clazomenium, equum (qui nunc aries appellatur) in muralibus machinis epium ad troiam, equo vehi bellerophonem, frenos et strata equorum pelethronium, pugnare ex equo thessalos, qui centauri appellati sunt, habitantes secundum pelium montem. bigas prima iunxit phrygum natio, quadrigas erichthonius. ordinem exercitus, signi dationem, tesseras, vigilias palamedes invenit troiano bello, specularum significationem eodem sinon, inducias lycaon, foedera theseus.

auguria ex avibus car, a quo caria appellata; adiecit ex ceteris animalibus orpheus, aruspicia delphus, ignispicia amphiarus, extispicia avium tiresias

thebanus, interpretationem ostentorum et somniorum amphictyon. astrologiam atlans libyae filius, ut alii, aegyptii, ut alii, assyrii, sphaeram in ea milesius anaximander, ventorum rationem aeolus hellenis filius. musicam amphion, fistulam et monaulum pan mercuri, obliquam tibiam midas in phrygia, geminas tibiae marsyas in eadem gente, lydios modulos amphion, dorios thamyrae thrax, phrygios marsyas phryx, citharam amphion, ut alii, orpheus, ut alii, linus. septem chordis primum cecinit iii ad iiii primas additis terpander, octavam simonides addidit, nonam Timotheus. cithara sine voce cecinit thamyris primus, cum cantu amphion, ut alii, linus. citharoedica carmina composuit terpander. cum tibiis canere voce troezenius ardalus instituit. saltationem armatam curetes docuere, pyrrichen pyrrus, utramque in creta. versum heroum pythio oraculo debemus. de poematum origine magna quaestio; ante troianum bellum probantur fuisse. prosam orationem condere pherecydes syrius instituit Cyri regis aetate, historiam cadmus milesius; ludos gymnicos in arcadia lycaon, funebres acastus in iolco, post eum theseus in isthmo, hercules olympiae; athleticam pittheus, pilam lusoriam gyges lydus; picturam aegyptii et in graecia euchir, daedali cognatus, ut aristoteli placet, ut theophrasto, polygnatus atheniensis.

nave primus in graeciam ex aegypto danaus advenit; antea ratibus navigabatur inventis in mari rubro inter insulas a rege erythra. reperiuntur qui mysos et troianos priores excogitasse in hellesponto putent, cum transirent adversus thracas. etiam nunc in britannico oceano vitiles corio circumsutae fiunt, in nilo ex papyro ac scirpo et harundine. longa nave iasonem primum navigasse philostephanus auctor est, hegesias parhalum, ctesias samiramin, archemachus aegaeonem, biremem damastes erythraeos fecisse, triremem thucydides aminoclen corinthium, quadriremem aristoteles carthaginenses, quinquere-mem mnesigiton salaminios, sex ordinum xenagoras syracusios, ab ea ad decemremem mnesigiton alexandrum magnum, ad duodecim ordines philostephanus ptolemaeum soterem, ad quindecim demetrium antiochi, ad xxx ptolemaeum philadelphum, ad xl ptolemaeum philopatorem, qui tryphon cognominatus est. onerariam hippos tyrius invenit, lembum cyrenenses, cumbam phoenices, ceblem rhodii, cercyrum cyprii. siderum observationem in navigando phoenices, remum copae, latitudinem eius plateae, vela icarus, malum et antennam daedalus, hippegum samii aut pericles atheniensis, tectas longas thasii; antea ex prora tantum et puppi pugnabatur. rostra addidit pisaeus tyreni, ancoram eupalamus, eandem bidentem anacharsis, harpagones et manus pericles atheniensis, adminicula gubernandi tiphys. classe princeps depugnavit minos. - animal occidit primus hyperbius martis filius, prometheus bovem. -

gentium consensus tacitus primus omnium conspiravit, ut ionum litteris uteretur. veteres graecas fuisse easdem paene quae nunc sint latinae, indicio erit delphica antiqui aeris, quae est hodie in palatio dono principum, minervae dicata in bibliotheca cum inscriptione tali: ΝΑΥΣΙΚΡΑΤΗΣ ... ΑΝΘΕΤΟ ... ΤΑΙ ... ΔΙΟΣ ... ΚΟΡΑΙ ... ΤΑΝ ... ΔΕΚΑΤΑΝ ...

sequens gentium consensus in tonsoribus fuit, sed romanis tardior. in italiam ex sicilia venire post romam conditam anno ccccliiii adducere p. titinio mena, ut auctor est Varro; antea intonsi fuere. primus omnium radi cotidie instituit africanus sequens; Divus Augustus cultris semper usus est.

tertius consensus fuit in horarum observatione, iam hic ratione accedens, quando et a quo in graecia reperta, diximus secundo volumine. serius etiam hic romae contigit. xii tabulis ortus tantum et occasus nominantur, post aliquot annos adiectus est et meridies, accenso consulum id pronuntiante, cum a curia inter rostra et graecostasin prospexisset solem; a columna maenia ad carcerem inclinato sidere supremam pronuntiavit, sed hoc serenis tantum diebus, usque ad primum punicum bellum. princeps solarium horologium statuisset ante xii annos quam cum pyrro bellatum est ad aedem quirini l. papirius cursor, cum eam dedicaret a patre suo votam, a fabio vestale proditur. sed neque facti horologii rationem vel artificem significat nec unde translatus sit aut apud quem scriptum id invenerit. M. Varro primum statutum in publico secundum rostra in columna tradit bello punico primo a m'. valerio messala cos. catina capta in sicilia, deportatum inde post xxx annos quam de papiriano horologio traditur, anno urbis cccclxxxx. nec congruebant ad horas eius lineae, paruerunt tamen ei annis undecentum, donec q. marcius philippus, qui cum l. paulo fuit censor, diligentius ordinatum iuxta posuit, idque munus inter censoria opera gratissima acceptum est. etiam tum tamen nubilo incertae fuere horae usque ad proximum lustrum. tunc scipio nasica collega laenati primus aqua divisit horas aequae noctium ac dierum idque horologium sub tecto dicavit anno urbis dxcv. tam diu populo romano indiscreta lux fuit.

nunc praevertemur ad reliqua animalia primumque terrestria.

LIBER VIII

ad reliqua transeamus animalia et primum terrestria.

maximum est elephans proximumque humanis sensibus, quippe intellectus illis sermonis patrii et imperiorum obedientia, officiorum quae didicere memoria, amoris et gloriae voluptas, immo vero, quae etiam in homine rara, probitas, prudentia, aequitas, religio quoque siderum solisque ac lunae veneratio. auctores sunt in mauretaniae saltibus ad quendam amnem, cui nomen est amilo, nitescente luna nova greges eorum descendere ibique se purificantes sollemniter aqua circumspergi atque ita salutato sidere in silvas reverti vitulorum fatigatos prae se ferentes. alienae quoque religionis intellectu creduntur maria transitori non ante naves conscendere quam invitati rectoris iureiurando de reditu, visique sunt fessi aegritudine, quando et illas moles infestant morbi, herbas supini in caelum iacentes, veluti tellure precibus allegata. nam, quod ad docilitatem attinet, regem adorant, genua submitunt, coronas porrigunt. indis arant minores, quos appellant nothos.

romae iuncti primum subire currum pompeii magni africano triumpho, quod prius india victa triumphante libero patre memoratur. procilius negat potuisse pompeii triumpho iunctos egredi porta. germanici caesaris munere gladiatorio quosdam etiam inconditos meatus edidire saltantium modo. vulgare erat per auras arma iacere, non auferentibus ventis, atque inter se gladiatorios congressus edere aut lascivienti pyrriche concludere. postea et per funes incessere, lecticis etiam ferentes quaterni singulos puerperas imitantes, plenisque homine tricliniis accubitus iere per lectos ita libratis vestigiis, ne quis potantium attingeretur. certum est unum tardioris ingeni in accipiendis quae tradebantur, saepius castigatum verberibus, eadem illa meditantem noctu repertum. mirum et adversis quidem funibus subire, sed maxime regredi, utique pronis. mucianus iii consul auctor est aliquem ex iis et litterarum ductus graecarum didicisse solitumque perscribere eius linguae verbis: "ipse ego haec scripsi et spolia celtica dicavi," itemque se vidente puteolis, cum advecti e nave egredi cogerentur, territos spatio pontis procul a continente porrecti, ut sese longinquitatis aestimatione fallerent, aversos retrorsus isse.

praedam ipsi in se expetendam sciunt solam esse in armis suis, quae iuba cornua appellat, herodotus tanto antiquior et consuetudo melius dentes. quam ob rem deciduos casu aliquo vel senecta defodiunt. hoc solum ebur est; cetero et in his quoque, qua corpus intexit, vilitas ossea. quamquam nuper ossa etiam in laminas secari coepere paenuria: etenim rara amplitudo iam dentium praeterquam ex india reperitur; cetera in nostro orbe cessare luxuriae. dentium candore intellegitur iuventa. circa hos beluis summa cura: alterius mucroni parant, ne sit proeliis hebes, alterius operario usu fodiunt radices, inpellunt moles; circumventique a venantibus primos constituunt quibus sint minimi, ne tanti proelium putetur, postea fessi inpactos arbori frangunt praedaeque se redimunt.

mirum in plerisque animalium scire quare petantur, sed et fere cuncta quid caveant. elephans homine obvio forte in solitudine et simpliciter oberrante clemens placidusque etiam demonstrare viam traditur; idem vestigio hominis animadverso prius quam homine intremescere insidiarum metu, subsistere ab olfactu, circumspectare, iras proflare nec calcare, sed erutum proximo tradere, illum sequenti, simili nuntio usque ad extremum, tunc agmen circumagi et reverti aciemque derigi. adeo omnium odori durare virus illud maiore ex parte ne nudorum quidem pedum. sic et tigris, etiam feris ceteris truculenta atque ipsa elephanti quoque spernens vestigia, hominis viso transferre dicitur protinus catulos, quonam modo agnito, ubi ante conspecto illo quem timet etenim tales silvas minime frequentari certum est. sane mirentur ipsam vestigii raritatem. sed unde sciunt timendi esse immo vero cur vel ipsius conspectum paveant, tanto viribus, magnitudine, velocitate praestantiores nimirum haec est natura rerum, haec potentia eius, saevissimas ferarum maximasque numquam vidisse, quod debeant timere, et statim intellegere, cum sit timendum.

elephanti gregatim semper ingrediuntur. ducit agmen maximus natu, cogit aetate proximus. amnem transitori minimos praemittunt, ne maiorum ingressu atterente alveum crescat gurgiti altitudo. antipater auctor est duos antiocho regi in bellicis usibus celebres etiam cognominibus fuisse; etenim novere ea. certe cato, cum imperatorum nomina annalibus detraxerit, eum, qui fortissime proeliatus esset in punica acie, surum tradidit vocatum altero dente mutilato. antiocho vadum fluminis experienti renuit aiæx, alioqui dux agminis semper. tum pronuntiatum eius fore principatum qui transisset, ausumque patroclum ob id phaleris argenteis, quo maxime gaudent, et reliquo omni primatu donavit. ille, qui notabatur, inedia mortem ignominiae praetulit. mirus namque pudor est, victusque vocem fugit victoris, terram ac verbenas porrigit. pudore numquam nisi in abdito coeunt, mas quinquennis, femina decennis. initur autem biennio quinis, ut ferunt, cuiusque anni diebus, nec amplius; sexto perfunduntur amne, non ante reduces ad agmen. nec adulteria novere nullave propter feminas inter se proelia ceteris animalibus pernicialia, nec quia desit illis amoris vis, namque traditur unus amasse quandam in aegypto corollas vendentem ac, ne quis vulgariter electam putet, mire gratam aristophani celeberrimo in arte grammatica, alius menandrum syracusanum incipientis iuventae in exercitu ptolemaei, desiderium eius, quotiens non videret, inedia testatus. et unguentariam quandam dilectam iuba tradit. omnium amoris fuere argumenta gaudium a conspectu blanditiaeque inconditae, stipes, quas populus dedisset, servatae et in sinum effusae. nec mirum esse amorem quibus sit memoria. idem namque tradit agnatum in senecta multos post annos qui rector in iuventa fuisset; idem divinationem quandam iustitiae, cum bocchus rex triginta elephantis totidem, in quos saevire instituerat, stipitibus adligatos obiecisset, procursantibus inter eos qui lacesserent, nec potuisse effici ut crudelitatis alienae ministerio fungerentur.

elephantos italia primum vidit pyrri regis bello et boves lucas appellavit in

lucanis visos anno urbis ccclxxii, roma autem in triumpho vii annis ad superiorem numerum additis, eadem plurimos anno dii victoria l. metelli pontificis in sicilia de poenis captos. cxlii fuere aut, ut quidam, cxx, travecti ratibus quas doliorum consertis ordinibus inposuerat. verrius eos pugnasse in circo interfectosque iaculis tradit paenuria consilii, quoniam neque ali placuisset neque donari regibus; l. piso inductos dumtaxat in circum atque, ut contemptus eorum incresceret, ab operariis hastas praepilatas habentibus per circum totum actos. nec quid deinde iis factum sit auctores explicant qui non putant interfectos.

clara est unius e romanis dimicatio adversus elephantum, cum Hannibal captivos nostros dimicare inter sese coegisset. namque unum qui supererat obiecit elephanto, et ille dimitti pactus, si interemisset, solus in harena congressus magno poenorum dolore confecit. Hannibal, cum famam eius dimicationis contemptum adlaturam beluis intellexeret, equites misit qui abeuntem interficerent. proboscidem eorum facillime amputari pyrri proeliorum experimentis patuit. romae pugnasse fenestella tradit primum omnium in circo claudi pulchri aedilitate curuli m. antonio a. postumio cos. anno urbis dclv, item post annos viginti lucullorum aedilitate curuli adversus tauros. pompeii quoque altero consulatu, dedicatione templi veneris victricis, viginti pugnare in circo aut, ut quidam tradunt, xviii, gaetulis ex adverso iaculantibus, mirabili unius dimicatione, qui pedibus confossis repsit genibus in catervas, abrepta scuta iaciens in sublime, quae decidentia voluptati spectantibus erant in orbem circumacta, velut arte, non furore beluae, iacerentur. magnum et in altero miraculum fuit uno ictu occiso; pilum autem sub oculo adactum in vitalia capitis venerat. universi eruptionem temptare, non sine vexatione populi, circumdatis claustris ferreis. qua de causa caesar dictator postea simile spectaculum editurus euripis harenam circumdedit, quos nero princeps sustulit equiti loca addens. sed pompeiani amissa fugae spe misericordiam vulgi inenarrabili habitu quaerentes supplicare quadam sese lamentatione conplorantes, tanto populi dolore, ut oblitus imperatoris ac munificentiae honori suo exquisitae flens universus consurgeret dirasque pompeio, quas ille mox luit, inprecaretur. pugnare et caesari dictatori tertio consulatu eius viginti contra pedites d iterumque totidem turrati cum sexagenis propugnatoribus, eodem quo priore numero peditum et pari equitum ex adverso dimicante, postea singuli principibus claudio et neroni in consummatione gladiatorum.

ipsius animalis tanta narratur clementia contra minus validos, ut in grege pecudum occurrentia manu dimoveat, ne quod obterat imprudens. nec nisi lacesciti nocent idque cum gregatim semper ambulent, minime ex omnibus solivagi. equitatu circumventi infirmos aut fessos vulneratosve in medium agmen recipiunt, acie, velut imperio aut ratione per vices subeunte.

capti celerrime mitificantur hordei suco. capiuntur autem in india unum ex domitis agente rectore, qui deprehensum solitarium abactumve a grege verberet ferum: quo fatigato transcendit in eum nec secus ac priorem regit.

africa foveis capit, in quas deerrante aliquo protinus ceteri congerunt ramos, moles devolvunt, aggeres construunt omnique vi conantur extrahere. ante domitandi gratia reges equitatu cogeant in vallem manu factam et longo tractu fallacem, cuius inclusos ripis fossisque fame domabant. argumentum erat ramus homine porrigente clementer acceptus. nunc dentium causa pedes eorum iaculantur alioqui mollissimos. trogydæ contermini aethiopiæ, qui hoc solo venatu aluntur, propinquas itineri eorum conscendunt arbores; inde totius agminis novissimum speculati extremas in clunes desiliunt. laeva adprehenditur cauda, pedes stipantur in sinistro femine: ita pendens alterum poplitem dextra caedit ac præacuta bipenni hoc crure tardato profugiens alterius poplitis nervos ferit, cuncta præceleri pernicitate peragens. alii tutiore genere, sed magis fallaci, ingentes arcus intentos defigunt humi longius; hos præcipui viribus iuvenes continent, alii conixi pari conatu contendunt ac prætereuntibus sagittarum venabula infigunt, mox sanguinis vestigiis secuntur.

elephantorum generis feminae multo pavidiore. domantur autem rabidi fame et verberibus, elephantis aliis admotis, qui tumultuantem catenis coerceant. et alias circa coitus maxime efferantur et stabula indorum dentibus sternunt. quapropter arcem eos coitu feminarumque pecuaria separant, quæ haut alio modo quam armentorum habent. domiti militant et turres armatorum in dorsis ferunt magna ex parte orientis bella conficiunt: prosternunt acies, proterunt armatos. iidem minimo suis stridore terrentur vulneratique et terri retro semper cedunt, haut minore partium suarum perniciæ. indicum africæ pavent nec contueri audent, nam et maior indicis magnitudo est.

decem annis gestare in utero vulgus existimat, aristoteles biennio nec amplius quam semel gignere pluresque quam singulos, vivere ducenis annis et quosdam ccc. iuventa eorum a sexagesimo incipit. gaudent omnibus maxime et circa fluvios vagantur, cum alioqui nare propter magnitudinem corporis non possint. iidem frigoris inpatientes; maximum hoc malum inflationemque et profluvium alvi nec alia morborum genera sentiunt. olei potu tela, quæ corpori eorum inhaereant, decidere inveniunt, a sudore autem facilius adhaerescere. et terram edisse iis tabificum est, nisi sæpius mandant; devorant autem et lapides; truncos quidem gratissimo in cibatu habent. palmas excelsiores fronte prosternunt atque ita iacentium absumunt fructum. mandunt ore, spirant et bibunt odoranturque haut inproprie appellata manu. animalium maxime odere murem et, si pabulum in præsepio positum attingi ab eo videre, fastidiunt. cruciatum in potu maximum sentiunt hausta hirudine, quam sanguisugam vulgo coepisse appellari adverto. hæc ubi in ipso animæ canali se fixit, intolerando adficit dolore. durissimum dorso tergus, ventri molle, sætarum nullum tegimentum, ne in cauda quidem præsidium abigendo taedio muscarum (namque id et tanta vastitas sentit), sed cancellata cutis, et invitans id genus animalium odore. ergo cum extentis recepere examina, artatis in rugas repente cancellis comprehensas enecant. hoc iis pro cauda, iuba, villo est. dentibus ingens pretium et deorum simulacris lautissima ex his materia.

invenit luxuria commendationem et aliam expetiti in callo manus saporis, haud alia de causa, credo, quam quia ipsum ebur sibi mandere videtur. magnitudo dentium videtur quidem in templis praecipua, sed tamen in extremis africae, qua confinis aethiopiae est, postium vicem in domiciliis praebere saepesque in his et pecorum stabulis pro palis elephantorum dentibus fieri polybius tradidit auctore gulusa regulo.

elephantos fert africa ultra syrticas solitudines et in mauretania, ferunt aethiopes et troglodytae, ut dictum est, sed maximos india bellantesque cum iis perpetua discordia dracones tantae magnitudinis et ipsos, ut circumplexu facili ambient nexuque nodi praestringant. conmoritur ea dimicatio, victusque congruens complexum elidit pondere.

mira animalium pro se cuique sollertia astutissima. ascendendi in tantam altitudinem difficultas draconi; itaque tritum iter ad pabula speculatus ab excelsa se arbore incit. scit ille inparem sibi luctatum contra nexus; itaque arborum aut rupium attritum quaerit. cavent hoc dracones ob idque gressus primum alligant cauda: resolvunt illi nodos manu; at hi in ipsas nares caput condunt pariterque spiritum praeccludunt et mollissimas lancinant partes. iidem obvii deprehensi in adversos erigunt se oculosque maxime petunt. ita fit ut plerumque caeci ac fame et maeroris tabe confecti reperiuntur. quam quis aliam tantae discordiae causam attulerit nisi naturam spectaculum sibi paria componentem

est et alia dimicationis huius fama. elephantis frigidissimum esse sanguinem; ob id aestu torrente praecipue draconibus expeti. quam ob rem in amnes mersos insidiari bibentibus coortosque inligata manu in aurem morsum defigere, quoniam is tantum locus defendi non possit manu. dracones esse tantos, ut totum sanguinem capiant, itaque elephantos ab iis ebibi siccatosque concidere et dracones inebriatos opprimi conmorique.

generat eos aethiopia indicis pares, vicenum cubitorum. id modo mirum, unde cristatos iuba crediderit. asachaei vocantur aethiopes apud quos maxime nascuntur; narrantque in maritimis eorum quaternos quinosque inter se cratium modo inplexos erectis capitibus velificantes ad meliora pabula arabiae vehi fluctibus.

megasthenes scribit in india serpentes in tantam magnitudinem adolescere, ut solidos hauriant cervos taurosque, metrodorus circa rhyndacum amnem in ponto, supervolantes ut quamvis alte perniciterque alites haustu raptas absorbeant. nota est in punicis bellis ad flumen bagradam a regulo imperatore ballistis tormentisque, ut oppidum aliquod, expugnata serpens cxx pedum longitudinis; pellis eius maxillaeque usque ad bellum numantinum duravere romae in templo. faciunt his fidem in italia appellatae bovae in tantam amplitudinem exeuntes, ut divo claudio principe occisae in vaticano solidus in alvo spectatus sit infans. aluntur primo bubuli lactis suctu, unde nomen traxere.

ceterorum animalium, quae modo convecta undique italiae contigere saepius, formas nihil attinet scrupulose referre. paucissima scythia gignit

inopia fruticum, pauca contermina illi germania, insignia tamen boum ferorum genera, iubatos bisontes excellentique et vi et velocitate uros, quibus inperitum volgus bubalorum nomen inponit, cum id gignat africa vituli potius cervique quadam similitudine. septentrio fert et equorum greges ferorum, sicut asinorum asia et africa, praeterea alcen iumento similem, ni proceritas aurium et cervicis distinguat; item natam in scadinavia insula nec umquam visam in hoc orbe, multis tamen narratam achlin haud dissimilem illi, set nullo suffraginum flexu, ideoque non cubantem et adclinem arbori in somno eaque incisa ad insidias capi, alias velocitatis memoratae. labrum ei superius praegrande; ob id retrograditur in pascendo, ne in priora tendens involvatur. tradunt in paenonia feram quae bonasus vocetur, equina iuba, cetera tauro similem, cornibus ita in se flexis, ut non sint utilia pugnae. quapropter fuga sibi auxiliari reddentem in ea fimum, interdum et trium iugerum longitudine, cuius contactus sequentes ut ignis aliquis amburat.

mirum pardos, pantheras, leones et similia condito in corporis vaginas unguium mucrone, ne refringantur hebetenturque, ingredi aversisque falcibus currere nec nisi in adpetendo protendere. leoni praecipua generositas tunc, cum colla armosque vestiunt iubae; id enim aetate contingit e leone conceptis. quos vero pardi generavere, semper insigni hoc carent; simili modo feminae. magna his libido coitus et ob hoc maribus ira. africa haec maxime spectat, inopia aquarum ad paucos amnes congregantibus se feris. ideo multiformes ibi animalium partus, varie feminis cuiusque generis mares aut vi aut voluptate miscente: unde etiam vulgare graeciae dictum semper aliquid novi africanam adferre. odore pardi coitum sentit in adultera leo totaque vi consurgit in poenam; idcirco ea culpa flumine abluitur aut longius comitatur. semel autem edi partum, lacerato unguium acie utero in enixu, volgum credidisse video.

aristoteles diversa tradit, vir quem in his magna secuturus ex parte praefandum reor. alexandro magno rege inflammato cupidine animalium naturas noscendi delegataque hac commentatione aristoteli, summo in omni doctrina viro, aliquot milia hominum in totius asiae graeciaeque tractu parere iussa, omnium quos venatus, aucupia piscatusque alebant quibusque vivaria, armenta, alvaria, piscinae, aviaria in cura erant, ne quid usquam genitum ignoraretur ab eo. quos percunctando quinquaginta ferme volumina illa praeclara de animalibus condidit. quae a me collecta in artum cum iis, quae ignoraverat, quaeso ut legentes boni consulant, in universis rerum naturae operibus medioque clarissimi regum omnium desiderio cura nostra breviter peregrinantes. is ergo tradit leaenam primo fetu parere quinque catulos ac per annos singulis minus, ab uno sterilesce. informes minimasque carnes magnitudine mustellarum esse initio, semenstres vix ingredi posse nec nisi bimenstres moveri; in europa autem inter acheloum tantum mestumque amnes leones esse, sed longe viribus praestantiores iis quos africa aut syria gignant.

leonum duo genera, compactile et breve crispioribus iubis. hos pavidiore esse quam longos simplicique villo; eos contemptores vulnere. urinam mares crure sublato reddere ut canes. gravem odorem, nec minus halitum.

raros in potu vesci alternis diebus, a saturitate interim triduo cibis carere. quae possint, in mandendo solida devorare, nec capiente aviditatem alvo coniectis in fauces unguibus extrahere aut si fugiendum in satietate habeant. vitam iis longam docet argumento, quod plerique dentibus defecti reperiantur. polybius, aemiliani comes, in senecta hominem ab his adpeti refert, quoniam ad persequendas feras vires non suppetant; tunc obsidere africae urbes, eaque de causa cruci fixos vidisse se cum scipione, quia ceteri metu poenae similis absterrentur eadem noxa.

leoni tantum ex feris clementia in supplices. prostratis parcat et, ubi saevit, in viros potius quam in feminas fremit, in infantes non nisi magna fame. credit iuba pervenire intellectum ad eos precum; in captivam certe gaetuliae reducem audit multorum in silvis impetum esse mitigatum adloquio ausae dicere, se feminam, profugam, infirmam, supplicem animalis omnium generosissimi ceterisque imperitantis, indignam eius gloria praedam. varia circa hoc opinio ex ingenio cuiusque vel casu, mulceri alloquiis feras, quippe cum etiam serpentes extrahi cantu cogique in poenam verum falsumne sit, non vita decreverit. leonum animi index cauda, sicut et equorum aures; namque et has notas generosissimo cuique natura tribuit. inmotus ergo placido, clemens blandienti, quod rarum est: crebrior enim iracundia, cuius in principio terra verberatur, incremento terga ceu quodam incitamento flagellantur. vis summa in pectore. ex omni vulnere sive ungue inpresso sive dente ater profluit sanguis. iidem satiati innoxii sunt. generositas in periculis maxime deprehenditur, non illo tantum modo, quo spernens tela diu se terrore solo tuetur ac velut cogi testatur cooriturque non tamquam periculo coactus, sed tamquam amentiae iratus. illa nobilior animi significatio: quamlibet magna canum et venantium urgente vi contemptim restitansque cedit in campis et ubi spectari potest; idem ubi virgulta silvasque penetravit, acerrimo cursu fertur velut abscondente turpitudinem loco. dum sequitur, insilit saltu, quo in fuga non utitur. vulneratus observatione mira percussorem novit et in quantalibet multitudine adpetit; eum vero, qui telum quidem miserit, sed non vulneraverit, correptum rotatumque sternit nec vulnerat. cum pro catulis feta dimicat, oculorum aciem traditur defigere in terram, ne venabula expavescat. cetero dolis carent et suspicione nec limis intuentur oculis aspicique simili modo nolunt. creditum est a moriente humum morderi lacrimamque leto dari. atque hoc tale tamque saevum animal rotarum orbis circumacti currusque inanes et gallinaceorum cristae cantusque etiam magis terrent, sed maxime ignes. aegritudinem fastidii tantum sentit, in qua medetur ei contumelia, in rabiem agente adnexarum lascivia simiarum; gustatus deinde sanguis in remedio est.

leonum simul plurium pugnam romae princeps dedit scaevola p. f. in curuli aedilitate, centum autem iubatorum primus omnium l. sulla, qui postea dictator fuit, in praetura. post eum pompeius magnus in circo dc, in iis iubatorum cccxv, caesar dictator cccc.

capere eos ardui erat quondam operis, foveisque maxime. principatu

claudii casus rationem docuit, pudendam paene talis ferae nomine, a pastore gaetuliae sago contra ingruentis impetum obiecto, quod spectaculum in harenam protinus tralatum est, vix credibili modo torpescere tanta illa feritate quamvis levi iniectu operto capite, ita ut devinciatur non repugnans. videlicet omnis vis constat in oculis, quo minus mirum sit a lysimacho alexandri iussu simul incluso strangulatum leonem. iugo subdidit eos primusque romae ad currum iunxit m. antonius, et quidem civili bello, cum dimicatum esset in pharsaliis campis, non sine ostento quodam temporum, generosos spiritus iugum subire illo prodigio significante. nam quod ita vectus est cum mima cytheride, super monstra etiam illarum calamitatum fuit. primus autem hominum leonem manu tractare ausus et ostendere mansuefactum hanno e clarissimis poenorum traditur damnatusque illo argumento, quoniam nihil non persuasurus vir tam artificis ingenii videbatur et male credi libertas ei, cui in tantum cessisset etiam feritas.

sunt vero et fortuitae eorum quoque clementiae exempla. mentor syracusanus in syria, leone obvio suppliciter volutante, attonitus pavore, cum refugienti undique fera opponeret sese et vestigia lamberet adulanti similis, animadvertit in pede eius tumorem vulnusque. extracto surculo liberavit cruciatu. pictura casum hunc testatur syracusis. simili modo elpis samius natione in africanam delatus nave, iuxta litus conspecto leone hiatu minaci, arborem fuga petit libero patre invocato, quoniam tum praecipuus votorum locus est, cum spei nullus est. set neque profugienti, cum potuisset, fera institerat et procumbens ad arborem hiatu, quo terruerat, miserationem quaerebat. os morsu avidiore inhaeserat dentibus cruciabatque inedia, non tantum poena in ipsis eius telis, suspectantem ac velut mutis precibus orantem, dum fortuitis fidens non est contra feram multoque diutius miraculo quam metu cessatum est. degressus tandem evellit praebenti et qua maxime opus esset adcommodanti. traduntque, quamdiu navis ea in litore steterit, retulisse gratiam venatus adgerendo. qua de causa libero patri templum in samo elpis sacravit, quod ab eo facto graeci κεχηνότης ... διονύσου appellavere. miremur postea vestigia hominum intellegi a feris, cum etiam auxilia ab uno animalium sperent cur enim non ad alia iere aut unde medicas manus hominis sciunt nisi forte vis malorum etiam feras omnia experiri cogit.

aeque memorandum et de panthera tradit demetrius physicus: iacentem in media via hominis desiderio repente apparuisse patri cuiusdam philini, adsectoris sapientiae; illum pavore coepisse regredi, feram vero circumvolutari non dubie blandientem seseque conflictantem maerore qui etiam in panthera intellegi posset. feta erat, catulis procul in foveam delapsis. primum ergo miserationis fuit non expavescere, proximum et curam intendere, secutusque qua trahebat vestem unguium levi iniectu, ut causam doloris intellexit simulque salutis suae mercedem, exemit catulos, ea cum his prosequente usque extra solitudines deductus laeta atque gestiente, ut facile appareret gratiam referre et nihil in vicem inputare, quod etiam in homine rarum est.

haec fidem et democrito adferunt, qui thoantem in arcadia servatum a dracone narrat. nutrierat eum puer dilectum admodum, parensque serpentis naturam et magnitudinem metuens in solitudines tulerat, in quibus circumvento latronum insidiis agnitoque voce subvenit. nam quae de infantibus ferarum lacte nutritis, cum essent expositi, produntur, sicut de conditoribus nostris a lupa, magnitudini factorum accepta fieri aequius quam ferarum naturae arbitrator.

panthera et tigris macularum varietate prope solae bestiarum spectantur, ceteris unus ac suus cuique generi color est, leonum tantum in syria niger. pantheris in candido breves macularum oculi. ferunt odore earum mire sollicitari quadrupes cunctas, sed capitis torvitate terreri; quam ob rem occultato eo reliqua dulcedine invitatas corripiunt. sunt qui tradant in armo iis similem lunae esse maculam crescentem in orbem seque cavantem pari modo. nunc varias et pardos, quae mares sunt, appellant in eo omni genere, creberrimo in africa syriaque. quidam ab his pantheras candore solo discernunt, nec adhuc aliam differentiam inveni.

senatus consultum fuit vetus, ne liceret africanas in italiam advehere. contra hoc tulit ad populum cn. aufidius tribunus plebis permisitque circensium gratia inportare. primus autem Scaurus aedilitate sua varias cl universas misit, dein pompeius magnus ccccx, Divus Augustus ccccx. idem q. tuberone paulo fabio maximo cos. iiii non. mai. theatri marcelli dedicatione tigrim primus omnium romae ostendit in cavea mansuefactam, divus vero claudius simul iiii.

tigrim hyrcani et indi ferunt, animal velocitatis tremendae et maxime cognitae, dum capitur totus eius fetus, qui semper numerosus est. ab insidiante rapitur equo quam maxime pernici atque in recentes subinde transfertur. at ubi vacuum cubile reperit feta - maribus enim subolis cura non est - , fertur praeceps odore vestigans. raptor adpropinquante fremitu abicit unum ex catulis; tollit illa morsu et pondere etiam ocior acta remeat iterumque consequitur ac subinde, donec in navem regresso inrita feritas saevit in litore.

camelos inter armenta pascit oriens, quarum duo genera, bactriae et arabiae; differunt, quod illae bina habent tubera in dorso, hae singula et sub pectore alterum, cui incumbant. dentium superiore ordine, ut boves, carent in utroque genere. omnes autem iumentorum ministeriis dorso funguntur atque etiam equitatus in proeliis. velocitas ut equo, sed sua cuique mensura sicuti vires. nec ultra adsuetum procedit spatium nec plus instituto onere recipit. odium adversus equos gerunt naturale. sitim et quadriduo tolerant implenturque, cum bibendi occasio est, et in praeteritum et in futurum, obturbata proculcatione prius aqua: aliter potu non gaudent. vivunt quinquagenis annis, quaedam et centenis. utrimque rabiem et ipsae sentiunt. castrandi genus etiam feminas, quae bello praeparentur, inventum est: fortiores ita fiunt coitu negato.

harum aliqua similitudo in duo transfertur animalia. nabun aethiopes vocant collo similem equo, pedibus et cruribus bovi, camelo capite, albis

maculis rutilum colorem distinguuntibus, unde appellata camelopardalis, dictatoris caesaris circensibus ludis primum visa romae. ex eo subinde cernitur, aspectu magis quam feritate conspicua, quare etiam ovis ferae nomen invenit.

pompei magni primum ludi ostenderunt chama, quem galli rufum vocabant, effigie lupi, pardorum maculis. iidem ex aethiopia quas vocant κήπους, quarum pedes posteriores pedibus humanis et cruribus, priores manibus fuere similes. hoc animal postea roma non vidit.

isdem ludis et rhinoceros unius in nare cornus, qualis saepe, visus. alter hic genitus hostis elephanto cornu ad saxa limato praeparat se pugnae, in dimicatione alvum maxime petens, quam scit esse molliorem. longitudo ei par, crura multo breviora, color buxeus.

lynxas vulgo frequentes et sphingas, fusco pilo, mammis in pectore geminis, aethiopia generat multaque alia monstris similia, pinnatos equos et cornibus armatos, quos pegasos vocant, crocotas velut ex cane lupoque conceptos, omnia dentibus frangentes protinusque devorata conficientes ventre, cercopithecus nigris capitibus, pilo asini et dissimiles ceteris voce, indicos boves unicorner tricornesque, leucrocotam, perniciosissimam feram asini feri magnitudine, clunibus cervinis, collo, cauda, pectore leonis, capite melium, bisulca ungula, ore ad aures usque rescisso, dentium locis osse perpetuo - (hanc feram humanas voces tradunt imitari. apud eosdem et quae vocatur eale, magnitudine equi fluvialis, cauda elephantis, colore nigra vel fulva, maxillis apri, maiora cubitalibus cornua habens mobilia, quae alterna in pugna sistit variatque infesta aut obliqua, utcumque ratio monstravit) - , sed atrocissimos tauros silvestres, maiores agrestibus, velocitate ante omnes, colore fulvos, oculis caeruleis, pilo in contrarium verso, rictu ad aures dehiscite iuxta cornua mobilia. tergori duritia silicis, omne respuens vulnus. feras omnes venantur, ipsi non aliter quam foveis capti feritate semper intereunt. apud eosdem nasci ctesias scribit quam mantichoran appellat, triplici dentium ordine pectinatim coeuntium, facie et auriculis hominis, oculis glaucis, colore sanguineo, corpore leonis, cauda scorpionis modo spicula infigentem, vocis ut si misceatur fistulae et tubae concentus, velocitatis magnae, humani corporis vel praecipue adpetentem. in india et boves solidis ungulis, unicorner, et feram nomine axin hinnulei pelle pluribus candidioribusque maculis, sacrorum liberi patris - (orsaei indi simias candentes toto corpore venantur) - , asperrimam autem feram monocerotem, reliquo corpore equo similem, capite cervo, pedibus elephanto, cauda apro, mugitu gravi, uno cornu nigro media fronte cubitorum duum eminente. hanc feram vivam negant capi.

apud hesperios aethiopus fons est nigris, ut plerique existimavere, nili caput, ut argumenta quae diximus persuadent. iuxta hunc fera appellatur catoblepas, modica alioqui ceterisque membris iners, caput tantum praegrave aegre ferens - id deiectum semper in terram - , alias internicio humani generis, omnibus, qui oculos eius videre, confestim expirantibus.

eadem et basilisci serpentis est vis. cyrenaica hunc generat provincia, duodecim non amplius digitorum magnitudine, candida in capite macula ut quodam diademate insignem. sibilo omnes fugat serpentes nec flexu multiplici, ut reliquae, corpus inpellit, sed celsus et erectus in medio incedens. necat frutices, non contactos modo, verum et adflatos, exurit herbas, rumpit saxa: talis vis malo est. creditum quondam ex equo occisum hasta et per eam subeunte vi non equitem modo, sed equum quoque absumptum. atque huic tali monstro - saepe enim enectum concupivere reges videre - mustellarum virus exitio est: adeo naturae nihil placuit esse sine pare. inferciunt has cavernis facile cognitis soli tabe. necant illae simul odore moriunturque, et naturae pugna conficitur.

sed in italia quoque creditur luporum visus esse noxius vocemque homini, quem priores contemplantur, adimere ad praesens. inertes hos parvosque africa et aegyptus gignunt, asperos trucesque frigidior plaga. homines in lupos verti rursusque restitui sibi falsum esse confidenter existimare debemus aut credere omnia quae fabulosa tot saeculis conperimus. unde tamen ista vulgo infixi sit fama in tantum, ut in maledictis versipelles habeat, indicabitur. euanthes, inter auctores graeciae non spretus, scribit arcadas tradere ex gente anthi cuiusdam sorte familiae lectum ad stagnum quoddam regionis eius duci vestituque in quercu suspenso tranare atque abire in deserta transfigurarique in lupum et cum ceteris eiusdem generis congregari per annos viiii. quo in tempore si homine se abstinerit, reverti ad idem stagnum et, cum tranaverit, effigiem recipere, ad pristinum habitum addito novem annorum senio. id quoque adicit, eandem recipere vestem. mirum est quo procedat graeca credulitas! nullum tam inpudens mendacium est, ut teste careat. item apollas, qui olympionicas scripsit, narrat demaenetum parrhasium in sacrificio, quod arcades iovi lycaeο humana etiamtum hostia faciebant, immolati pueri exta degustasse et in lupum se convertisse, eundem x anno restitutum athleticae se exercuisse in pugilatu victoremque olympia reversum. quin et caudae huius animalis creditur vulgo inesse amatorium virus exiguo in villo eumque, cum capiatur, abici nec idem pollere nisi viventi dereptum. dies, quibus coeat, toto anno non amplius duodecim. eundem in fame vesci terra inter auguria; ad dexteram commeantium praeciso itinere si pleno id ore fecerit, nullum ominum praestantius. sunt in eo genere qui cervari vocantur, qualem e gallia in pompeii magni harena spectatum diximus. huic quamvis in fame mandenti, si respexerit, oblivionem cibi subrepere aiunt digressumque quaerere aliud.

quod ad serpentes attinet, vulgatum est colorem eius plerasque terrae habere, in qua occultentur. innumera esse genera. cerastis corpore eminere cornicula saepe quadrigemina, quorum motu, reliquo corpore occulto, sollicitent ad se aves. geminum caput amphisbaenae, hoc est et a cauda, tamquam parum esset uno ore fundi venenum. aliis squamas esse, aliis picturas, omnibus exitiale virus. iaculum ex arborum ramis vibrari, nec pedibus tantum pavendas serpentes, sed ut missile volare tormento. colla aspidum intumescere, nullo ictus remedio praeterquam si confestim partes

contactae amputentur. unus huic tam pestifero animali sensus vel potius affectus est: coniugia ferme vagantur, nec nisi cum pari vita est. itaque alterutra interempta incredibilis ultionis alteri cura: persequitur interfectorem unumque eum in quantolibet populi agmine notitia quadam infestat, perrumpit omnes difficultates, permeat spatia nec nisi omnibus arcetur aut praeceleris fuga.

non est fateri rerum natura largius mala an remedia genuerit. iam primum hebetes oculos huic malo dedit, eosque non in fronte adversos cernere, sed in temporibus - itaque excitatur saepius auditu quam visu - , deinde internecivum bellum cum ichneumone. notum est animal hac gloria maxime, in eadem natum aegypto. mergit se limo saepius siccaturque sole, mox ubi pluribus eodem modo se coriis loricavit, in dimicationem pergit. in ea caudam attollens ictus inritos aversus excipit, donec obliquo capite speculatus invadat in fauces. nec hoc contentus aliud haud mitius debellat animal.

crocodilum habet nilus, quadripes malum et terra pariter ac flumine infestum. unum hoc animal terrestre linguae usu caret, unum superiore mobili maxilla inprimit morsum, alias terribile pectinatim stipante se dentium serie. magnitudine excedit plerumque duodeviginti cubita. parit ova quanta anseres, eaque extra eum locum semper incubat praedivinatione quadam, ad quem summo auctu eo anno egressurus est nilus. nec aliud animal ex minore origine in maiorem crescit magnitudinem. et unguibus autem armatus est, contra omnes ictus cute invicta. dies in terra agit, noctes in aqua, teporis utrumque ratione. hunc saturum cibo piscium et semper esculento ore in litore somno datum parva avis, quae trochilos ibi vocatur, rex avium in italia, invitat ad hiantium pabuli sui gratia, os primum eius adsultim repurgans, mox dentes et intus fauces quoque ad hanc scabendi dulcedinem quam maxime hiantes, in qua voluptate somno pressum conspicatus ichneumon, per easdem fauces ut telum aliquod inmissus, erodit alvum.

similis crocodilo, sed minor etiam ichneumone, est in nilo natus scincos, contra venena praecipuus antidotis, item ad inflammandam virorum venerem.

verum in crocodilo maior erat pestis quam ut uno esset eius hoste natura contenta. itaque et delphini inmeantes nilo, quorum dorso tamquam ad hunc usum cultellata inest pinna, abigentes eos praedam ac velut in suo tantum amne regnantes, alioqui in pares viribus ipsi, astu interimunt. callent enim in hoc cuncta animalia sciuntque non sua modo commoda, verum et hostium adversa, norunt sua tela, norunt occasiones partesque dissidentium inbelles. in ventre mollis est tenuisque cutis crocodilo: ideo se ut terrii mergunt delphini subeuntesque alvum illa secant spina. quin et gens hominum est huic beluae adversa in ipso nilo, a tentyri insula, in qua habitat, appellata. mensura eorum parva, sed praesentia animi in hoc tantum usu mira. terribilis haec contra fugaces belua est, fugax contra sequentes. sed adversum ire soli hi audent, quin et flumini innatant dorsoque equitantium modo inpositi hiantibus resupino capite ad morsum addita in os clava, a dextra ac laeva tenentes extrema eius utrimque, ut frenis in terram agunt captivos ac voce etiam sola

territos cogunt evomere recentia corpora ad sepulturam. itaque uni ei insulae crocodili non adnant olfactuque eius generis hominum, ut psyllorum serpentes, fugantur. hebetes oculos hoc animal dicitur habere in aqua, extra acerrimi visus, quattuorque menses hiemis semper inedia trahere in specu. quidam hoc unum quamdiu vivat crescere arbitrantur; vivit autem longo tempore.

maior altitudine in eodem nilo belua hippopotamius editur, unguis binis quales bubus, dorso equi et iuba et hinnitu, rostro resimo, cauda et dentibus aprorum aduncis, sed minus noxiis, tergoris ad scuta galeasque impenetrabilis, praeterquam si umore madeant. depascitur segetes destinatione ante, ut ferunt, determinatas in diem et ex agro ferentibus vestigiis, ne quae revertenti insidiae comparentur.

primus eum et quinque crocodilos romae aedilitatis suae ludis M. Scaurus temporario euripo ostendit. hippopotamius in quadam medendi parte etiam magister exstitit. adsidua namque satietate obesus exit in litus recenti harundinum caesura speculatum atque, ubi acutissimam vidit stirpem, inprimens corpus venam quandam in crure vulnerat atque ita profluvio sanguinis morbidum alias corpus exonerat et plagam limo rursus obducit.

simile quiddam et volucris in eadem aegypto monstravit, quae vocatur ibis, rostri aduncitate per eam partem se perluens, qua reddi ciborum onera maxime salubre est. nec haec sola: multis animalibus reperta sunt usui futura et homini. dictamnum herbam extrahendis sagittis cervi monstrare percussi eo telo pastuque herbae eius eiecto; iidem percussi a phalangio, quod est aranei genus, aut aliquo simili cancos edendo sibi medentur. est et ad serpentium ictus praecipua qua se lacerti, quotiens cum his conservare pugnam, vulnerati refovent. chelidoniam visui saluberrimam hirundines monstrare vexatis pullorum oculis illa medentes. testudo cunilae, quam bubulam vocant, pastu vires contra serpentes refovet, mustella ruta in murium venatu cum iis dimicatione conserta. ciconia origano, hedera apri in morbis sibi medentur et cancos vescendo maxime mari eiectos. anguis, hiberno situ membrana corporis obducta, feniculi suco impedimentum illud exuit nitidusque vernat. exuit autem a capite primum nec celerius quam uno die et nocte, replicans, ut extra fiat membranae quod fuerit intus. idem hiberna latebra visu obscurato maratho herbae se adfricans oculos inunguit ac refovet; si vero squamae obtorpuere, spinis iuniperi se scabit. draco vernam nausiam silvestris lactucae suco restinguit. pantheras per fricatas carnes aconito barbari venantur. occupat ilico fauces earum angor, quare pardalianches id venenum appellavere quidam; at fera contra hoc excrementis hominis sibi medetur, et alias tam avida eorum, ut a pastoribus ex industria in aliquo vase suspensa altius, quam ut queat saltu attingere, iaculando se appetendoque deficiat et postremo expiret, alioqui vivacitatis adeo lentae, ut eiectis interaneis diu pugnet. elephans, chamaeleone concolori frondi devorato, occurrit oleastro huic veneno suo. ursi cum mandragorae mala gustavere, formicas lambunt. cervus herba cinare venenatis pabulis resistit. palumbes, graculi, merulae, perdices

lauri folio annum fastidium purgant, columbae, turtures et gallinaei herba quae vocatur helxine, anates, anseres ceteraeque aquaticae herba siderite, grues et similes iunco palustri. corvus occiso chamaeleone, qui etiam victori suo nocet, lauro infestum virus extinguit.

milia praeterea, utpote cum plurimis animalibus eadem natura rerum caeli quoque observationem et ventorum, imbrium, tempestatum praesagia alia alio modo dederit, quod persequi inmensum est, aequae scilicet quam reliquam cum singulis hominum societatem. siquidem et pericula praemonent non fibris modo extisque, circa quod magna mortalium portio haeret, sed alia quadam significatione. ruinas imminentibus musculi praemigrant, aranei cum telis primi cadunt. auguria quidem artem fecere apud romanos et sacerdotum collegium vel maxime sollemne. est inter ea locis rigentibus et volpes, animal alioqui sollertia dirum. amnes gelatos lacusque non nisi ad eius itum reditumque transeunt. observatum eam aure ad glaciem adposita coniectare crassitudinem gelus. nec minus clara exitii documenta sunt etiam contemnendis animalibus. M. Varro auctor est a cuniculis suffossum in hispania oppidum, a talpis in thessalia, ab ranis civitatem in gallia pulsam, ab locustis in africa, ex gyara cycladum insula incolas a muribus fugatos, in italia amynclas a serpentibus deletas. citra cynamolgos aethiopus late deserta regio est, a scorpionibus et solipugis gente sublata, et a scolopendris abactos rhoetienses auctor est theophrastus. sed ad reliqua ferarum genera redeamus.

hyaenis utramque esse naturam et alternis annis mares, alternis feminas fieri, parere sine mare vulgus credit, aristoteles negat. collum ut iuba in continuitatem spinae porrigitur flectique nisi circumactu totius corporis non quit. multa praeterea mira traduntur, sed maxime sermonem humanum inter pastorum stabula adsimulare nomenque alicuius addiscere, quem evocatum foris laceret, item vomitionem hominis imitari ad sollicitandos canes quos invadat. ab uno animali sepulcra erui inquisitione corporum. feminam raro capi. oculis mille esse varietates colorumque mutationes. praeterea umbrae eius contactu canes obmutescere, et quibusdam magicis artibus omne animal, quod ter lustraverit, in vestigio haerere.

huius generis coitu leaena aethiopica parit corocottam, similiter voces imitantem hominum pecorumque. acies ei perpetua, in utraque parte oris nullis gingivis, dente continuo: ne contrario occurso hebetetur, capsarum modo includitur. hominum sermones imitari et mantichoram in aethiopia auctor est iuba.

hyaenae plurimae gignuntur in africa, quae et asinorum silvestrium multitudinem fundit. mares in eo genere singuli feminarum gregibus imperitant; timent libidinis aemulos et ideo gravidas custodiunt morsuque natos mares castrant. contra gravidae latebras petunt et parere furto cupiunt gaudentque copia libidinis.

easdem partes sibi ipsi pontici amputant fibri periculo urgente, ob hoc se peti gnari; castoreum id vocant medici. alias animal horrendi morsus arbores iuxta flumina ut ferro caedit, hominis parte comprehensa non ante quam fracta

concrepuerint ossa morsus resolvit. cauda piscium his, cetera species lutrae. utrumque aquaticum, utrique mollior pluma pilus.

ranae quoque rubetae, quarum et in terra et in umore vita, plurimis refertae medicaminibus, deponere ea adsidue ac resumere pastu dicuntur, venena tantum semper sibi reservantes.

similis et vitulo marino victus in mari ac terra, simile fibris et ingenium. evomit fel suum ad multa medicamenta utile, item coagulum ad comitiales morbos, ob ea se peti prudens. theophrastus auctor est anguis modo et stelliones senectutem exuere itaque protinus devorare praeripientes comitali morbo remedia. eosdem innocui ferunt in graecia morsus, noxios esse in sicilia.

cervis quoque est sua malignitas, quamquam placidissimo animalium. urgente vi canum ultro confugiunt ad hominem et in pariendo semitas minus cavent humanis vestigiis tritas quam secreta ac feris opportuna. conceptus earum post arcturi sidus. octonis mensibus ferunt partus, interim et geminos. a conceptu separant se, at mares relictis rabie libidinis saeviunt, fodiunt scrobes. tunc rostra eorum nigrescunt, donec aliqui abluant imbres. feminae autem ante partum purgantur herba quadam, quae seselis dicitur, faciliore ita utentes utero; a partu duas, quae tamnus et seselis appellantur, pastae redeunt ad fetum: illis imbui lactis primos volunt sucos quacumque de causa. editos partus exercent cursu et fugam meditari docent, ad praerupta ducunt saltumque demonstrant. iam mares soluti desiderio libidinis avidae petunt pabula; ubi se praepingues sensere, latebras quaerunt fatentes incommodum pondus. et alias semper in fuga adquiescunt stantesque respiciunt, cum prope ventum est, rursus fugae praesidia repetentes. hoc fit intestini dolore tam infirmi, ut ictu levi rumpatur intus. fugiunt autem latratu canum audito secunda semper aura, ut vestigia cum ipsis abeant. mulcentur fistula pastoralis et cantu, cum erexere aures, acerrimi auditus, cum remisere, surdi. cetero animal simplex et omnium rerum miraculo stupens in tantum, ut equo aut bucula accedente propius hominem iuxta venantem non cernant aut, si cernant, arcum ipsum sagittasque mirentur. maria trameant gregatim nantes porrecto ordine et capita inponentes praecedentium clunibus vicibusque ad terga redeuntes. hoc maxime notatur a cilicia cyprum traicientibus. nec vident terras, sed in odorem earum natant. cornua mares habent solique animalium omnibus annis stato veris tempore amittunt. ideo sub ista die quam maxime invia petunt: latent amissis velut inermes, sed et hi bono suo invidentes. dextrum cornu negant inveniri ceu medicamento aliquo praeditum, idque mirabilius fatendum est, cum et in vivariis mutant omnibus annis. defodi ab iis putant. accensi autem utrius libeat odore et serpentes fugantur et comitiales morbi deprehenduntur. indicia quoque aetatis in illis gerunt, singulos annis adicientibus ramos usque ad sexennes; ab eo tempore similia revivescunt, nec potest aetas discerni; sed dentibus senecta declaratur: aut enim paucos aut nullos habent nec in cornibus imis ramos, alioqui ante frontem prominere solitos iunioribus. non decidunt castratis cornua nec nascuntur, erumpunt

autem renascentibus tuberibus primo aridae cuti similia, dein teneris increscunt ferulis harundineas in paniculas molli plumata lanugine. quamdiu carent iis, noctibus procedunt ad pabula. increscentia solis vapore durant ad arbores subinde experientes; ubi placuit robur, in aperta prodeunt. captique iam sunt hedera in cornibus viridante, ex attritu arborum ut in aliquo ligno teneris, dum experiuntur, innata. sunt aliquando et candido colore, qualem fuisse traditur q. sertorii cervam, quam esse fatidicam hispaniae gentibus persuaserat. et his cum serpente pugna: vestigant cavernas nariumque spiritu extrahunt renitentes. ideo singulare abigendis serpentibus odor adusto cervino cornu, contra morsus vero praecipuum remedium ex coagulo hinnulei matris in utero occisi. vita cervis in confesso longa, post c annos aliquibus denuo captis cum torquibus aureis, quos alexander magnus addiderat, adopertis iam cute in magna obesitate. febrium morbos non sentit hoc animal, quin et medetur huic timori. quasdam modo principes feminas scimus omnibus diebus matutinis carnem eam degustare solitas et longo aevo caruisse febribus, quod ita demum existimant ratum, si vulnere uno interierit.

est eadem specie, barba tantum et armorum villo distans, quem tragelaphon vocant, non alibi quam iuxta phasim amnem nascens.

cervos africa propemodum sola non gignit, at chamaeleonem et ipsa, quamquam frequentior est indiae. figura et magnitudo erat lacerti, nisi crura essent recta et excelsiora. latera ventri iunguntur ut piscibus; et spina simili modo eminet. rostrum, ut in parvo, haut absimile suillo, cauda praelonga, in tenuitatem desinens, implicans se viperinis orbibus, ungues adunci, motus tardior ut testudini, corpus asperum ceu crocodilo, oculi in recessu cavo, tenui discrimine, praegrandes et corpori concolores. numquam eos operit nec pupillae motu, sed totius oculi versatione circumaspicit. ipse celsus hianti semper ore solus animalium nec cibo nec potu alitur nec alio quam ae+ris alimento, rictu terrifico fere, innoxius alioqui. et coloris natura mirabilior: mutat namque eum subinde et oculis et cauda et toto corpore redditque semper quemcumque proxime attingit praeter rubrum candidumque; defuncto pallor est. caro in capite et maxillis et ad commissuram caudae admodum exigua nec aliubi toto corpore; sanguis in corde et circa oculos tantum; viscera sine splene. hibernis mensibus latet, ut lacertae.

mutat colores et scytharum tarandrus nec aliud ex iis quae pilo vestiuntur, nisi in indis lycaon, cui iubata traditur cervix. nam thoes - luporum id genus est procerius longitudine, brevitate crurum dissimile, velox saltu, venatu vivens, innocuum homini - habitum, non colorem, mutant, per hiemes hirti, aestate nudi. tarandro magnitudo quae bovi est, caput maius cervino nec absimile, cornua ramosa, ungulae bifidae, villus magnitudine ursorum, sed, cum libuit sui coloris esse, asini similis. tergori tanta duritia, ut thoraces ex eo faciant. colorem omnium arborum, fruticum, florum locorumque reddit metuens in quibus latet, ideoque raro capitur. mirum esset habitum corpori tam multiplicem dari, mirabilius est et villo.

hystrices generat india et africa, spinea contectas cute irenaceorum genere,

sed hystrici longiores aculei et, cum intendit cutem, missiles. ora urgentium figit canum et paulo longius iaculatur. hibernis autem se mensibus condit, quae natura multis et ante omnia ursis.

eorum coitus hiemis initio nec vulgari quadripedum more, sed ambobus cubantibus complexisque; dein secessus in specus separatim, in quibus pariunt xxx die plurimum quinos. hi sunt candida informisque caro, paulo muribus maior, sine oculis, sine pilo; ungues tantum prominent. hanc lambendo paulatim figurant. nec quicquam rarius quam parientem videre ursam. ideo mares quadragenis diebus latent, feminae quaternis mensibus. specus si non habuere, ramorum fruticumque congerie aedificant, impenetrabiles imbribus mollique fronde constratos. primis diebus bis septenis tam gravi somno premuntur, ut ne vulneribus quidem excitari queant. tunc mirum in modum veterno pinguescunt. illi sunt adipēs medicaminibus apti contraque defluvium capilli tenaces. ab his diebus residunt ac priorum pedum suctu vivunt. fetus rigentes adprimendo pectori fovent non alio incubitu quam ad ova volucres. mirum dictu, credit theophrastus per id tempus coctas quoque ursorum carnes, si adserventur, increscere; cibi nulla tunc argumenta nec nisi umoris minimum in alvo inveniri, sanguinis exiguas circa corda tantum guttas, reliquo corpori nihil inesse. procedunt vere, sed mares praepingues, cuius rei causa non prompta est, quippe ne somno quidem saginatis, praeter xiiii dies, ut diximus. exeuntes herbam quandam arum nomine laxandis intestinis, alioqui concretis, devorant friantque surculos dentibus praedomantes ora. oculi eorum hebetantur, qua maxime causa favos expetunt, ut convulneratum ab apibus os levet sanguine gravedinem illam. invalidissimum urso caput, quod leoni firmissimum. ideo urgente vi praecipitaturi se ex aliqua rupe manibus cooperto iaciuntur ac saepe in harena colapho infracto exanimantur. cerebro veneficium inesse hispaniae credunt occisorumque in spectaculis capita cremant testato, quoniam potum in ursinam rabiem agat. ingrediuntur et bipedes; arborem aversi derepunt. tauros ex ore cornibusque eorum omnibus pedibus suspensi pondere fatigant. nec alteri animalium in maleficio stultitia sollertior. annalibus notatum est m. pisone m. messala cos. a. d. xiiii kal. oct. domitium ahenobarbum aedilem curulem ursos numidicos centum et totidem venatores aethiopas in circo dedisse. miror adiectum numidicos fuisse, cum in africa ursum non gigni constet.

conduntur hieme et pontici mures, dumtaxat albi, quorum palatum in gustu sagacissimum auctores quonam modo intellexerint miror. conduntur et alpini, quibus magnitudo melius est, sed hi pabulo ante in specus convecto, cum quidem narrant alternos marem ac feminam subrosae complexos fascem herbae supinos, cauda mordicus adprehensa, invicem detrahi ad specum ideoque illo tempore detricto esse dorso. sunt his pares et in aegypto similiterque resident in clunes et binis pedibus gradiuntur prioribusque ut manibus utuntur.

praeparant hiemi et irenaei cibos ac volutati supra iacentia poma adfixa spinis, unum amplius tenentes ore, portant in cavas arbores. iidem mutationem

aquilonis in austrum condentes se in cubile praesagiunt. ubi vero sensere venantem, contracto ore pedibusque ac parte omni inferiore, qua raram et innocuam habent lanuginem, convolvuntur in formam pilae, ne quid comprehendendi possit praeter aculeos. in desperatione vero urinam in se reddunt tabificam, tergori suo spinisque noxiam, propter hoc se capi gnari. quam ob rem exinanita prius urina venari ars est, et tum praecipua dos tergori, alias corrupto, fragili, putribus spinis atque deciduis, etiam si vivat subtractus fuga. ob id non nisi in novissima spe maleficio eo perfunditur, quippe et ipsi odere suum veneficium, ita parcentes sibi terminumque supremum opperientes, ut ferme ante captivitas occupet. calidae postea aquae adpersu resolvitur pila, adprehensusque pes alter e posterioribus suspendiosa fame necat. aliter non est occidere et tergori parcere. ipsum animal non, ut remur plerique, vitae hominum supervacuum est, si non sint illi aculei, frustra vellerum mollitia in pecude mortalibus data: hac cute expoliuntur vestes. magnum fraus et ibi lucrum monopolio invenit, de nulla re crebrioribus senatus consultis nulloque non principe adito querimoniis provincialibus.

vrinae et duobus aliis animalibus ratio mira. leontophonon accipimus vocari parvum nec aliubi nascens quam ubi leo gignitur, quo gustato tanta illa vis et ceteris quadripedum imperitans ilico expiret. ergo corpus eius exustum adspargunt aliis carnibus polentae modo insidiantes ferae necantque etiam cinere: tam contraria est pestis. haut inmerito igitur odit leo visumque frangit et citra morsum exanimat; ille contra urinam spargit, prudens hanc quoque leoni exitialem. lyncum umor ita redditus, ubi gignuntur, glaciatur arescitve in gemmas carbunculis similes et igneo colore fulgentes, lyncurium vocatas atque ob id sucino a plerisque ita generari prodito. novere hoc sciuntque lynces et invidentes urinam terra operiunt, eoque celerius solidatur illa.

alia sollertia in metu melibus: sufflatae cutis distentu ictus hominum et morsus canum arcent.

provident tempestatem et sciuri obturatisque, qua spiraturus est ventus, cavernis ex alia parte aperiunt fores. de cetero ipsis villosior cauda pro tegumento est. ergo in hiemes aliis provisum pabulum, aliis pro cibo somnus.

serpentium vipera sola terra dicitur condi, ceterae arborum aut saxorum cavis. et alias vel annua fame durant, algore modo dempto. omnia secessus tempore veneno orba dormiunt. simili modo et cocleae, illae quidem iterum et aestatibus, adhaerentes maxime saxis aut, etiam iniuria resupinatae avolsaeque, non tamen exeuntes. in baliaribus vero insulis cavaticae appellatae non prorpunt e cavis terrae - neque herba vivunt - , sed uvae modo inter se cohaerent. est et aliud genus minus vulgare adhaerente operculo eiusdem testae se operiens. obrutae terra semper hae et circa maritimas tantum alpes quondam effossae coepere iam erui et in veliterno. omnium tamen laudatissimae in astypalaea insula.

lacertae, inimicissimum genus cocleis, negantur semenstrem vitam excedere. lacerti arabiae cubitales, in indiae vero nyso monte xxiiii in longitudinem pedum, colore fulvi aut punicei aut caerulei.

ex his quoque animalibus, quae nobiscum degunt, multa sunt cognita digna, fidelissimumque ante omnia homini canis atque equus. pugnasse adversus latrones canem pro domino accepimus confectumque plagis a corpore non recessisse, volucres ac feras abigentem. ab alio in epiro agnitum in conventu percussorem domini laniatuque et latratu coactum fateri scelus. garamantum regem canes cum ab exilio reduxere proeliati contra resistentes. propter bella colophonii itemque castabalenses cohortes canum habuere. hae primae dimicabant in acie numquam detrectantes; haec erant fidissima auxilia nec stipendiorum indiga. canes defendere cimbris caesis domus eorum plaustris inpositas. canis iasone lycio interfecto cibum capere noluit inediaque consumptus est. is vero, cui nomen hyrcani reddit duris, accenso regis lysimachi rogo iniecit se flammae, similiterque hieronis regis. memorat et pyrrhum, gelonis tyranni canem, philistus; memoratur et icomedis bithyniae regis, uxore eius cosingi lacerata propter lasciviosem cum marito iocum. apud nos vulcatium nobilem, qui cascellium ius civile docuit, asturcone e suburbano redeuntem, cum advesperavisset, canis a grassatore defendit; item caelium senatorem aegrum placentiae ab armatis oppressum, nec prius ille vulneratus est quam cane interempto. sed super omnia in nostro aevo actis p. r. testatum appio iunio et p. silio cos., cum animadverteretur ex causa neronis germanici filii in titium sabinum et servitia eius, unius ex his canem nec in carcere abigi potuisse nec a corpore recessisse abiecti, in gradibus gemitoriis maestos edentem ululatus magna populi romani corona, ex qua cum quidam ei cibum obiecisset, ad os defuncti tulisse. innatavit idem, cadavere in tiberim abiecto, sustentare conatus, effusa multitudine ad spectandam animalis fidem.

soli dominum novere et ignotum quoque, si repente veniat, intellegunt; soli nomina sua, soli vocem domesticam agnoscunt. itinera quamvis longa meminere, nec ulli praeter hominem memoria maior. impetus eorum et saevitia mitigatur ab homine considente humi. plurima alia in iis cotidie vita invenit, sed in venatu sollertia et sagacitas praecipua est. scrutatur vestigia atque persequitur, comitantem ad feram inquisitorem loro trahens, qua visa quam silens et occulte, set quam significans demonstratio est cauda primum, deinde rostro! ergo etiam senecta fessos caecosque ac debiles sinu ferunt, ventos et odorem captantes protendentesque rostra ad cubilia.

e tigribus eos indi volunt concipi et ob id in silvis coitus tempore alligant feminas. primo et secundo fetu nimis feroces putant gigni, tertio demum educant. hoc idem e lupis galli, quorum greges suum quisque ductorem e canibus et ducem habent. illum in venatu comitantur, illi parent; namque inter se exercent etiam magisteria. - (certum est iuxta nilum amnem currentes lambere, ne crocodilorum aviditati occasionem praebeant) - indiam petenti alexandro magno rex albaniae dono dederat inusitatae magnitudinis unum, cuius specie delectatus iussit ursos, mox apros et deinde dammas emitti, contemptim immobili iacente eo, qua segnitia tanti corporis offensus imperator generosi spiritus interemi eum iussit. nuntiavit hoc fama regi. itaque alterum mittens addidit mandata, ne in parvis experiri vellet, sed in leone elephantove:

duos sibi fuisse, hoc interempto praeterea nullum fore. nec distulit alexander leonemque fractum protinus vidit. postea elephantum iussit induci, haut alio magis spectaculo laetatus. horrentibus quippe villis per totum corpus ingenti primum latratu intonuit, mox ingruit adsultans contraque membra exurgens hinc et illinc artificii dimicatione, qua maxime opus esset, infestans atque evitans, donec adsidua rotatum vertigine adflixit, ad casum eius tellure concussa.

canum generi bis anno partus. iusta ad pariendum annua aetas. gerunt uterum sexagenis diebus. gignunt caecos et, quo largiore aluntur lacte, eo tardiorum visum accipiunt, non tamen umquam ultra xxi diem nec ante septimum. quidam tradunt, si unus gignatur, nono die cernere, si gemini, decimo itemque in singulos adici totidem tarditatis ad lucem dies, et ab ea quae sit femina ex primipara genita faunos cerni. optimus in fetu qui novissimus cernere incipit aut quem primum fert in cubile feta.

rabies canum sirio ardente homini pestifera, ut diximus, ita morsis letali aquae metu. quapropter obviam itur per xxx eos dies, gallinaceo maxime fimo inmixto canum cibus aut, si praevenerit morbus, veratro. a morsu vero unicum remedium, oraculo quodam nuper repertum, radix silvestris rosae, quae cynorrhoda appellatur. columella auctor est, si xl die quam sit natus castretur morsu cauda summusque eius articulus auferatur spinae nervo exempto, nec caudam crescere nec canes rabidos fieri. canem locutum in prodigiis, quod equidem adnotaverim, accepimus et serpentem latrasse, cum pulsus tarquinius est regno.

eidem alexandro et equi magna raritas contigit. bucephalan eum vocarunt sive ab aspectu torvo sive ab insigni taurini capitis armo inpressi. xiii talentis ferunt ex philonici pharsalii grege emptum, etiam tum puero capto eius decore. neminem hic alium quam alexandrum regio instratu ornatus recepit in sedem, alias passim recipiens. idem in proeliis memoratae cuiusdam perhibetur operae, thebarum oppugnatione vulneratus in alium transire alexandrum non passus, multa praeterea eiusdem modi, propter quae rex defuncto ei duxit exequias urbemque tumulto circumdedit nomine eius. nec caesaris dictatoris quemquam alium recepisse dorso equus traditur, idemque similes humanis pedes priores habuisse, hac effigie locatus ante veneris genetricis aedem. fecit et Divus Augustus equo tumulum, de quo germanici caesaris carmen est. agrigenti conplurium equorum tumuli pyramides habent. equum adamatum a samiramide usque in coitum iuba auctor est. scythici quidem equitatus equorum gloria strepunt: occiso regulo ex provocatione dimicante hostem, cum ad spoliandum venisset, ab equo eius ictibus morsuque confectum; alium detracto oculorum operimento et cognito cum matre coitu petiisse praerupta atque exanimatum. aequa ex causa in reatino agro laceratum prorigam invenimus. namque et cognationum intellectus his est, atque in grege prioris anni sororem libentius etiam quam matrem equa comitatur. docilitas tanta est, ut universus sybaritani exercitus equitatus ad symphoniae cantum saltatione quadam moveri solitus inveniatur. iidem

praesagiunt pugnam et amissos lugent dominos: lacrimas interdum desiderio fundunt. interfecto Nicomede rege equus eius inedia vitam finivit. phylarchus refert centaretum e galatis, in proelio occiso antiocho, potitum equo eius conscendisse ovanter, at illum indignatione accensum domitis frenis, ne regi posset, praecipitem in abrupta isse exanimatumque una. philistus a dionysio relictum in caeno haerentem, ut se evellisset, secutum vestigia domini examine apium iubae inhaerente, eoque ostento tyrannidem a dionysio occupatam.

ingenia eorum inenarrabilia. iaculantes obsequia experiuntur difficiles conatus corpore ipso nisuque iuvantium; item tela humi collecta equiti porrigunt. nam in circo ad currus iuncti non dubie intellectum adhortationis et gloriae fatentur. claudi caesaris saecularium ludorum circensibus, excusso in carceribus auriga albatu corace, occupavere primatum, optinere opposcentes, effundentes omniaque contra aemulos, quae debuissent peritissimo auriga insistente, facientes, cum puderet hominum artes ab equis vinci, peracto legitimo cursu ad cretam steterunt. maius augurium apud priscos plebeis circensibus excusso auriga ita, ut si staret, in capitolium cucurrisse equos aedemque ter lustrasse; maximum vero eodem pervenisse a veis cum palma et corona, effuso ratumenna qui ibi vicerat, unde postea nomen portae est. sarmatae longinquo itineri inedia pridie praeparant eos, potum exiguum inperientes, atque ita per centena milia et quinquaginta continuo cursu euntibus insident.

vivunt annis quidam quinquagenis, feminae minore spatio; eadem quinquennio finem crescendi capiunt, mares anno addito. forma equorum, quales maxime legi oporteat, pulcherrime quidem vergilio vate absoluta est; sed et nos diximus in libro de iaculatione equestri condito, et fere inter omnes constare video. diversa autem circo ratio quaeritur. itaque cum bimi in alio subiungantur imperio, non ante quinquennes ibi certamen accipit.

partum in eo genere undenis mensibus ferunt, duodecimo gignunt. coitus verno aequinoctio bimo utrimque vulgaris, sed a trimatu firmior partus. generat mas ad annos xxxiii, utpote cum a circo post vicesimum annum mittantur ad subolem. opunte et ad xl durasse tradunt adiutum modo in attollenda priore parte corporis. sed ad generandum paucis animalium minor fertilitas. qua de causa intervalla admissurae dantur, nec tamen quindecim initus eiusdem anni valet tolerare. equarum libido extinguitur iuba tonsa. gignunt annis omnibus ad quadragesimum. vixisse equum lxxv annos proditur. in hoc genere gravida stans parit praeterque ceteras fetum diligit. et sane equis amoris innasci veneficium, hippomanes appellatum, in fronte, caricae magnitudine, colore nigro, quod statim edito partu devorat feta aut partum ad ubera non admittit. si quis praereptum habeat, olfactu in rabiem id genus agitur. amissa parente in grege armenti reliquae fetae educant orbem. terram attingere ore triduo proximo quam sit genitus negant posse. quo quis acrior, in bibendo nares mergit. scythae per bella feminis uti malunt, quoniam urinam cursu non inpedito reddant.

constat in lusitania circa olisiponem oppidum et tagum amnem equas favonio flante obversas animalem concipere spiritum, idque partum fieri et gigni pernicissimum ita, sed triennium vitae non excedere. in eadem hispania gallaica gens est et asturica; equini generis his sunt quos tieliones vocamus; minore forma appellatos asturcones gignunt, quibus non vulgaris in cursu gradus, sed mollis alterno crurum explicatu glomeratio, unde equis tolutim carpere incursum traditur arte.

equo fere qui homini morbi, praeterque vesicae conversio, sicut omnibus in genere veterino.

asinum [cccc] nummum emptum q. axio senatori auctor est M. Varro, haut scio an omnium pretio animalium victo. opera sine dubio generi munifica, arando quoque, sed mularum maxime progeneratione. patria etiam spectatur in his, arcadicis in achaia, in italia reatinis. ipsum animal frigoris maxime inpatiens. ideo non generatur in ponto, nec aequinoctio verno, ut cetera pecua, admittitur, sed solstitio. mares in remissione operis deteriores. partus a tricensimo mense ocissimus, sed a trimatu legitimus, totidem quot equae et isdem mensibus et simili modo. sed incontinens uterus urina genitale reddit, ni cogatur in cursum verberibus a coitu. raro geminos parit. paritura lucem fugit et tenebras quaerit, ne conspiciatur ab homine. gignit tota vita, quae est ei ad tricensimum annum. partus caritas summa, sed aquarum taedium maius: per ignes ad fetus tendunt, eadem, si rivus minimus intersit, horrent etiam pedes omnino tinguere. nec nisi adsuetos potant fontes quae sunt in pecuariis, atque ita ut sicco tramite ad potum eant. nec pontes transeunt per raritatem eorum tralucentibus fluviis, mirumque dictu, sitiunt et si mutantur aquae; ut bibant cogendae exorandaeve sunt. nec nisi spatiosa in cubitu laxitas tuta; varia namque somnio visa concipiunt ictu pedum crebro, qui nisi per inane emicuit, repulso durioris materiae clauditem ilico adfert. quaestus ex iis opima praedia exuperat. notum est in celtiberia singulas quadringentena milia nummum enixas, mularum maxime partu. aurium referre in iis et palpebrarum pilos aiunt; quamvis enim unicolori reliquo corpore, totidem tamen colores, quot ibi fuere, reddi. pullos earum epulari maecenas instituit, multum eo tempore praelatos onagris. post eum interiit auctoritas saporis asino. - moriente visu celerrime id genus deficit. -

ex asino et equa mula gignitur mense xiii, animal viribus in labores eximium. ad tales partus equas neque quadrimis minores neque decennibus maiores legunt arcerique utrumque genus ab altero narrant nisi in infantia eius generis quod ineat lacte hausto. quapropter subreptos pullos in tenebris equarum uberi asinarumve eculeos admovent. gignitur autem mula et ex equo et asina, sed effrenis et tarditatis indomitae. lenta omnia et e vetulis. conceptum ex equo secutus asini coitus abortu perimit, non item asini equus. feminas a partu optime septimo die inpleri observatum, mares fatigatos melius inplere. quae non prius, quam dentes quos pullinos appellant iaciat, conceperit, sterilis intellegitur et quae non primo initu generare coeperit. equo et asina genitos mares hinnulos antiqui vocabant contraque mulos quos asini

et equae generarent. observatum ex duobus diversis generibus nata tertii generis fieri et neutri parentium esse similia eaque ipsa, quae sunt ita nata, non gignere in omni animalium genere; idcirco mulas non parere. est in annalibus nostris peperisse saepe, verum prodigii loco habitum. theophrastus vulgo parere in cappadocia tradit, sed esse id animal ibi sui generis. mulae calcitratus inhibetur vini crebriore potu. in plurium graecorum est monumentis cum equa muli coitu natum quod vocaverint ginnum, id est parvum mulum. generantur ex equa et onagris mansuefactis mulae veloces in cursu, duritia eximia pedum, verum strigoso corpore, indomito animo. sed generator onagro et asina genitus omnes antecellit. onagri in phrygia et lycaonia praecipui. pullis eorum ceu praestantibus sapore africa gloriatur, quos lalisiones appellat. mulum lxxx annis vixisse atheniensium monimentis apparet; gavisī namque, cum templum in arce facerent, quod derelictus senecta scandentia iumenta comitatu nисуque exhortaretur, decretum fecere ne frumentarii negotiatores ab incerniculis eum arcerent.

bubus indicis camelorum altitudo traditur, cornua in latitudinem quaternorum pedum. in nostro orbe epiroticis laus maxima a pyrrhi, ut ferunt, iam inde regis cura. id consecutus est non ante quadrimatum ad partus vocando; praegrandes itaque fuere et hodieque reliquiae stirpium durant. at nunc anniculae fecunditatem poscuntur, tolerantius tamen bimae, tauri generationem quadrimi. implent singuli denas eodem anno. tradunt, si a coitu in dexteram partem abeant tauri, generatos mares esse; si in laevam, feminas. conceptio uno initu peragitur, quae si forte pererravit, xx post diem marem femina repetit. pariunt mense x; quicquid ante genitum, inutile est. sunt auctores ipso complente decimum mensem die parere. gignunt raro geminos. coitus a delphini exortu a. d. pr. non. ianuariis diebus xxx, aliquis et autumnō, gentibus quidem quae lacte vivunt ita dispensatus, ut omni tempore anni supersit id alimentum. tauri non saepius quam bis die ineunt. boves animalium soli et retro ambulantes pascuntur, apud garamantas quidem haut aliter. vita feminis xv annis longissima, maribus xx. robur in quinquennatu. lavatione calidae aquae traduntur pinguescere et si quis incisa cute spiritum harundine in viscera adigat. non degeneres existimandi etiam minus laudato aspectu: plurimum lactis alpinis, quibus minimum corporis, plurimum laboris capite, non cervice, iunctis. syriacis non sunt palearia, sed gibber in dorso. carici quoque in parte asiae, foedi visu tubere super artus a cervicibus eminente, luxatis cornibus, excellentes in opere narrantur, cetero nigri coloris candidive ad laborem damnantur. tauris minora quam bubus cornua tenuioraque. domitura boum in trimatu, postea sera, ante praematura. optime cum domito iuvenus inbuitur. socium enim laboris agrique culturae habemus hoc animal, tantae apud priores curae, ut sit inter exempla damnatus a populo romano die dicta, qui concubino procaci rure omassum edisse se negante occiderat bovem, actusque in exilium tamquam colono suo interempto.

tauris in aspectu generositas torva fronte, auribus saetosis, cornibus in procinctu dimicationem poscentibus. sed tota comminatio prioribus in

pedibus. stat ira gliscente alternos replicans spargensque in alvum harenam et solus animalium eo stimulo ardescens. vidimus ex imperio dimicantes et iocose demonstratos rotari, cornibus cadentes excipi iterumque regi, modo iacentes ex humo tolli bigarumque etiam curru citato velut aurigas insistere. thessalorum gentis inventum est equo iuxta quadripedante cornu intorta cervice tauros necare; primus id spectaculum dedit romae caesar dictator. hinc victimae opimae et lautissima deorum placatio. huic tantum animali omnium, quibus procerior, cauda non statim nato consummatae ut ceteris mensurae: crescit uni, donec ad vestigia ima perveniat. quam ob rem victimarum probatio in vitulo, ut articulum suffraginis contingat; brevior non litant. hoc quoque notatum, vitulos ad aras umeris hominis adlatos non fere litare, sicut nec claudicante nec aliena hostia deos placari nec trahente se ab aris. est frequens in prodigiis priscorum bovem locutum, quo nuntiato senatum sub diu haberi solitum.

bos in aegypto etiam numinis vice colitur; apin vocant. insigne ei in dextro latere candicans macula cornibus lunae crescere incipientis, nodus sub lingua, quem cantharum appellant. non est fas eum certos vitae excedere annos, mersumque in sacerdotum fonte necant quaesituri luctu alium, quem substituant, et donec invenerint maerent derasis etiam capitibus; nec tamen umquam diu quaeritur. inventus deducitur memphim a sacerdotibus c. delubra ei gemina, quae vocant thalamos, auguria populorum: alterum intrasse laetum est, in altero dira portendit. responsa privatis dat e manu consulentium cibum capiendo. germanici caesaris manum aversatus est haut multo postea extincti. cetero secretus, cum se proripuit in coetus, incedit submotu lictorum, gregesque puerorum comitantur carmen honori eius canentium; intellegere videtur et adorari velle. hi greges repente lymphati futura praecinunt. femina bos ei semel anno ostenditur, suis et ipsa insignibus, quamquam aliis, semperque eodem die et inveniri eam et extinguere tradunt. memphi est locus in nilo, quem a figura vocant phialam, omnibus annis ibi auream pateram argenteamque mergentes diebus quos habent natales apis. septem hi sunt, mirumque neminem per eos a crocodilis attingi, octavo post horam diei sextam redire beluae feritatem.

magna et pecori gratia vel in placamentis deorum vel in usu vellerum. ut boves victum hominum excolunt, ita corporum tutela pecori debetur. generatio bimis utrimque ad novenos annos, quibusdam et ad x; primiparis minores fetus. coitus omnibus ab arcturi occasu, id est a. d. iiii idus maias, ad aquilae occasum, id est x kal. augustas. gerunt partum diebus cl; postea concepti invalidi. cordos vocabant antiqui post id tempus natos. multi hibernos agnos praeferunt vernis, quoniam magis intersit ante solstitium quam ante brumam firmos esse, solumque hoc animal utiliter bruma nasci. arieti naturale agnas fastidire, senectam ovium consecrari, et ipse melior senecta, mutilus quoque utilior. ferocia eius cohibetur cornu iuxta aurem terebrato. dextro teste praeligato feminas generat, laevo mares. tonitrua solitariis ovibus abortus inferunt; remedium congregare eas, ut coetu iuventur. aquilonis flatu

mares concipi dicunt, austri feminas, atque in eo genere arietum maxime spectantur ora, quia cuius coloris sub lingua habuere venas, eius et lanicium in fetu est variumque, si plures fuere. et mutatio aquarum potusque variat.

ovium summa genera duo, tectum et colonicum, illud mollius, hoc in pascuo delicatius, quippe non tectum rubis vexatur. operimenta ei ex arabicis praecipua. lana autem laudatissima apula et quae in italia graeci pecoris appellatur, alibi italica; tertium locum milesiae oves optinent. apulae breves villo nec nisi paenulis celebres; circa tarentum canusiumque summam nobilitatem habent, in asia vero eodem genere laudiceae. alba circumpadanis nulla praefertur, nec libra centenos nummos ad hoc aevi excessit ulla. oves non ubique tondentur; durat quibusdam in locis vellendi mos. colorum plura genera, quippe cum desint etiam nomina iis quas nativas appellant aliquot modis: hispania nigri velleris praecipuas habet, pollentia iuxta alpes cani, asia rutili, quas erythraeas vocant, item baetica, canusium fulvi, tarentum et suae pulliginis. sucidis omnibus medicata vis. histriae liburniaeque pilo propior quam lanae, pexis aliena vestibus et quam salacia scutulato textu commendat in lusitania. similis circa piscinas provinciae narbonensis, similis et in aegypto, ex qua vestis detrita usu pingitur rursusque aevo durat. est et hirtae pilo crasso in tapetis antiquissima gratia iam; certe iis usos homerus auctor est. aliter haec galli pingunt, aliter parthorum gentes. lanae et per se coactae vestem faciunt et, si addatur acetum, etiam ferro resistunt, immo vero etiam ignibus novissimo sui purgamento. quippe aenis polientium extracta in tomenti usum veniunt, galliarum, ut arbitror, invento; certe gallicis hodie nominibus discernitur. nec facile dixerim qua id aetate coeperit; antiquis enim torus e stramento erat, qualiter etiam nunc in castris. gausapae patris mei memoria coepere, amphimallia nostra sicut villosa etiam ventralia. nam tunica lati clavi in modum gausapae texti nunc primum incipit. lanarum nigrae nullum colorem bibunt. de reliquarum infectu suis locis dicemus in conchyliis maris aut herbarum natura.

lanam in colu et fuso tanaquilis, quae eadem gaia caecilia vocata est, in templo sancus durasse prodente se auctor est M. Varro factamque ab ea togam regiam undulatam in aede fortunae, qua ser. tullius fuerat usus. inde factum ut nubentes virgines comitaretur colus compta et fusus cum stamine. ea prima texuit rectam tunicam, quales cum toga pura tironi induuntur novaeque nuptae. undulata vestis prima e lautissimis fuit; inde sororiculata defluxit. togas rasas phryxianasque Divi Augusti novissimis temporibus coepisse scribit fenestella. crebrae papaveratae antiquiorem habent originem iam sub lucilio poeta in torquato notatae. praetextae apud etruscos originem invenere. trabeis usos accipio reges; pictae vestes iam apud homerum sunt iis, et inde triumphales natae. acu facere id phryges invenerunt, ideoque phrygioniae appellatae sunt. aurum intexere in eadem asia invenit attalus rex, unde nomen attalicis. colores diversos picturae intexere babylon maxime celebravit et nomen inposuit. plurimis vero liceis texere, quae polymita appellant, alexandria instituit, scutulis dividere gallia. metellus scipio tricliniaria

babylonica sestertium octingentis milibus venisse iam tunc ponit in catonis criminibus, quae neroni principi quadragens sestertio nuper stetere. servi tullii praetextae, quibus signum fortunae ab eo dicatae coopertum erat, duravere ad seiani exitum, mirumque fuit neque diffluisse eas neque teredinum iniurias sensisse annis quingentis sexaginta. vidimus iam et viventium vellera purpura, cocco, conchylio sesquipedalibus libris infecta, velut illa sic nasci cogente luxuria.

in ipsa ove satis generositas ostenditur brevitate crurum, ventris vestitu. is quibus nudus esset, apicas vocabant damnabantque. syriae cubitales ovium caudae plurimumque in ea parte lanicii. castrari agnos nisi quinquemenstres praematurum existimatur.

est in hispania, sed maxime corsica, non absimile pecori genus musmonum, caprino villo quam pecoris velleri propius, quorum e genere et ovibus natos prisci umbros vocaverunt. infirmissimum pecori caput, quam ob rem aversum a sole pasci cogendum, quoniam stultissima animalium lanata: qua timuere ingredi, unum cornu raptum sequuntur. vita longissima anni x, in aethiopia xiii. capris eodem loco xi, in reliquo orbe plurimum octoni. utrumque genus intra quartum coitum impletur.

caprae pariunt et quaternos, sed raro admodum; ferunt v mensibus, ut oves. capri pinguitudine sterilesunt. ante trimos minus utiliter generant et in senecta nec ultra quadriennium. incipiunt septimo mense et adhuc lactentes. mutilum in utroque sexu utilius. primus in die coitus non implet, sequens efficacior ac deinde. concipiunt novembri mense, ut martio pariant turgescitibus virgultis, aliquando anniculae, semper bimae, nisi in trimatu inutiles. pariunt octonis annis. abortus frigori obnoxius. oculos suffusos capra iunci punctu sanguine exonerat, caper rubi. sollertiam eius animalis mucianus visam sibi prodidit in ponte praetenui duabus obviis e diverso: cum circumactum angustiae non caperent nec reciprocationem longitudo in exilitate caecam, torrente rapido minaciter subterfluente, alteram decubuisse atque ita alteram proculcatae supergressam. mares quam maxime simos, longis auribus infractisque, armis quam villosissimis probant; feminarum generositatis insigne laciniae corporibus e cervice binae dependentes. non omnibus cornua, sed quibus sunt, in his et indicia annorum per incrementa nodorum. mutilis lactis maior ubertas. auribus eas spirare, non naribus, nec umquam febris carere archelaus auctor est. ideo fortassis anima iis quam ovibus ardentior calidioresque concubitus. tradunt et noctu non minus cernere quam interdiu: ideo, si caprinum iecur vescantur, restitui vespertinam aciem iis quos nyctalopas vocant. in cilicia circaque syrtes villo tonsili vestiuntur. capras in occasum declini sole in pascuis negant contueri inter sese, sed aversas iacere, reliquis autem horis adversas et inter cognationes. dependet omnium mento villus, quem aruncum vocant. hoc si quis adprehensam ex grege unam trahat, ceterae stupentes spectant; id evenit et cum quandam herbam aliqua ex iis momorderit. morsus earum arbori est exitialis. olivam lambendo quoque sterilem faciunt eaque ex causa minervae non immolantur.

suilli pecoris admissura a favonio ad aequinoctium vernum, aetas octavo mense, quibusdam in locis etiam quarto, usque ad octavum annum. partus bis anno, tempus utero quattuor mensum, numerus fecunditati ad vicanos, sed educare nequeunt tam multos. diebus x circa brumam statim dentatos nasci nigridius tradit. implentur uno coitu, qui et geminatur propter facilitatem aboriendi. remedium, ne prima subatione neque ante flaccidas aures coitus fiat. mares non ultra trimatum generant. feminae senectute fessae cubantes coeunt. comesse fetus in his non est prodigium. suis fetus sacrificio die quinto purus est, pecoris die vii, bovis xxx. coruncanus ruminales hostias, donec bidentes fierent, puras negavit. suem oculo amisso putant cito extinguī; alioqui vita ad xv annos, quibusdam et vicanos. verum efferantur, et alias obnoxium genus morbis, anginae maxime et strumae. index suis invalidae cruor in radice saetae dorso evolsae, caput obliquum in incessu. paenuriam lactis praepingues sentiunt et primo fetu minus sunt numerosae. in luto volutatio generi grata. intorta cauda; id etiam notatum, facilius litare in dexterum quam in laevum detorta. pinguescunt lx diebus, sed magis tridui inedia saginatione orsa. animalium hoc maxime brutum animamque ei pro sale datam non inlepide existimabatur. compertum agnitam vocem suarii furto abactis, mersoque navigio inclinatione lateris unius remeasse. quin et duces in urbe forum nundinarium domosque petere discunt, et feri sapiunt vestigia palude confundere, urina fugam levare. castrantur feminae quoque, sicuti et cameli, post bidui inediam suspensae pernis prioribus vulva recisa; celerius ita pinguescunt. adhibetur et ars iecori feminarum sicut anserum, inventum m. apici, fico arida saginatis ac satie necatis repente mulsi potu dato. neque alio ex animali numerosior materia ganeae: quinquaginta prope saporēs, cum ceteris singuli. hinc censoriarum legum paginae interdictaque cenis abdomina, glandia, testiculi, vulvae, sincipita verrina, ut tamen publili mimorum poetae cena, postquam servitutem exuerat, nulla memoretur sine abdomine, etiam vocabulo suminis ab eo inposito.

placuerē autem et feri sues. iam catonis censoris orationes aprunum exprobrant callum. in tres tamen partes diviso media ponebatur, lumbus aprunus appellata. solidum aprum romanorum primus in epulis adposuit p. servilius, pater eius rulli, qui ciceronis consulatu legem agrariam promulgavit: tam propinqua origo nunc cotidiana rei est. et hoc annales notarunt, horum scilicet ad emendationem morum, quibus non tota quidem cena, sed in principio bini ternique pariter manduntur apri.

vivaria eorum ceterarumque silvestrium primus togati generis invenit fulvius lippinus; in tarquiniensi feras pascere instituit, nec diu imitatores defuere l. lucullus et q. hortensius.

sues ferae semel anno gignunt. maribus in coitu plurima asperitas. tunc inter se dimicant indurantes attritu arborum costas lutoque se tergorantes. feminae in partu asperiores, et fere similiter in omni genere bestiarum. apris maribus non nisi anniculis generatio. in india cubitales dentium flexus; gemini ita ex rostro, totidem a fronte, ceu vituli cornua, exeunt. pilus aereo similis

agrestibus, ceteris niger. at in arabia suillum genus non vivit.

in nullo genere aeque facilis mixtura cum fero, qualiter natos antiqui hybridas vocabant ceu semiferos, ad homines quoque, ut c. antonium ciceronis in consulatu collegam, appellatione tralata. non in suis autem tantum, sed in omnibus quoque animalibus, cuiuscumque generis ullum est placidum, eiusdem invenitur et ferum, utpote cum hominum etiam silvestrium tot genera praedicta sint. caprae tamen in plurimas similitudines transfigurantur. sunt caprae, sunt rupicaprae, sunt ibices pernecitatis mirandae, quamquam onerato capite vastis cornibus gladiatorum ceu vaginis. in haec se librat, ut tormento aliquo rotatus, in petras potissimum, e monte aliquo in alium transilire quaerens, atque recussu pernecius quo libuit exultat. sunt et oryges, soli quibusdam dicti contrario pilo vestiri et ad caput verso. sunt et dammae et pygargi et strepsicerotes multaue alia haut dissimilia. sed illa alpes, haec transmarini situs mittunt.

simiarum quoque genera plura. hominis figurae proxima caudis inter se distinguuntur. mira sollertia visco inungi laqueisque calciari imitatione venantium tradunt, mucianus et latrunculis lusisse, fictas cera nuces visu distinguere; lunam cavam triste esse quibus in eo genere cauda sit, novam exultatione adorari. nam defectum siderum et ceterae pavent quadripedes. simiarum generi praecipua erga fetum adfectio. gestant catulos quae mansuefactae intra domos peperere, omnibus demonstrant tractarique gaudent, gratulationem intelligentibus similes, itaque magna ex parte complectendo necant. efferatior cynocephalis natura sicut satyris. callitriches toto paene aspectu differunt; barba est in facie, cauda late fusa primori parte. hoc animal negatur vivere in alio quam aethiopiae quo gignitur caelo.

et leporum plura sunt genera. in albis candidi, quibus hibernis mensibus pro cibatu nivem credunt esse; certe liquescente ea rutescunt annis omnibus, et est alioqui animal intolerandi rigoris album. leporum generis sunt et quos hispania cuniculos appellat, fecunditatis innumerae famemque baliarum insulis populatis messibus adferentis. - (fetus ventri exectos vel uberibus ablatis, non repurgatis interaneis, gratissimo in cibatu habent; laurices vocant) - certum est baliaricos adversus proventum eorum auxilium militare a Divo Augusto petisse. magna propter venatum eum viverris gratia est; iniciunt eas in specus, qui sunt multifores in terra - unde et nomen animali - , atque ita eiectos superne capiunt. archelaus auctor est, quot sint corporis cavernae ad excrementa lepori, totidem annos esse aetatis; varius certe numerus reperitur. idem utramque vim singulis inesse ac sine mare aeque gignere. benigna circa hoc natura innocua et esculenta animalia fecunda generavit. lepus, omnium praedae nascens, solus praeter dasypodem superfetat, aliud educans, aliud in utero pilis vestitum, aliud in plume, aliud inchoatum gerens pariter. nec non et vestes leporino pilo facere temptatum est, tactu non perinde molli ut in cute, propter brevitatem pili dilabidas. hi mansuescunt raro, cum feri dici iure non possint; complura namque sunt nec placida nec fera, sed mediae inter utrumque naturae, ut in volucribus hirundines, apes, in mari delphini.

quo in genere multi et hos incolas domuum posuere mures, haut spernendum in ostentis etiam publicis animal. adrosis lanuvi clipeis argenteis marsicum portendere bellum, carboni imperatori apud clusium fasceis, quibus in calciatu utebatur, exitium. plura eorum genera in cyrenaica regione, alii lata fronte, alii acuta, alii irenaceorum genere pungentibus pilis. theophrastus auctor est, in gyara insula, cum incolas fugaverint, ferrum quoque rosisse eos, id quod natura quadam et ad chalybas facere in ferrariis officinis. aurariis quidem in metallis ob hoc alvos eorum excidi semperque furtum id deprehendi; tantam esse dulcedinem furandi. venisse murem cc denariis casilinum obsidente Hannibale eumque qui vendiderat fame interisse, emptorem vixisse annales tradunt. cum candidi provenere, laetum faciunt ostentum. nam sauricum occentu dirimi auspicia annales refertos habemus. saurices et ipsos hieme condi auctor est nigidius, sicut glires, quos censoriae leges princepsque M. Scaurus in consulatu non alio modo cenis ademere quam conchyilia aut ex alio orbe convectas aves. semiferum et ipsum animal, cui vivaria in doliis idem qui apris instituit. qua in re notatum, non congregare se nisi populares eiusdem silvae et, si misceantur alienigenae amne vel monte discreti, interire dimicando. genitores suos fessos senecta alunt insigni pietate. senium finitur hiberna quiete - conditi enim et hi cubant - , rursus aestate iuvenescunt. similis et nitelis quies est hieme.

mirum rerum naturam non solum alia aliis dedisse terris animalia, sed in eodem quoque situ quaedam aliquis locis negasse. in mesia silva italiae non nisi in parte reperiuntur hi glires. in lycia dorcades non transeunt montes sexis vicinos, onagri limitem qui cappadociam a cilicia dividit. in hellesponto in alienos fines non commeant cervi, et circa arginusam elaphum montem non excedunt, auribus etiam in monte fissis. in poroselene insula viam mustelae non transeunt. item boeotiae lebadetae inlatae solum ipsum fugiunt, quae iuxta in orchomeno tota arva subruunt, talpae. quarum e pellibus cubicularia vidimus stragula: adeo ne religio quidem a portentis submovet delicias. in ithaca lepores inlati moriuntur extremis quidem in litoribus, in ebuso cuniculi, scatentibus iuxta hispania baliaribusque. cyrenis mutae fuere ranae; inlatis e continente vocalibus durat genus earum. mutae sunt etiamnum in seripho insula; eadem alio tralatae canunt, quod accidere et in lacu thessaliae sicandro tradunt. in italia muribus araneis venenatus est morsus; eosdem ulterior appennino regio non habet. iidem ubicumque sunt, orbitam si transiere, moriuntur. in olympo macedoniae monte non sunt lupi nec in creta insula; ibi quidem nec vulpes ursive atque omnino nullum maleficum animal praeter phalangium. in araneis id genus dicemus suo loco. mirabilius in eadem insula cervos praeterquam in cydoneatarum regione non esse, item apros et attagenas, irenaceos, in africa autem nec apros nec cervos nec capreas nec ursos.

iam quaedam animalia indigenis innoxia advenas interemunt, sicut serpentes parvi in myrinthe, quos terra nasci proditur. item in syria angues circa euphratis maxime ripas dormientes syros non attingunt aut, etiamsi

calcati momordere, non sentiuntur malefici, aliis cuiuscumque gentis infesti, avide et cum cruciatu exanimantes, quam ob rem et syri non necant eos. contra in latmo cariae monte aristoteles tradit a scorpionibus hospites non laedi, indigenas interemi. sed reliquorum quoque animalium et praeterea terrestrium dicemus genera.

LIBER IX

animalium, quae terrestria appellavimus hominum quadam consortione degentia, indicata natura est. ex reliquis minimas esse volucres convenit. quam ob rem prius aequorum, amnium stagnorumque dicentur.

sunt autem conplura in his maiora etiam terrestribus. causa evidens umoris luxuria. alia sors alitum quibus vita pendentibus. in mari autem, tam late supino mollique ac fertili nutrimento, accipiente causas genitales e sublimi semperque pariente natura pleraque etiam monstrifica reperiuntur, perplexis et in semet aliter atque aliter nunc flatu nunc fluctu convolutis seminibus atque principiis, vera ut fiat vulgi opinio, quicquid nascatur in parte naturae ulla, et in mari esse praeterque multa quae nusquam alibi. rerum quidem, non solum animalium, simulacra inesse licet intellegere intuentibus uvam, gladium, serras, cucumin vero et colore et odore similem, quo minus miremur equorum capita in tam parvis eminere cocleis.

plurima autem et maxima animalia in indico mari, ex quibus ballaenae quaternum iugerum, pristis ducenum cubitorum, quippe ubi locustae quaterna cubita impleant, anguillae quoque in gange amne tricenos pedes. sed in mari beluae circa solstitia maxime visuntur. tunc illic ruunt turbines, tunc imbres, tunc deiectae montium iugis procellae ab imo vertunt maria pulsatasque ex profundo beluas cum fluctibus volvunt tanta, ut alias thynnorum, multitudine, ut magni alexandri classis haut alio modo quam hostium acie obvia contrarium agmen adversa fronte derexerit: aliter sparsis non erat evadere. non voce, non sonitu, non ictu, sed fragore terrentur nec nisi ruina turbantur. cadara appellatur rubri maris paeninsula ingens; huius obiectu vastus efficitur sinus, xii dierum et noctium remigio enavigatus ptolemaeo regi, quando nullius aerae recipit afflatum. huius loci quiete praecipue ad immobilem magnitudinem beluae adolescent. gedrosos, qui arabim amnem accolunt, alexandri magni classium praefecti prodiderunt in domibus fores maxillis beluarum facere, ossibus tecta contignare, ex quibus multa quadragenum cubitorum longitudinis reperta. exeunt et pecori similes beluae ibi in terram pastaeque radices fruticum remeant et quaedam equorum, asinorum, taurorum capitibus, quae depascuntur sata.

maximum animal in indico mari pristis et ballaena est, in gallico oceano physeter, ingentis columnae modo se attollens altiorque navium velis diluviem quandam eructans, in gaditano oceano arbor, in tantum vastis dispansa ramis, ut ex ea causa fretum numquam intrasse credatur. apparent et rotae appellatae a similitudine, quaternis distinctae hae radiis, modiolos earum oculis duobus utrimque claudentibus.

tiberio principi nuntiavit olisiponensium legatio ob id missa, visum auditumque in quodam specu concha canentem tritonem qua noscitur forma. et nereidum falsa non est, squamis modo hispido corpore etiam qua humanam effigiem habet. namque haec in eodem spectata litore est, cuius morientis

etiam cantum tristem accolae audivere longe, et Divo Augusto legatus galliae complures in litore apparere exanimis nereidas scripsit. auctores habeo in equestri ordine splendentes, visum ab iis in gaditano oceano marinum hominem toto corpore absoluta similitudine; ascendere eum navigia nocturnis temporibus statimque degravari quas insederit partes et, si diutius permaneat, etiam mergi. tiberio principe contra lugdunensis provinciae litus in insula simul trecentas amplius beluas reciprocans destituit oceanus, mirae varietatis et magnitudinis, nec pauciores in santorum litore interque reliquas elephantos et arietes candore tantum cornibus adsimulatis, nereidas vero multas. turranus prodidit expulsam beluam in gaditana litora, cuius inter duas pinnas ultimae caudae cubita sedecim fuissent, dentes eiusdem cxx, maximi dodrantium mensura, minimi semipedum. beluae, cui dicebatur exposita fuisse andromeda, ossa romae apportata ex oppido iudaeae iope ostendit inter reliqua miracula in aedilitate sua M. Scaurus longitudine pedum xl, altitudine costarum indicos elephantos excedente, spinae crassitudine sesquipedali.

ballaenae et in nostra maria penetrant. in gaditano oceano non ante brumam conspici eas tradunt, condi autem statis temporibus in quodam sinu placido et capaci, mire gaudentes ibi parere. hoc scire orcas, infestam iis beluam et cuius imago nulla repraesentatione exprimi possit alia quam carnis immensae dentibus truculentae. inrumpunt ergo in secreta ac vitulos earum aut fetas vel etiamnum gravidas lancinant morsu incursoque ceu liburnicarum rostris fodiunt. illae ad flexum immobiles, ad repugnandum inertes et pondere suo oneratae, tunc quidem et utero graves pariendive poenis invalidae, solum auxilium novere in altum profugere et se tuto defendere oceano. contra orcae occurrere laborant seseque opponere et caveatas angustias trucidare, in vada urgere, saxis inlidere. spectantur ea proelia ceu mari ipso sibi irato, nullis in sinu ventis, fluctibus vero ad anhelitus ictusque quantos nulli turbines volvant. orca et in portu ostiensi visa est oppugnata a claudio principe. venerat tum exaedificante eo portum, invitata naufragiis tergorum advectorum e gallia, satiansque se per complures dies alveum in vado sulcaverat, adtumulata fluctibus in tantum, ut circumagi nullo modo posset et, dum saginam persequitur in litus fluctibus propulsam, emineret dorso multum super aquas carinae vice inversae. praetendi iussit caesar plagas multiplices inter ora portus profectusque ipse cum praetorianis cohortibus populo romano spectaculum praebuit, lanceas congerente milite e navigiis adsultantibus, quorum unum mergi vidimus reflatu beluae oppletum unda.

ora ballaenae habent in frontibus ideoque summa aqua natantes in sublime nimbos efflant. spirant autem confessione omnium et paucissima alia in mari, quae internorum viscerum pulmonem habent, quoniam sine eo spirare animal nullum putatur. nec piscium branchias habentes anhelitum reddere ac per vices recipere existimant quorum haec opinio est, nec multa alia genera etiam branchiis carentia, in qua sententia fuisse aristotelem video et multis persuasisse doctrina insignibus. nec me protinus huic opinioni eorum accedere haut dissimulo, quoniam et pulmonum vice alia possint spirabilia inesse

viscera ita volente natura, sicut et pro sanguine est multis alius umor. in aquas quidem penetrare vitalem hunc halitum quis miretur, qui etiam reddi ab his eum cernat et in terras quoque, tanto spissiore naturae partem, penetrare argumento animalium quae semper defossa vivunt, ceu talpae accedunt apud me certe efficacia ut credam, etiam omnia in aquis spirare naturae suae sorte, primum saepe adnotata piscium aestivo calore quaedam anhelatio et alia tranquillo velut oscitatio, ipsorum quoque, qui sunt in adversa opinione, de somno piscium confessio - quis enim sine respiratione somno locus - , praeterea bullantium aquarum sufflatio lunaeque effectum concharum quoque corpora augescunt. super omnia est quod esse auditum et odoratum piscibus non erit dubium, ex aeris utrumque materia. odorem quidem non aliud quam infectum aeris intellegi possit. quam ob rem de his opinetur ut cuique libitum erit. branchiae non sunt ballaenis nec delphinis. haec duo genera fistula spirant, quae ad pulmonem pertinet, ballaenis a fronte, delphinis a dorso. et vituli marini, quos vocant phocas, spirant ac dormiunt in terra; item testudines, de quibus mox plura.

velocissimum omnium animalium, non solum marinorum, est delphinus, ocior volucre, acrior telo, ac nisi multum infra rostrum os illi foret medio paene in ventre, nullus piscium celeritatem eius evaderet. sed adfert moram providentia naturae, quia nisi resupini atque conversi non corripiunt, quae causa praecipue velocitatem eorum ostendit. nam cum fame conciti fugientem in vada ima persecuti piscem diutius spiritum continuere, ut arcu missi ad respirandum emicant tantaque vi exiliunt, ut plerumque vela navium transvolent. vagantur fere coniugia; pariunt catulos decimo mense aestivo tempore, interim et binos. nutriunt uberibus, sicut ballaena, atque etiam gestant fetus infantia infirmos; quin et adultos diu comitantur magna erga partum caritate. adolescent celeriter, x annis putantur ad summam magnitudinem pervenire. vivunt et tricenis, quod cognitum praecisa cauda in experimentum. abundunt tricenis diebus circa canis ortum occultanturque incognito modo, quod eo magis mirum est, si spirare in aqua non queunt. solent in terram erumpere, incerta de causa, nec statim tellure tacta moriuntur multoque ocus fistula clausa. lingua est iis contra naturam aquatiliu mobilis, brevis atque lata, haut differens suillae. pro voce gemitus humano similis, dorsum repandum, rostrum simum. qua de causa nomen simonis omnes miro modo agnoscunt maluntque ita appellari.

delphinus non homini tantum amicum animal, verum et musicae arti, mulcetur symphoniae cantu, set praecipue hydraulici sono. hominem non expavescit ut alienum, obviam navigiis venit, adludit exultans, certat etiam et quamvis plena praeterit vela. Divo Augusto principe lucrinum lacum invectus pauperis cuiusdam puerum ex baiano puteolos in ludum litterarium itantem, cum meridiano immorans appellatum eum simonis nomine saepius fragmentis panis, quem ob iter ferebat, adlexisset, miro amore dilexit. pigeret referre, ni res maecenatis et fabiani et flavi alfi multorumque esset litteris mandata. quocumque diei tempore inelamatus a puero, quamvis occultus atque abditus,

ex imo advolabat pastusque e manu praebebat ascensuro dorsum, pinnae aculeos velut vagina condens, receptumque puteolos per magnum aequor in ludum ferebat simili modo revehens pluribus annis, donec morbo extincto puero subinde ad consuetum locum ventitans tristis et maerenti similis ipse quoque, quod nemo dubitaret, desiderio expiravit. alius intra hos annos africo litore hipponis diarruti simili modo ex hominum manu vescens praebensque se tractandum et adludens nantibus inpositosque portans unguento perunctus a flaviano proconsule africae et sopitus, ut apparuit, odoris novitate fluctuatusque similis exanimi caruit hominum conversatione ut iniuria fugatus per aliquot menses, mox reversus in eodem miraculo fuit. iniuriae potestatum in hospitales ad visendum venientium hipponenses in necem eius compulerunt. ante haec similia de puero in iaso urbe memorantur, cuius amore spectatus longo tempore, dum abeuntem in litus avidae sequitur, in harenam invectus expiravit. puerum alexander magnus babylone neptunio sacerdotio praefecit, amorem illum numinis propitii fuisse interpretatus. in eadem urbe iaso hegesidemus scribit et alium puerum hermian nomine similiter maria perequitantem, cum repentinae procellae fluctibus exanimatus esset, relatum, delphinumque causam leti fatentem non reversum in maria atque in sicco expirasse. hoc idem et naupacti accidisse theophrastus tradit. nec modus exemplorum: eadem amphilochoi et tarentini de pueris delphinisque narrant. quae faciunt ut credatur, arionem quoque citharoedicae artis, interficere nautis in mari parantibus ad intercipiendos eius quaestus, eblanditum uti prius caneret cithara, congregatis cantu delphinis cum se iecisset in mare, exceptum ab uno taenarum in litus pervectum.

est provinciae narbonensis et in nemausiensi agro stagnum latera appellatum, ubi cum homine delphini societate piscantur. innumera vis mugilum stato tempore angustis faucibus stagni in mare erumpit observata aestus reciprocatone. qua de causa praetendi non queunt retia, eaque moles ponderis nullo modo toleretur, etiamsi non sollertia insidiatur tempori. simili ratione in altum protinus tendunt, quod vicino gurgite efficitur, locumque solum pandendis retibus habilem effugere festinant. quod ubi animadvertere piscantes - concurrunt autem multitudo temporis gnara et magis etiam voluptatis huius avida - totusque populus e litore quanto potest clamore conciet simonem in spectaculi eventum, celeriter delphini exaudiunt desideria aquilonum flatu vocem prosequente, austro vero tardius ex adverso referente; set tum quoque inproviso in auxilium advolare properant. apparet acies, quae protinus disponitur in loco, ubi coniectus est pugnae. opponunt sese ab alto trepidosque in vada urgent: tum piscatores circumdant retia furcisque sublevant. mugilum nihilo minus velocitas transilit: at illos excipiunt delphini et occidisse ad praesens contenti cibos in victoriam differunt. opere proelium fervet, includique retibus se fortissime urgentes gaudent ac, ne id ipsum fugam hostium stimulet, inter navigia et retia natantesve homines ita sensim elabuntur, ut exitus non aperiant. saltu, quod est alias blandissimum iis, nullus conatur evadere, ni summittantur sibi retia. egressus protinus ante vallum

proeliatur. ita peracta captura quos interemere diripiunt. sed enixioris operae quam in unius diei praemium conscii sibi opperiantur in posterum nec piscibus tantum, sed et intrita panis e vino satiantur.

quae de eodem genere piscandi in iasio sinu mucianus tradit, hoc differunt, quod ultro neque inelamati praesto sint partesque e manibus accipiant et suum quaeque cumba e delphinis socium habeat, quamvis noctu et ad faces. ipsis quoque inter se publica est societas. capto a rege cariae alligatoque in portu ingens reliquorum convenit multitudo maestitia quadam, quae posset intellegi, miserationem petens, donec dimitti rex eum iussit. quin et parvos semper aliquis grandior comitatur ut custos, conspectique iam sunt defunctum portantes, ne laceraretur a beluis.

delphinorum similitudinem habent qui vocantur thursiones. distant et tristitia quidem aspectus - abest enim illa lascivia - , maxime tamen rostris canicularum maleficientiae adsimulati.

testudines tantae magnitudinis indicum mare emittit, uti singularum superficie habitabiles casas integant atque inter insulas rubri praecipue maris his navigent cumbis. capiuntur multis quidem modis, sed maxime evectae in summa pelagi antemeridiano tempore blandito, eminente toto dorso per tranquilla fluitantes, quae voluptas libere spirandi in tantum fallit oblitae sui, ut solis vapore siccato cortice non queant mergi invitaeque fluitent opportuna venantium praedae. ferunt et pastum egressas noctu avideque saturatas lassari atque, ut remeaverint matutino, summa in aqua obdormiscere; id prodi stertentium sonitu. tum adnatare tacite leniterque singulis ternos; a duobus in dorsum verti, a tertio laqueum inici supinae atque ita e terra a pluribus trahi. in phoenicio mari haut ulla difficultate capiuntur ultroque veniunt stato tempore anni in amnem eleutherum effusa multitudine.

dentes non sunt testudini, set rostri margines acuti, superna parte inferiorem claudente pyxidum modo. in mari conchylis vivunt, tanta oris duritia, ut lapides comminuant, in terram egressae herbis. pariunt ova avium ovis similia ad centena numero eaque defossa extra aquas et cooperta terra, pavita hac pectore et complanata, incubant noctibus. educunt fetus annuo spatio. quidam oculis spectandoque ova foveri ab iis putant, feminas coitum fugere, donec mas festucam aliquam inponat aversae. trogodytae cornigeras habent, ut in lyra adnexis cornibus latis, sed mobilibus, quorum in natando remigio se adjuvant; chelium id vocatur, eximiae testudinis, sed rariae. namque scopuli praeacuti chelonophagos terrent, trogodytae autem, ad quos adnant, ut sacras adorant. sunt et terrestres, quae ob id in operibus chersinae vocantur, in africae desertis, qua parte maxime sitientibus harenis squalent, roscido, ut creditur, umore viventes. neque aliud ibi animal provenit.

testudinum putamina secare in laminas lectosque et repositoria iis vestire carvilius pollio instituit, prodigi et sagacis ad luxuriae instrumenta ingenii.

aquatilium tegumenta plura sunt. alia corio et pilo integuntur ut vituli et hippopotami, alia corio tantum ut delphini, cortice ut testudines, silicum duritia ut ostreae et conchae, crustis ut locustae, crustis et spinis ut echini,

squamis ut pisces, aspera cute ut squatina, qua lignum et eboram poliuntur, molli ut murenarum, alia nulla ut polypi.

quae pilo vestiuntur, animal pariunt, ut pristis, ballaena, vitulus. hic parit in terra, pecudum more secundas partus reddit. initu canum modo cohaeret; parit nonnumquam geminis plures, educat mammis fetum. non ante duodecimum diem deducit in mare, ex eo subinde adsuefaciens. interficiuntur difficulter nisi capite eliso. ipsis in sono mugitus - unde nomen vituli - , accipiunt tamen disciplinam vocemque pariter et iussu populum salutant incondito fremitu, nomine vocati respondent. nullum animal graviore somno premitur. pinnis, quibus in mari utuntur, humi quoque vice pedum serpunt. pelles eorum etiam detractas corpori sensum aequorum retinere tradunt semperque aestu maris recedente inhorrescere, praeterea dextrae pinnae vim soporiferam inesse somnosque adlicere subditam capiti. - pilo carentium duo omnino animal pariunt, delphinus ac vipera.

piscium species sunt lxxiiii, praeter crustis intacta, quae sunt xxx. de singulis alias dicemus; nunc enim naturae tractantur insignium.

praecipua magnitudine thynni. invenimus talenta xv pendisse, eiusdem caudae latitudinem duo cubita et palmum. fiunt et in quibusdam amnium haut minores, silurus in nilo, isox in rheno, attilus in pado, inertia pinguescens ad mille aliquando libras, catenato captus hamo nec nisi boum iugis extractus. atque hunc minimus, appellatus clupea, venam quandam eius in faucibus mira cupidine appetens morsu exanimat. silurus grassatur, ubicumque est, omne animal appetens, equos innatantes saepe demergens. praecipue in moeno germaniae amne protelis boum et in danuvio marris extrahitur, porculo marino simillimus. et in borysthene memoratur praecipua magnitudo, nullis ossibus spinisque intersitis, carne praedulci. in gange indiae platanistas vocant, rostro delphini et cauda, magnitudine autem xvi cubitorum. in eodem esse status sebosus haut modico miraculo adfert vermes, branchiis binis sex cubitorum, caeruleos, qui nomen a facie traxerunt. his tantas esse vires, ut elephantos ad potus venientes mordicus comprehensa manu eorum abstrahant.

thynni mares sub ventre non habent pinnam. intrant e magno mari pontum verno tempore gregatim, nec alibi fetificant. cordyla appellatur partus, qui fetas redeuntes in mare autumnis comitatur; limosae vero aut e luto pelamydes incipiunt vocari et, cum annum excessere tempus, thynni. hi membratim caesi cervice et abdomine commendantur atque clidio, recenti dumtaxat et tum quoque gravi ructu. cetera parte plenis pulpamentis sale adservantur. melandrya vocantur quercus assulis similia. vilissima ex his quae caudae proxima, quia pingui carent, probatissima quae faucibus. at in alio pisce circa caudam exercitatissima. pelamydes in apolectos particulatimque coniectae in genera cybiorum dispertiuntur.

piscium genus omne praecipua celeritate adolescit, maxime in ponto. causa multitudo amnium dulces inferentium aquas. amiam vocant cuius incrementum singulis diebus intellegitur. cum thynnibus haec et pelamydes in pontum ad dulciora pabula intrant gregatim suis quaeque ducibus, et primi

omnium scombri, quibus est in aqua sulpureus color, extra qui ceteris. hispaniae cetarias hi replent, thynnis non commeantibus.

sed in pontum nulla intrat bestia piscibus malefica praeter vitulos et parvos delphinos. thynni dextera ripa intrant, exeunt laeva. id accidere existimatur, quia dextro oculo plus cernant, utroque natura hebeti. est in euripo thracii bospori, quo propontis euxino iungitur, in ipsis europam asiamque separantis freti angustis saxum miri candoris, a vado ad summa perlucens, iuxta calchedonem in latere asiae. huius aspectu repente territi semper adversum byzantii promunturium, ex ea causa appellatum aurei cornus, praecipiti petunt agmine. itaque omnis captura byzantii est, magna calchedonis penuria, in passibus medii interfluentis euripi. opperiuntur autem aquilonis flatum, ut secundo fluctu exeant e ponto, nec nisi intrantes portum byzantium capiuntur. bruma non vagantur; ubicumque deprehensi, usque ad aequinoctium ibi hibernant. iidem saepe navigia velis euntia comitantes mira quadam dulcedine per aliquot horarum spatia et passuum milia a gubernaculis spectantur, ne tridente quidem in eos saepius iacto territi. quidam eos, qui hoc e thynnis faciant, pompilos vocant. multi in propontide aestivant, pontum non intrant; item soleae, cum rhombi intrent, nec saepia est, cum lolligo reperiatur; saxatilius turdus et merula desunt, sicut conchyliis, cum ostreae abundant. omnia autem hibernant in aegaeo. intrantium pontum soli non remeant trichiae - graecis enim plerisque nominibus uti par erit, quando aliis atque aliis eosdem diversi appellare tractus -, sed hi soli in histrium mare subeunt et ex eo subterraneis eius venis in hadriaticum mare defluunt, itaque et illic descendentes nec umquam subeuntes e mari visuntur.

thynnorum captura est a vergiliarum exortu ad arcturi occasum. reliquo tempore hiberno latent in gurgitibus imis, nisi tepore aliquo evocati aut pleniluniis. pinguescunt et in tantum, ut dehiscant. vita longissima iis bienni.

animal est parvum scorpionis effigie, aranei magnitudine. hoc se et thynno et ei qui gladius vocatur, crebro delphini magnitudinem excedenti, sub pinna adfigit aculeo tantoque infestat dolore, ut in naves saepenumero exiliant. quod et alias faciunt aliorum vim timentes mugiles maxime, tam praecipuae velocitatis, ut transversa navigia interim superiaciant.

sunt et in hac parte naturae auguria, sunt et piscibus praescita. siculo bello ambulante in litore augusto piscis e mari ad pedes eius exilivit, quo argumento vates respondere, neptunum patrem adoptante tum sibi sexto pompeio - tanta erat navalis rei gloria -, sub pedibus caesaris futuros qui maria tempore illo tenerent.

piscium feminae maiores quam mares. in quodam genere omnino non sunt mares, sicut erythinis et channis; omnes enim ovis gravidae capiuntur. vagantur gregatim fere cuiusque generis squamosi. capiuntur ante solis ortum: tum maxime piscium fallitur visus. noctibus quies, set inlustribus aequae quam die cernunt. aiunt et si teratur gurgis interesse capturae; itaque plures secundo tractu capi quam primo. gustu olei maxime, dein modicis imbris gaudent alunturque. quippe et harundines, quamvis in palude prognatae, non tamen

sine imbre adolescent, et alias ubicumque pisces in eadem aqua adsidui, si non adfluat, exanimantur.

praegelidam hiemem omnes sentiunt, sed maxime qui lapidem in capite habere existimantur, ut lupi, chromis, sciaena, phagri. cum asperae hiemes fuere, multi caeci capiuntur. itaque his mensibus iacent speluncis conditi, sicut in genere terrestrium retulimus, maxime hippurus et coracini, hieme non capti praeterquam statis diebus paucis et isdem semper, item murena et orphus, conger, percae et saxatiles omnes. terra quidem, hoc est vado maris excavato, condi per hiemes torpedinem, psettam, soleam tradunt.

quidam rursus aestus inpatientia mediis fervoribus sexagenis diebus latent, ut glaucus, aselli, auratae. fluviatilium silurus caniculae exortu sideratur, et alias semper fulgure sopitur; hoc et in mari accidere cyprino putant. et alioqui totum mare sentit exortum eius sideris, quod maxime in bosporo apparet. alga enim et pisces superferuntur, omniaque ab imo versa.

mulgilum natura ridetur in metu capite abscondito totos se occultari credentium. isdem tam incauta salacitas, ut in phoenice et in narbonensi provincia coitus tempore e vivariis marem linea longinqua per os ad branchias religata emissum in mare eademque linea retractum feminae sequantur ad litus rursusque feminam mares partus tempore.

apud antiquos piscium nobilissimus habitus acipenser, unus omnium squamis ad os versis contra quam in nando meant, nullo nunc in honore est, quod equidem miror, cum sit rarus inventu. quidam eum elopem vocant.

postea praecipuam auctoritatem fuisse lupo et asellis nepos cornelius et laberius poeta mimorum tradidere. luporum laudatissimi qui appellantur lanati a candore mollitiaque carnis. asellorum duo genera, callariae minores et bacchi, qui non nisi in alto capiuntur, ideo praelati prioribus. at in lupis in amne capti praeferuntur.

nunc principatus scaro datur, qui solus piscium dicitur ruminare herbisque vesci atque non aliis piscibus, carpathio maxime mari frequens. promunturium troadis lectum numquam sponte transit. inde advectos tiberio claudio principe optatus e libertis eius praefectus classis inter ostiensem et campaniae oram sparsos disseminavit, quinquennio fere cura adhibita, ut capti redderentur mari. postea frequentes inveniuntur italiae litore, non antea ibi capti, admovetque sibi gula saporis piscibus satis et novum incolam mari dedit, ne quis peregrinas aves romae parere miretur. proxima est mensa iecori dumtaxat mustelarum, quas, mirum dictu, inter alpis quoque lacus raetiae brigantinus aemulas marinis generat.

ex reliqua nobilitate et gratia maxima est et copia mullis, sicut magnitudo modica, binasque libras ponderis raro admodum exuperant nec in vivariis piscinisque crescunt. septentrionalis tantum hos et proxima occidentis parte gignit oceanus. cetero genera eorum plura; nam et alga vescuntur et ostreis et limo et aliorum piscium carne, et barba gemina insigniuntur inferiori labro. lutarium ex iis vilissimi generis appellant; hunc semper comitatur sargus nomine alius piscis et caenum fodiente eo excitatum devorat pabulum. nec

litorariis gratia. laudatissimi conchylium sapiunt. nomen iis fenestella a colore mulleorum calciamentorum datum putat. pariunt ter annis; certe totiens fetura apparet. mullum expirantem versicolori quadam et numerosa varietate spectari proceres gulae narrant, rubentium squamarum multiplici mutatione pallescentem, utique si vitro spectetur inclusus. m. apicius, ad omne luxus ingenium natus, in sociorum garo - nam ea quoque res cognomen invenit - necari eos praecellens putavit atque e iecore eorum allecem excogitare.

provocavit - id enim est facilius dixisse quam quis vicerit - asinius celer e consularibus hoc pisce prodigos omnes gaio principe unum mercatus hs [viii] mullum. quae reputatio aufert traversum animum ad contemplationem eorum, qui in conquestione luxus coquos emi singulos pluris quam equos quiritabant. at nunc coci trium horum pretiis parantur et coquorum pisces, nullusque prope iam mortalis aestimatur pluris quam qui peritissime cenum domini mergit. mullum lxxx librarum in mari rubro captum licinius mucianus prodidit, quanti mercatura eum luxuria suburbanis litoribus inventum

est et haec natura, ut alii alibi pisces principatum optineant, coracinus in aegypto, zaeus, idem faber appellatus, gadibus, circa ebusum salpa, obscenus alibi et qui nusquam percoqui possit nisi ferula verberatus; in aquitania salmo fluviatilis marinis omnibus praefertur.

piscium alii branchias multiplices habent, alii simplices, alii duplices. his aquam emittunt acceptam ore. senectutis indicium squamarum duritia, quae non sunt omnibus similes. duo lacus italiae in radicibus alpium larius et verbannus appellantur, in quibus pisces omnibus annis vergiliarum ortu existunt squamis conspicui crebris atque praeacutis, clavorum caligarum effigie, nec amplius quam circa eum mensem visuntur.

miratur et arcadia suum exocoetum, appellatum ab eo quod in siccum somni causa exeat. circa clitorium vocalis hic traditur et sine branchiis, idem aliquis adonis dictus.

exeunt in terram et qui marini mures vocantur et polypi et murenae, quin et in indiae fluminibus certum genus piscium ac deinde resilit. nam in stagna et amnes transeundi plerisque evidens ratio est, ut tutos fetus edant, quia non sint ibi qui devorent partus fluctusque minus saeviant. has intellegi ab iis causas servarique temporum vices magis miretur, si quis reputet quoto cuique hominum nosci uberrimam esse capturam sole transeunte piscium signum.

marinorum alii sunt plani, ut rhombi, soleae ac passerres, qui ab rhombis situ tantum corporum differunt - dexter hic resupinatis est illis, passeri laevis - , alii longi, ut murena, conger. ideo pinnarum quoque fiunt discrimina, quae pedum vice sunt datae piscibus, nullis supra quaternas, quibusdam binae, aliquis nullae. in fucino tantum lacu piscis est qui octonis pinnis natat. binae omnino longis et lubricis, ut anguillis et congris, aliis nullae, ut murenis, quibus nec branchiae. haec omnia flexuoso corporum impulsu ita mari utuntur, ut serpentes terra, et in sicco quoque repunt; ideo etiam vivaciora talia. et e planis aliqua non habent pinnae, ut pastinacae - ipsa enim latitudine natant - et quae mollia appellantur, ut polypi, quoniam pedes illis pinnarum vicem

praestant.

anguillae octonis vivunt annis. durant et sine aqua, quinis et senis diebus aquilone spirante, austro paucioribus ... ant hieme, eadem in exigua aqua non tolerant neque in turbida. ideo circa vergilias maxime capiuntur fluminibus tum praecipue turbidis. pascuntur noctibus. exanimis piscium solae non fluitant. lacus est italiae benacus in veronensi agro mincium amnem tramittens, ad cuius emersus annuo tempore, octobri fere mense, autumnali sidere, ut palam est, hiemato lacu, fluctibus glomeratae volvuntur in tantum mirabili multitudine, ut in excipulis eius fluminis ob hoc ipsum fabricatis singulorum milium reperiantur globi.

murena quocumque mense parit, cum ceteri pisces stato pariant. ova eius citissime crescunt. in sicca litora elapsas vulgus coitu serpentium impleri putat. aristoteles zmyrum vocat marem qui generet; discrimen esse quod murena varia et infirma sit, zmyrus unicolor et robustus dentesque et extra os habeat. in gallia septentrionali murenis omnibus dextera in maxilla septenae maculae ad formam septentrionis aureo colore fulgent, dumtaxat viventibus, pariterque cum anima extinguuntur. invenit in hoc animali documenta saevitiae vedius pollio, eques romanus ex amicis Divi Augusti, vivariis earum inmergens damnata mancipia, non tamquam ad hoc feris terrarum non sufficientibus, sed quia in alio genere totum pariter hominem distrahi spectare non poterat. ferunt aceti gustu praecipue eas in rabiem agi. tenuissimum iis tergus, contra anguillis crassius, eoque verberari solitos tradit verrius praetextatos et ob id multam iis dici non institutum.

planorum piscium alterum est genus, quod pro spina cartilaginem habet, ut raiae, pastinacae, squatinae, torpedo et quos bovis, lamiae, aquilae, ranae nominibus graeci appellant. quo in numero sunt squali quoque, quamvis non plani. haec graece in universum *σελάχη* appellavit aristoteles primus hoc nomine iis inposito. nos distinguere non possumus, nisi si cartilaginea appellare libeat. omnia autem carnivora sunt talia et supina vescuntur, ut in delphinis diximus, et cum ceteri pisces ova pariant, hoc genus solum, ut ea quae cete appellant, animal parit, excepta quam ranam vocant.

est parvus admodum piscis adsuetus petris, echeneis appellatus. hoc carinis adhaerente naves tardius ire creduntur, inde nomine inposito. quam ob causam amatoris quoque veneficiis infamis est et iudiciorum ac litium mora, quae crimina una laude pensat fluxus gravidarum utero sistens partusque continens ad puerperium. in cibos tamen non admittitur. pedes eum habere arbitrantur, aristoteles ... it apposita pinnae similitudine. mucianus muricem esse latiore purpura, neque aspero neque rotundo ore neque in angulos prodeunte rostro, sed sicut concha utroque latere sese colligente. quibus inhaerentibus plenam venti stetisse navem periandri portantem, ut castrarentur, nobiles pueros; conchas, quae id praestiterint, apud cnidiorum venerem coli. trebius niger pedalem esse et crassitudine quinque digitorum, naves morari; praeterea hanc esse vim eius adservati in sale, ut aurum, quod deciderit in altissimos puteos, admotus extrahat.

mutant colorem candidum menae et fiunt aestate nigriores. mutat et phycis, reliquo tempore candida, vere varia. eadem piscium sola nidificat ex alga atque in nido parit.

volat sane perquam similis volucris hirundo, item miluus, subit in summa maria piscis ex argumento appellatus lucerna, linguaque ignea per os exerta tranquillis noctibus relucet. attollit e mari sesquipedanea fere cornua quae ab iis nomen traxit. rursus draco marinus, captus atque inmissus in harenam, cavernam sibi rostro mira celeritate excavat.

piscium sanguine carent de quibus dicemus. sunt autem tria genera: primum quae mollia appellantur, dein contacta crustis tenuibus, postremo testis conclusa duris. mollia sunt loligo, saepia, polypus et cetera generis eius. his caput inter pedes et ventrem, pediculi octoni omnibus. saepiae et loligini pedes duo ex his longissimi et asperi, quibus ad ora admovent cibos et in fluctu se velut ancoris stabiliunt, cetera cirri, quibus venantur.

loligo etiam volitat extra aquam se efferens, quod et pectunculi faciunt, sagittae modo. - saepiarum generi mares varii et nigriores constantiaeque maioris. percussae tridente feminae auxiliantur, at femina icto mare fugit. ambo autem, ubi sensere se adprehendi, effuso atramento, quod pro sanguine iis est, infusata aqua absconduntur.

polyporum multa genera. terreni maiores quam pelagii. omnibus brachiiis ut pedibus ac manibus utuntur, cauda vero, quae est bisulca et acuta, in coitu. et polypis fistula in dorso, qua tramittunt mare, eamque modo in dexteram partem, modo in sinistram transferunt. natant obliqui in caput, quod praedurum est sufflatione viventibus. cetero per brachia velut acetabulis dispersis haustu quodam adhaerescunt; tenent supini, ut avelli non queant. vada non adprehendunt, et grandibus minor tenacitas. soli mollium in siccum exeunt, dumtaxat asperum; levitatem odere. vescuntur conchyliorum carne, quorum conchas complexu crinium frangunt; itaque praeiacentibus testis cubile eorum deprehenditur. et cum alioqui brutum habeatur animal, ut quod ad manum hominis adnatet, in re quodammodo familiari callet. omnia in domum conportat, dein putamina erosa carne egerit adnatantesque pisciculos ad ea venatur. colorem mutat ad similitudinem loci, et maxime in metu. ipsum brachia sua rodere falsa opinio est - id enim a congris evenit ei - , sed renasci, sicut colotis et lacertis caudas, haut falsum.

inter praecipua autem miracula est qui vocatur nautilus, ab aliis pompilos. supinus in summa aequorum pervenit, ita se paulatim adsubrigens, ut emissa omni per fistulam aqua velut exoneratus sentina facile naviget. postea prima duo brachia retorquens membranam inter illa mirae tenuitatis extendit, qua velificante in aura, ceteris subremigans brachiiis, media se cauda ut gubernaculo regit. ita vadit alto liburnicarum gaudens imagine, si quid pavoris interveniat, hausta se mergens aqua.

polyporum generis est ozaena dicta a gravi capitis odore, ob hoc maxime murenis eam consectantibus.

polypi binis mensibus conduntur. ultra bimatum non vivunt. pereunt autem

tabe semper, feminae celerius et fere a partu.

non sunt praetereunda et l. lucullo proconsule baeticae conperta de polypis, quae trebius niger e comitibus eius prodidit: avidissimos esse concharum, illas ad tactum conprimi, praecedentes brachia eorum, utroque escam ex praedante capere. carent conchae visu omnique sensu alio quam cibi et periculi. insidiantur ergo polypi apertis inpositoque lapillo extra corpus, ne palpitatu eiciatur: ita securi grassantur extrahuntque carnes. illae se contrahunt, sed frustra, discuneatae. tanta sollertia animalium hebetissimis quoque est. praeterea negat ullum atrocius esse animal ad conficiendum hominem in aqua. luctatur enim complexu et sorbet acetabulis ac numeroso suctu trahit, cum in naufragos urinantesve impetum cepit. sed si invertatur, elanguescit vis; exporrigunt enim se resupinati. cetera, quae idem retulit, monstro propiora possunt videri. carthaginiensis in cetariis adsuetus exire e mari in lacus eorum apertos atque ibi salsamenta populari - mire omnibus marinis expectantibus odorem quoque eorum, qua de causa et nassis inlinuntur - , convertit in se custodum indignationem adsiduitate furti inmodicam. saepes erant obiectae, sed has transcendebat per arborem nec deprehendi potuit nisi canum sagacitate. hi redeuntem circumvasere noctu, concitique custodes expavere novitatem. primum omnium magnitudo inaudita erat, dein colos muria obliti, odore diri. quis ibi polypum expectasset aut ita cognosceret cum monstro dimicare sibi videbantur. namque et adflatu terribili canes agebat, nunc extremis crinibus flagellatos, nunc robustioribus brachiis clavarum modo incussos, aegreque multis tridentibus confici potuit. ostendere lucullo caput eius, dolii magnitudine, amphorarum xv capax, atque, ut ipsius trebi verbis utar, "barbas, quas vix utroque brachio complecti esset, clavarum modo torosas, longas pedum xxx, acetabulis sive caliculis urnalibus pelvium modo, dentes magnitudini respondentes." reliquiae adservatae miraculo pendere pondo dcc. saepias quoque et lolligines eiusdem magnitudinis expulsas in litus illud idem auctor est. in nostro mari lolligines quinque cubitorum capiuntur, saepiae binum. neque his bimatu longior vita.

navigeram similitudinem et aliam in propontide visam sibi prodidit mucianus: concham esse acatii modo carinatum, inflexa puppe, prora rostrata. in hanc condi nauplium, animal saepiae simile, ludendi societate sola. duobus hoc fieri generibus: tranquillo enim vectorem demissis palmulis ferire ut remis; si vero flatus invitet, easdem in usum gubernaculi porrigi pandique buccarum sinus aerae. huius voluptatem esse ut ferat, illius ut regat, simulque eam descendere in duo sensu carentia, nisi forte tristi - id etenim constat - omine navigantium humana calamitas in causa est.

locustae crusta fragili muniuntur in eo genere quod caret sanguine. latent mensibus quinque. similiter cancri, qui eodem tempore occultantur, et ambo veris principio senectutem anguium more exuunt renovatione tergorum. cetera in undis natant, locustae reptantium modo fluitant, si nullus ingruat metus, recto meatu, cornibus, quae sunt propria rotunditate praepilata, ad latera porrectis; isdem erectis in pavore oblique in latera procedunt. cornibus inter se

dimicant. unum hoc animalium, nisi vivum ferventi aqua incoquatur, fluida carne non habet callum. vivunt petrosis locis, cancri mollibus. hieme aprica litora sectantur, aestate in opaca gurgitum recedunt. omnia eius generis hieme laeduntur, autumno et vere pinguescunt et plenilunio magis, quia noctes sidus tepido fulgore mitificat.

cancrorum genera carabi, astaci, maeae, paguri, heracleotici, leones et alia ignobiliora. carabi cauda a ceteris cancris distant. in phoenice hippoe vocantur, tantae velocitatis, ut consequi non sit. cancris vita longa, pedes octoni, omnes in obliquum flexi. feminae primus pes duplex, mari simplex. praeterea bina bracchia denticulatis forcipibus. superior pars in primoribus his movetur, inferiore immobili. dexterum brachium omnibus maius. universi aliquando congregantur. os ponti evincere non valent; quam ob rem egressi circumeunt apparetque tritum iter. pinotheras vocatur minimus ex omni genere, ideo opportunus iniuriae. huic sollertia est inanum ostrearum testis se condere et, cum adcreverit, migrare in capaciores. cancri in pavore et retrorsi pari velocitate redeunt. dimicant inter se ut arietes adversis cornibus incursantes. contra serpentium ictus medentur. sole cancri signum transeunte et ipsorum, cum exanimati sint, corpus transfigurari in scorpiones narratur in sicco. ex eodem genere sunt echini, quibus spinae pro pedibus. ingredi est iis in orbem volvi, itaque detritis saepe aculeis inveniuntur. ex his echinometrae appellantur quorum spinae longissimae, calyces minimi. nec omnibus idem vitreus color. circa toronen candidi nascuntur, spina parva. ova omnium amara, quina numero. ora in medio corpore in terram versa. tradunt saevitiam maris praesagire eos correptisque opperiri lapillis, mobilitatem pondere stabilientes; nolunt volutatione spinas atterere. quod ubi videre nautici, statim pluribus ancoris navigia infrenant.

in eodem genere coeleae aquatiles terrestresque, exerentes se domicilio binaque ceu cornua protendentes contrahentesque, oculis carent, itaque corniculis praetemptant iter. pectines in mari ex eodem genere habentur, reconditi et ipsi magnis frigoribus ac magnis aestibus, unguisque velut igne lucentes in tenebris, etiam in ore mandentium.

firmiter iam testae murices et concharum genera, in quibus magna ludentis naturae varietas. tot colorum differentiae, tot figurae planis, concavis, longis, lunatis, in orbem circumactis, dimidio orbe caesis, in dorsum elatis, levibus, rugatis, denticulatis, striatis, vertice muricatum intorto, margine in mucronem emisso, foris effuso, intus replicato, iam distinctione virgulata, crinita, crispa, canaliculatum, pectinatim divisa, imbricatim undata, cancellatim reticulata, in obliquum, in rectum expansa, densata, porrecta, sinuata, brevi nodo ligatis, toto latere conexas, ad plausum apertas, ad bucinum recurvis. navigant ex iis veneriae praebentesque concavam sui partem et aurae oppositas per summa aequorum velificant. saliunt pectines et extra volitant sequae et ipsi carinant.

sed quid haec tam parva commemoro, cum populatio morum atque luxuria non aliunde maior quam e concharum genere proveniat iam quidem ex tota rerum natura damnosissimum ventri mare est tot modis, tot mensis, tot

piscium saporibus, quis pretia capientium periculo fiunt. sed quota haec portio est reputantibus purpuras, conchylia, margaritas! parum scilicet fuerat in gulas condi maria, nisi manibus, auribus, capite totoque corpore a feminis iuxta virisque gestarentur. quid mari cum vestibus, quid undis fluctibusque cum vellere non recte recipit haec nos rerum natura nisi nudos esto, sit tanta ventri cum eo societas: quid tergori parum est, nisi qui vescimur periculis etiam vestiamur adeo per totum corpus anima hominis quaesita maxime placent.

principium ergo columenque omnium rerum pretii margaritae tenent. indicus maxime has mittit oceanus inter illas beluas tales tantasque, quas diximus, per tot maria venientes, tam longo terrarum tractu et tantis solis ardoribus. atque indis quoque in insulas petuntur et admodum paucas. fertilissima est taprobane et stoidis, ut diximus in circuitu mundi, item perimula, promunturium indiae. praecipue autem laudantur circa arabiam in persico sinu maris rubri.

origo atque genitura conchae sunt, haut multum ostrearum conchis differentes. has ubi genitalis anni stimularit hora, pandentes se quadam oscitatione impleri roscido conceptu tradunt, gravidas postea eniti, partumque concharum esse margaritas pro qualitate roris accepti. si purus influxerit, candorem conspici; si vero turbidus, et fetum sordescere; eundem pallere caelo minante. conceptum ex eo quippe constare, caelique iis maiorem societatem esse quam maris: inde nubilum trahi colorem aut pro claritate matutina serenum. si tempestive satientur, grandescere et partus; si fulguret, conprimit conchas ac pro ieiunii modo minui; si vero etiam tonuerit, pavidas ac repente compressas quae vocant physemata efficere, specie modo inani inflata sine corpore; hos esse concharum abortus. sani quidem partus multiplici constant cute, non inproprie callum ut existimari corporis possit. itaque et purgantur a peritis. miror ipso tantum eas caelo gaudere, sole rufescere candoremque perdere ut corpus humanum. quare praecipuum custodiunt pelagiae, altius mersae quam ut penetrent radii. flavescent tamen et illae senecta rugisque torpescunt, nec nisi in iuventa constat ille qui quaeritur vigor. crassescunt etiam in senecta conchisque adhaerescunt nec his evelli queunt nisi lima. quibus una tantum est facies et ab ea rotunditas, aversis planities, ob id tympania nominantur. cohaerentes videmus in conchis hac dote unguenta circumferentibus. cetero in aqua mollis unio, exemptus protinus durescit.

concha ipsa, cum manum vidit, conprimit sese operitque opes suas, gnara propter illas se peti, manumque, si praeveniat, acie sua abscidat, nulla iustiore poena, et aliis munita suppliciis, quippe inter scopulos maior pars invenitur, in alto quoque comitantibus marinis canibus, nec tamen aures feminarum arcentur. quidam tradunt sicut apibus, ita concharum examinibus singulas magnitudine et vetustate praecipuas esse veluti duces, mirae ad cavendum sollertiae. has urinantium cura peti, illis captis facile ceteras palantes retibus includi, multo deinde obrutas sale in vasis fictilibus; rosa carne omni nucleos quosdam corporum, hoc est uniones, decidere in ima.

vsu atteri non dubium est coloremque indiligentia mutare. dos omnis in candore, magnitudine, orbe, levore, pondere, haut promptis rebus in tantum, ut nulli duo reperiantur indiscreti: unde nomen unionum romanae scilicet inposuere deliciae, nam id apud graecos non est, ne apud barbaros quidem, inventores rei eius, aliud quam margaritae. et in candore ipso magna differentia: clarior in rubro mari repertis, in indico specularium lapidum squamas adsimulant, alias magnitudine praecellentes. summa laus coloris est exaluminatos vocari. et procerioribus sua gratia est. elenchos appellant fastigata longitudine alabastrorum figura in plenior orbem desinentes. hos digitis suspendere et binos ac ternos auribus feminarum gloria est, subeuntque luxuriae eius nomina externa, exquisita perditio nepotatu, si quidem, cum id fecere, crotalia appellant, ceu sono quoque gaudeant et collisu ipso margaritarum; cupiuntque iam et pauperes, lictorem feminae in publico unionem esse dictitantes. quin et pedibus, nec crepidarum tantum obstragulis, set totis socculis addunt. neque enim gestare iam margaritas, nisi calcent ac per uniones etiam ambulent, satis est.

in nostro mari reperiri solebant crebrius circa bosporum thracium, rufi ac parvi in conchis quas myas appellant. at in acarnania quae vocatur pina gignit, quo apparet non uno conchae genere nasci. namque et iuba tradit arabicis concham esse similem pectini insecto, hirsutam echinorum modo, ipsum unionem in carne grandini similem. conchae non tales ad nos adferuntur. nec in acarnania autem laudati reperiuntur, enormes et feri colorisque marmorei. meliores circa actium, sed et hi parvi, et in mauretaniae maritimis. alexander polyhistor et sudines senescere eos putant coloremque expirare.

firmum corpus esse manifestum est, quod nullo lapsu franguntur. non autem semper in media carne reperiuntur, sed aliis atque aliis locis, vidimusque iam in extremis etiam marginibus velut e concha exeuntes et in quibusdam quaternos quinosque. pondus ad hoc aevi semunciae pauci singulis scripulis excessere. in britannia parvos atque decolores nasci certum est, quoniam divus iulius thoracem, quem veneri genetrici in templo eius dicavit, ex britannicis margaritis factum voluerit intellegi.

lolliam paulinam, quae fuit gai principis matrona, ne serio quidem aut sollemni caerimoniarum aliquo apparatu, sed mediocrium etiam sponsalium cena, vidi smaragdis margaritisque opertam, alterno textu fulgentibus toto capite, crinibus spira, auribus, collo monilibus, digitis. quae summa quadringentiens hs colligebat, ipsa confestim parata mancipationem tabulis probare. nec dona prodigi principis fuerant, sed avitae opes, provinciarum scilicet spoliis partae. hic est rapinarum exitus, hoc fuit quare m. lollius infamatus regum muneribus in toto oriente interdicta amicitia a gaio caesare augusti filio venenum biberet, ut neptis eius quadringentiens hs operta spectaretur ad lucernas! computet nunc aliquis ex altera parte quantum curius aut fabricius in triumphis tulerint, imagnetur illorum fercula, ex altera parte lolliam, unam imperii mulierculam, accubantem: non illos curru detractos quam in hoc vicisse malit nec haec summa luxuriae exempla sunt. duo fuere

maximi uniones per omne aevum; utrumque possedit cleopatra, aegypti reginarum novissima, per manus orientis regum sibi traditos. haec, cum exquisitis cotidie antonius saginaretur epulis, superbo simul ac procaci fastu, ut regina meretrix lautitiam eius omnem apparatusque obtrectans, quaerente eo, quid adstrui magnificentiae posset, respondit una se cena centiens hs absumpturam. cupiebat discere antonius, sed fieri posse non arbitrabatur. ergo sponsonibus factis postero die, quo iudicium agebatur, magnificam alias cenam, ne dies periret, sed cotidianam, antonio apposuit inridenti computationemque expostulanti. at illa corollarium id esse et consumpturam eam cenam taxationem confirmans solamque se centiens hs cenaturam, inferri mensam secundam iussit. ex praecepto ministri unum tantum vas ante eam posuere aceti, cuius asperitas visque in tabem margaritas resolvit. gerebat auribus cum maxime singulare illud et vere unicum naturae opus. itaque expectante antonio, quidnam esset actura, detractum alterum mersit ac liquefactum obsorbuit. iniecit alteri manum l. plancus, iudex sponsonis eius, eum quoque parante simili modo absumere, victumque antonium pronuntiavit omine rato. comitatur fama unionis eius parem, capta illa tantae quaestionis victrice regina, dissectum, ut esset in utrisque veneris auribus romae in pantheo dimidia eorum cena. non ferent hanc palmam spoliabunturque etiam luxuriae gloria. prior id fecerat romae in unionibus magnae taxationis clodius, tragoedi aesopi filius, relictus ab eo in amplis opibus heres, ne triumviratu suo nimis superbiat antonius paene histrioni comparatus, et quidem nulla sponsione ad hoc producto (quo magis regium fiat), sed ut experiretur in gloriam palati, quidnam saperent margaritae. atque ut mire placuere, ne solus hoc sciret, singulos uniones convivis quoque absorbendos dedit.

romae in promiscuum ac frequentem usum venisse alexandria in dicionem redacta, primum autem coepisse circa sullana tempora minutas et viles fenestella tradit, manifesto errore, cum aelius stilo circa iugurthinum bellum unionum nomen inponi cum maxime grandibus margaritis prodit.

et hoc tamen aeternae prope possessionis est; sequitur heredem, in mancipatum venit ut praedium aliquod: conchylia et purpuras omnis hora atterit, quibus eadem mater luxuria paria paene et margaritis pretia fecit.

purpurae vivunt annis plurimum septenis. latent sicut murices circa canis ortum tricenis diebus. congregantur verno tempore mutuoque attritu lentorem cuiusdam cerae salivant. simili modo et murices, sed purpurae florem illum tinguendis expetitur vestibis in mediis habent faucibus. liquoris hic minimi est candida vena, unde pretiosus ille bibitur nigrantis rosae colore subluens; reliquum corpus sterile. vivas capere contendunt, quia cum vita sucum eum evomunt. et maioribus quidem purpuris detracta concha auferunt, minores cum testa vivas frangunt, ita demum eum expuentes. tyri praecipuus hic asiae, meninge africae et gaetulo litore oceani, in laconica europae. fasces huic securesque romanae viam faciunt, idemque pro maiestate pueritiae est, distinguit ab equite curiam, dis advocatur placandis omnemque vestem inluminat, in triumphali miscetur auro. quapropter excusata et purpurae sit

insania. sed unde conchyliis pretia, quis virus grave in fucis, color austerus in glauco et irascenti similis mari

lingua purpurae longitudine digitali, qua pascitur perforando reliqua conchylia: tanta duritia aculeo est. aquae dulcedine necantur et sicubi flumen inmergitur; alioqui captae et diebus quinquagenis vivunt saliva sua. conchae omnes celerrime crescunt, praecipue purpurae: anno magnitudinem implent.

quod si hactenus transcurrat expositio, fraudatam profecto se luxuria credat nosque indiligentiae damnet. quam ob rem persequemur etiam officinas, ut, tamquam in victu frugum noscitur ratio, sic omnes qui istis gaudent in praemio vitae suae calleant. concharum ad purpuras et conchylia - eadem enim est materia, sed distat temperamento - duo sunt genera: bucinum minor concha ad similitudinem eius qua bucini sonus editur - unde et causa nomini - , rotunditate oris in margine incisa; alterum purpura vocatur canaliculato procurrente rostro et canaliculi latere introrsus tubulato, qua proseratur lingua. praeterea clavatum est ad turbinem usque aculeis in orbem septenis fere, qui non sunt bucino, sed utrisque orbis totidem, quot habeant annos. bucinum non nisi petris adhaeret circaque scopulos legitur.

purpurae nomine alio pelagiae vocantur. earum genera plura pabulo et solo discreta: lutense putre limo et algense nutritum alga, vilissimum utrumque. melius taeniense in taeniis maris collectum, hoc quoque tamen etiamnum levius atque dilutius. calculense appellatur a calculo in mari, mire aptum conchyliis, et longe optimum purpuris dialutense, id est vario soli genere pastum. capiuntur autem purpurae parvulis rarisque textu veluti nassis in alto iactis. inest his esca, clusiles mordacesque conchae, ceu mitulos videmus. has semineces, sed redditas mari avido hiatu reviviscentes, appetunt purpurae porrectisque linguis infestant. at illae aculeo exstimulae claudunt sese comprimuntque mordentia. ita pendentes aviditate sua purpurae tolluntur.

capi eas post canis ortum aut ante vernum tempus utilissimum, quoniam, cum cerificavere, fluxos habent sucos. sed id tinguentium officinae ignorant, cum summa vertatur in eo. eximitur postea vena quam diximus, cui addi salem necessarium, sextarios ferme centenas in libras; macerari triduo iustum, quippe tanto maior vis, quanto recentior, fervere in plumbo, singulasque amphoras centenas aquae, quingentenas medicaminis libras aequali ac modico vapore torreri et ideo longinquae fornacis cuniculo. ita despumatis subinde carnibus, quas adhaesisse venis necesse est, decimo ferme die liquata cortina vellus elutriatum mergitur in experimentum et, donec spei satis fiat, uritur liquor. rubens color nigrante deterior. quinis lana potat horis rursusque mergitur carminata, donec omnem ebibat saniem. bucinum per se damnatur, quoniam fucum remittit: pelagio ad modum alligatur nimiaeque eius nigritiae dat austeritatem illam nitoremque qui quaeritur cocci. ita permixtis viribus alterum altero excitatur aut adstringitur. summa medicaminum in libras ... vellerum bucini ducenae et e pelagio cxi. ita fit amethysti colos eximius ille. at tyrius pelagio primum satiatur inmatura viridique cortina, mox permutatur in bucino. laus ei summa in colore sanguinis concreti, nigricans aspectu idemque

spectu refulgens. unde et homero purpureus dicitur sanguis.

purpurae usum romae semper fuisse video, sed romulo in trabea. nam toga praetexta et latiore clavo tullum hostilium e regibus primum usum etruscis devictis satis constat. nepos cornelius, qui Divi Augusti principatu obiit: “me,” inquit, “iuvene violacea purpura vigeat, cuius libra denariis centum veniat, nec multo post rubra tarentina. huic successit dibapha tyria, quae in libras denariis mille non poterat emi. hac p. lentulus spinther aedilis curulis primus in praetexta usus inprobabatur. qua purpura quis non iam,” inquit, “tricliniaria facit” spinther aedilis fuit urbis conditae anno dcxci Cicerone consule. dibapha tunc dicebatur quae bis tincta esset, veluti magnifico incendio, qualiter nunc omnes paene commodiores purpurae tinguntur.

in conchyliata veste cetera eadem sine bucino, praeterque ius temperatur aqua et pro indiviso humani potus excremento. dimidia et medicamina adduntur. sic gignitur laudatus ille pallor saturitate fraudata tantoque dilutior, quanto magis vellera esuriunt.

pretia medicamento sunt quidem pro fertilitate litorum viliora, non tamen usquam pelagii centenas libras quinquagenos nummos excedere et bucini centenos sciant qui ista mercantur inmenso.

set alia e fine initia, iuvatque ludere incendio et lusus geminare miscendo iterumque et ipsa adulterare adulteria naturae, sicut testudines tingere, argentum auro confundere, ut electra fiant, addere his aera, ut corinthia. non est satis abstulisse gemmae nomen amethystum; rursus absolutum inebriatur tyrio, ut sit ex utroque nomen inprobum simulque luxuria duplex, et cum confecere conchyliia transire melius in tyrium putant. paenitentia hoc primo debet invenisse, artifice mutante quod damnavat. inde ratio nata, votum quoque factum e vitio portentosis ingeniis, et gemina demonstrata via luxuriae, ut color alius operiretur alio, suavior ita fieri leniorque dictus; quin et terrena miscere coccoque tinctum tyrio tingere, ut fieret hysginum. coccum galatiae, rubens granum, ut dicemus in terrestribus, aut circa emeritam lusitaniae in maxima laude est. verum, ut simul peragantur nobilia pigmenta, anniculo grano languidus sucus, idem a quadrimo evanidus. ita nec recenti vires neque senescenti. abunde tractata est ratio qua se virorum iuxta feminarumque forma credit amplissimam fieri.

concharum generis et pina est. nascitur in limosis, subrecta semper nec umquam sine comite, quem pinoteren vocant, alii pinophylacem; is est squilla parva, aliubi cancer dapis adsectator. pandit se pina, luminibus orbum corpus intus minutis piscibus praebens. adsultant illi protinus et, ubi licentia audacia crevit, implent eam. hoc tempus speculatus index morsu levi significat. illa congressu quicquid inclusit exanimat partemque socio tribuit.

quo magis miror quosdam existimasse aquatilibus nullum inesse sensum. novit torpedo vim suam ipsa non torpens, mersaque in limo se occultat, piscium qui securi supernatantes obtorpuere corripienti. - huius iecori teneritas nulla praefertur. - nec minor sollertia ranae, quae in mari piscatrix vocatur. eminentia sub oculis cornicula turbato limo exerit, adsultantibus pisciculis

praetrahens, donec tam prope accedant, ut adsiliat. simili modo squatina et rhombus abditi pinnae exertas movent specie vermiculorum, item quae vocantur raiiae. nam pastinaca latrocinatorum ex occulto transeunt radio, quod telum est ei, figens. argumenta sollertiae huius, quod tardissimi piscium hi mugilem velocissimum omnium habentes in ventre reperiuntur.

scolopendrae, terrestribus similes, quas centipedes vocant, hamo devorato omnia interanea evomunt, donec hamum egerant, dein resorbent. at vulpes marinae simili in periculo gluttiunt amplius usque ad infirma lineae, qua facile praerodant. cautius qui glanis vocatur aversos mordet hamos nec devorat, sed esca spoliatur.

grassatur aries ut latro et nunc grandiorum navium in salo stantium occultatus umbra, si quem nandi voluptas invitet, expectat, nunc elato extra aquam capite piscantium cumbas speculatur occultusque adnatans mergit.

equidem et iis inesse sensum arbitror, quae neque animalium neque fruticum, sed tertiam quandam ex utroque naturam habent, urticis dico et sponseis.

urticae noctu vagantur locumque mutant. carnosae frondis iis natura, et carne vescuntur. vis pruritu mordax est eademque, quae terrestres urticae. contrahit ergo se quam maxime rigens ac praenatante piscicula frondem suam spargit conplectensque devorat. alias marcenti similis et iactari se passa fluctu algae vice, contactos piscium attrituque petrae scalpentes pruritus invadit. eadem noctu pectines et echinos per ... quaerit. cum admoveri sibi manum sentit, colorem mutat et contrahitur. tacta uredinem mittit, paulumque si fuit intervalli, absconditur. ora ei in radice esse traduntur, excrementa per summa tenui fistula reddi.

spongearum tria genera accepimus: spissum ac praedurum et asperum tragos id vocatur, spissum et mollius manus, tenue densumque, ex quo penicilli, achillium. nascuntur omnes in petris, aluntur conchis, pisce, limo. intellectum inesse iis apparet, quia, ubi avulsorem sensere, contractae multo difficilius abstrahuntur; hoc idem fluctu pulsante faciunt. vivere esca manifesto conchae minutae in iis repertae ostendunt. circa toronen vesci illis avulsas etiam aiunt et ex relictis radicibus recrescere in petris; cruoris quoque inhaeret colos, africanis praecipue, quae generantur in syrtibus. maximae fiunt manoe, sed mollissimae circa lyciam, in profundo autem nec ventoso molliores; in hellesponto asperae, et densae circa maleam. putrescunt in apricis locis, ideo optimae in gurgitibus. viventibus idem qui madentibus nigricans colos. adhaerent nec parte nec totae; intersunt enim fistulae quaedam inanes quaternae fere aut quinae, per quas pasci existimantur. sunt et aliae, sed superne concretae. et subesse membrana quaedam radicibus earum intellegitur. vivere constat longo tempore. pessimum omnium genus est earum quae aplysiae vocantur, quia elui non possunt; in quibus magnae sunt fistulae et reliqua densitas spissa.

canicularum maxime multitudo circa eas urinantes gravi periculo infestat. ipsi ferunt et nubem quandam crassescere super capita, animali planorum

piscium similem, prementem eos arcentemque a recipiendo, et ob id stilos praeacutos lineis adnexos habere sese, quia nisi perfossae ita non recedant, caliginis et pavoris, ut arbitror, opere. nubem enim et nebulam, cuius nomine id malum appellant, inter animalia haut ulla conperit quisquam. cum caniculis atrox dimicatio. inguina et calces omnemque candorem corporum appetunt. salus una in adversas eundi utroque terrendi, pavet enim hominem aequae ac terret, et ita sors aequa in gurgite. ut ad summa aquae ventum est, ibi periculum anceps adempta ratione contra eundi, dum conetur emergere, et salus omnis in sociis. funem illi religatum ab umeris eius trahunt; hunc dimicans, ut sit periculi signum, laeva quatit, dextera adprehenso stilo in pugna est. modicus alias tractus; ut prope carinam ventum est, nisi praeceleri vi repente rapuit, absumi spectant. ac saepe iam subducti e manibus auferuntur, si non trahentium opem conglobato corpore in pilae modum ipsi adiuvere. protendunt quidem tridentes alii, set monstro sollertia est navigium subeundi atque ita e tuto proeliandi. omnis ergo cura ad speculandum hoc malum insumitur. certissima est securitas vidisse planos pisces, quia numquam sunt ubi maleficae bestiae, qua de causa urinantes sacros appellant eos.

silicea testa inclusis fatendum est nullum esse sensum, ut ostreis. multis eadem natura quae frutici, ut holothuriis, pulmonibus, stellis. adeoque nihil non gignitur in mari, ut cauponarum etiam aestiva animalia, pernici molesta saltu aut quae capillus maxime celat, existant et circumglobata escae saepe extrahantur, quae causa somnum piscium in mari noctibus infestare existimatur. quibusdam vero ipsis innascuntur, quo in numero chalcis accipitur.

nec venena cessant dira, ut in lepore, qui in indico mari etiam tactu pestilens vomitum dissolutionemque stomachi protinus creat, in nostro offa informis, colore tantum lepori similis, in indis et magnitudine et pilo, duriore tantum. nec vivus ibi capitur. aequae pestiferum animal araneus, spinae in dorso aculeo noxius. sed nullum usquam execrabilius quam radius super caudam eminens trygonis, quam nostri pastinacam appellant, quincunciali magnitudine: arbores infixus radici necat, arma ut telum perforat vi ferri et veneni malo.

morbos universa genera piscium, ut cetera animalia etiam fera, non accipimus sentire. verum aegrotare singulos manifestum facit aliquorum macies, cum in eodem genere praepingues alii capiuntur.

quonam modo generent, desiderium et admiratio hominum differri non patitur. pisces attritu ventrium coeunt tanta celeritate, ut visum fallant, delphini et reliqua cete simili modo et paulo diutius. femina piscis coitus tempore marem sequitur, ventrem eius rostro pulsans; sub partu mares feminas similiter, ova vescentes earum. nec satis est generationi per se coitus, nisi editis ovis interspersando mares vitale adperserint virus. non omnibus id contingit ovis in tanta multitudine; alioqui replerentur maria et stagna, cum singuli uteri innumerabilia concipiant.

piscium ova in mari crescunt, quaedam summa celeritate, ut murenarum, quaedam paulo tardius. plani piscium, quibus cauda non est ... aculeatique, et testudines in coitu superveniunt, polypi crine uno feminae naribus adnexo, saepiae et lolligines linguis, componentes inter se brachia et in contrarium nantes; ore et pariunt. sed polypi in terram verso capite coeunt, reliqua mollium tergis ut canes, item locustae et squillae, cancri ore. ranae superveniunt, prioribus pedibus alas feminae mare adprehendente, posterioribus clunes. pariunt minimas carnes nigras, quas gyrimos vocant, oculis tantum et cauda insignes, mox pedes figurantur cauda findente se in posteriores. mirumque, semestri vita resolvuntur in limum nullo cernente, et rursus vernis aquis renascuntur quae fuere natae, perinde occulta ratione, cum omnibus annis id eveniat. et mituli, pectines sponte naturae in harenosis proveniunt; quae durioris testae sunt, ut murices, purpurae, salivario lentore, sicut acescente umore culices; apua spuma maris incalcescente, cum admissus est imber; quae vero siliceo tegmine operiuntur, ut ostrea, putrescente limo aut spuma circa navigia diutius stantia defixosque palos et lignum maxime. nuper conpertum in ostreariis umorem iis fetificum lactis modo effluere. anguillae atterunt se scopulis; ea strigmenta vivescunt, nec alia est earum procreatio. piscium diversa genera non coeunt praeter squatinam et raia, ex quibus nascitur priore parte raiae similis, et nomen ex utroque compositum apud graecos trahit. quaedam tempore anni gignuntur et in umore ut in terra, vere pectines, limaces, hirudines; eadem tempore evanescent. piscium lupus et trichias bis anno parit, et saxatiles omnes; mulli ter et chalcis, cyprini sexiens, scorpaenae bis ac sargi, vere et autumnus, ex planis squatina bis sola, autumnus, occasu vergiliarum, plurimi piscium tribus mensibus aprilis, maius, iunius, salpae autumnus, sargi, torpedo, squali circa aequinoctium, molles vere, saepia omnibus mensibus. ova eius glutino atramenti ad speciem uvae cohaerentia masculus prosequitur adflatu; alias sterilescent. polypi hieme coeunt, pariunt vere ova tortili vibrata pampino, tanta fecunditate, ut multitudinem ovorum occisi non recipiant cavo capitis quo praegnantem tulere; excludunt I die, e quibus multa propter numerum intercidunt. locustae et reliqua tenuioris crustae ponunt ova super ipsa atque ita incubant. polypus femina modo in ovis sedet, modo cavernam cancellato brachiorum inplexu claudit. saepia in terreno parit inter harundines aut sicubi enata alga, excludit quinto decimo die. lolligines in alto conserta ova edunt ut saepiae. purpurae, murices eiusdemque generis vere pariunt. echini ova pleniluniis habent hieme; et coelae hiberno tempore nascuntur.

torpedo octogenos fetus habens invenitur eaque intra se parit, ova praemollia in alium locum uteri transferens atque ibi excludens. simili modo omnia quae cartilaginea appellavimus. ita fit ut sola piscium et animal pariant et ova concipiant. silurus mas solus omnium edita custodit ova, saepe et quinquagenis diebus, ne absumantur ab aliis. ceterae feminae in triduo excludunt, si mas attigit.

acus sive belone unus piscium dehiscens propter multitudinem utero parit.

a partu coalescit vulnus, quod et in caecis serpentibus tradunt. mus marinus in terra scrobe effosso parit ova et rursus obruit terra, tricensimo die refossa aperit fetumque in aquam ducit.

erythini et channae volvas habere traduntur; qui trochos appellatur a graecis, ipse se inire. fetus omnium aquatilium inter initia visu carent.

aevi piscium memorandum nuper exemplum accepimus. pausilypum villa est campaniae haut procul neapoli; in ea in caesaris piscinis a pollione vedio coniectum piscem sexagensimum post annum expirasse scribit annaeus seneca, duobus aliis aequalibus eius ex eodem genere etiam tunc viventibus. quae mentio piscinarum admonet, ut paulo plura dicamus hac de re prius quam digrediamur ab aquatilibus.

ostrearum vivaria primus omnium sergius orata invenit in baiano aetate L. Crassi oratoris ante marsicum bellum, nec gulae causa, sed avaritiae, magna vectigalia tali ex ingenio suo percipiens, ut qui primus pensiles invenerit balineas, ita mangonicatas villas subinde vendendo. is primus optimum saporem ostreis lucrinis adiudicavit, quando eadem aquatilium genera aliubi atque aliubi meliora, sicut lupi pisces in tiberi amne inter duos pontes, rhombus ravennae, murena in sicilia, elops rhodi, et alia genera similiter, ne culinarum censura peragatur. nondum britannica serviebant litora, cum orata lucrina nobilitabat. postea visum tanti in extremam italiam petere brundisium ostreas, ac, ne lis esset inter duos sapes, nuper excogitatum famem longae advectionis a brundisio conpascere in lucrino.

eadem aetate prior licinius murena reliquorum piscium vivaria invenit, cuius deinde exemplum nobilitas secuta est philippi, hortensi. lucullus exciso etiam monte iuxta neapolim maiore impendio quam villam exaedificaverat euripum et maria admisit, qua de causa magnus pompeius xerxen togatum eum appellabat. [30x1]30 hs e piscina ea defuncto illo veniere pisces.

murenarum vivarium privatim excogitavit ante alios c. hirrius, qui cenis triumphalibus caesaris dictatoris sex milia numero murenarum mutua appendit. nam permutare quidem pretio noluit aliave merce. huius villam infra quam modicam [30x1]30 piscinae vendiderunt. invasit dein singulorum piscium amor. apud baulos in parte baiana piscinam habuit hortensius orator, in qua murenam adeo dilexit, ut exanimatam flesse credatur. in eadem villa antonia drusi murenae, quam diligebat, inaures addidit, cuius propter famam nonnulli baulos videre concupiverunt.

coclearum vivaria instituit fulvius lippinus in tarquiniensi paulo ante civile bellum quod cum pompeio magno gestum est, distinctis quidem generibus earum, separatim ut essent albae, quae in reatino agro nascuntur, separatim illyricae, quibus magnitudo praecipua, africanae, quibus fecunditas, solitanae, quibus nobilitas. quin et saginam earum commentus est sapa et farre aliisque generibus, ut cocleae quoque altilis ganeam implerent: cuius artis gloria in eam magnitudinem perductas, ut lxxx quadrantis caperent singularum calices, auctor est M. Varro.

piscium genera etiamnum a theophrasto mira produntur. circa babylonis

rigua decedentibus fluviis in cavernis aquas habentibus remanere quosdam, inde exire ad pabula pinnulis gradientes crebro caudae motu, contraque venantes refugere in suas cavernas et in his obversos stare; capita eorum esse ranae marinae similia, reliquas partes gobionum, branchias ut ceteris piscibus. circa heracleam et cromnam et multifariam in ponto unum genus esse quod extremas fluminum aquas sectetur cavernasque sibi faciat in terra atque in his vivat, etiam reciprocis amnibus siccato litore; effodi ergo, motu demum corporum vivere eos adprobante. circa eandem heracleam eodemque lyco amne decedente ovis relictis in limo generari pisces, qui ad pabula petenda palpitent exiguis branchiis, quo fieri non indigos umoris, propter quod et anguillas diutius vivere exemptas aquis, ova autem in sicco maturari ut testudinum. eadem in ponti regione adprehendi glacie piscium maxime gobiones non nisi patinarum calore vitalem motum fatentes. et in his quidem, tametsi mirabilis, est tamen aliqua ratio. idem tradit in paphlagonia effodi pisces gratissimos cibus terrenos altis scrobibus in iis locis, in quibus nullae restagnent aquae, miraturque et ipse gigni sine coitu: umoris quidem vim aliquam inesse quam puteis arbitratur, ceu vero in ullis reperiantur pisces. quicquid est hoc, certe minus admirabilem talparum facit vitam, subterranei animalis, nisi forte vermium terrenorum et his piscibus natura inest.

verum omnibus his fidem nili inundatio adfert omnia excedente miraculo. quippe detegente eo muscoli reperiuntur inchoato opere genitalis aquae terraeque, iam parte corporis viventes, novissima effigie etiamnum terrena.

nec de anthia pisce sileri convenit quae plerosque adverto credidisse. chelidonias insulas diximus asiae scopulosi maris ante promunturium tauri sitas; ibi frequens hic piscis et celeriter capitur uno genere. parvo navigio et concolori veste eademque hora per aliquot dies continuos piscator enavigat certo spatio escamque proicit. quicquid vero mutetur, suspecta fraus praedae est, cavetque quod timuit. cum id saepe factum est, unus aliquande consuetudine invitatus anthias escam adpetit. notatur hic intentione diligenti ut auctor spei conciliatorque capturae; neque est difficile, cum per aliquot dies solus accedere audeat. tandem et aliquos invenit paulatimque comitatio postremo greges adducit innumeros, iam vetustissimis quibusque adsuets piscatorem agnoscere et e manu cibum rapere. tum ille paulum ultra digitos in esca iaculatus hamum singulos involat verius quam capit, ab umbra navis brevi conatu rapiens ita ne ceteri sentiant, alio intus excipiente centonibus raptum, ne palpitatio ulla aut sonus ceteros abigat. conciliatorem nosse ad hoc prodest, ne capiatur, fugituro in reliquum grege. ferunt discordem socium duci insidiatum pulchre noto cepisse malefica voluntate; agnitum in macello socio, cuius iniuria erat, et damni formulam editam condemnatumque addit mucianus aestimata lite. iidem anthiae, cum unum hamo teneri viderint, spinis, quas in dorso serratas habent, lineam secare traduntur, eo qui teneatur extendente, ut praecidi possit. at inter sargos ipse qui tenetur ad scopulos lineam terit.

praeter haec claros sapientia auctores video mirari stellam in mari. ea

figura est, parva admodum caro intus, extra duriore callo. huic tam igneum fervorem esse tradunt, ut omnia in mari contacta adurat, omnem cibum statim peragat. quibus sit hoc cognitum experimentis haut facile dixerim, multoque memorabilius duxerim id cuius experiendi cotidie occasio est.

concharum e genere sunt dactyli, ab humanorum unguium similitudine appellati. his natura in tenebris remoto lumine alio fulgere claro et, quanto magis umorem habeant, lucere in ore mandentium, lucere in manibus atque etiam in solo ac veste decidentibus guttis, ut procul dubio pateat, suci illam naturam esse, quam miraremur etiam in corpore.

sunt et inimiciarum atque concordiae miracula. mugil et lupus mutuo odio flagrant, conger et murena caudam inter se praerodentes. polypum in tantum locusta pavet, ut, si iuxta vidit omnino, moriatur, locustam conger; rursus polypum congrui lacerant. nigidius auctor est praerodere caudam mugili lupum eosdemque statis mensibus concordēs esse; omnes autem vivere, quibus caudae sic amputentur. at e contrario amicitiae exempla sunt, praeter illa quorum diximus societatem, ballaena et musculus, quando praegravi superciliorum pondere obrutis eius oculis infestantia magnitudinem vada prae-natans demonstrat oculorumque vice fungitur.

hinc volucrum naturae dicentur.

LIBER X

sequitur natura avium, quarum grandissimi et paene bestiarum generis struthocameli africi vel aethiopici altitudinem equitis insidentis equo excedunt, celeritatem vincunt, ad hoc demum datis pinnis, ut currentem adiuvent. cetero non sunt volucres nec a terra attolluntur. ungulae iis cervinis similes, quibus dimicant, bisulcae et comprehendendis lapidibus utiles, quos in fuga contra sequentes ingerunt pedibus. concoquendi sine dilectu devorata mira natura, sed non minus stoliditas in tanta reliqui corporis altitudine, cum colla frutice occultaverint, latere sese existimantium. praemia ex iis ova, propter amplitudinem pro quibusdam habita vasis, conosque bellicos et galeas adornantes pinnae.

aethiopes atque indi discolores maxime et inenarrabiles ferunt aves et ante omnes nobilem arabiae phoenicem, haud scio an fabulose, unum in toto orbe nec visum magno opere. aquilae narratur magnitudine, auri fulgore circa colla, cetero purpureus, caeruleam roseis caudam pinnis distinguentibus, cristis fauces caputque plumeo apice honestante. primus atque diligentissime togatorum de eo prodidit manilius, senator ille maximis nobilis doctrinis doctore nullo: neminem extitisse qui viderit vescentem, sacrum in arabia soli esse, vivere annis dxi, senescentem casiae turisque surculis construere nidum, replere odoribus et superemori. ex ossibus deinde et medullis eius nasci primo ceu vermiculum, inde fieri pullum, principioque iusta funera priori reddere et totum deferre nidum prope panchaiam in solis urbem et in ara ibi deponere. cum huius alitis vita magni conversionem anni fieri prodit idem manilius iterumque significationes tempestatum et siderum easdem reverti, hoc autem circa meridiem incipere quo die signum arietis sol intraverit, et fuisse eius conversionis annum prodente se p. licinio cn. cornelio cos. ccxv. cornelius valerianus phoenicem devolvavisse in aegyptum tradit q. plautio sex. papinio cos. allatus est et in urbem claudii principis censura anno urbis dccc et in comitio propositus, quod actis testatum est, sed quem falsum esse nemo dubitaret.

ex his quas novimus aquilae maximus honos, maxima et vis. sex earum genera. melanae+tos a graecis dicta, eadem leporaria, minima magnitudine, viribus praecipua, colore nigricans, sola aquilarum fetus suos alit - ceterae, ut dicemus, fugant - , sola sine clangore, sine murmuratione. conversatur autem in montibus, secundi generis pygargus in oppidis et in campis, albicante cauda. tertii morphnos, quam homerus et percnum vocat, aliqui et plangum et anatariam, secunda magnitudine et vi; huic vita circa lacus. phemonoe, apollinis dicta filia, dentes esse ei prodidit, mutae alias carentique lingua, eandem aquilarum nigerrimam, prominentiore cauda; consensit et boeus. huius ingenium est et testudines raptas frangere e sublimi iaciendo, quae fors interemit poetam aeschylum, praedictam fatis, ut ferunt, eius diei ruinam secura caeli fide caventem. quarti generis est percnopterus, eadem oripelargus,

vulturina specie, alis minimis, reliqua magnitudine antecellens, sed inbellis et degener, ut quam verberet corvus; eadem ieiunae semper aviditatis et querulae murmurationis. sola aquilarum exanima fert corpora; ceterae, cum occidere, considunt. haec facit, ut quintum genus γνῆσιον vocetur velut verum solumque incorruptae originis, media magnitudine, colore subrutilo, rarum conspectu. superest haliae+tos, clarissima oculorum acie, librans ex alto sese visoque in mari pisce praeceps in eum ruens et discussis pectore aquis rapiens. illa, quam tertiam fecimus, aquaticas aves circa stagna adpetit mergentes se subinde, donec sopitas lassatasque rapiat. spectanda dimicatio, ave ad perfugia litorum tendente, maxime si condensa harundo sit, aquila inde ictu abigente alae et, cum adpetiit in lacu, scandente umbramque suam nanti sub aquam a litore ostendente, rursus ave in diverso et ubi minime se credat expectari emergente. haec causa gregatim avibus natandi, quia plures simul non infestantur respersu pinnarum occaecantes. saepe et aquilae ipsae, non tolerantes pondus adprehensum, una merguntur. haliae+tus tantum inplumes etiamnum pullos suos percutiens subinde cogit adversos intueri solis radios et, si coniventem umectantemque animadvertit, praecipitat e nido velut adulterinum atque degenerem. illum, cuius acies firma contra stetit, educat. haliae+ti suum genus non habent, sed ex diverso aquilarum coitu nascuntur. id quidem, quod ex his natum est, in ossifragis genus habet, e quibus vultures minores progenerantur et ex his magni, qui omnino non generant. quidam adiciunt genus aquilae quam barbatam vocant, tusci vero ossifragam.

tribus primis et quinto aquilarum generi inaedificatur nido lapis ae+tites, quem aliqui dixere gagiten, ad multa remedia utilis, nihil igne deperdens. - est autem lapis iste praegnans intus alio, cum quatiās, velut in utero sonante. - sed vis illa medica non nisi nido dereptis. nidificant in petris et arboribus, pariunt et ova terna, excludunt pullos binos; visi sunt et tres aliquando. alterum expellunt taedio nutriendi. quippe eo tempore ipsis cibum negavit natura, prospiciens ne omnium ferarum fetus raperentur. unguēs quoque earum invertuntur diebus his, albescunt inedia pinnae, ut merito partus suos oderint. sed eiectos ab iis cognatum genus ossifragi excipiunt et educant cum suis. verum adultos quoque persequitur parens et longe fugat, aemulos scilicet rapinae. et alioqui unum par aquilarum magno ad populandum tractu, ut satietur, indiget. determinant ergo spatia nec in proximo praedantur. rapta non protinus ferunt, sed primo deponunt expertaeque pondus tunc demum abeunt. - oppetunt non senio nec aegritudine, sed fame, in tantum superiore adcrecente rostro, ut aduncitas aperiri non queat. - a meridiano autem tempore operantur et volant; prioribus horis diei, donec impleantur hominum conventu fora, ignavae sedent. aquilarum pinnae mixtas reliquarum alitum pinnas devorant. negant umquam solam hanc alitem fulmine exanimatam; ideo armigeram iovis consuetudo iudicavit.

romanis eam legionibus gaius marius in secundo consulatu suo proprie dicavit. erat et antea prima cum quattuor aliis: lupi, minotauri, equi aprique singulos ordines anteibant. paucis ante annis sola in aciem portari coepta erat,

reliqua in castris relinquebantur; marius in totum ea abdicavit. ex eo notatum, non fere legionis umquam hiberna esse castra ubi aquilarum non sit iugum.

primo et secundo generi non minorum tantum quadripedum rapina, sed etiam cum cervis proelia. multum pulverem volutatu collectum insidens cornibus excutit in oculos, pinnis verberans, donec praecipitet in rupes. nec unus hostis illi satis: est acrior cum dracone pugna multoque magis anceps, etiamsi in ae+re. ova hic consecratur aquilae aviditate melefica. aquila ob hoc rapit ubicumque visum, ille multiplici nexu alas ligat, ita se implicans, ut simul decidat ipse.

celebris apud seston urbem aquilae gloria est: educatam a virgine retulisse gratiam aves primo, mox deinde venatus adgerentem, defuncta postremo in rogam accensum eius iniecisse sese et simul conflagrasse. quam ob causam incolae quod vocant heroum in eo loco fecere, appellatum iovis et virginis, quoniam illi deo ales adscribitur.

vulturum praevalent nigri. nidos nemo attigit; ideo et fuere qui putarent illos ex adverso orbe advolare. falso: nidificant in excelsissimis rupibus; fetus quidem saepe cernuntur, fere bini. vmbricius, haruspicum in nostro aevo peritissimus, parere tradit ova xiii, uno ex his reliqua ova nidumque lustrare, mox abicere. triduo autem ante advolare eos, ubi cadavera futura sunt.

sanqualem avem atque inmusulum augures romani magnae quaestioni habent. inmusulum aliqui vulturis pullum arbitrantur esse et sanqualem ossifragum. masurius sanqualem ossifragam esse dicit, inmusulum autem pullum aquilae prius quam albicet cauda. quidam post mucium augurem visos non esse romae confirmavere; ego, quod veri similis, in desidia rerum omnium arbitror non agnitos.

accipitrum genera sedecim invenimus, ex his aegithum, claudum altero pede, prosperrimi augurii nuptialibus negotiis et pecuariae rei; triorchem a numero testium, cui principatum in auguriis phemonoe dedit. buteonem hunc appellant romani, familia etiam cognominata, cum prospero auspicio in ducis navi sedisset. epileum graeci vocant qui solus omni tempore apparet; ceteri hieme abeunt. distinctio generum ex aviditate: alii non nisi e terra rapiunt avem, alii non nisi circa arbores volitantem, alii sedentem in sublimi, aliqui volantem in aperto. itaque et columbae novere ex his pericula visoque considunt vel subvolant, contra naturam eius auxiliantes sibi. in insula africae cerne in oceano accipitres totius masaesyliae humi fetificant nec alibi nascuntur, illis adsueti gentibus.

in thraciae parte super amphipolim homines et accipitres societate quadam aucupantur. hi ex silvis et harundinetis excitant aves, illi supervolantes deprimunt rursus; captas aucupes dividunt cum iis. traditum est missas in sublime sibi excipere eos et, cum sit tempus capturae, clangore ac volatus genere invitare ad occasionem. simile quiddam lupi ad maeotim paludem faciunt. nam nisi partem a piscantibus suam acceperere, expansa eorum retia lacerant.

accipitres avium non edunt corda. nocturnus accipiter cybindis vocatur,

rarus etiam in silvis, interdiu minus cernens. bellum internecivum gerit cum aquila, cohaerentesque saepe prenduntur.

coccyx videtur ex accipitre fieri, tempore anni figuram mutans, quoniam tunc non apparent reliqui nisi perquam paucis diebus. ipse quoque, modico tempore aestatis visus, non cernitur postea. est autem neque aduncis unguibus, solus accipitrum, nec capite similis illis neque alio quam colore, ac visu columbi potius; quin et absumitur ab accipitre, si quando una apparuere, sola omnium avis a suo genere interempta. mutat autem et vocem. procedit vere, occultatur caniculae ortu, inter quae parit in alienis nidis, maxime palumbium, maiore ex parte singula ova, quod nulla alia avis, raro bina. causa pullos subiciendi putatur quod sciat se invisam cunctis avibus; nam minutae quoque infestant. ita non fore tutam generi suo stirpem opinatur, ni fefellerit; quare nullum facit nidum, alioqui trepidum animal. educat ergo subditum adulterato feta nido. ille, avidus ex natura, praeripit cibos reliquis pullis, itaque pinguescit et nitidus in se nutricem convertit. illa gaudet eius specie miraturque sese ipsam, quod talem pepererit; suos comparatione eius damnat ut alienos absumique etiam se inspectante patitur, donec corripiat ipsam quoque, iam volandi potens. nulla tunc avium suavitate carnis comparatur illi.

milui ex eodem accipitrum genere magnitudine differunt. notatum in his, rapacissimam et famelicam semper alitem nihil esculenti rapere umquam e funerum ferculis nec olympiae ex ara ac ne ferentium quidem manibus nisi lugubri municipiorum immolantium ostento. iidem videntur artem gubernandi docuisse caudae flexibus, in caelo monstrante natura quod opus esset in profundo. milui et ipsi hibernis mensibus latent, non tamen ante hirundinem abeuntes. traduntur autem et a solstitiis adfici podagra.

volucrum prima distinctio pedibus maxime constat: aut enim aduncos ungues habent aut digitos, aut palmipedum in genere sunt, uti anseres et aquaticae fere aves. aduncos ungues habentia carne tantum vescuntur ex parte magna; cornices et alio pabulo, ut quae duritiam nucis rostro repugnantem volantes in altum in saxa tegulasve iaciant iterum ac saepius, donec quassatam perfringere queant. ipsa ales est inauspicatae garrulitatis, a quibusdam tamen laudata. ab arcturi sidere ad hirundinum adventum notatur eam in minervae lucis templisque raro, alicubi omnino non aspici, sicut athenis; inauspicatissima fetus tempore, hoc est post solstitium. praeterea sola haec etiam volantes pullos aliquamdiu pascit. ceterae omnes ex eodem genere pellunt nidis pullos ac volare cogunt, sicut et corvi, qui et ipsi non carne tantum aluntur. sed robustos quoque fetus suos fugant longius; itaque parvis in vicis non plus bina coniugia sunt, circa crannonem quidem thessaliae singula perpetuo. genitores suboli loco cedunt.

diversa in hac et supradicta alite quaedam. corvi ante solstitium generant; iidem aegrescunt sexagenis diebus, siti maxime, ante quam fici coquantur autumno. cornix ab eo tempore corripitur morbo.

corvi pariunt, cum plurimum, quinos. ore eos parere aut coire vulgus arbitratur ideoque gravidas, si ederint corvinum ovum, per os partum reddere

atque in totum difficulter parere, si tecto inferantur. aristoteles negat: non hercule magis quam in aegypto ibim, sed illam exosculationem, quae saepe cernitur, qualem in columbis esse. corvi in auspiciis soli videntur intellectum habere significationum suarum. nam cum medi hospites occisi sunt, omnes e peloponneso et attica regione volaverunt. pessima eorum significatio, cum glutiunt vocem velut strangulati.

vincos unguis et nocturnae aves habent, ut noctuae, bubo, ululae. omnium horum hebetes interdum oculi. bubo, funebris et maxime abominatus publicis praecipue auspiciis, deserta incolit nec tantum desolata, sed dira etiam et inaccessa, noctis monstrum, nec cantu aliquo vocalis, sed gemitu. itaque in urbibus aut omnino in luce visus dirum ostentum est. privatorum domibus insidentem plurimum scio non fuisse feralem. volat numquam quo libuit, sed transversus aufertur. capitolii cellam ipsam intravit sexto palpellio histro l. pedanio cos., propter quod nonis martiis urbs lustrata est eo anno.

inauspicata est et incendiaria avis, quam propter saepenumero lustratam urbem in annalibus invenimus, sicut l. cassio c. mario cos., quo anno et bubone viso lustratam esse. quae sit avis ea, non reperitur nec traditur. quidam ita interpretantur, incendiariam esse quaecumque apparuerit carbonem ferens ex aris vel altaribus; alii spinturnicem eam vocant, sed haec ipsa quae esset inter aves, qui se scire diceret non inveni. cliviam quoque avem ab antiquis nominatam animadverto ignorari - quidam clamatoriam dicunt, labeo prohibitoriam - , et apud nigridium super appellatur avis, quae aquilarum ova frangat. sunt praeterea complura genera depicta in etrusca disciplina saeculis non visa, quae nunc defecisse mirum est, cum abundant etiam quae gula humana populatur.

externorum de auguriis peritissime scripsisse hylas nomine putatur. is tradit noctuam, bubonem, picum arbores cavantem, trygonem, cornicem a cauda de ovo exire, quoniam pondere capitum perversa ova posteriorem partem corporum fovendam matri adplicent.

noctuarum contra aves sollers dimicatio. maiore circumdatae multitudine resupinae pedibus repugnant collectaeque in artum rostro et unguibus totae teguntur. auxiliatur accipiter collegio quodam naturae bellumque partitur. noctuas sexagenis diebus hiemis cubare et novem voces habere tradit nigridius.

sunt et parvae aves uncorum unguium, ut pici martio cognomine insignes et in auspiciis magni. quo in genere arborum cavatores scandentes in subrectum felium modo, illi vero et supini, percussi corticis sono pabulum subesse intellegunt. pullos in cavis educant avium soli. adactos cavernis eorum a pastore cuneos admota quadam ab iis herba elabi creditur vulgo. trebius auctor est clavum cuneumve adactum quanta libeat vi arbori, in qua nidum habeat, statim exilire cum crepitu arboris, cum insederit clavo aut cuneo. ipsi principales latio sunt in auguriis a rege qui nomen huic avi dedit. unum eorum praescitum transire non queo. in capite praetoris urbani aelii tuberionis in foro iura pro tribunali reddentis sedit ita placide, ut manu prehenderetur. respondere vates exitium imperio portendi, si dimitteretur, at si

exanimaretur, praetori. et ille avem protinus concerpsit nec multo post implevit prodigium.

vlescuntur et glande in hoc genere pomisque multae, sed quae carne tantum, non bibunt, excepto miluo, quod ipsum in auguriis dirum est. uncus unguis habentes omnino non congregantur et sibi quaeque praedantur. sunt autem omnes fere altivolae praeter nocturnas, et magis maiores. omnibus alae grandes, corpus exiguum. ambulant difficulter; in petris raro consistunt curvatura unguum prohibente.

nunc de secundo genere dicamus, quod in duas dividitur species, oscines et alites. illarum generi cantus oris, his magnitudo differentiam dedit; itaque praecedent et ordine, omnesque reliquas in iis pavonum genus cum forma tum intellectu eius et gloria. gemmantes laudatus expandit colores, adverso maxime sole, quia sic fulgentius radiant. simul umbrae quosdam repercussus ceteris, qui et in opaco clarius micant, conchata quaerit cauda omnesque in acervum contrahit pinnarum quos spectari gaudet oculos. idem cauda annuis vicibus amissa cum foliis arborum, donec renascatur alia cum flore, pudibundus ac maerens quaerit latebram. vivit annis xxv. colores fundere incipit in trimatu. ab auctoribus non gloriosum tantum animal hoc traditur, sed et malivolum, sicut anserem verecundum, quoniam has quoque quidam addiderunt notas in iis, haut probatas mihi.

pavonem cibi gratia romae primus occidit orator hortensius aditiali cena sacerdotii. saginare primus instituit circa novissimum piraticum bellum m. aufidius lurco exque eo quaestu reditus hs sexagena milia habuit.

proxime gloriam sentiunt et hi nostri vigiles nocturni, quos excitandis in opera mortalibus rumpendoque somno natura genuit. norunt sidera et ternas distinguunt horas interdiu cantu. cum sole eunt cubitum quartaque castrensi vigilia ad curas laboremque revocant nec solis ortum incautis patiuntur obrepere diemque venientem nuntiant cantu, ipsum vero cantum plausu laterum. imperitant suo generi et regnum in quacumque sunt domo exercent. dimicatione paritur hoc inter ipsos velut ideo tela agnata cruribus suis intelligentium, nec finis saepe commorientibus. quod si palma contigit, statim in victoria canunt seque ipsi principes testantur; victus occultatur silens aegreque servitium patitur. et plebs tamen aequae superba graditur ardua cervice, cristis celsa, caelumque sola volucrum aspicit crebra, in sublime caudam quoque falcata erigens. itaque terrori sunt etiam leonibus ferarum generosissimis. iam ex his quidam ad bella tantum et proelia adsidua nascuntur - quibus etiam patrias nobilitarunt, rhodum aut tanagram; secundus est honos habitus melicis et chalcidicis - , ut plane dignae aliti tantum honoris perhibeat romana purpura. horum sunt tripudia solistima, hi magistratus nostros cotidie regunt domusque ipsis suas claudunt aut reserant. hi fasces romanos inpellunt aut retinent, iubent acies aut prohibent, victoriarum omnium toto orbe partarum auspices. hi maxime terrarum imperio imperant, extis etiam fibrisque haut aliter quam opimae victimae diis grati. habent ostenta et praeposteri eorum vespertinique cantus: namque totis noctibus

canendo boeotiis nobilem illam adversus lacedaemonios praesagivere victoriam, ita coniecta interpretatione, quoniam victa ales illa non caneret.

desinunt canere castrati, quod duobus fit modis, lumbis adustis candente ferro aut imis cruribus, mox ulcere oblito figlina creta; facilius ita pinguescunt. pergami omnibus annis spectaculum gallorum publice editur ceu gladiatorum. invenitur in annalibus in agro ariminensi m. lepidio q. catulo cos. in villa galerii locutum gallinaceum, semel, quod equidem sciam.

et anseri vigil cura capitolio testata defenso, per id tempus canum silentio proditis rebus, quam ob causam cibaria anserum censores in primis locant. quin et fama amoris aegii dilecta forma pueri nomine ... olenii et glauces ptolemaeo regi cithara canentis, quam eodem tempore et aries amasse proditur. potest et sapientiae videri intellectus iis esse: ita comes perpetuo adhaesisse lacydi philosopho dicitur, nusquam ab eo, non in publico, non in balineis, non noctu, non interdiu, digressus.

nostri sapientiores, qui eos iecoris bonitate novere. fartilibus in magnam amplitudinem crescit, exemptum quoque lacte mulso augetur. nec sine causa in quaestione est, quis tantum bonum invenerit, scipio metellus vir consularis an marcus seiurus eadem aetate eques romanus. sed, quod constat, messalinus cotta, messalae oratoris filius, palmas pedum ex iis torrere atque patinis cum gallinaceorum cristis condire repperit; tribuetur enim a me culinibus cuiusque palma cum fide. mirum in hac alite a morinis usque romam pedibus venire. fessi proferuntur ad primos; ita ceteri stipatione naturali propellunt eos.

candidorum alterum vectigal in pluma. velluntur quibusdam locis bis anno, rursus plumigeri vestiuntur. mollior quae corpori proxima, et e germania laudatissima. candidi ibi, verum minores; gantae vocantur. pretium plumae eorum in libras denarii quini. et inde crimina plerumque auxiliorum praefectis, a vigili statione ad haec aucupia dimissis cohortibus totis; eoque deliciae processere, ut sine hoc instrumento durare iam ne virorum quidem cervices possint.

aliud repperit syriae pars quae commagene vocatur, adipem eorum in vase aereo cum cinnamo nive multa obrutum ac rigore gelido maceratum ad usum praeclari medicaminis, quod ab gente dicitur commagenum.

anserini generis sunt chenalopeces et, quibus lautiores epulas non novit britannia, chenerotes, fere ansere minores. decet tetraonas suos nitor absolutaque nigritia, in superciliis cocci rubor. alterum eorum genus vulturum magnitudinem excedit, quorum et colorem reddit, nec ulla ales, excepto struthocamelo, maius corpore implens pondus, in tantum aucta, ut in terra quoque immobilis prehendatur. gignunt eos alpes et septentrionalis regio. in vivariis saporem perdunt. moriuntur contumacia spiritu revocato. proximae iis sunt quas hispania aves tardas appellat, graecia ὄριδας, damnatas in cibis; emissa enim ossibus medulla odoris taedium extemplo sequitur.

indutias habet gens pygmaea abscessu gruum, ut diximus, cum iis dimicantium. immensus est tractus, quo veniunt, si quis reputet, a mari eoo. quando proficiscantur consentiunt; volant ad prospiciendum alte, ducem quem

sequantur eligunt, in extremo agmine per vices qui adclament dispositos habent et qui gregem voce contineant. excubias habent nocturnis temporibus lapillum pede sustinentes, qui laxatus somno et decidens indiligentiam coarguat; ceterae dormiunt, capite subter alam condito alternis pedibus insistentes. dux erecto providet collo ac praedicat. eadem mansuefactae lasciviunt gyrosque quosdam indecoro cursu vel singulae peragunt. certum est, pontum transvolaturas primum omnium angustias petere inter duo promunturia criu metopon et carambim, mox saburra stabiliri; cum medium transierint, abici lapillos e pedibus, cum attigerint continentem, et e gutture harenam. cornelius nepos, qui Divi Augusti principatu obiit, cum scriberet turdos paulo ante coeptos saginari, addidit ciconias magis placere quam grues, cum haec nunc ales inter primas expetatur, illam nemo velit attingisse.

ciconiae quonam e loco veniant aut quo se referant, inconpertum adhuc est. e longinquo venire non dubium eodem quo grues modo, illas hiemis, has aestatis advenas. abiturae congregantur in loca certa comitataeque sic, ut nulla generis sui relinquatur nisi captiva et serva, ceu lege praedicta die recedunt. nemo vidit agmen discedentium, cum discessurum appareat, nec venire, sed venisse cernimus. utrumque nocturnis fit temporibus, et quamvis ultra citrave pervolent, numquam tamen advenisse usquam nisi noctu existimantur. pythons comen vocant in asia patentibus campis, ubi congregatae inter se commurmurant eamque, quae novissima advenit, lacerant atque ita abeunt. notatum post idus augustas non temere visas ibi. sunt qui ciconiis non inesse linguam confirmant. honos iis serpentium exitio tantus, ut in thessalia capital fuerit occidis eademque legibus poena, quae in homicidam.

simili anseres quoque et olores ratione commeant, sed horum volatus cernitur. liburnicarum more rostrato impetu feruntur, facilius ita findentes aëra quam si recta fronte inpellerent; a tergo sensim dilatante se cuneo porrigitur agmen largeque inpellenti praebetur aurae. colla inponunt praecedentibus, fessos duces ad terga recipiunt. - (ciconiae nidos eosdem repetunt, geneticum senectam invicem educant) - olorum morte narratur flebilis cantus, falso, ut arbitror, aliquot experimentis. iidem mutua carne vescuntur inter se.

verum haec commeantium per maria terrasque peregrinatio non patitur differri minores quoque, quibus est natura similis. utcumque enim supra dictas magnitudo et vires corporum invitare videri possint, coturnices ante etiam semper adveniunt quam grues, parva avis et, cum ad nos venit, terrestris potius quam sublimis. advolant et hae simili modo, non sine periculo navigantium, cum adpropinquavere terris. quippe velis saepe incidunt, et hoc semper noctu, merguntque navigia. iter est iis per hospitia certa. austro non volant, umido scilicet et graviore vento; aura tamen vehi volunt propter pondus corporum viresque parvas - hinc volantium illa conquestio labore expressa - , aquilone ergo maxime volant, ortygometra duce. primam earum terrae adpropinquantem accipiter rapit. semper hic remeantes comitatum sollicitant, abeuntque una persuasae glottis et otus et cychramus. glottis

praelongam exerit linguam, unde ei nomen. hanc initio blandita peregrinatione avidè profectam paenitentia in volatu cum labore scilicet subit: reverti incomitatum piget et sequi nec umquam plus uno die pergit, in proximo hospitio deserit. verum invenitur alia antecedente anno relicta simili modo in singulos dies. cychramus perseverantior festinat etiam pervenire ad expetitas sibi terras. itaque noctu is eas excitat admonetque itineris. otus bubone minor est, noctuis maior, auribus plumeis eminentibus, unde et nomen illi - quidam latine axionem vocant - , imitatrix alias avis ac parasita et quodam genere saltatrix. capitur haut difficulter ut noctuae, intentam in aliquem circumeunte alio. quod si ventus agmen adverso flatu coepit inhibere, pondusculis lapidum adprehensis aut gutture harena repleto stabilitae volant. coturnicibus veneni semen gratissimus cibus, quam ob causam eas damnavere mensae, simulque comitalem propter morbum despui suetum, quem solae animalium sentiunt praeter hominem.

abeunt et hirundines hibernis mensibus, sola carne vescens avis ex iis quae aduncos ungues non habent. sed in vicina abeunt apricos secutae montium recessus, inventaeque iam sunt ibi nudaе atque deplumes. thebarum tecta subire negantur, quoniam urbs illa saepius capta sit, nec bizyes in threcia propter scelera terei. caecina volaterranus equestris ordinis, quadrigarum dominus, comprehensas in urbem secum auferens victoriae nuntias amicis mittebat in eundem nidum remeantes inlito victoriae colore. tradit et fabius pictor in annalibus suis, cum obsideretur praesidium romanum a ligustinis, hirundinem a pullis ad se adlatam, ut lino ad pedem eius adligato nodis significaret, quoto die adveniente auxilio eruptio fieri deberet.

abeunt et merulae turdique et sturni simili modo in vicina. sed hi plumam non amittunt nec occultantur, visi saepe ibi quo hibernum pabulum petunt; itaque in germania hieme maxime turdi cernuntur. verius turtur occultatur pinnasque amittit. abeunt et palumbes; quoniam et in his incertum. sturnorum generi proprium catervatim volare et quodam pilae orbe circumagi, omnibus in medium agmen tendentibus. volucrum soli hirundini flexuosi volatus velox celeritas, quibus ex causis neque rapinae ceterarum alitum obnoxia est. eadem sola avium non nisi in volatu pascitur.

temporum magna differentia avibus: perennes, ut columbae, semenstres, ut hirundines, trimenstres, ut turdi, turtures, et quae, cum fetum eduxere, abeunt, ut galguli, upupae.

auctores sunt omnibus annis advolare ilium ex aethiopia aves et conflare ad memnonis tumulum, quas ob id memnonidas vocant. hoc idem quinto quoque anno facere eas in aethiopia circa regiam memnonis, exploratum sibi cremutius tradit. simili modo pugnant meleagrides in boeotia. africae hoc est gallinarum genus, gibberum, variis sparsum plumis. quae novissimae sunt peregrinarum avium in mensas receptae propter ingratum virus; verum meleagri tumulus nobiles eas fecit.

seleucides aves vocantur quarum adventum ab iove precibus inpetrant cadmi montis incolae, fruges eorum locustis vastantibus. nec unde veniant

quoque abeant compertum, numquam conspectis nisi cum praesidio earum indiget. invocant et aegyptii ibis suas contra serpentium adventum, et elei myiacoren deum muscarum multitudine pestilentiam adferente, quae protinus intereunt quam litatum est ei deo.

sed in secessu avium et noctuae paucis diebus latere traduntur, quarum genus in creta insula non esse, etiam, si qua invecta sit, emori. nam haec quoque mira naturae differentia: alia aliis locis negat, tamquam genera frugum fruticumve, sic et animalium; non nasci tralaticium, invecta emori mirum. quod illud est unius generis saluti adversum, quaeve ista naturae invidia aut qui terrarum dicti avibus termini rhodos aquilam non habet. transpadana italia iuxta alpes larium lacum appellat amoenum arbusto agro, ad quem ciconiae non permeant, sicuti nec octavum citra lapidem ab eo inmensa alioqui finitimo insubrum tractu examina graculorum monedularum, cui soli avi furacitas argenti auriue praecipue mira est. picus martius in tarentino agro negatur esse. nuper et adhuc tamen rara ab appennino ad urbem versus cerni coepere picarum genera, quae longa insignes cauda variae appellantur; proprium iis calvescere omnibus annis, cum serantur rapa. perdices non transvolant boeotiae fines in attica, nec ulla avis in ponto insula, qua sepultus est achilles, sacratam ei aedem. in fidenate agro iuxta urbem ciconiae nec pullos nec nidum faciunt. at in agrum volaterranum palumbium vis e mari quotannis advolat. romae in aedem herculis in foro boario nec muscae nec canes intrant. multa praeterea similia, quae prudens subinde omitto in singulis generibus, fastidio parcens, quippe cum theophrastus tradat invecticias esse in asia etiam columbas et pavones et cervos et in cyrenaica vocales ranas.

alia admiratio circa oscines. fere mutant colorem vocemque tempore anni ac repente fiunt aliae, quod in grandiore alitum genere grues tantum; hae enim senectute nigrescunt. merula ex nigra rufescit, canit aestate, hieme balbutit, circa solstitium muta. rostrum quoque anniculis in ebur transfiguratur, dumtaxat maribus. turdis colos aestate circa cervicem varius, hieme concoloribus.

lusciniis diebus ac noctibus continuis xv garrulus sine intermisso cantus densante se frondium germine, non in novissimis digna miratu ave. primum tanta vox tam parvo in corpusculo, tam pertinax spiritus; deinde in una perfecta musica scientia: modulatus editur sonus et nunc continuo spiritu trahitur in longum, nunc variatur inflexo, nunc distinguitur conciso, copulatur intorto, promittitur revocato, infuscatur ex inopinato, interdum et secum ipse murmurat, plenus, gravis, acutus, creber, extentus, ubi visum est, vibrans, summus, medius, imus. breviterque omnia tam parvulis in faucibus, quae tot exquisitis tibiaram tormentis ars hominum excogitavit, non ut sit dubium hanc suavitatem praemonstratam efficaci auspicio, cum in ore stesichori cecinit infantis. ac ne quis dubitet artis esse, plures singulis sunt cantus, nec iidem omnibus, sed sui cuique. certant inter se, palamque animosa contentio est. victa morte finit saepe vitam spiritu prius deficiente quam cantu. meditantur aliae iuveniores versusque quos imitentur accipiunt. audit discipula intentione

magna et reddit, vicibusque reticent: intellegitur emendatae correptio et in docente quaedam reprehensio. ergo servorum illis pretia sunt, et quidem ampliora quam quibus olim armigeri parabantur. scio hs [vi] candidam alioqui, quod est prope invisitatum, venisse, quae agrippinae claudi principis coniugi dono daretur. visum iam saepe iussas canere coepisse et cum symphonia alternasse, sicut homines repertos qui sonum earum addita in transversas harundines aqua foramen inspirantes linguaeve parva aliqua opposita mora indiscreta redderent similitudine. sed hae tantae tamque artifices argutiae a xv diebus paulatim desinunt, nec ut fatigatas possis dicere aut satiatis. mox aestu aucto in totum alia vox fit, nec modulata aut varia; mutatur et color. postremo hieme ipsa non cernitur. linguis earum tenuitas illa prima non est quae ceteris avibus. pariunt vere primo, cum plurimum, sena ova.

alia ratio ficedulis, nam formam simul coloremque mutant. hoc nomen autumnno habent, postea melancoryphi vocantur. sic et erithacus hieme, idem phoenicurus aestate. mutat et upupa, ut tradit aeschylus poeta, obscena alias pastu avis, crista visenda plicatili, contrahens eam subrigensque per longitudinem capitis.

oenanthe quidem etiam statos latebrae dies habet. exoriente sirio occultata ab occasu eiusdem prodit, quod miremur, ipsis diebus utrumque. chlorion quoque, qui totus est luteus, hieme non visus, circa solstitia procedit. merulae circa cyllenen arcadiae, nec usquam aliubi, candidae nascuntur. ibis circa pelusium tantum nigra est, ceteris omnibus locis candida.

oscines praeter exceptas non temere fetus faciunt ante aequinoctium vernalis aut post autumnale, ante solstitium autem dubios, post solstitium vitales.

eo maxime sunt insignes halcyones. dies earum partus maria quique navigant novare. ipsa avis paulo amplior passere, colore cyanea et parte inferiore tantum purpurea, candidis admixta pinnis collo, gracili ac procero rostro. alterum genus earum magnitudine distinguitur et cantu: minores in harundinetis canunt. halcyonem videre rarissimum est nec nisi vergiliarum occasu et circa solstitia brumamve, nave aliquando circumvolata statim in latebras abeunt. fetificant bruma, qui dies halcyonides vocantur, placido mari per eos et navigabili, siculo maxime. faciunt autem vii ante brumam diebus nidos et totidem sequentibus pariunt. nidi earum admirationem habent pilae figura paulum eminenti, ore perquam angusto, grandium spongearum similitudine. ferro intercidi non queunt, franguntur ictu valido, ut spuma arida maris. nec unde confingantur invenitur; putant ex spinis aculeatis, piscibus enim vivunt. subeunt et in amnes. pariunt ova quina.

gaviae in petris nidificant, mergi et in arboribus. pariunt plurimum terna, sed gaviae aestate, mergi incipiente vere.

halcyonum nidi figura reliquarum quoque sollertiae admonet, neque alia parte ingenia avium magis admiranda sunt. hirundines luto construunt, stramento roborant. si quando inopia est luti, madefactis multa aqua pinnis

pulverem spargunt; ipsum vero nidum mollibus plumis floccisque consternunt tepefaciendis ovis, simul ne durus sit infantibus pullis. in fetu summa aequitate alternant cibum. notabili munditia egerunt excrementa pullorum adultioresque circumagi docent et foris saturitatem emittere. alterum est hirundinum genus rusticarum et agrestium, quae raro in domibus diversos figura, sed eadem materia confingunt nidos, totos supinos, faucibus porrectis in angustum, utero capaci, mirum qua peritia et occultandis habiles pullis et substernendis molles. in aegypti heracleotico ostio molem continuatione nidorum evaganti nilo inexpugnabilem opponunt stadii fere unius spatium, quod humano opere perfici non posset. in eadem aegypto iuxta oppidum copton insula est sacra isidi, quam ne laceret amnis idem, muniunt opere, incipientibus vernis diebus palea et stramento rostrum eius firmantes, continuatis per triduum noctibus tanto labore, ut multas in opere emori constet; eaque militia illis cum anno redit semper. tertium est earum genus: excavant ripas atque ita internidificant. - (harum pulli ad cinerem ambusti mortifero faucium malo multisque aliis morbis humani corporis medentur) - non faciunt hae nidos migrantque multis diebus ante, si futurum est, ut auctus amnis attingat.

in genere vitiparrarum est cui nidus ex musco arido ita absoluta perficitur pila, ut inveniri non possit aditus. acanthyllis appellatur eadem figura ex lino intexens. picorum aliquis suspenditur surculo primis in ramis cyathi modo, ut nulla quadripes possit accedere. galgulos quidem ipsos dependentes pedibus somnum capere confirmant, quia tutiores ita se sperent. iam publicum quidem omnium est tabulata ramorum sustinendo nido provide eligere, camarare ab imbri aut fronde protegere densa. in arabia cinnamolgi avis appellatur cinnami surculis nidificans; plumbatis eos sagittis decutiunt indigenae mercis gratia. in scythis avis magnitudine otidis binos parit in leporina pelle semper in cacuminibus ramorum suspensa. picae cum diligentius visum ab homine nidum sentire, ova transgerunt alio. hoc in iis avibus, quarum digiti non sint accommodati conplectendis transferendisque ovis, miro traditur modo. namque surculo super bina ova inposito ac feruminato alvi glutino, subdita cervice medio, aequa utrimque libra deportant alio.

nec vero iis minor sollertia, quae cunabula in terra faciunt corporis gravitate prohibita sublimem petere. merops vocatur genitores suos reconditos pascens, pallido intus colore pinnarum, superne cyaneo, priore parte subrutilo. nidificat in specu sex pedum defossa altitudine.

perdices spina et frutice sic muniunt receptaculum, ut contra feram abunde vallentur. ovis stragulum molle pulvere contumulant nec in quo loco peperere incubant: ne cui frequentior conversatio suspecta sit, transferunt alio. illae quidem et maritos suos fallunt, quoniam intemperantia libidinis frangunt earum ova, ne incubando detineantur. tunc inter se dimicant mares desiderio feminarum; victum aiunt venerem pati. id quidem et coturnices trogon et gallinaceos aliquando, perdices vero a domitis feros et novos aut victos iniri promiscue. capiuntur quoque pugnacitate eiusdem libidinis, contra aucupis

inlicem exeunte in proelium duce totius gregis. capto eo procedit alter ac subinde singuli. rursus circa conceptum feminae capiuntur contra aucupum feminam exeuntes, ut rixando abigant eam. nec in alio animali par opus libidinis. si contra mares steterint, feminae aura ab iis flante praegnantem fiunt, hiantes autem exerta lingua per id tempus aestuant. concipiunt et supervolantium adflatu, saepe voce tantum audita masculi, adeoque vincit libido etiam fetus caritatem, ut illa furtim et in occulto incubans, cum sensit feminam aucupis accedentem ad marem, recanat revocetque et ultro praebeat se libidini. rabie quidem tanta feruntur, ut in capite aucupantium saepe caecae motu sedeant. si ad nidum is coepit accedere, procurrit ad pedes eius feta, praegravem aut delumbem sese simulans, subitoque in procursu aut brevi aliquo volatu cadit, ut fracta ala aut pedibus, at procurrit iterum iamiam prehensurum effugiens spemque frustrans, donec in diversum abducat a nidis. eadem in pavore, libera ac materna vacans cura, in sulco resupina glaebe se terrae pedibus adprehensa operit. perdicum vita et ad sedecim annos durare existimatur.

ab iis columbarum maxime spectantur simili ratione mores. inest pudicitia illis plurima et neutri nota adulteria. coniugi fidem non violant communemque servant domum. nisi caelebs aut vidua nidum non relinquit. et imperiosos mares, subinde etiam iniquos ferunt, quippe suspicio est adulterii, quamvis natura non sit: tunc plenum querela guttur saevique rostro ictus, mox in satisfactione exosculatio et circa veneris preces crebris pedum orbibus adulatio. amor utrique subolis aequalis; saepe et ex hac causa castigatio pigrius intrante femina ad pullos. parturienti solatia et ministeria ex mare. pullis primo salsiorem terram collectam gutture in ora inspuunt praeparantes tempestivitatem cibo. proprium generis eius et turturum, cum bibant, colla non resupinare largeque bibere iumentorum modo.

vivere palumbes ad tricensimum annum, aliquas et ad quadragensimum, habemus auctores, uno tantum incommodo unguium - eodem et argumento senectae - , qui citra perniciem reciduntur. cantus omnibus similis atque idem trino conficitur versu praeterque in clausula gemitu, hieme mutis, a vere vocalibus. nigridius putat, cum ova incubet sub tecto, nominatam palumbem relinquere nidos. pariunt autem post solstitium. columbae et turtures octonis annis vivunt. contra passeri minimum vitae, cui salacitas par. mares negantur anno diutius durare argumento, quia nulla veris initio appareat nigritudo in rostro, quae ab aestate incipit. feminis longiusculum spatium. verum columbis inest quidam et gloriae intellectus: nosse credas suos colores varietatemque dispositam; quin etiam ex volatu quaeritur: plaudere in caelo varieque sulcare. qua in ostentatione ut vinctae praebentur accipitri, implicatis strepitu pinnis, qui non nisi ipsis alarum umeris eliditur, alioquin soluto volatu multum velociores. speculatur occultus fronde latro et gaudentem in ipsa gloria rapit. ob id cum iis habenda est avis quae tinnungulus vocatur; defendit enim illas terretque accipitres naturali potentia in tantum, ut visum vocemque eius fugiant. hac de causa praecipuus columbis amor eorum, feruntque, si in

quattuor angulis defodiuntur in ollis novis oblitis, non mutare sedem columbas - quod et auro insectis alarum articulis quaesivere aliqui, non aliter innoxiiis vulneribus - , multivaga alioqui ave. est enim ars illis inter se blandiri et corrumpere alias furtoque comitatiores reverti. quin et internuntiae in magnis rebus fuere, epistulas adnexas earum pedibus obsidione mutinensi in castra consulum Decumo Bruto mittente. quid vallum et vigil obsidio atque etiam retia in amne praetenta profuere antonio, per caelum eunte nuntio et harum amore insaniunt multi. super tecta exaedificant turres iis nobilitatemque singularum et origines narrant, vetere iam exemplo. l. axius eques romanus ante bellum civile pompeianum denariis cccc singula paria venditavit, ut M. Varro tradit. quin et patriam nobilitavere in campania grandissimae provenire existimatae.

harum volatus in reputationem ceterarum quoque volucrum inpellit. omnibus animalibus reliquis certus et unius modi et in suo cuique genere incessus est; aves solae vario meatu feruntur et in terra et in ae+re. ambulant aliquae, ut cornices; saliant aliae, ut passeress, merulae; currunt, ut perdices, rusticulae; ante se pedes iaciunt, ut ciconiae, grues. expandunt alas pendentesque raro intervallo quatunt, aliae crebrius, sed et primas dumtaxat pinnas, aliae tota latera plaudunt; quaedam vero maiore ex parte compressis volant percussoque semel, aliquae et gemino ictu, ae+re feruntur: velut inclusum eum prementes eiacularantur sese in sublime, in rectum, in pronum. impingi putes aliquas aut rursus ab alto cadere has, illas salire. anates solae quaeque sunt eiusdem generis in sublime protinus sese tollunt atque e vestigio caelum petunt, et hoc etiam ex aqua. itaque in foveas, quibus feras venamur, delapsae solae evadunt. vultur et fere graviores nisi ex procursu aut altiore cumulo inmissae non evolant; cauda reguntur. aliae circumspiciunt, aliae flectunt colla, nec ullae vescuntur ea quae rapuere pedibus. sine voce non volant multae, aut e contrario semper in volatu silent. subrectae, praeae, obliquae in latera, in ora, quaedam et resupinae feruntur, ut, si pariter cernantur plura genera, non in eadem natura meare videantur.

plurimum volant quae apodes, quia careant usu pedum, ab aliis cypseli appellantur, hirundinum specie. nidificant in scopulis. hae sunt quae toto mari cernuntur, nec umquam tam longo naves tamque continuo cursu recedunt a terra, ut non circumvolitent eas apodes. cetera genera residunt et insistent; his quies nisi in nido nulla: aut pendent aut iacent.

et ingenia aequae varia, ad pastum maxime. caprimulgi appellantur, grandioris merulae aspectu, fures nocturni; interdiu enim visu carent. intrant pastorum stabula caprarumque uberibus advolant suctum propter lactis, qua iniuria uber emoritur caprisque caecitas, quas ita mulserunt, oboritur. platea nominatur advolans ad eas, quae se in mari mergunt, et capita illarum morsu corripient, donec capturam extorqueat. eadem cum devoratis se inplevit conchis, calore ventris coctas evomit atque ita ex iis esculenta eligit testas excernens.

villaribus gallinis et religio inest. inhorrescunt edito ovo excutiantque sese

et circumactae purificant aut festuca aliqua sese et ova lustrant. minimae avium cardueles imperata faciunt, nec voce tantum, sed pedibus et ore pro manibus. est quae boum mugitus imitetur, in arelatensi agro taurus appellata, alioquin parva est. equorum quoque hinnitus anthus nomine herbae pabulo adventu eorum pulsa imitatur, ad hunc modum se ulciscens. super omnia humanas voces reddunt, psittaci quidem etiam sermocinantes. india hanc avem mittit, siptacen vocat, viridem toto corpore, torque tantum miniato in cervice distinctam. imperatores salutat et quae accipit verba pronuntiat, in vino praecipue lasciva. capiti eius duritia eadem quae rostro. hoc, cum loqui discit, ferreo verberatur radio; non sentit aliter ictus. cum devolat, rostro se excipit, illi innititur leviolemque ita se pedum infirmitati facit.

minor nobilitas, quia non ex longinquo venit, sed expressior loquacitas certo generi picarum est. adamant verba quae loquantur nec discunt, sed diligunt meditantisque intra semet curam atque cogitationem, intentionem non occultant. constat emori victas difficultate verbi ac, nisi subinde eadem audiant, memoria falli quaerentesque mirum in modum hilarari, si interim audierint id verbum. nec vulgaris his forma, quamvis non spectanda: satis illis decoris in specie sermonis humani est. verum addiscere alias negant posse quam ex genere earum quae glande vescantur, et inter eas facilius quibus quini sint digiti in pedibus, ac ne eas quidem ipsas nisi primis duobus vitae annis. latiores linguae omnibus in suo cuique genere, quae sermonem imitantur humanum. quamquam id paene in omnibus contigit: agrippina claudii caesaris turdum habuit, quod numquam ante, imitantem sermones hominum. cum haec proderem, habebant et caesares iuvenes sturnum, item lusciniis graeco ac latino sermone dociles, praeterea meditantes assidue et in diem nova loquentes, longiore etiam contextu. docentur secreto et ubi nulla alia vox misceatur, adsidente qui crebro dicat ea, quae condita velit, ac cibis blandiente.

reddatur et corvis sua gratia, indignatione quoque populi romani testata, non solum conscientia. tiberio principe ex fetu supra castorum aedem genito pullus in adpositam sutrinam devolavit, etiam religione commendatus officinae domino. is mature sermoni adsuefactus, omnibus matutinis evolans in rostra in forum versus, tiberium, dein germanicum et drusum caesares nominatim, mox transeuntem populum romanum salutabat, postea ad tabernam remeans, plurium annorum adsiduo officio mirus. hunc sive aemulatione vicinitatis manceps proximae sutrinae sive iracundia subita, ut voluit videri, excrementis eius posita calceis macula, exanimavit, tanta plebei consternatione, ut primo pulsus ex ea regione, mox interemptus sit funusque aliti innumeris celebratum exequiis, constratum lectum super aethiopum duorum umeros, praecedente tibicine et coronis omnium generum ad rogam usque, qui constructus dextra viae appiae ad secundum lapidem in campo rediculi appellato fuit. adeo satis iusta causa populo romano visa est exequiarum ingenium avis aut supplicii de cive romano in ea urbe, in qua multorum principum nemo deduxerat funus, scipionis vero aemiliani post

carthaginem numantiamque deletas ab eo nemo vindicaverat mortem. hoc gestum m. servilio c. cestio cos. a. d. v kal. apriles. nunc quoque erat in urbe roma, haec prodente me, equitis romani cornix e baetica primum colore mira admodum nigro, dein plura contexta verba exprimens et alia atque alia crebro addiscens. nec non et recens fama crateri monocerotis cognomine in erizena regione asiae corvorum opera venantis eo quod devehebat in silvas eos insidentes corniculo umerisque; illi vestigabant agebantque eo perducta consuetudine, ut exeuntem sic comitarentur et feri. tradendum putavere memoriae quidam, visum per sitim lapides congerentem in situlam monimenti, in qua pluvia aqua durabat, sed quae attingi non posset; ita descendere paventem expressisse tali congerie quantum poturo sufficeret.

nec diomedias praeteribo aves. iuba cataractas vocat, et eis esse dentes oculosque igneo colore cetero candidis tradens. duos semper his duces: alterum ducere agmen, alterum cogere. scrobes excavare rostro, inde crate consternere et operire terra quae ante fuerit egesta; in his fetificare. fores binas omnium scrobibus: orientem spectare quibus exeant in pascua, occasum quibus redeant. alvum exoneraturas subvolare semper et contrario flatu. uno hae in loco totius orbis visuntur, in insula, quam diximus nobilem diomedis tumulo atque delubro contra apuliae oram, fulicarum similes. advenas barbaros clangore infestant, graecis tantum adulantur miro discrimine, velut generi diomedis hoc tribuentes, aedemque eam cotidie pleno gutture madentibus pinnis perluunt atque purificant, unde origo fabulae diomedis socios in earum effigies mutatos.

non omittendum est, cum de ingeniis disserimus, e volucris hirundines indociles esse, e terrestribus mures, cum elephantis iussa faciant, leones iugum subeant, in mari vituli totque piscium genera mitescant.

bibunt aves suctu, ex iis, quibus longa colla, intermittentes et capite resupinato velut infundentes sibi; porphyrio solus morsu bibit. idem est proprio genere, omnem cibum aqua subinde tinguens, deinde pede ad rostrum veluti manu adferens. laudatissimi in commagene. rostra iis et praelonga crura rubent.

haec quidem et himantopodi multo minori, quamquam eadem crurum altitudine. nascitur in aegypto. insistit ternis digitis. praecipue ei pabulum muscae. vita in italia paucis diebus.

graviore omnes fruge vescuntur, altivolae carne tantum, inter aquaticas mergi, soliti avide vorare et quae ceterae reddunt.

olorum similitudinem onocrotali habent nec distare existimarentur omnino, nisi faucibus ipsis inesset alterius utriusque genus. huc omnia inexplebile animal congerit, mira ut sit capacitas. mox perfecta rapina sensim inde in os reddita in veram alvum ruminantis modo refert. gallia hos septentrionalis proxima oceano mittit.

in hercynio germaniae saltu invisitata genera alitum accepimus, quarum plumae ignium modo conluceant noctibus. in ceteris nihil praeter nobilitatem longinquitate factam memorandum occurrit: phalerides in seleucia parthorum

et in asia, aquaticarum laudatissimae, rursus phasianae in colchis - geminas ex pluma aures submittunt subriguntque - , numidicae in parte africae numidia; omnesque iam in italia.

phoenicopteri linguam praecipui saporis esse apicius docuit, nepotum omnium altissimus gurgis. attagen maxime ionius celeber et vocalis alias, captus vero obmutescens, quondam existimatus inter raras aves, iam et in gallia hispaniaque. capitur circa alpes etiam, ubi et phalacrocoraces, avis baliarium insularum peculiaris, sicut alpium pyrrhocorax, luteo rostro niger, et praecipua sapore lagopus. pedes leporino villo nomen hoc dedere cetero candidae, columbarum magnitudine. non extra terram eam vesci facile, quando nec vita mansuescit et corpus ocissime marcescit. est et alia nomine eodem, a coturnicibus magnitudine tantum differens, croceo unctu cibis gratissima. visam in albis ab se peculiarem aegypti et ibim egnatius calvinus praefectus earum prodidit.

venerunt in italiam bedriacensibus bellis civilibus trans padum et novae aves - ita enim adhuc vocantur - , turdorum specie, paulum infra columbas magnitudine, sapore gratae. baliarum insulae nobiliorem etiam supra dicto porphyryonem mittunt. ibi et buteo accipitrum generis in honore mensarum est, item vibiones; sic vocant minorem gruem.

pegasos equino capite volucres et grypas aurata aduncitate rostri fabulosos reor, illos in scythia, hos in aethiopia. equidem et tragopana, de qua plures affirmant, maiorem aquila, cornua in temporibus curvata habentem, ferruginei coloris, tantum capite phoeniceo. nec sirenes impetraverint fidem, adfirmet licet dinon, clitarchi celebrati auctoris pater, in india esse mulcerique earum cantu quos gravatos somno lacerent. qui credat ista, et melampodi profecto aures lambendo dedisse intellectum avium sermonis dracones non abnuat vel quae democritus tradit nominando aves quarum confuso sanguine serpens gignatur, quem quisquis ederit intellecturus sit alitum colloquia, quaeque de una ave galerita privatim commemorat, etiam sine his immensa vitae ambage circa auguria. nominantur ab homero scopes avium genus: neque harum saturicos motus, cum insidentur, plerisque memoratos facile conceperim mente, neque ipsae iam aves noscuntur, quam ob rem de confessis disseruisse praestiterit.

gallinas saginare deliaci coepere, unde pestis exorta opimas aves et suo pte corpore unctas devorandi. hoc primum antiquis cenarum interdictis exceptum invenio iam lege gai fanni consulis undecim annis ante tertium punicum bellum, ne quid volucre poneretur praeter unam gallinam quae non esset altilis, quod deinde caput translatum per omnes leges ambulavit. inventumque deverticulum est in fraudem earum gallinaceos quoque pascendi lacte madidis cibis: multo ita gratiores adprobantur. feminae quidem ad saginam non omnes eliguntur nec nisi in cervice pingui cute. postea culinarum artes, ut clunes spectentur, ut dividantur in tergora, ut a pede uno dilatatae repositoria occupent. dedere et parthi cocis suos mores. nec tamen in hoc mangonio quicquam totum placet, clune, alibi pectore tantum laudatis.

aviaria primus instituit inclusis omnium generum avibus m. laenius strabo brundisi equestris ordinis. ex eo coepimus carcere animalia coercere, quibus rerum natura caelum adsignaverat. maxime tamen insignis est in hac memoria clodii aesopi, tragici histrionis, patina hs [c] taxata, in qua posuit aves cantu aliquo aut humano sermone vocales, hs [vi] singulas coemptas, nulla alia inductus suavitate nisi ut in iis imitationem hominis manderet, ne quaestus quidem suos reveritus illos opimos et voce meritos, dignus prorsus filio, a quo devoratas diximus margaritas, non sic tamen, ut verum facere velim inter duos iudicium turpitudinis, nisi quod minus est summas rerum naturae opes quam hominum linguas cenasse.

generatio avium simplex videtur esse, cum et ipsa habeat sua miracula, quoniam et quadripedes ova gignunt, chamaeleontes, lacertae et quae diximus ... , item serpentes. pinnatorum autem infecunda sunt quae aduncos habent ungues. cenchris sola ex his supra quaterna edit ova. tribuit hoc avium generi natura, ut fecundiores essent fugaces earum quam fortes. plurima pariunt struthocameli, gallinae, perdices soli. coitus avibus duobus modis, femina considente humi, ut in gallinis, aut stante, ut in gruibus.

ovorum alia sunt candida, ut columbis, perdicibus, alia pallida, ut aquaticis, alia punctis distincta, ut meleagridum, alia rubri coloris, ut phasianis, cenchridi. intus autem omne ovum volucrum bicolor, aquaticis lutei plus quam albi, id ipsum magis luridum quam ceteris; piscium unicolor, in quo nihil candidi. avium ova ex calore fragilia, serpentium ex frigore lenta, piscium ex liquore mollia. aquatilium rotunda, reliqua fere fastigio cacuminata. exeunt a rotundissima sui parte, dum pariuntur, molli putamine, sed protinus durescente quibuscumque emergunt portionibus. quae oblonga sint ova, gratioris saporis putat horatius flaccus. feminam edunt quae rotundiora gignuntur, reliqua marem. umbilicus ovis a cacumine inest, ceu gutta eminens in putamine.

quaedam omni tempore coeunt, ut gallinae, et pariunt, praeterquam duobus mensibus hiemis brumalibus. ex iis iuvencae plura quam veteres, sed minora, et in eodem fetu prima ac novissima. est autem tanta fecunditas, ut aliquae et sexagena pariant, aliquae cotidie, aliquae bis die, aliquae in tantum, ut effetae moriantur. hadrianis laus maxima. columbae deciens anno pariunt, quaedam et undeciens, in aegypto vero etiam brumali mense. hirundines et merulae et palumbi et turtures bis anno pariunt, ceterae aves fere semel. turdi, in cacuminibus arborum luto nidificantes paene contextim, in secessu generant. a coitu x diebus ova maturescunt in utero, vexatis autem gallinae et columbae pinna evulsa aliave simili iniuria diutius.

omnibus ovis medio vitelli parva inest velut sanguinea gutta, quod esse cor avium existimant, primum in omni corpore id gigni opinantes: in ovo certe gutta ea salit palpitatque. ipsum animal ex albo liquore ovi incorporatur. cibus eius in luteo est. omnibus intus caput maius toto corpore, oculi compressi capite maiores. increscente pullo candor in medium vertitur, luteum circumfunditur. vicensimo die si moveatur ovum, iam viventis intra putamen

vox auditur. ab eodem tempore plumescit, ita positus, ut caput supra dextrum pedem habeat, dextram vero alam supra caput. vitellus paulatim deficit. aves omnes in pedes nascuntur, contra quam reliqua animalia. quaedam gallinae omnia gemina ova pariunt et geminos interdum excludunt, ut cornelius celsus auctor est, alterum maiorem; aliqui negant omnino geminos excludi. plus vicena quina incubanda subici vetant. parere a bruma incipiunt. optima fetura ante vernum aequinoctium. post solstitium nata non implent magnitudinem iustam tantoque minus, quanto serius provenere.

ova incubari intra decem dies edita utilissimum; vetera aut recentiora infecunda. subici inpari numero debent. quarto die post quam coepere incubari, si contra lumen cacumine ovorum adprehenso ima manu purus et unius modi perluceat color, sterilia existimantur esse proque iis alia substituenda. et in aqua est experimentum: inane fluitat, itaque sidentia, hoc est plena, subici volunt. concuti vero experimento vetant, quoniam non gignant confusis vitalibus venis. incubationi datur initium post novam lunam, quia prius inchoata non proveniant. celerius excluduntur calidis diebus; ideo aestate undevicensimo educent fetum, hieme xxv. si incubitu tonuit, ova pereunt; et accipitris audita voce vitiantur. remedium contra tonitrus clavus ferreus sub stramine ovorum positus aut terra ex aratro. quaedam autem et citra incubitum sponte naturae gignunt, ut in aegypti fimetis. scitum de quodam potore reperit syracusis tam diu potare solitum, donec cooperta terra fetum ederent ova.

quin et ab homine perficiuntur. iulia augusta prima sua iuventa tib. caesare ex nerone gravida, cum parere virilem sexum admodum cuperet, hoc usa est puellari augurio, ovum in sinu fovendo atque, cum deponendum haberet, nutrici per sinum tradendo, ne intermitteretur tepor; nec falso augurata proditur. nuper inde fortassis inventum, ut ova calido in loco inposita paleis igne modico foverentur homine versante, pariterque et stato die illinc erumperet fetus. traditur quaedam ars gallinarii cuiusdam dicentis, quod ex quaque esset. narrantur et mortua gallina mariti earum visi succedentes in vicem et reliqua fetae more facientes abstinentesque se cantu. super omnia est anatum ovis subditis atque exclusis admiratio prima non plane agnoscentis fetum, mox incerti singultus sollicite convocantis, postremo lamenta circa piscinae stagna mergentibus se pullis natura duce.

gallarum generositas spectatur crista erecta, interim et gemina, pinnis nigris, ore rubicundo, digitis inparibus, aliquando et super iiii digitos traverso uno. ad rem divinam luteo rostro pedibusque purae non videntur, ad opertanea sacra nigrae. est et pumilionum genus non sterile in iis, quod non in alio genere alitum, sed quibus centra, fecunditas rara et incubatio ovis noxia.

inimicissima autem omni generi pituita maximeque inter messis ac vindemiae tempus. medicina in fame et cubitus in fumo, utique si e lauru aut herba sabina fiat, pinna per transversas inserta nares et per omnes dies mota; cibus alium cum farre aut aqua perfusus, in qua maduerit noctua, aut cum semine vitis albae coctus ac quaedam alia.

columbae proprio ritu osculantur ante coitum. pariunt fere bina ova, ita natura moderante, ut aliis crebrior sit fetus, aliis numerosior. palumbis et turtur plurimum terna nec plus quam bis vere pariunt, atque ita, si prior fetus corruptus est et ut, quamvis iii pepererint, numquam plus ii educant. tertium inritum est; urinum vocant. palumbis incubat femina post meridiana in matutinum, cetero mas. columbae marem semper et feminam pariunt, priorem marem, postridie feminam. incubant in eo genere ambo, interdum mas, noctu femina. excludunt xx die, pariunt a coitu v. aestate quidem interdum binis mensibus terna educunt paria, namque xviii die excludunt statimque concipiunt; quare inter pullos saepe ova inveniuntur, et alii provolant, alii erumpunt. ipsi deinde pulli quinquemenstres fetificant. et ipsae autem inter se, si mas non sit, feminae aequae saliunt pariuntque ova inrita, ex quibus nihil gignitur, quae hypenemia graeci vocant.

pavo a trimatu parit; primo anno unum aut alterum ovum, sequenti quaterna quinave, ceteris duodena, non amplius, intermittens binos dies ternosve parit, et ter anno, si gallinis subiciantur incubanda. mares ea frangunt desiderio incubantium; quapropter noctu et in latebris pariunt aut in excelso cubantes, set nisi molli strato excepta franguntur. mares singuli quinis sufficiunt coniugibus. cum singulae aut binae fuere, corrumpitur salacitate fecunditas. partus excluditur diebus ter novenis aut tardius tricenisimo.

anseris in aqua coeunt, pariunt vere aut, si bruma coiere, post solstitium, xl prope, bis anno, si priorem fetum gallinae excludant, alias plurima ova xvi, paucissima vii. si quis subripiat, pariunt donec rumpantur. aliena non excludunt. incubanda subici utilissimum viiii aut xi. incubant feminae tantum tricenis diebus, si vero tepidiores sint, xxv. pullis eorum urtica contactu mortifera, nec minus aviditas nunc satietate nimia, nunc suamet vi, quando adprehensa radice morsu saepe conantes avellere ante colla sua abrumpunt. contra urticam remedium est stramento ab incubitu subdita radix earum.

ardiolarum tria genera: leucon, asterias, pelion. hi in coitu anguntur; mares quidem cum vociferatu sanguinem etiam ex oculis profundunt. nec minus aegre pariunt gravidae. aquila tricenis diebus incubat et fere maiores alites, minores vicens, ut miluus et accipiter. miluus fere parit numquam plus ternos, is qui aegolios vocatur et quaternos, corvus aliquando et quinos. incubant totidem diebus. cornicem incubantem mas pascit. pica novenos, melancoryphus supra xx parit, semper numero impari, nec alia iis plures: tanto fecunditas maior parvis. hirundini caeci primo pulli sunt et fere omnibus quibus numerosior fetus.

inrita ova, quae hypenemia diximus, aut mutua feminae inter se libidinis imaginatione concipiunt aut pulvere, nec columbae tantum, sed et gallinae, perdices, pavones, anseres, chenalopeces. sunt autem sterilia et minora ac minus iucundi saporis et magis umida. quidam et vento putant ea generari, quae de causa etiam zephyria appellant. urina autem vere tantum fiunt incubatione derelicta, quae alii cynosura dixere. ova aceto macerata in tantum emolliuntur, ut per anulos transeant. servari ea in lomento aut hieme in paleis, aestate in

furfuribus utilissimum. sale exinaniri creduntur.

volucrum animal parit vespertilio tantum, cui et membranaceae pinnae uni. eadem sola volucrum lacte nutrit ubera admovent. parit geminos; volitat amplexa infantes secumque portat. eidem coxendix una traditur esse. in cibatu culices gratissimi.

rursus in terrestribus ova pariunt serpentes, de quibus nondum dictum est. coeunt complexu, adeo circumvolutae sibi ipsae, ut una existimari biceps possit. viperarum mas caput inserit in os, quod illa abrodit voluptatis dulcedine. terrestrium eadem sola intra se parit ova, unius coloris et mollia, ut pisces. tertio die intra uterum catulos excludit, dein singulis diebus singulos parit, xx fere numero. itaque ceteri tarditatis impatientes percurrunt latera occisa parente. ceterae serpentes contexta ova in terra incubant et fetum sequenti excludunt anno. crocodili vicibus incubant, mas et femina. sed reliquorum quoque terrestrium reddatur generatio.

bipedum solus homo animal gignit. homini tantum primi coitus paenitentia, augurium scilicet vitae a paenitenda origine. ceteris animalibus statim per tempora anni concubitus, homini, ut dictum est, omnibus horis dierum noctiumque; ceteris satias in coitu, homini prope nulla. messalina claudi caesaris coniunx, regalem hanc existimans palmam, elegit in id certamen nobilissimam et prostitutis ancillam mercenariae stipis eamque nocte ac die superavit quinto atque vicensimo concubitu. in hominum genere maribus devotula veneris, excogitata omnia scelere naturae, feminis vero abortus. quantum in hac parte multo nocentiores quam ferae sumus! viros avidiores veneris hieme, feminas aestate hesiodus prodidit.

coitus aversis elephantis, camelis, tigribus, lyncibus, rhinocerotis, leoni, dasypodi, cuniculis, quibus aversa genitalia. cameli etiam solitudines aut secreta certe petunt, neque intervenire datur sine pernicie; coitus toto die, et his tantum ex omnibus. quibus solida ungula in quadripedum genere, mares olfactus accendit. avertuntur et canes, phocae, lupi, in medioque coitu invitique etiam cohaerent. supra dictorum dasypodum plerumque feminae priores superveniunt, in reliquis mares. ursi autem, ut dictum est, humanitus strati, irenaei stantes ambo inter se complexi, feles mare stante, femina subiacente, vulpes in latera proiectae maremque femina amplexa. taurorum cervorumque feminae vim non tolerant; ea de causa ingrediuntur in conceptu. cervi vicissim ad alias transeunt et ad priores redeunt. lacertae ut ea, quae sine pedibus sunt, circumflexu venerem novare.

omnia animalia quo maiora corpore, hoc minus fecunda. singulos gignunt elephantis, cameli, equi; acanthis duodenos, avis minima. ocissime pariunt quae plurimos gignunt. quo maius est animal, tanto diutius formatur in utero. diutius gestantur quibus longiora sunt vitae spatia, neque crescentium tempestiva ad generandum aetas. quae solidas habent ungulas, singulos; quae bisulcas, et geminos pariunt; quorum in digitos pedum fissura divisa est, et numerosiora in fetu. sed superiora omnia perfectos edunt partus, haec inchoatos, in quo sunt genere leaenae, ursae; et vulpes informe etiam magis

quam supra dicta parit, rarumque est videre parientem. postea lambendo calefaciunt fetus omnia ea et figurant. pariunt plurimum quaternos. caecos autem gignunt canes, lupi, pantherae, thoes.

canum plura genera. laconicae octavo mense utrimque generant; ferunt lx diebus et plurimum iii. ceterae canes et semenstres coitum patiuntur. implentur omnes uno coitu. quae ante iustum tempus concepere, diutius caecos habent catulos, et omnes totidem diebus. existimantur in urina attollere crus fere semenstres; id est signum consummati virium roboris. feminae hoc idem sidentes. partus duodeni quibus numerosissimi, cetero quini, seni, aliquando singuli, quod prodigiosum putant, sicut omnes mares aut omnes feminas gigni. primos quosque mares pariunt, in ceteris alternant. ineuntur a partu sexto mense. octonos laconicae pariunt. propria in eo genere maribus labore salacitas. vivunt laconici annis denis, feminae duodenis, cetera genera xv annis, aliquando et xx, nec tota sua aetate generant, fere a duodecimo desinentes.

felium et ichneumonum reliqua ut canum. vivunt annis senis. dasypodes omni mense pariunt et superfetant, sicut lepores. a partu statim implentur; concipiunt quamvis ubera siccante fetu. pariunt vero caecos. elephantum, ut diximus, pariunt singulos magnitudine vituli trimenstris. camelum xii mensibus ferunt; a trimatu pariunt vere iterumque post annum implentur a partu. equas autem post tertium demum aut post unum ab enixu utiliter admitti putant coguntque invitas. asinas et septimo die concipere facillime creditur. equarum iubas tondere praecipiunt, ut asinorum coitum patiantur humilitate; comantes enim gloria superbire. a coitu solae animalium currunt exadversus aquilonem austrumve, prout marem aut feminam concepere. colorem ilico mutant, rubriore pilo vel quicumque sit pleniore: hoc argumento desinunt admittere, etiam volentes. nec inpedit partus quasdam ab opere falluntque gravidarum. vicisse olympia praegnantem echecratidis thessali invenimus. equos et canes et sues initum matutinum adpetere, feminas autem post meridiem blandiri diligentiores tradunt. equas domitas lx diebus equire ante quam gregales, sues tantum coitu spumam ore fundere, verrem subantis audita voce, ni admittatur, cibum non capere usque in maciem, feminas autem in tantum efferari, ut hominem lancinent, candida maxime veste indutum. rabies ea aceto mitigatur naturae adperso. aviditas coitus putatur et cibus fieri, sicut viro eruca, pecori caepa. quae ex feris mitigentur, non concipere, ut anseres, apros vero tarde et cervos nec nisi ab infantia educatos mirum est. quadrupedum praegnantem venerem arcent praeter equam et suam; sed superfetant dasypus et lepus tantum.

quaecumque animal pariunt, in capita gignunt circumacto fetu sub enixum, alias in utero porrecto. quadrupedes gestantur extentis ad longitudinem cruribus et ad alvum suam adplicatis; homo in semet conglobatus inter duo genua naribus sitis. molas, de quibus ante diximus, gigni putant, ubi mulier non ex mare, verum ex semet ipsa tantum conceperit. ideo nec animari, quia non sit ex duobus, altricemque habere per se vitam illam quae satis

arboribusque contingat. ex omnibus, quae perfectos fetus, sues tantum et numerosos edunt, nam plures contra naturam solidipedum aut bisulcorum.

super cuncta est murium fetus, haut sine cunctatione dicendus, quamquam sub auctore aristotele et alexandri magni militibus. generatio eorum lambendo constare, non coitu, dicitur. ex una genitos cxx tradiderunt, apud persas vero praegnantibus in ventre parentis repertas. et salis gustatu fieri praegnantibus opinantur. itaque desinit mirum esse unde vis tanta messes populetur murium agrestium, in quibus illud quoque adhuc latet, quoniam modo illa multitudo repente occidat. nam nec exanimes reperiuntur neque extat qui murem hieme in agro effoderit. plurimi ita ad troada proveniunt et iam inde fugaverunt incolae. proventus eorum siccitatibus. tradunt etiam obituris vermiculum in capite gigni. aegypti muribus durus pilus sicut irenaeis. iidem bipedes ambulant ceu alpini quoque. - cum diversi generis coiere animalia, ita demum generant, si tempus nascendi par habent. - quadripedum ova gignentium lacertas ore parere, ut creditur vulgo, aristoteles negat. neque incubant eadem, oblitae quo sint in loco enixae, quoniam huic animali nulla memoria; itaque per se catuli erumpunt.

anguem ex medulla hominis spinae gigni accepimus a multis. pleraque enim occulta et caeca origine proveniunt, etiam in quadripedum genere, sicut salamandrae, animal lacertae figura, stellatum, numquam nisi magnis imbribus proveniens et serenitate desinens. huic tantus rigor, ut ignem tactu restinguat non alio modo quam glacies. eiusdem sanie, quae lactea ore vomitur, quacumque parte corporis humani contacta toti defluunt pili, idque, quod contactum est, colorem in vitiliginem mutat.

quaedam ergo gignuntur ex non genitis et sine ulla simili origine, ut supra dicta et quaecumque ver statumque tempus anni generant. ex his quaedam nihil gignunt ut salamandrae, neque est in iis masculum femininumve, sicut neque in anguillis omnibusque quae nec animal nec ovum ex sese generant. neutrum est et ostreis genus et ceteris adhaerentibus vado vel saxo. quae autem per se generantur, si in mares et feminas discripta sunt, generant quidem aliquid coitu, sed imperfectum ac dissimile et ex quo nihil amplius gignatur, ut vermiculos muscae. id magis declarabit natura eorum quae insecta dicuntur, arduae explanationis omnia et privatim dicato opere narranda. quapropter ingenium praedictorum et reliqua subtexitur edissertatio.

ex sensibus ante cetera homini tactus, dein gustatus; reliquis superatur a multis. aquilae clarius cernunt, vultures sagacius odorantur, liquidius audiunt talpae: obrutae terra, tam denso atque surdo naturae elemento, praeterea voce omni in sublime tendente, sermonem exaudiunt et, si de iis loquere, intellegere etiam dicuntur et profugere. auditus cui hominum primo negatus est, huic et sermonis usus ablati, nec sunt naturaliter surdi, ut non iidem sint et muti. in marinis ostreis auditum esse non est verisimile, sed ad sonum mergere se dicuntur solenes; ideo et silentium in more piscantibus. pisces quidem auditus nec membra habent nec foramina, audire tamen eos palam est, utpote cum plausu congregari feros ad cibum adsuetudine in quibusdam

vivariis spectetur et in piscinis caesaris genera piscium ad nomen venire quosdamve singulos. itaque produntur etiam clarissime audire mugil, lupus, salpa, chromis et ideo in vado vivere.

olfactum iis esse manifeste patet, quippe non omnes eadem esca capiuntur et prius quam adpetant odorantur. quosdam et speluncis latentes salsamento inlitis faucibus scopuli piscator expellit velut sui cadaveris agnitionem fugientes, conveniuntque ex alto etiam ad quosdam odores, ut saepiam ustam et polypum, quae ideo coiciuntur in nassas. sentinae quidem navium odorem procul fugiunt, maxime tamen piscium sanguinem. non potest petris avelli polypus; idem cunila admota ab odore protinus resilit. purpurae quoque faetidius capiuntur. nam de reliquo animalium genere quis dubitet cornus cervini odore serpentes fugantur, sed maxime styracis; origani aut calcis aut sulphuris formicae necantur. culices acida petunt, ad dulcia non advolant.

tactus sensus omnibus est, etiam quibus nullus alius; nam et ostreis et terrestrium vermibus quoque.

existimaverim omnibus sensum et gustatus esse. cur enim alios alia saporibus adpetant in quo vel praecipua naturae varietas et lusus: alia dentibus praedantur, alia unguibus, alia rostri aduncitate carpunt, alia latitudine eruunt, alia acumine excavant, alia sugunt, alia lambunt, sorbent, mandunt, vorant. nec minor varietas in pedum ministerio, ut rapiant, distrahant, teneant, premant, pendeant, tellurem scabere non cessent.

venenis capreae et coturnices, ut diximus, pinguescunt, placidissima animalia, at serpentes ovis, spectanda quidem draconum arte: aut enim solida hauriunt, si iam fauces capiunt, quae deinde in semet convoluti frangunt intus atque ita putamina extussunt, aut si tenerior est catulis adhuc aetas, orbe adprehensa spirae ita sensim vehementerque praestringunt, ut amputata parte ceu ferro e reliqua, quae amplexu tenetur, sorbeant. simili modo avibus devoratis solidis contentione plumam excitam revomunt.

scorpiones terra vivunt. serpentes, cum occasio est, vinum praecipue adpetunt, cum alioqui exiguo indigeant potu; eadem minimo et paene nullo cibo, cum adservantur inclusae, sicuti aranei quoque, alioqui suctu viventes. ideo nullum interit fame aut siti venenatum. nam neque calor iis nec sanguis nec sudor, quae aviditatem naturali sale augent. in quo genere omnia magis exitialia, si suum genus edere ante quam noceant. condit in thesauros maxillarum cibum sphingiorum et satyrorum genus, mox inde sensim ad mandandum manibus expromit, et quod formicis in annum, sollemne est his in dies vel horas. unum animal digitos habentium herba alitur, lepus; ea et fruge solidipedes, et e bisulcis sues omni cibatu et radicibus. solidipedum volutatio propria. serratorum dentium carnivora sunt omnia; ursi et fruge, fronde, vindemia, pomis vivunt et apibus, cancris etiam ac formicis; lupi, ut diximus, et terra in fame. pecus potu pinguescit, ideo sal illis aptissimus; item veterina, quamquam et fruge et herba, scilicet ut bibere, sic edunt. ruminant praeter iam dicta silvestrium cervi, cum a nobis aluntur, omnia autem iacentia potius quam stantia, et hieme magis quam aestate, septenis fere mensibus. pontici

quoque mures simili modo remandunt.

in potu autem, quibus serrati dentes, lambunt et mures hi vulgares, quamvis ex alio genere sint. quibus continui dentes, sorbent, ut equi, boves. neutrum ursi, sed aquam quoque morsu vorant. in africa maior pars ferarum aestate non bibunt inopia imbrium, quam ob causam capti mures libyci, si bibere, moriuntur. orygem perpetuo sitientia africae generant ex natura loci potu carentem et mirabili modo ad remedia sitientium: namque gaetuli latrones eo durant auxilio, repertis aperto corpore eorum saluberrimi liquoris vesicis.

insidunt in eadem africa pardi condensam arborem occultatique ex ramis in praetereuntia desiliunt atque e volucrum sede grassantur. feles quidem quo silentio, quam levibus vestigiis obrepunt avibus! quam occulte speculatae in musculos exiliunt! excrementa sua effossa obruunt terra, intellegentes odorem illum indicem sui esse. ergo et alios quosdam sensus esse quam supra dictos haut difficulter apparet.

sunt enim quaedam iis bella amicitiaeque, unde et adfectus, praeter illa quae de quibusque eorum suis diximus locis. dissident olores et aquilae, corvus et chloreus noctu invicem ova exquirentes, simili modo corvus et miluus, illo praeipiente huic cibos, cornices atque noctua, aquilae et trochilus, si credimus, quoniam rex appellatur avium, noctuae et ceterae minores aves, rursus cum trochilo mustela et cornix, turtur et pyralis, ichneumones vespae et phalangia aranei, aquaticae brentos et gavia et harpe, harpe et triorchis accipiter, sorices et ardiolae invicem fetibus insidiantes, - (aegithus avis minima cum asino; spinetis enim se scabendi causa atterens nidos eius dissipat, quod adeo pavet, ut voce omnino rudentis audita ova eiciat, pulli ipsi metu cadant; igitur advolans ulcera eius rostro excavat) - volpes et milui, angues et mustelae et sues. aesalon vocatur parva avis ova corvi frangens, cuius pulli infestantur a volpibus. invicem haec catulos eius ipsamque vellit; quod ubi viderunt corvi, contra auxiliantur velut adversus communem hostem. et acanthis in spinis vivit; idcirco asinos et ipsa odit flores spinae devorantes, aegithum vero in tantum, ut sanguinem eorum credant non coire multisque ideo veneficiis infament. dissident thoes et leones, et minima aequae ac maxima. formicosam arborem urucae cavent. librat araneus se filo in caput serpentis porrectae sub umbra arboris suae tantaque vi morsu cerebrum adprehendit, ut stridens subinde et vertigine rotata ne filum quidem pendens rumpere, adeo non fugere queat. nec finis ante mortem est.

rursus amici pavones et columbae, turtures et psittaci, merulae et turtures, cornix et ardiolae contra volpium genus communibus inimiciis, harpe et miluus contra triorchin. quid, non et adfectus indicia sunt etiam in serpentibus, inmitissimo animalium genere dicta sunt quae arcadia narrat de domino a dracone servato et agnito voce draconis. de aspide miraculum phylarcho reddatur. is enim auctor est, cum ad mensam cuiusdam veniens in aegypto aleretur adsidue enixa catulos, quorum ab uno filium hospitis interemptum, illam reversam ad consuetudinem cibi intellexisse culpam et necem intulisse catulo nec postea in tectum id reversam.

somni quaestio non obscuram coniectationem habet. in terrestribus omnia quae coniveant dormire manifestum est. aquatilia quoque exiguum quidem, etiam qui de ceteris dubitant, dormire tamen existimant, non oculorum argumento, quia non habent genas, verum ipsa quiete cernuntur placida ceu soporata neque aliud quam caudas moventia et ad tumultum aliquem expavescentia. de thynnis confidentius adfirmatur; iuxta ripas enim aut petras dormiunt, plani autem piscium in vado, ut manu saepe tollantur. nam delphini ballaenaeque stertentes etiam audiuntur. insecta quoque dormire silentio apparet, quae ne luminibus quidem admotis excitentur.

homo genitus premitur somno per aliquot menses, dein longior in dies vigilia. somniat statim infans; nam et pavore expergiscitur et suctum imitatur. quidam vero numquam, quibus mortiferum fuisse signum contra consuetudinem somnium invenimus exempla. magnus hic in vita locus et diversis refertus documentis, utrumne sint aliqua praescita animi quiescentis, quae fiant ratione, an fortuita res sit ut pleraque. si exemplis agatur, profecto paria fiant. a vino et a cibis proxima atque in redormitione vana esse visa prope convenit. est autem somnus nihil aliud quam animi in medium sese recessus. praeter hominem somniare equos, canes, boves, pecora, capras palam est: ob hoc creditur et in omnibus quae animal pariant. de iis quae ova gignunt incertum est, sed dormire ea certum.

verum et ad insecta transeamus; haec namque restant immensae subtilitatis animalia.

LIBER XI

restant immensae subtilitatis animalia, quando aliqui ea neque spirare et sanguine etiam carere prodiderunt. multa haec et multigena, terrestrium volucrumque vita (alia ... pinnata, ut apes, alia utroque modo, ut formicae, aliqua et pinnis et pedibus carentia), et iure omnia insecta appellata ab incisuris, quae nunc cervicium loco, nunc pectorum atque alvi, praecincta separant membra, tenui modo fistula cohaerentia, aliquis vero non tota incisurae ambiente ruga, sed in alvo aut superne tantum imbricatis flexili vertebra, nusquam alibi spectatiore naturae rerum artificio. in magnis siquidem corporibus aut certe maioribus facilis officina sequaci materia fuit: in his tam parvis atque tam nullis quae ratio, quanta vis, quam inextricabilis perfectio! ubi tot sensus collocavit in culice et sunt alia dictu minora: sed ubi visum in eo praetendit ubi gustatum adplicavit ubi odoratum inseruit ubi vero truculentam illam et portione maximam vocem ingeneravit qua subtilitate pinna adnexuit, praelongavit pedum crura, disposuit ieiunam caveam uti alvum, avidam sanguinis et potissimum humani sitim accendit! telum vero perfodiendo tergori quo spiculavit ingenio atque, ut in capaci, cum cerni non possit exilitas, reciproca generavit arte, ut fodiendo acuminatum pariter sorbendoque fistulosum esset! quos teredini ad perforanda robora terebrarum sono teste dentes adfixit potissimumque e ligno cibatum fecit! sed turrigeros elephantorum miramur umeros taurorumque colla et truces in sublime iactus, tigrium rapinas, leonum iubas, cum rerum natura nusquam magis quam in minimis tota sit. quapropter quaeso ne legentes, quoniam ex his spernunt multa, etiam relata fastidio damnent, cum in contemplatione naturae nihil possit videri supervacuum.

insecta multi negarunt spirare, idque ratione persuadentes, quoniam viscera interiora nexus spirabilis non inessent. itaque vivere ut fruges arboresque, sed plurimum interesse, spiret aliquid an vivat. eadem de causa nec sanguinem iis esse, qui sit nullis carentibus corde atque iecore. sic nec spirare ea quibus pulmo desit. unde numerosa quaestionum series exoritur. iidem enim et vocem esse iis negant in tanto murmure apium, cicadarum sono, et alia quae suis aestimabuntur locis. nam mihi contuenti semper suasit rerum natura nihil incredibile existimare de ea. nec video cur magis possint non trahere animam talia et vivere quam spirare sine visceribus, quod etiam in marinis docuimus quamvis arcente spiritum densitate et altitudine umoris. volare quidem aliqua et animatu carere in ipso spiritu viventia, habere sensum victus, generationis, operis atque etiam de futuro curam, et quamvis non sint membra quae velut carina sensus invehant, esse tamen iis auditum, olfactum, gustatum, eximia praeterea naturae dona, sollertiam, animum, artem, quis facile crediderit sanguinem non esse iis fateor sic ut terrestribus quidem, cunctis inter se similem: verum ut saepiae in mari sanguinis vires atramentum optineat, purpurarum generi infector ille sucus, sic et insectis quisquis est vitalisumor,

hic erit sanguis. denique existimatio sua cuique sit: nobis propositum est naturas rerum manifestas indicare, non causas indagare dubias.

insecta, ut intellegi possit, non videntur habere nervos nec ossa nec spinas nec cartilaginem nec pingua nec carnes, ne crustam quidem fragilem ut quaedam marina, nec quae iure dicatur cutis, sed mediae cuiusdam inter omnia haec naturae corpus, arenti simile, nervo mollius, in reliquis partibus tutius vere quam durius. et hoc solum iis est, nec praeterea aliud. nihil intus nisi admodum paucis intestinum implicatum. itaque divolsis praecipua vivacitas et partium singularum palpitatio, quia quaecumque est ratio vitalis illa non certis inest membris, sed toto in corpore, minime tamen capite, solumque non movetur nisi cum pectore avolsum. in nullo genere plures sunt pedes, et quibus ex his plurimi, diutius vivunt divulsa, ut in scolopendris videmus. habent autem oculos praeterque e sensibus et tactum atque gustatum, aliqua et odoratum, pauca et auditum.

sed inter omnia ea principatus apibus et iure praecipua admiratio, solis ex eo genere hominum causa genitis. mella contrahunt sucumque dulcissimum atque subtilissimum ac saluberrimum, favos confingunt et ceras mille ad usus vitae, laborem tolerant, opera conficiunt, rem publicam habent, consilia privatim quoque, at duces gregatim et, quod maxime mirum sit, mores habent praeter cetera, cum sint neque mansueti generis neque feri. tanta est natura rerum, ut prope ex umbra minima animalis incomparabile effecerit quiddam. quos efficaciae industriaeque tantae comparemus nervos, quas vires quos ratione medius fidiis iis viros, hoc certe praestantioribus, quod nihil novere nisi commune non sit de anima quaestio, constet et de sanguine, quantum tamen esse in tantulis potest aestimemus post ea ingenium.

hieme conduntur - unde enim firmas pruinas nivesque et aquilonum flatus perferre vires - sane et insecta omnia, sed minus diu quae parietibus nostris occultata mature tepefiunt. circa apes aut temporum locorumve ratio mutata est, aut erraverunt priores. conduntur a vergiliarum occasu et latent ultra exortum - adeo non ad veris initium, ut dixere, nec quisquam in italia de alvis existimat ante fabas florentes - , exeunt ad opera et labores, nullusque, cum per caelum licuit, otio perit dies. primum favos construunt, ceram fingunt, hoc est domos cellasque faciunt, dein subolem, postea mella, ceram ex floribus, melliginem e lacrimis arborum quae glutinum pariunt, salicis, ulmi, harundinis suco, cummi, resina. his primum alvum ipsam intus in totum ut quodam tectorio inlinunt et aliis amarioribus sucis contra aliarum bestiarum aviditates, id se facturas consciae quod concupisci possit; isdem fores quoque latiores circumstruunt.

prima fundamenta commosin vocant periti, secunda pissoceron, tertia propolin, inter coria cerasque, magni ad medicamina usus. commosis crusta est prima, saporis amari. pissoceros super eam venit, picantium modo, ceu dilutior cera. e vitium populorumque mitiore cummi propolis, crassioris iam materiae additis floribus, nondum tamen cera, sed favorum stabilimentum, qua omnes frigoris aut iniuriae aditus obstruuntur, odore et ipsa etiamnum gravi,

ut qua plerique pro galbano utantur.

praeter haec convehitur erithace, quam aliqui sandaracam, alii cerinthum vocant. hic erit apium dum operantur cibus, qui saepe invenitur in favorum inanitatibus sepositus, et ipse amari saporis. gignitur autem rore verno et arborum suco cummum modo, capitur in ficis minor, austri flatu nigrior, aquilonibus melior et rubens, plurimus in graecis nucibus. Menecrates florem esse dicit, sed nemo praeter eum.

ceras ex omnium arborum satorumque floribus confingunt excepta rumice et echinopode; herbarum haec genera. falso excipitur et spartum, quippe cum in hispania multa in spartariis mella herbam eam sapiant. falso et oleas excipi arbitror, quippe olivae proventu plurima examina gigni certum est. fructibus nullis nocetur. mortuis ne floribus quidem, non modo corporibus, insidunt. operantur intra lx p. et subinde consumptis in proximo floribus speculatores ad pabula ulteriora mittunt. noctu deprehensae in expeditione excubant supinae, ut alas a rore protegant, ne quis miretur amore earum captos aristomachum solensem duodesexaginta annis nihil aliud egisse, philiscum vero thasium in desertis apes colentem agrium cognominatum, qui ambo scripsere de iis.

ratio operis mire divisi: statio ad portas more castrorum, quies in matutinum, donec una excitet gemino aut triplici bombo ut bucino aliquo. tunc universae provolant, si dies mitis futurus est. praedivinant enim ventos imbresque, cum se continent tectis; itaque temperie caeli otium hoc inter praescita habent. cum agmen ad opera processit, aliae flores adgerunt pedibus, aliae aquam ore guttasque lanugine totius corporis. quibus est earum adulescentia, ad opera exeunt et supra dicta convehunt, seniores intus operantur. quae flores comportant, prioribus pedibus femina onerant propter id natura scabra, pedes priores rostro, totaeque onustae remeant sarcina pandatae. excipiunt eas ternae quaternae, quae exonerant. sunt enim intus quoque officia divisa: aliae struunt, aliae poliunt, aliae suggerunt, aliae cibum comparant ex eo quod adlatum est; neque enim separatim vescuntur, ne inaequalitas operis et cibi fiat et temporis. struunt orsae a concamaratione alvi textumque velut a summa tela deducunt, limitibus binis circa singulos actus, ut aliis intrent, aliis exeant. favi, superiore parte adfixi et paulum etiam lateribus, simul haerent et pendent; ima alvum non contingunt, oblongi aut rotundi, qualiter poposcit alvus, aliquando et duorum generum, cum duo examina concordibus populis dissimiles habuere ritus. ruentes ceras fulciunt, pilarum intergerivis a solo fornicatis, ne desit aditus ad sarcium. primi fere tres versus inanes struuntur, ne promptum sit quod invitet furantem; novissimi maxime implentur melle. ideo aversa alvo favi eximuntur. gerulae secundos flatus captant. si cooriatur procella, adprehensi pondusculo lapilli se librant; quidam in umeros eum inponi tradunt. iuxta vero terram volant in adverso flatu vepribus evitatis. mira observatio operis: cessantium inertiam notant, castigant, mox et puniunt morte. mira munditia amoliuntur omnia e medio, nullaeque inter opera spurcitiae iacent; quin et excrementa operantium intus, ne longius recedant, unum congesta in locum turbidis diebus et operis otio

egerunt. cum advesperascit, in alvo strepunt minus ac minus, donec una circumvolet eodem quo excitavit bombo ceu quietem capere imperans, et hoc castrorum more. tunc repente omnes conticescunt.

domos primum plebei exaedificant, deinde regibus. si speratur largior proventus, adiciuntur contubernia et fucis. hae cellarum minimae, sed ipsi maiores apibus. sunt autem fuci sine aculeo, velut imperfectae apes novissimaeque a fessis aut iam emeritis inchoatae, serotinus fetus et quasi servitia verarum apium, quam ob rem imperant iis primosque expellunt in opera, tardantes sine clementia puniunt. neque in opere tantum, sed in fetu quoque adiuvant eas, multum ad calorem conferente turba. certe quo maior eorum fuit multitudo, hoc maior fit et examinum proventus. cum mella coeperunt maturescere, abigunt eos multaeque singulos adgressae trucidant. nec id genus nisi vere conspicitur. fucus ademptis alis in alvum reiectus ipse ceteris admittit. regias imperatoribus futuris in ima parte alvi exstruunt amplas, magnificas, separatas, tuberculo eminentes, quod si exprimatur, non gignuntur. sexangulae omnes cellae a singulorum pedum opere. nihil horum stato tempore, sed rapiunt diebus serenis munia. melle uno alterove summum die cellas replent.

venit hoc ex ae+re et maxime siderum exortu, praecipueque ipso sirio explendescente, nec omnino prius vergiliarum exortu, sublucanis temporibus. itaque tum prima aurora folia arborum melle roscida inveniuntur ac, si qui matutino sub diu fuere, unctas liquore vestes capillumque concretum sentiunt, sive ille est caeli sudor sive quaedam siderum saliva sive purgantis se ae+ris sucus; utinamque esset purus ac liquidus et suae naturae, qualis defluit primo! nunc vero e tanta cadens altitudine multumque, dum venit, sordescens et obvio terrae halitu infectus, praeterea e fronde ac pabulis potus et in utriculos congestus apium - ore enim eum vomunt - , ad hoc suco florum corruptus et alvi vitiis maceratus totiensque mutatus, magnam tamen caelestis naturae voluptatem adfert. ibi optimus semper, ubi optimorum doliolis florum conditur. fit atticae regionis hoc et siculae hymetto et hybla locis, mox calydna insula. est autem initio mel ut aqua dilutum et primis diebus fervet ut musta seque purgat, vicensimo die crassescit, mox obducitur tenui membrana, quae fervoris ipsius spuma conrescit. sorbetur optimum et minime fronde infectum e quercus, tiliae, harundinum foliis.

summa quidem bonitatis natione constat, ut supra diximus, pluribus modis. aliubi enim favi cera spectabiles gignuntur, ut in sicilia, paelignis, aliubi copia mellis, ut in creta, cypro, africa, aliubi magnitudine, ut in septentrionalibus, viso iam in germania octo pedum longitudinis favo in cava parte nigro. in quocumque tamen tractu terna sunt genera mellis. vernum ex floribus constructo favo, quod ideo vocatur anthinum. hoc quidam attingi vetant, ut largo alimento valida exeat suboles. alii ex nullo minus apibus relinquunt, quoniam magna sequatur ubertas magnorum siderum exortu, praeterea solstitio, cum thymum et uva florere incipiunt, praecipua cellarum materia. est autem in eximendis favis necessaria dispensatio, quoniam inopia cibi

desperant moriunturque aut diffugiunt, contra copia ignaviam adfert, ac iam melle, non erithace, pascuntur. ergo diligentiores ex hac vindemia xv partem apibus relinquunt. dies status inchoandae, ut quadam lege naturae, si scire aut observare homines vellent, tricensus ab educto examine, fereque maio mense includitur haec vindemia.

alterum genus est mellis aestivi, quod ideo vocatur horaeon a tempestivitate praecipua, ipso sirio exsplendescente post solstitium diebus xxx fere. immensa circa hoc subtilitas naturae mortalibus patefacta est, nisi fraus hominum cuncta perniciē corrumpet. namque ab exortu sideris cuiuscumque, sed nobilium maxime, aut caelestis arcus, si non sequantur imbres, sed ros tepescat solis radiis, medicamenta, non mella, gignuntur, oculis, ulceribus internisque visceribus dona caelestia. quod si servetur hoc sirio exoriente casuque congruat in eundem diem, ut saepe, veneris aut iovis mercurive exortus, non alia suavitas visque mortalium malis a morte revocandis quam divini nectaris fiat.

mel plenilunio uberius capitur, sereno die pinguius. in omni melle quod per se fluxit ut mustum oleumque, appellatur acetum. maxime laudabile est aestivum omne rutilum, ut siccioribus confectum diebus. album mel non fit ubi thymum est, sed oculis et ulceribus aptissimum existimatur. e thymo coloris aurei, saporis gratissimi, quo fit palam; ... doliolis pingue, e marino rore spissum. quod concrescit autem, minime laudatur. thymosum non coit et tactu praetenuia fila mittit, quod primum bonitatis argumentum est; abrumpi statim et resilire guttas vilitatis indicium habetur. sequens probatio ut sit odoratum et ex dulci acre, glutinosum, perlucidum. aestiva mellatione x partem cassio dionysio apibus relinqui placet, si plenae fuerint alvi; si minus, pro rata portione aut, si inanes, omnino non attingi. huic vindemiae attici signum dedere initium caprifici, alii diem volcano sacrum.

tertium genus mellis minime probatum silvestre, quod ericaeum vocant. convehitur post primos autumnī imbres, cum erice sola floret in silvis, ob id harenoso simile. gignit id maxime arcturi exortus ex a. d. pr. id. septembres. quidam aestivam mellationem ad arcturi exortum proferunt, quoniam ad aequinoctium autumnī ab eo supersint dies xiiii, et ab aequinoctio ad vergiliarum occasum diebus xxxviii plurima sit erice. athenienses eam tetralicen appellant, euboea sisyrum, putantque apibus esse gratissimam, fortassis quia tunc nulla alia sit copia. haec ergo mellatio fine vindemiae et vergiliarum occasu idibus novembribus fere includitur. relinqui ex ea duas partes apibus ratio persuadet, et semper eas partes favorum, quae habeant erithacen. a bruma ad arcturi exortum diebus lx somno aluntur sine ullo cibo. ab arcturi exortu ad aequinoctium vernum tepidiore tractu iam vigilant, sed etiamnum alvo se continent servatosque in id tempus cibos repetunt. in italia vero hoc idem a vergiliarum exortu faciunt et in eum dormiunt. alvos quidam in eximendo melle expendunt, ita diribentes quantum relinquunt. aequitas quidem etiam in iis obstringitur, feruntque societate fraudata alvos mori. in primis ergo praecipitur, lautī ut purique eximant mella. factorem mulierumque

menses odere. cum eximantur mella, apes abigi fumo utilissimum, ne irascantur aut ipsae avide vorent. fumo crebriore et ignavia earum excitatur ad opera, nam nisi incubavere, favos lividos faciunt. rursus fumo nimio inficiuntur, quando iniuriam celerrime sentiunt mella, vel minimo contactu roris acescentia. et ob id inter genera servatur quod acapnum vocant.

fetus quonam modo progenerarent, magna inter eruditos et subtilis fuit quaestio. apium enim coitus visus est numquam. plures existimavere ore confingi floribus compositas apte atque utiliter; aliqui coitu unius, qui rex in quoque appelletur examine: hunc esse solum marem, praecipua magnitudine, ne fatiscat; ideo fetum sine eo non edi, apesque reliquas tamquam marem feminas comitari, non tamquam ducem. quam probabilem alias sententiam fucorum proventus coarguit. quae enim ratio, ut idem coitus imperfectos generet alios propior vero prior existimatio fieret, ni rursus alia difficultas occurreret. quippe nascuntur aliquando in extremis favis apes grandiores, quae ceteras fugant. oestrus vocatur hoc malum, quonam modo nascens, si ipsae fingunt quod certum est, gallinarum modo incubant. id, quod exclusum est, primo vermiculus videtur candidus, iacens transversus adhaerensque ita ut pars cerae videatur. rex statim mellei coloris, ut electo flore ex omni copia factus, neque vermiculus, sed statim pinniger. cetera turba cum formam capere coepit, nymphae vocantur, ut fuci serenes aut cephenes. si quis alterutris capita demat prius quam pinnae habeant, pro gratissimo sunt pabulo matribus. tempore procedente instillant cibos atque incubant, tum maxime murmurantes, caloris, ut putant, faciendi gratia necessarii excludendis pullis, donec ruptis membranis, quae singulos cingunt, ovorum modo universum agmen emergat. spectatum hoc romae consularis cuiusdam surburbano, alvis cornu lanternae tralucido factis. fetus intra xlv diem peragitur. fit in favis quibusdam qui vocatur clavus, amarae duritia cerae, cum fetum inde non eduxere morbo aut ignavia aut infecunditate naturali; hic est abortus apium. protinus autem educti operantur quadam disciplina cum matribus, regemque iuvenem aequalis turba comitatur. reges plures inchoantur, ne desint. postea ex his suboles cum adulta esse coepit, concordii suffragio deterrimos necant, ne distrahant agmina. duo autem genera eorum: melior rufus, deterior niger variusque. omnibus forma semper egregia et duplo quam ceteris maior, pinnae breviores, crura recta, ingressus celsior, in fronte macula quodam diademate candicans. multum etiam nitore a vulgo differunt.

quaerat nunc aliquis, unusne hercules fuerit et quot liberi patres, et reliqua vetustatis situ obruta! ecce in re parva villisque nostris adnexa, cuius adsidue copia est, non constat inter auctores, rex nullumne solus habeat aculeum, maiestate tantum armatus, an dederit quidem eum natura, sed usum eius illi tantum negaverit. illud constat, imperatorem aculeo non uti. mira plebei circa eum obedientia. cum procedit, una est totum examen circaque eum globatur, cingit, protegit, cerni non patitur. reliquo tempore, cum populus in labore est, ipse opera intus circumit, similis exhortanti, solus immunis. circa eum satellites quidam lictoresque, adsidui custodes auctoritatis. procedit foris non

nisi migraturo examine. id multo intellegitur ante, aliquot diebus murmure intus strepente, apparatus indice diem tempestivum eligentium. si quis alam ei detruncet, non fugiat examen. cum processere, se quaeque proximam illi cupit esse, in officio conspici gaudet. fessum umeris sublevant, validius fatigatum ex toto portant. si qua lassata defecit aut forte aberravit, odore persequitur. ubicumque ille consedit, ibi cunctarum castra sunt.

tunc ostenta faciunt privata ac publica, uva dependente in domibus templisque, saepe expiata magnis eventibus. sedere in ore infantis tum etiam platonis, suavitatem illam praedulcis eloqui portendentes. sedere in castris drusi imperatoris, cum prosperrime pugnatum apud arbalonem est, hautquaquam perpetua haruspicum coniectura, qui dirum id ostentum existimant semper. duce presso totum tenetur agmen, amisso dilabitur migratque ad alios. esse utique sine rege non possunt. invitae autem interemunt eos, cum plures fuere, potiusque nascentium domos diruunt, si proventus desperatur. tunc et fucos abigunt. quamquam et de his video dubitari propriumque iis genus esse aliquos existimare, sicut furibus, grandissimis inter illos, sed nigris lataque alvo, ita appellatis, quia furtim devorent mella. certum est ab apibus fucos interfici. utique regem non habent. et quo modo sine aculeo nascantur in quaestione est.

vmido vere melior fetus, sicco mel copiosius; quod si defecit aliquas alvos cibus, impetum in proximas faciunt rapinae proposito. at illae contra derigunt aciem et, si custos adsit, alterutra pars, quae sibi favere sensit, non adpetit eum. ex aliis quoque saepe dimicant causis duasque acies contrarias duosque imperatores instruunt, maxime rixa in convehendis floribus exserta et suos quibusque evocantibus, quae dimicatio iniectu pulveris aut fumo tota discutitur, reconciliatur vero lacte vel aqua mulsa.

apes sunt et rusticae silvestresque, horridae aspectu, multo iracundiores, sed opere ac labore praestantes. urbanarum duo genera: optimae breves variaequae et in rotunditatem compactiles, deteriores longae et quibus similitudo vesparum, etiamnum deterrimae ex iis pilosae. in ponto sunt quaedam albae, quae bis in mense mella faciunt, circa thermodontem autem fluvium duo genera, aliarum quae in arboribus mellificant, aliarum quae sub terra, triplici cerarum ordine, uberrimi proventus. aculeum apibus dedit natura, ventri consertum ad unum ictum. hoc infixio quidam eas statim emori putant, aliqui non nisi in tantum adacto, ut intestini quippiam sequatur, sed fucos postea esse nec mella facere velut castratis viribus pariterque et nocere et prodesse desinere. est in exemplis equus ab iis occisus. odere foedos odores proculque fugiunt, sed et fictos; itaque unguenta redolentes infestant. ipsae plurimorum animalium iniuriis obnoxiae. inpugnant eas naturae eiusdem degeneres vespae atque crabrones, etiam e culicum genere qui vocantur muliones. populantur hirundines et quaedam aliae aves. insidiantur aquantibus ranae, quae maxima earum est operatio tum cum subolem faciunt; nec hae tantum quae stagna rivosque obsident, verum et rubetae veniunt ultro adrepentesque foribus portas sufflant: ad hoc statio provolat confestimque

abripitur. nec sentire ictus apium ranae traduntur. inimicae et oves difficile se e lanis earum explicantibus. cancrorum etiam odore, si quis iuxta coquat, exanimantur.

quin et morbos suapte natura sentiunt. index eorum tristitia torpens et cum ante fores in teporem solis promotis aliae cibos ministrant, cum defunctas progerunt funerantiumque more comitantur exequias. rege ea peste consumpto maeret plebes ignavo dolore, non cibos convehens, non procedens; tristi tantum murmure glomeratur circa corpus eius. subtrahitur itaque deductae multitudini. alias spectantes exanimem luctum non minuunt; tunc quoque ni subveniatur, fame moriuntur. hilaritate igitur et nitore sanitas aestimatur. sunt et operis morbi: cum favos non explent, claron vocant; item blapsigonian, si fetum non peragent.

inimica et echo est resultanti sono, qui pavidas alterno pulset ictu; inimica et nebula. aranei quoque vel maxime hostiles: cum praevaluere, ut intexant, enecant alvos. papilio etiam hic ignavus et inhonoratus, luminibus accensis advolitans, pestifer, nec uno modo: nam et ipse ceras depascitur et relinquit excrementa, e quibus teredines gignuntur; fila etiam araneosa, quacumque incessit, alarum maxime e lanugine obtexit. nascuntur et in ipso ligno teredines, quae ceras praecipue adpetunt. infestat et aviditas pastus, nimia florum satietate verno maxime tempore alvo cita. oleo quidem non apes tantum, sed omnia insecta exanimantur, praecipue si capite uncto in sole ponantur. aliquando et ipsae contrahunt mortis sibi causas, cum sensere eximi mella, avidae vorantes, cetero praeparcae et quae alioqui prodigas atque edaces non secus ac pigras et ignavas proturbent. nocent et sua mella ipsis inlitaque ab aversa parte moriuntur. tot hostibus, tot casibus - et quotam portionem eorum commemoro - tam munificum animal expositum est. remedia dicemus suis locis; nunc enim sermo de natura est.

gaudent plausu atque tinnitu aeris eoque convocantur. quo manifestum est auditus quoque inesse sensum. effecto opere, educto fetu functae munere omni exercitationem tamen sollemnem habent, spatiataeque in aperto et in altum elatae, gyris volatu editis, tum demum ad cibum redeunt. vita iis longissima, ut prospere inimica ac fortuita cedant, septenis annis. universas alvos numquam ultra decem annos durasse proditur. sunt qui mortuas, si intra tectum hieme serventur, dein sole verno torreantur ac ficulneo cinere tepido foveantur, putent revivescere; in totum vero amissas reparari ventribus bubulis recentibus cum fimo obrutis, vergilius iuvenorum corpore exanimato, sicut equorum vespas atque crabrones, sicut asinorum scarabaeos, mutante natura ex aliis quaedam in alia. sed horum omnium coitus cernuntur, et tamen in fetu eadem prope natura quae apibus.

vespae in sublimi e luto nidos faciunt, in iis ceras, crabrones cavernis aut sub terra. et horum omnium sexangulae cellae, cerae autem e cortice, araneosae. fetus ipse inaequalis ut barbaris: alius evolat, alius in nympa est, alius in vermiculo, et autumno, non vere, omnia ea. plenilunio maxime crescunt. vespae quae ichneumones vocantur - sunt autem minores quam aliae

- unum genus ex araneis peremunt, phalangium appellatum, et in nidos suos ferunt, deinde inlinunt et ex iis incubando suum genus procreant. praeterea omnes carne vescuntur contra quam apes, quae nullum corpus attingunt. sed vespae muscas grandiores venantur amputatoque iis capite reliquum corpus auferunt. crabronum silvestres in arborum cavernis degunt; hieme ut cetera insecta conduntur; vita bimatum non transit. ictus eorum haut temere sine febris est. auctores sunt ter novenis punctis interfici hominem. aliorum, qui mitiores videntur, duo genera: opifices, minores corpore, qui moriuntur hieme, matres, quae biennio durant; hi et clementes. nidos vere faciunt fere quadrifores, in quibus opifices generentur. his eductis alios deinde maiores nidos fingunt, in quibus matres futuras producant iam: tum opifices funguntur munere et pascunt eas. latior matrum species, dubiumque an habeant aculeos, quia non egrediuntur. et iis sui fuci. quidam opinantur omnibus his ad hiemem decidere aculeos. nec crabronum autem nec vesparum generi reges aut examina, sed subinde renovatur multitudo subole.

quantum inter haec genus est bombycum, in assyria proveniens, maius quam supra dicta. nidos luto fingunt salis specie, adplicatos lapidi, tanta duritia, ut spiculis perforari vix possint. in iis ceras largius quam apes faciunt, dein maiorem vermiculum.

et alia horum origo. ex grandiore vermiculo gemina protendens sui generis cornuum urica fit, dein quod vocatur bombylis, ex ea necydallus, ex hoc in sex mensibus bombyx. telas araneorum modo texunt ad vestem luxumque feminarum, quae bombycina appellatur. prima eas redordiri rursusque texere invenit in coo mulier pamphile, plateae filia, non fraudanda gloria excogitatae rationis, ut denudet feminas vestis.

bombycas et in coo insula nasci tradunt, cupressi, terebinthi, fraxini, quercus florem imbribus decussum terrae halitu animante. fieri autem primo papiliones parvos nudosque, mox frigoribus inpatientia villis inhorrescere et adversus hiemem tunicas sibi instaurare densas, pedum asperitate radentes foliorum lanuginem. in vellera hanc ab iis cogi subigique unguium carminatione, mox trahi in tramas, tenuari ceu pectine, postea adprehensam corpori involvi nido volubili; tum ab homine tolli fictilibusque vasis tepore et furfurum esca nutrir, atque ita subnasci sui generis plumas, quibus vestitos ad alia pensa dimitti. quae vero capta sint lanifica, umore lentescere, mox in fila tenuari iunceo fuso. nec pudit has vestes usurpare etiam viros levitatem propter aestivam: in tantum a lorica gerenda discessere mores, ut oneri sit etiam vestis. assyria tamen bombyce adhuc feminis cedimus.

araneorum his non absurde iungatur natura, digna vel praecipua admiratione. plura autem sunt genera nec dictu necessaria in tanta notitia. phalangia ex iis appellantur quorum noxii morsus, corpus exiguum, varium, acuminatum, adsultim ingredientium. altera eorum species nigri, prioribus cruribus longissimis. omnibus internodia terna in cruribus. luporum minimi non texunt, maiores in terra, et cavernis exigua vestibula praepandunt. tertium eorundem genus erudita operatione conspicuum. orditur telas tantique operis

materiae uterus ipsius sufficit, sive ita corrupta alvi natura stato tempore, ut democrito placet, sive est quaedam intus lanigera fertilitas: tam moderato ungue, tam tereti filo et tam aequali deducit stamina, ipso se pondere usus. texere a medio incipit, circinato orbe subtemina adnectens, maculasque paribus semper intervallis, sed subinde crescentibus ex angusto dilatans indissolubili nodo implicat. quanta arte celat pedicas a scutulato rete grassantes! quam non ad hoc videtur pertinere crebratae pexitas telae et quadam politurae arte ipsa per se tenax ratio tramae! quam laxis ad flatum ac non respuenda quae veniant sinus! derelicta lasso praetendi summa parte arbitrare licia: at illa difficile cernuntur atque, ut in plagis, lineae offensae praecipitant in sinum. specus ipse qua concamaratur architectura! et contra frigora quanto villosior! quam remotus a medio aliudque agenti similis, inclusus vero sic, ut sit necne intus aliquis cerni non possit! age firmitas, quando rumpentibus ventis, qua pulverum mole degravante! latitudo telae saepe inter duas arbores, cum exercet artem et discit texere, longitudo fili a cacumine ac rursus a terra per illud ipsum velox reciprocatio, subitque pariter ac fila deducit. cum vero captura incidit, quam vigilans et paratus accursus! licet extrema haereat plaga, semper in medium currit, quia sic maxime totum concutiendo implicat. scissa protinus reficit ad polituram sarcians. namque et lacertarum catulos venantur, os primum tela involventes et tunc demum labra utraque morsu adprehendentes, amphitheatrali spectaculo, cum contigit. sunt ex eo et auguria. quippe incremento annuum futuro telas suas altius tollunt. iidem sereno texunt, nubilo retexunt, ideoque multa aranea imbrium signa sunt. feminam putant esse quae texat, marem qui venetur; ita paria fieri merita coniugio.

aranei conveniunt clunibus, pariunt vermiculos ovis similes: nam nec horum differri potest genitura, quoniam insectorum vix ulla alia ratio est. pariunt autem omnia in tela, set sparsa, quia saliant atque ita emittunt. phalangia tantum in ipso specu incubant magnum numerum, qui, ut emersit, matrem consumit, saepe et patrem; adiuvat enim incubare. pariunt autem et trecenos - ceterae pauciores - et incubant triduo. consummantur aranei quater septenis diebus.

similiter his et scorpiones terrestres vermiculos ovorum specie pariunt similiterque pereunt, pestis inopportuna, veneni serpentium, nisi quod graviore supplicio lenta per triduum morte conficiunt, virginibus letali semper ictu et feminis fere in totum, viris autem matutino, exeuntes cavernis prius quam aliquo fortuito ictu ieiunum egerant venenum. semper cauda in ictu est nulloque momento meditari cessat, ne quando desit occasio; ferit et obliquo ictu et inflexo. venenum ab iis candidum fundi apollodorus auctor est, in novem genera discriptis per colores maxime supervacuos, quoniam non est scire quos minime exitiales praedixerit. geminos quibusdam aculeos esse, maresque saevissimos - nam coitum iis tribuit - , intellegi autem gracilitate et longitudine. venenum omnibus medio die, cum incanduerit solis ardoribus, itemque, cum sitiunt, inexpleriles potus. constat et septena caudae internodia

saeuora esse; pluribus enim sena sunt. hoc malum africae volucre etiam austri faciunt pandentibus brachia ut remigia sublevantes; apollodorus idem plane quibusdam inesse pinnas tradit. saepe psylli, qui reliquarum venena terrarum inuehentes quaestus sui causa peregrinis malis implevere italiam, hos quoque importare conati sunt, sed vivere intra siculi caeli regionem non potuere. visuntur tamen aliquando in italia, sed innocui, multisque aliis in locis, ut circa pharum in aegypto. in scythia interemunt etiam sues, alioqui vivaciores contra venena talia, nigras quidem celerius, si in aquam se inmerserint. homini icto putatur esse remedio ipsorum cinis potus in vino. magnam adversitatem oleo mersis et stellionibus putant esse, innocuis dumtaxat iis qui et ipsi carent sanguine, lacertarum figura; aequae scorpiones in totum nullis nocere quibus non sit sanguis. quidam et ab ipsis fetum devorari arbitrantur; unum modo relinqui sollertissimum et qui se ipsius matris clunibus inponendo tutus et a cauda et a morsu loco fiat; hunc esse reliquorum ultorem, qui postremo genitores superne conficiat. pariuntur autem undeni.

chamaeleonum stelliones hi quodam modo naturam habent, rore tantum viventes praeterque araneis.

similis cicadis vita, quarum duo genera: minores quae primae proveniunt et novissimae pereunt; sunt autem mutae. sequens est volatura earum quae canunt; vocantur achetae et, quae minores ex his sunt, tettigonia. sed illae magis canorae. mares canunt in utroque genere, feminae silent. gentes vescuntur iis ad orientem, etiam parthi opibus abundantibus. ante coitum mares praeferunt, a coitu feminas, ovis earum corrupti, quae sunt candida. coitus supinis. asperitas praeacuta in dorso, qua excavant feturae locum in terra. fit primo vermiculus, deinde ex eo quae vocatur tettigometra, cuius cortice rupto circa solstitia evolant, noctu semper, primo nigrae atque durae. unum hoc ex iis, quae vivunt, et sine ore est; pro eo quiddam aculeatorum linguis simile, et hoc in pectore, quo rorem lambunt. pectus ipsum fistulosum. hoc canunt achetae, ut dicemus. de cetero in ventre nihil est. excitatae cum subvolant, umorem reddunt, quod solum argumentum est rore eas ali. isdem solis nullum ad excrementa corporis foramen. oculis tam hebetes, ut, si quis digitum contrahens ac remittens adpropinquet iis, transeant velut folio ludente. quidam duo alia genera faciunt earum: surculariam, quae sit grandior; frumentariam, quam alii avenariam vocant, apparet enim simul cum frumentis arescentibus. cicadae non nascuntur in raritate arborum - idcirco non sunt cyrenis nisi circa oppidum - nec in campis nec in frigidis aut umbrosis nemoribus. est quaedam et his locorum differentia. in milesia regione paucis sunt locis, sed in cephallania amnis quidam paenuriam earum et copiam dirimit. at in regino agro silent omnes, ultra flumen in locrensi canunt. pinnarum illis natura quae apibus, sed pro corpore amplior.

insectorum autem quaedam binas gerunt pinnas, ut muscae, quaedam quaternas, ut apes. membranis et cicadae volant. quaternas habent quae aculeis in alvo armantur. nullum, cui telum in ore, pluribus quam binis advolat pinnis. illis enim ultionis causa datum est, his aviditatis. nullis eorum pinnae

reviviscunt avulsae. nullum, cui aculeus in alvo, bipinne est.

quibusdam pinnarum tutelae crusta supervenit, ut scarabaeis, quorum tenuior fragiliorque pinna. his negatus aculeus, sed in quodam genere eorum grandi cornua praelonga, bisulca dentatis forcipibus in cacumine, cum libuit, ad morsum coeuntibus, infantium etiam remediis ex cervice suspenduntur; lucavos vocat hos nigidius. aliud rursus eorum genus, qui e fimo ingentes pilas aversi pedibus volutant parvosque in iis contra rigorem hiemis vermiculos fetus sui nidulantur. volitant alii magno cum murmure aut mugitu, alii focos et prata crebris foraminibus excavant, nocturno stridore vocales. lucent ignium modo noctu laterum et clunium colore lampyrides, nunc pinnarum hiatu refulgentes, nunc vero compressu obumbratae, non ante matura pabula aut post desecta conspicuae. e contrario tenebrarum alumna blattis vita, lucemque fugiunt in balinearum maxime umido vapore prognatae. fodiunt ex eodem genere rutili atque praegrandes scarabaei tellurem aridam favosque parvae et fistulosae modo spongiae medicato melle fingunt. in threcia iuxta olynthum locus est parvus, in quo unum hoc animal exanimatur, ob hoc cantharolethrus appellatus. pinnae insectis omnibus sine scissura. nulli cauda nisi scorspioni. hic eorum solus et brachia habet et in cauda spiculum; reliquorum quibusdam aculeus in ore, ut asilo, sive tabanum dici placet, item culici et quibusdam muscis, omnibus autem his in ore et pro lingua. sunt hi aculei quibusdam hebetes neque ad punctum, sed ad suctum, ut muscarum generi, in quo lingua evidens fistula est. nec sunt talibus dentes. aliis cornicula ante oculos praetenduntur ignava, ut papilionibus. quaedam insecta carent pinnis, ut scolopendra.

insectorum pedes quibus sunt, in obliquum moventur. quorundam extremi longiores foris curvantur, ut locustis.

hae pariunt, in terram demisso spinae caule, ova condensa autumnii tempore. ea durant hieme; e terra subsequenti anno exitu veris emittunt parvas, nigrantes et sine cruribus pinnisque reptantes. itaque vernis aquis intereunt ova, sicco vere maior proventus. alii duplicem earum fetum geminumque exitum tradunt: vergiliarum exortu parere, deinde ad canis ortum obire et alias renasci; quidam arcturi occasu renasci. mori matres, cum pepererint, certum est, vermiculo statim circa fauces innascente qui eas strangulat. eodem tempore mares obeunt. et tam frivola ratione morientes serpentem, cum libuit, necant singulae, faucibus eius adprehensis mordicus. non nascuntur nisi rimosis locis. in india ternum pedum longitudinis esse traduntur, cruribus et feminibus serrarum usum praebere, cum inaruerint. est et alius earum obitus: gregatim sublatae vento in maria aut stagna decidunt. forte hoc casusque evenit, non, ut prisci existimavere, madefactis nocturno umore alis. iidem quippe nec volare eas noctibus propter frigora tradiderunt, ignari etiam longinqua maria ab iis transiri, continuata plurium dierum - quod maxime miremur - fame quoque, quam propter externa pabula petere sciunt. deorum irae pestis ea intellegitur. namque et grandiores cernuntur et tanto volant pinnarum stridore, ut aliae alites credantur, solemque obumbrant

sollicitis suspectantibus populis, ne suas operiant terras. sufficiunt quippe vires et, tamquam parum sit maria transisse, immensos tractus permeant diraque messibus nube contegunt, multa contactu adurentes, omnia vero morsu erodentes et fores quoque tectorum.

italiam ex africa maxime coortae infestant, saepe populo romano ad sibyllina coacto remedia confugere inopiae metu. in cyrenaica regione lex etiam est ter anno debellandi eas, primo ova obtinendo, dein fetum, postremo adultas, desertoris poena in eum qui cessaverit. et in lemno insula certa mensura praefinita est, quam singuli enecatarum ad magistratus referant. graculos quoque ob id colunt adverso volatu occurrentes earum exitio. necare et in syria militari imperio coguntur. tot orbis partibus vagatur id malum. parthis et hae in cibo gratae.

vox earum proficisci ab occipitio videtur. eo loco in commissura scapularum habere quasi dentes existimantur eosque inter se terendo stridorem edere, circa duo maxime aequinoctia, sicut cicadae circa solstitium. coitus locustarum qui et insectorum omnium quae coeunt, marem portante femina, in eum feminarum ultimo caudae reflexo tardoque digressu. minores autem in omni hoc genere feminis mares.

plurima insectorum vermiculum gignunt, nam et formicae similem ovis vere, ... et hae communicantes laborem ut apes, sed illae faciunt cibos, hae condunt. ac si quis conparet onera corporibus earum, fateatur nullis portione vires esse maiores. gerunt ea morsu; maiora aversae postremis pedibus moliantur umeris obnixae. et his rei publicae ratio, memoria, cura. semina adrosa condunt, ne rursus in frugem exeant e terra, maiora ad introitum dividunt, madefacta imbre proferunt atque siccant. operantur et noctu plena luna, eadem interlunio cessant. iam in opere qui labor, quae sedulitas! et quoniam ex diverso convehunt altera alterius ignara, certi dies ad recognitionem mutuam nundinis dantur. quae tunc earum concursatio, quam diligens cum obviis quaedam conlocutio atque percunctatio! silices itinere earum adtritosis videmus et opere semitam factam, ne quis dubitet, qualibet in re quid possit quantulacumque adsiduitas. sepeliunt inter se viventium solae praeter hominem. non sunt in sicilia pinnatae.

indicae formicae cornua erythris in aede herculis fixa miraculo fuere. aurum hae cavernis egerunt terra in regione septentrionalium indorum qui dardae vocantur. ipsis color felium, magnitudo aegypti luporum. erutum hoc ab iis tempore hiberno indi furantur aestivo fervore, conditis propter vaporem in cuniculos formicis, quae tamen odore sollicitatae provolant crebroque lacerant quamvis praevelocibus camelis fugientes. tanta pernicitas feritasque est cum amore auri.

multa autem insecta et aliter nascuntur, atque in primis e rore. insidet hic raphani folio primo vere et spissatus sole in magnitudinem milii cogitur. inde porrigitur vermiculus parvus et triduo mox uruca, quae adiectis diebus accrescit, immobilis, duro cortice. ad tactum tantum movetur, araneo accreta, quam chrysallidem appellant. rupto deinde cortice volat papilio.

sic quaedam ex imbri generantur in terra, quaedam et in ligno. nec enim cossi tantum in eo, sed etiam tabani ex eo nascuntur et alias, ubicumque umor est nimius, sicut intra hominem taenia tricennum pedum, aliquando et plurium longitudine. iam in carne exanima et viventium quoque hominum et capillo, qua foeditate et sulla dictator et alcman ex clarissimis graeciae poetis obiere. hoc quidem et aves infestat, phasianas vero interemit nisi pulverantes sese; pilos habentium asinum tantum immunem hoc malo credunt et oves. gignuntur autem et vestis genere, praecipue lanicio interemptarum a lupis ovium. aquas quoque quasdam, quibus lavemur, fertiliores eius generis invenio apud auctores, quippe cum etiam cerae id gignant quod animalium minimum existimatur. alia rursus generantur sordibus aridi soli, posteriorum lascivia crurum petauristae, alia pulvere umido in cavernis volucra.

est animal eiusdem temporis, infixio semper sanguini capite vivens atque ita intumescens. unum animalium, cui cibi non sit exitus, dehiscit in nimia satietate, alimento ipso moriens. numquam hoc in iumentis gignitur, in bubus frequens, in canibus aliquando, in quibus omnia; in ovibus et in capris hoc solum. aequae mira sanguinis et hirudinum in palustri aqua sitis; namque et hae toto capite conduntur. est volucre canibus peculiare suum malum, aures maxime lancinans, quae defendi morsu non queunt.

idem pulvis in lanis et veste tineas creat, praecipue si araneus una includatur. sitiens enim et omnem umorem absorbens ariditatem ampliat. hoc et in chartis nascitur. est earum genus tunicas suas trahentium quo cocleae modo; sed harum pedes cernuntur. spoliatae exspirant. si adcrevere, faciunt chrysallidem. ficarios culices caprificus generat, cantharidas vermiculi ficorum et piri et peuces et cynacanthae et rosae. venenum hoc remedia secum habet: alae medentur, quibus demptis letale est. rursus alia genera culicum aescens natura gignit, quippe cum et in nive inveniantur vetustiore vermiculi rutili - nam et ipsa nix vetustate rufescit - hirti pilis, in media quidem candidi, grandiores torpentesque.

gignit aliqua et contrarium naturae elementum. siquidem in cypri aerariis fornacibus et medio igni maioris muscae magnitudinis volat pinnatum quadrupes; appellatur pyralis, a quibusdam pyrotocon. quamdiu est in igni, vivit; cum evasit longiore paulo volatu, emoritur.

hypanis fluvius in ponto circa solstitium defert acinorum effigie tenues membranas, quibus erumpit volucre quadrupes supra dicti modo, nec ultra unum diem vivit, unde hemerobion vocatur. reliquis talium ab initio ad finem septenarii sunt numeri, culici et vermiculis ter septeni, corpus parientibus quater septeni; mutationes et in alias figuras transitus trinis aut quadrinis diebus. cetera ex his pinnata autumnio fere moriuntur tabe alarum, tabani quidem etiam caecitate. muscis umore exanimatis, si cinere condantur, redit vita.

nunc per singulas corporum partes praeter iam dicta membratim tractetur historia.

caput habent cuncta quae sanguinem. in capite paucis animalium nec nisi

volucris apices, diversi quidem generis, phoenici plumarum serie e medio eo exeunte alia, pavonibus crinitis arbusculis, stymphalidi cirro, phasianae corniculis, praeterea parvae avi, quae, ab illo galerita appellata quondam, postea gallico vocabulo etiam legioni nomen dederat alaudae. diximus et cui plicatilem cristam dedisset natura. per medium caput a rostro residentem et fulicarum generi dedit, cirros pico quoque martio et grui balearicae, sed spectatissimum insigne gallinaceis, corporeum, serratum; nec carnem ita esse nec cartilaginem nec callum iure dixerimus, verum peculiare datum. draconum enim cristas qui viderit, non reperitur.

cornua multis quidem et aquatiliis et marinorum et serpentium variis data sunt modis, sed quae iure cornua intellegantur, quadrupedum tantum generi; actaeonem enim et cipum etiam in latia historia fabulosos reor. nec alibi maior naturae lascivia. lusit animalium armis, sparsit haec in ramos, ut cervorum, aliis simplicia tribuit, ut in eodem genere subulonis ex argumento dictis, aliorum fudit in palmas digitosque emisit ex iis, unde platycerotas vocant. dedit ramosa capreis, sed parva nec fecit decidua, convoluta in anfractum arietum generi, ceu caestus daret, infesta tauris - in hoc quidem genere et feminis tribuit, in multis tantum maribus - , rupicapris in dorsum adunca, dammis in adversum; erecta autem rugarumque ambitu contorta et in leve fastigium exacuta, ut lyras decerent, strepsiceroti, quem addacem africa appellat; mobilia eadem, ut aures, phrygiae armentis, trogoditarum in terram directae, qua de causa obliqua cervice pascuntur, aliis singula, et haec medio capite aut naribus, ut diximus. iam quidem aliis ad incursum robusta, aliis ad ictum, aliis adunca, aliis redunca, aliis ad iactum pluribus modis, supina, convexa, conversa, omnia in mucronem nigrantia. in quodam genere pro manibus ad scabendum corpus, coeleis ad praetemptandum iter, corporea haec, sicut cerastis; his aliquando singula, coeleis semper bina et ut protendantur ac resiliant.

vrorum cornibus barbari septentrionales potant urnisque bina capitis unius cornua implent; alii praefixa hastilia cuspidant. apud nos in lamnas secta tralucet atque etiam lumen inclusum latius fundunt multasque alias ad delicias conferuntur, nunc tincta, nunc sublita, nunc quae cestrota a picturae genere dicuntur. - (omnibus autem cava et in mucrone demum concreta sunt, cervis tantum tota solida et omnibus annis decidua) - boum attritis ungulis cornua unguendo arvina medentur agricolae, adeoque sequax natura est, ut in ipsis viventium corporibus ferventi cera flectantur atque nascentium in diversas partes torqueantur, ut singulis capitibus quaterna fiant.

tenuiora feminis plerumque sunt, ut in pecore multis, ovium nulla nec cervorum; nec quibus multifidi pedes, nec solidipedum ulli excepto asino indico, qui uno armatus est cornu. bisulcis bina natura tribuit, nulli superne primores habenti dentes. qui putant eos in cornua absumi, facile corguuntur cervarum natura, quae nec dentes habent (ut neque mares) nec tamen cornua. ceterorum ossibus adhaerent, cervorum tantum cutibus enascuntur.

capita piscibus portione corporum maxima, fortassis ut mergantur.

ostrearum generi nulla nec spongis nec aliis fere, quibus solus ex sensibus tactus est. quibusdam indiscretum caput, ut cancris.

in capite animalium cunctorum homini plurimus pilus, iam quidem promiscue maribus ac feminis, apud intonsas utique gentes. atque etiam nomina ex eo capillatis alpium incolis, galliae comatae, ut tamen sit aliqua in hoc terrarum differentia. quippe myconii carentes eo gignuntur, sicut in cauno lienosi. et quaedam animalium naturaliter calvent, sicut struthocameli et corvi aquatici, quibus apud graecos nomen inde. defluvium eorum in muliere rarum, in spadonibus non visum, nec in ullo ante veneris usum nec infra cerebrum aut infra verticem aut circa tempora atque aures. calvitium uni tantum animalium homini praeterquam innatum. canities homini tantum et equo, sed homini semper a priore parte capitis, tum deinde ab aversa. vertex bini hominum tantum aliquis.

capitis ossa plana, tenuia, sine medullis, serratis pectinatim structa compagibus. perfracta non queunt solidari, sed exempta modice non sunt letalia, in vicem eorum succedente corporea cicatrice. infirmissima esse ursis, durissima psittacis suo diximus loco.

cerebrum omnia habent animalia quae sanguinem, etiam in mari quae mollia appellavimus, quamvis careant sanguine, ut polypus. sed homo portione maximum et umidissimum omniumque viscerum frigidissimum, duabus supra subterque membranis velatum, quarum alterutram rumpi mortiferum est. cetero viri quam feminae maius. omnibus hoc sine sanguine, sine venis, et seboris sine pingui. aliud esse quam medullam eruditi docent, quoniam coquendo durescat. omnium cerebro medio insunt ossicula parva. uni homini in infantia palpitat nec corroboratur ante primum sermonis exordium. hoc est viscerum excelsissimum ... quae caelo capitis, sine carne, sine cruore, sine sordibus. hanc habent sensus arcem, huc venarum omnis a corde vis tendit, hic desinit, hoc columnen altissimum, hic mentis est regimen. omnium autem animalium in priora pronum, quia et sensus ante nos tendunt. ab eo proficiscitur somnus, hinc capitis nutatio. quae cerebrum non habent, non dormiunt. - cervis in capite inesse vermiculi sub linguae inanitate et circa articulum, quae caput iungitur, numero xx produntur. -

aures homini tantum immobiles. ab his flaccorum cognomina. nec in alia parte feminis maius impendium margaritis dependentibus; in oriente quidem et viris aurum eo loci gestare decus existimatur. animalium aliis maiores, aliis minores; cervis tantum scissae ac velut divisae, sorici pilosae, sed aliquae omnibus animalium dumtaxat generantibus, excepto vitulo marino atque delphino et quae cartilaginea appellavimus et viperis: haec cavernas tantum habent aurium loco praeter cartilaginea et delphinum, quem tamen audire manifestum est. nam et cantu mulcentur et capiuntur attoniti sono. quam audiant mirum. iidem nec olfactus vestigia habent, cum olfaciant sagacissime. pinnatorum animalium buboni tantum et oto plumae velut aures, ceteris cavernae ad auditum; simili modo squamigeris atque serpentibus. in equis et omni iumentorum genere indicia animi praeferunt, marcidae fessis, micantes

pavidis, subrectae furentibus, resolutae aegris.

facies homini tantum, ceteris os aut rostra. frons et alii, sed homini tantum tristitiae, hilaritatis, clementiae, severitatis index. in assensu eius supercilia homini et pariter et alterna mobilia. et in his pars animi: negamus iis, annuimus. haec maxime indicant fastum, superbiam. aliubi conceptaculum, sed hic sedem habet; in corde nascitur, huc subit, hic pendet. nihil altius simul abruptiusque invenit in corpore, ubi solitaria esset.

subiacent oculi, pars corporis pretiosissima et quae lucis usu vitam distinguat a morte. non omnibus animalium hi; ostreis nulli, quibusdam concharum dubii. pectines enim, si quis digitos adversum hiantes eos moveat, contrahuntur ut videntes, et solenes fugiunt admota ferramenta. quadripedum talpis visus non est; oculorum effigies inest, si quis praetentam detrahat membranam. et inter aves ardiolarum in genere quos leucos vocant, altero oculo carere tradunt, optimi augurii, cum ad austrum volent septentrionemve: solvi enim pericula et metus narrant. nigidius nec locustis, cicadis esse dicit. cocleis oculorum vicem cornicula bina praetemptatu implent. nec lumbricis ulli sunt vermiumve generi.

oculi homini tantum diverso colore, ceteris in suo cuique genere similes. et equorum quibusdam glauci, sed in homine numerosissimae varietatis atque differentiae: grandiores, modici, parvi; prominentes quos hebetiores putant, conditi quos clarissime cernere, sicuti colore caprinos.

praeterea alii contuentur longinqua, alii nisi prope admota non cernunt. multorum visus fulgore solis constat, nubilo die non cernentium nec post occasus. alii interdiu hebetiores, noctu praeter ceteros cernunt. de geminis pupillis aut quibus noxii visus essent satis diximus. caesii in tenebris clariores. ferunt ti. caesari, nec alii genitorum mortalium, fuisse naturam ut expergefactus noctu paulisper haut alio modo quam luce clara contueretur omnia, paulatim tenebris sese obducentibus. Divo Augusto equorum modo glauci fuere superque hominem albicantis magnitudinis, quam ob causam diligentius spectari eos iracunde ferebat; claudio caesari ab angulis candore carnoso sanguineis venis subinde suffusi, gaio principi rigentes, neroni ... at, nisi cum coniveret ad prope admota, hebetes. [xx] gladiatorum in gai principis ludo fuere, in iis duo omnino qui contra comminationem aliquam non coniverent, et ob id invicti. tantae hoc difficultatis est homini. plerisque vero naturale ut nictari non cessent, quos pavidiores accepimus. oculus unicolor nulli; communi candore omnibus medius colos differens. neque ulla ex parte maiora animi indicia cunctis animalibus, sed homini maxime, id est moderationis, clementiae, misericordiae, odii, amoris, tristitiae, laetitiae. contuitu quoque multiformes, truces, torvi, flagrantes, graves transversi, limi, summissi, blandi. profecto in oculis animus habitat. ardent, intenduntur, umectant, conivent. hinc illa misericordiae lacrima, hos cum exosculamur, animum ipsum videmur attingere, hinc fletus et rigantes ora rivi. quis ille est umor in dolore tam fecundus et paratus aut ubi reliquo tempore animo autem videmus, animo cernimus: oculi ceu vasa quaedam visibilem eius partem

accipiunt atque tramittunt. sic magna cogitatio obcaecat abducto intus visu. sic in morbo comitali animo caligante aperti nihil cernunt. quin et patentibus dormiunt lepores multique hominum, quos κορυβαντιᾶν graeci dicunt. tenuibus multisque membranis eos natura composuit, callosis contra frigora caloresque in extumo tunicis, quas subinde purificat lacrimationum salivis, lubricos propter incurstantia et mobiles.

media eorum cornua fenestravit pupilla, cuius angustiae non sinunt vagari incertam aciem ac velut canali dirigunt obiterque incidentia facile declinant, aliis nigri, aliis ravi, aliis glauci coloris orbibus circumdatis, ut habili mixtura et accipiat circumiecto candore lux et temperato percussu non obstrepat. adeoque his absoluta vis speculi, ut tam parva illa pupilla totam imaginem reddat hominis. ea causa est, ut pleraeque alitum e manibus hominum oculos potissimum adpetant, quod effigiem suam in iis cernentes velut ad cognata desideria sua tendunt. veterina tantum quaedam ad incrementa lunae morbos sentiunt. sed homo solus emisso umore caecitate liberatur. post vicensimum annum multis restitutus est visus, quibusdam statim nascentibus negatus nullo oculorum vitio, multis repente ablatus simili modo nulla praecedente iniuria. venas ab iis pertinere ad cerebrum peritissimi auctores tradunt; ego et ad stomachum crediderim: certe nulli sine redundatione eius eruitur oculus. morientibus illos operire rursusque in rogo patefacere quiritium magno ritu sacrum est, ita more condito, ut neque ab homine supremum eos spectari fas sit et caelo non ostendi nefas. uni animalium homini depravantur, unde cognomina strabonum et paetorum. ab isdem qui altero lumine orbi nascerentur coclites vocabantur; qui parvis utrisque, ocellae; luscini iniuriae cognomen habuerunt. nocturnorum animalium veluti felium in tenebris fulgent radiantque oculi, ut contueri non sit; et caprae lupoque splendent lucemque iaculantur. vituli marini et hyaenae in mille colores transeunt subinde. quin et in tenebris multorum piscium refulgent, aridi sicut robusti caudices putresque vetustate. non conivere diximus quae non obliquis oculis, sed circumacto capite cernerent. chamaeleonis oculos ipsos circumagi totos tradunt. cancri in oblicum aspiciunt crusta fragili inclusos gerentes. locustis, squillis magna ex parte sub eodem munimento praeduri eminent. quorum duri sunt, minus cernunt quam quorum umidi. serpentium catulis et hirundinum pullis, si quis eruat, renasci tradunt. insectorum omnium et testacei operimenti oculi moventur sicut quadripedum aures. quibus fragilia operimenta, his oculi duri. omnia talia et pisces et insecta non habent genas nec integunt oculos. omnibus membrana vitri modo tralucida obtenditur.

palpebrae in genis homini utrimque, mulieribus fuco etiam infectae cotidiano: tanta est decoris adfectatio, ut tinguantur oculi quoque. alia de causa hoc natura dederat ceu vallum quoddam visus et prominens munimentum contra occurrentia animalia aut alia fortuito incidentia. defluere eas haut inmerito venere abundantibus tradunt. ex ceteris nulli sunt nisi quibus et in reliquo corpore pili, sed quadripedibus in superiore tantum gena, volucris in inferiore et quibus molle tergus, ut serpentibus, et quadripedum

quae ova pariunt, ut lacertae. struthocamelus alitum sola ut homo utrimque palpebras habet.

ne genae quidem omnibus. ideo neque nictatio nisi iis quae animal generant, graviores alitum inferiore gena conivent, eadem nictantur ab angulis membrana obeunte. columbae et similia utraque conivent; at quadrupes quae ova pariunt, ut testudines, crocodili, inferiore tantum sine ulla nictatione propter praeduros oculos. extremum ambitum genae superioris antiqui cilium vocavere, unde et supercilia. hoc vulnere aliquo diductum non coalescit, ut in paucis humani corporis membris.

infra oculos malae homini tantum, quas prisci genas vocabant, xii tabularum interdicto radi a feminis vetantes. pudoris haec sedes: ibi maxime ostenditur rubor.

infra eas hilaritatem risumque indicantes buccae et altior homini tantum, quem novi mores subdolae inrisioni dicavere, nasus. non alii animalium nares eminent: avibus, serpentibus, piscibus foramina tantum ad olfactus sine naribus, et hinc cognomina simorum, silonum. septimo mense genitis saepenumero foramina aurium et narium defuere.

labra, a quibus brocchi, labeones dicti, et os probum duriusve animal generantibus. pro his cornea et acuta volucris rostra, eadem rapto viventibus adunca, collecto recta, herbas eruentibus limumque lata, ut et suum generi; iumentis vice manus ad colligenda pabula. ora apertiora laniatu viventibus.

mentum nulli praeter hominem, nec malae. maxillas crocodilus tantum superiores movet, terrestres quadrupes eodem quo cetera more praeterque in oblicum.

dentium tria genera, serrati aut continui aut exerti: serrati pectinatim coeuntes, ne contrario occurso atterantur, ut serpentibus, piscibus, canibus; continui, ut homini, equo; exerti, ut apro, hippopotamio, elephanto. continuorum qui digerunt cibum lati et acuti, qui conficiunt duplices; qui discriminant eos canini appellantur: hi sunt serratis longissimi. continui aut utraque parte oris sunt, ut equo, aut superiore primores non sunt, ut bubus, ovibus omnibusque quae ruminant. caprae superiores non sunt praeter primores geminos. nulli exerti quibus serrati, raro feminae, et tamen sine usu. itaque cum apri percutiant, feminae sues mordent. nulli, cui cornua, exerti, sed omnibus concavi; ceteris dentes solidi. piscium omnibus serrati praeter scarum; huic uni aquatilium plani. cetero multis eorum in lingua et toto ore, ut turba vulnere molliant quae attritu subigere non queunt, multis et in palato atque etiam in cauda, praeterea in os vergentes, ne excidant cibi nullum habentibus retinendi adminiculum.

similes aspidi et serpentibus, sed duo in supera parte dextra laevaue longissimi, tenui fistula perforati, ut scorpioni aculei, venenum infundentes. non aliud hoc esse quam fel serpentium et inde venas sub spina ad os pervenire diligentissimi auctores scribunt; quidam unum esse eum et, quia sit aduncus, resupinari, cum momorderit; aliqui tum decidere eum rursusque recrescere faciem decussu, et sine eo esse quas tractari cernamus. scorpionis

caudae inesse eum et plerisque ternos. viperis dentes gingivis conduntur. haec, eodem praegnans veneno, inpressum dentium repulso virus fundit in morsus. volucrum nulli dentes praeter vespertilionem. camelus una ex iis, quae non sunt cornigera, in superiore maxilla primores non habet. cornua habentium nulli serrati. et cocleae dentes habent. indicio est et a minimis earum derosa vicia. at in marinis crustata et cartilaginea primores habere, item echinis quinos esse unde intellegi potuerit miror. dentium vice aculeus insectis. simiae dentes ut homini. elephanto intus ad mandendum iiii, praeterque eos prominent masculis reflexi, feminis recti atque proni. musculus marinus, qui ballaenam antecedit, nullos habet, sed pro iis saetis intus os hirtum et linguam etiam ac palatum. terrestrium minutis quadripedibus primores bini utrimque longissimi.

ceteris cum ipsis nascuntur, homini postquam natus est septimo mense. reliquis perpetui manent, mutantur homini, leoni, iumento, cani et ruminantibus, sed leoni et cani non nisi canini appellati. lupi dexter caninus in magnis habetur operibus. maxillares, qui sunt a caninis, nullum animal mutat. homini novissimi, qui genuini vocantur, circiter vicensimum annum gignuntur, multis et octogensimo, feminis quoque, sed quibus in iuventa non fuere nati. decidere in senecta et mox renasci certum est. zoclen samothracem, cui renati essent post ciiii annos, mucianus visum a se prodidit. cetero maribus plures quam feminis in homine, pecude, capra, sue. timarchus nicoclis filius paphi duos ordines habuit maxillarium; frater eius non mutavit primores ideoque praetrivit. est exemplum dentis homini et in palato geniti. a caninis amissi casu aliquo numquam renascuntur. ceteris senecta rufescunt, equo tantum candidiores fiunt.

aetas veterinorum dentibus iudicatur. equo sunt numero xl. amittit tricensimo mense primores utrimque binos, sequenti anno totidem proximos, cum subeunt dicti columellares; quinto anno incipiente amittit binos, qui sexto anno renascuntur; septimo omnes habet et renatos et inmutabiles. equo castrato prius non decidunt dentes. asinorum genus tricensimo mense similiter amittit, dein senis mensibus. quod si non prius peperere quam decidant postremi, sterilitas certa. boves bimi mutant. subus non decidunt umquam. absumpta hac observatione senectus in equis et ceteris veterinis intellegitur dentium brocchitate, superciliorum canitia et circa ea lacunis, cum fere xvi annorum existimantur. hominum dentibus quoddam inest virus; namque et speculi nitorem ex adverso nudati hebetant et et columbarum fetus implumes necant. reliqua de iis in generatione hominum dicta sunt. erumpentibus morbi corpora infantium accipiunt. reliqua animalia quae serratos habent saevissime dentunt.

linguae non omnibus eodem modo. tenuissima serpentibus et trisulca, vibrans, atri coloris et, si extrahas, praelonga; lacertis bifida et pilosa, vitulis quoque marinis duplex, sed supra dictis capillamenti tenuitate. ceteris ad circumlambenda ora, piscibus paulo minus quam tota adhaerens, crocodilis tota; sed in gustatu linguae vice carnosum aquatilibus palatum. leonibus,

pardis omnibusque generis eius, etiam felibus, imbricatae asperitatis ac limae similis attenuansque lambendo cutem hominis, quae causa etiam mansuefacta, ubi ad vicinum sanguinem pervenit saliva, invitat ad rabiem. de purpurarum linguis diximus. ranis prima cohaeret, intima absoluta a guttore, qua vocem emittunt mares, cum vocantur ololygones. statim id tempore evenit, cientibus ad coitum feminas. tum siquidem inferiore labro demisso ad libramentum aquae modice receptae in fauces palpitante ibi lingua ululatus eliditur. tunc et extenti buccarum sinus perlucet, oculi flagrant labore perpulsi. quibus in posteriore parte aculei, his et dentes et lingua, apibus etiam praelonga, eminens et cicadis. quibus aculeus in ore fistulosus, his nec lingua nec dentes. quibusdam insectis intus lingua, ut formicis; ceterum latet et elephanto praecipue. reliquis in suo genere semper absoluta, homini tantum ita saepe constricta venit, ut intercidi eas necesse sit. metellum pontificem adeo inexplanatae fuisse accipimus, ut multis mensibus tortus credatur, dum meditatur in dedicanda aede opi opiferae dicere. ceteris septimo ferme anno sermonem exprimit. multis vero talis ars eius contingit, ut avium et animalium vocis indiscreta edatur imitatio. intellectus saporum ceteris in prima lingua, homini et in palato.

tonsillae in homine, in sue glandulae. quod inter eas uvae nomine ultimo dependet palato, homini tantum est. sub ea minor lingua nulli ova generantium. opera eius gemina duabus interpositae fistulis. interior earum appellatur arteria, ad pulmonem atque cor pertinens; hanc operit in epulando, spiritu et voce in illa meante, ne, si potus cibusve in alienum deerraverit tramitem, torqueat. altera exterior appelletur sane gula, qua cibus atque potus devolant. tendit haec ad stomachum, is ad ventrem. hanc per vices operit, cum spiritus tantum aut vox comseat, ne restagnatio intempestiva alvi obstrepat. ex cartilagine et carne arteria, gula e nervo et carne constat.

cervix nulli nisi quibus utraque haec; ceteris collum, quibus tantum gula. sed quibus cervix, e multis vertebrisque orbiculatim ossibus flexilis ad circumspectum articulorum nodis iungitur, leoni tantum et lupo et hyaenae singulis rectisque ossibus rigens. cetero spinae adnectitur, spina lumbis, ossea, sed tereti structura, per mediae foramina a cerebro medulla descendente. eandem esse ei naturam quam cerebro colligunt, quoniam praetenui eius membrana modo incisa statim expiretur. quibus longa crura, his longa et colla, item aquaticis quamvis brevia crura habentibus, simili modo uncus unguis.

guttur homini tantum et subus intumescit, aquarum quae potantur plerumque vitio. summum gulae fauces vocantur, extremum stomachus. hoc nomine est sub arteria iam carnosa inanitas adnexa spinae, ad latitudinem ac longitudinem lagonae modo fusa. quibus fauces non sunt, ne stomachus quidem est nec colla nec guttur, ut piscibus, et ora ventribus iunguntur. testudini marinae lingua nulla nec dentes: rostri acie comminuit omnia. postea arteria et stomachus denticulatus callo in modum rubi ad conficiendos cibos, decreascentibus crenis quicquid adpropinquant ventri; novissima asperitas ut scobinae fabrilis.

cor animalibus ceteris medio pectore est, homini tantum infra laevam papillam turbinato mucrone in priora eminens. piscibus solis ad os spectat. hoc primum nascentibus formari in utero tradunt, deinde cerebrum, sicut tardissime oculos, sed hos primum emori, cor novissime. huic praecipuus calor. palpitat certe et quasi alterum movetur intra animal praemolli firmoque opertum membranae involucro, munitum costarum et pectoris muro, ut pariat praecipuam vitae causam et originem. prima domicilia intra se animo et sanguini praebet sinuoso specu et in magnis animalibus triplici, in nullo non gemino. ibi mens habitat. ex hoc fonte duae grandes venae in priora et terga discurrunt sparsaque ramorum serie per alias minores omnibus membris vitalem sanguinem rigant. solum hoc viscerum vitiis non maceratur nec supplicia vitae trahit laesumque mortem ilico adfert. ceteris corruptis vitalitas in corde durat.

bruta existimantur animalium quibus durum riget, audacia quibus parvum est, pavida quibus praegrande. maximum autem est portione muribus, lepori, asino, cervo, pantherae, mustelis, hyaenis et omnibus timidis aut propter metum maleficis. in paphlagonia bina perdicibus corda. in equorum corde et boum ossa reperiuntur interdum. augeri id per singulos annos in homine et binas drachmas ponderi ad quinquagensimum annum accedere, ab eo detrahi tantundem, et ideo non vivere hominem ultra centensimum annum defectu cordis aegyptii existimant, quibus mos est cadavera adservare medicata. hirto corde gigni quosdam homines proditur neque alios fortioris esse industriae, sicut aristomenen messenium, qui trecentos occidit lacedaemonios. ipse convulneratus captus semel per cavernam lautumiarum evasit angustias, volpium aditus secutus. iterum captus sopitis custodibus somno ad ignem advolutus lora cum corpore exussit. tertium capto lacedaemonii pectus dissecuere viventi, hirsutumque cor repertum est.

in corde summo pinguitudo quaedam est laetis extis. non semper autem in parte extorum habitum est. l. postumio l. f. albino rege sacrorum post cxxvi olympiadem, cum rex pyrrhus ex italia decessisset, cor in extis haruspices inspicere coeperunt. caesari dictatori, quo die primum veste purpurea processit atque in sella aurea sedit, sacrificanti in extis defuit. unde quaestio magna de divinatione argumentantibus, potueritne sine illo viscere hostia vivere an ad tempus amiserit. negatur cremari posse in iis qui cardiaco morbo obierint, negatur et veneno interemptis. certe exstat oratio vitelli, qua gnaeum pisonem eius sceleris coarguit, hoc usus argumento palamque testatus non potuisse ob venenum cor germanici caesaris cremari. contra genere morbi defensum est piso.

sub eo pulmo est spirandique officina attrahens ac reddens animam, idcirco spongesosus ac fistulis inanibus cavus. pauca eum, ut dictum est, habent aquatilia, cetera ova parientia exiguum spumosumque nec sanguineum. ideo non sitiunt. eadem est causa, quare sub aqua diu ranae et phocae urinentur. testudo quoque, quamvis praegramdem et sub toto tegumento habeat, sine sanguine tamen habet. quanto minor hic corporibus, tanto velocitas maior.

chamaeleonti portione maximus et nihil aliud intus.

iecur in dextera parte est, in eo quod caput extorum vocant magnae varietatis. m. marcello circa mortem, cum periit ab Hannibale, defuit in extis; sequenti deinde die geminum repertum est. defuit et c. mario, cum immolaret vticae, item gaio principi kal. ian., cum iniret consulatum quo anno interfectus est, claudio successori eius quo mense interemptus est veneno. Divo Augusto spoleti sacrificanti primo potestatis suae die sex victimarum iocinera replicata intrinsecus ab ima fibra reperta sunt responsumque duplicaturum intra annum imperium. caput extorum tristis ostenti caesus quoque est, praeterquam in sollicitudine ac metu; tunc enim peremit curas. bina iocinera leporibus circa briletum et tharnen et in cherroneso ad propontidem, mirumque, tralatis alio interit alterum.

in eodem est fel, non omnibus datum animalibus. in euboeae chalcide nullum pecori, in naxo prae grande geminumque, ut sit prodigii loco utrumque advenae. equi, muli, asini, cervi, capreae, apri, cameli, delphini non habent. murium aliqui habent. hominum paucis non est, quorum validudo firma et vita longior. sunt qui equo non quidem in iecore esse, sed in alvo putent et cervo in cauda aut intestinis; ideo tantam amaritudinem, ut a canibus non attingantur. est autem nihil aliud quam purgamentum, pessimumque sanguinis ideo et in materia eius. certe iecur nulli est nisi sanguinem habentibus. accipit hoc a corde, cui iungitur, funditque in venas.

sed in felle nigro insaniae causa homini morsque toto reddito. hinc et in mores crimen bilis nomine: adeo magnum est in hac parte virus, cum se fundit in animum. quin et toto vagum corpore colorem oculis quoque aufert, illud quidem redditum etiam ae+nis, nigrescuntque contacta eo, ne quis miretur id venenum esse serpentium. - (carent eo quae apsinthio vescuntur in ponto) - sed avibus et parte tamen altera intestino iungitur in corvis, coturnicibus, phasianis, quibusdam intestimo tantum, ut in columbis, accipitre, murenis; paucis avium in iecore. serpentibus portione maxime copiosum. et piscibus autem est toto plerisque intestino, sicut accipitri, miluo; praeterea et in iecore est, ut cetis omnibus. - vitulis quidem marinis ad multa quoque nobile. tauros felle aureus ducitur color. haruspices id neptuno et umoris potentiae dicavere, geminumque fuit Divo Augusto quo die apud actium vicit.

murium iocusculis fibrae ad numerum lunae in mense congruere dicuntur totidemque inveniri, quotum lumen eius sit, praeterea bruma increscere. cuniculorum exta in baetica gemina saepe reperiuntur. ranarum rubetarum altera fibra a formicis non attingitur propter venenum, ut arbitrantur. iecur maxime vetustatis patiens centenis durare annis obsidionum exempla prodidere.

exta serpentibus et lacertis longa. caecinae volaterrano dracones emicuisse de extis laeto prodigio traditur, et profecto nihil incredibile sit aestimantibus pyrrho regi quo die periit praecisa hostiarum capita repsisse sanguinem suum lambentia. exta homini ab inferiore viscerum parte separantur membrana, quam praecordia appellant, quia a corde praetenditur quod graeci

appellaverunt φρένας. omnia quidem principalia viscera membranis propriis ac velut vaginis inclusit providens natura; in hac fuit et peculiaris causa vicinitas alvi, ne cibo supprimeretur animus. huic certe refertur accepta subtilitas mentis; ideo nulla est ei caro, sed nervosa exilitas. in eadem praecipua hilaritatis sedes, quod titillatu maxime intellegitur alarum, ad quas subit, non aliubi tenuiore humana cute ideoque scabendi dulcedine ibi proxima. ob hoc in proeliis gladiatorumque spectaculis mortem cum risu traiecta praecordia attulerunt.

subest venter stomachum habentibus, ceteris simplex, ruminantibus geminus, sanguine carentibus nullus. intestinum enim ab ore incipiens quibusdam eodem reflectitur, ut saepiae et polypo. in homine adnexus infimo stomacho similis canino. his solis animalium inferiore parte angustior; itaque et sola vomunt, quia repleto propter angustias supprimitur cibus, quod accidere non potest iis quorum spatiosa laxitas eum in inferiora transmittit.

ab hoc ventriculo lactes in ove et homine, per quas labitur cibus, in ceteris hillae, a quibus capaciora intestina ad alvum, hominique flexuosissimis orbibus. idcirco magis avidi ciborum quibus ab alvo longius spatium. item minus sollertes quibus obesissimus venter. aves quoque geminos sinus habent quaedam: unum quo mergunt recentia ut guttur, alterum in quem ex eo dimittunt concoctione maturata, ut gallinae, palumbes, columbae, perdices. ceterae fere carent eo, sed gula patientiore utuntur, ut graculi, corvi, cornices. quaedam neutro modo, sed ventrem proximum habent, quibus praelonga colla et angusta, ut porphyrii. venter solidipedum asper et durus; terrestrium aliis denticulatae asperitatis, aliis cancellatim mordacis, quibus neque dentes utrimque nec ruminatio. hic conficiuntur cibi, hinc in alvum delabuntur. media haec umbilico adnexa omnibus, in homine suillae infima parte similis, a graecis appellatur colon, ubi dolorum magna causa. angustissima canibus, quae de causa vehementi nisu nec sine cruciatu levant eam. insatiabilia animalium quibus a ventre protinus recto intestino transeunt cibi, ut lupis cervariis et inter aves mergis. ventres elephanto quattuor, cetera subus similia, pulmo quadruplo maior bubulo. avibus venter carnosus callosusque. in ventre hirundinum pullis lapilli candido aut rubenti colore, qui chelidonii vocantur, magicis narrati artibus, reperiuntur; et in iuvenearum secundo ventre pilae rotunditate nigricans tophus, nullo pondere, singulare, ut putant, remedium aegre parientibus, si tellurem non attigerit.

ventriculus atque intestina pingui ac tenui omento integuntur praeterquam ova gignentibus. huic adnectitur lien in sinistra parte adversus iecori, cum quo locum aliquando permutat, sed prodigiose. quidam eum putant inesse ova parientibus, item serpentibus admodum exiguum. ita certe apparet in testudine et crocodilo et lacertis et ranis. aegocephalo avi non inesse constat neque iis quae careant sanguine. peculiare cursus impedimentum aliquando in eo, quam ob rem minuitur cursorum laborantibus. et per vulnus etiam exempto vivere animalia tradunt. sunt qui putent adimi simul risum homini intemperantiamque eius constare lienis magnitudine. asiae regio scepis

appellatur, in qua minimos esse pecori tradunt, et inde ad lienem invecta remedia.

at in brileto et tharne quaterni renes cervis, contra pinnatis squamosisque nulli. de cetero summis adhaerent lumbis. dexter omnibus elatior et minus pinguis sicciorque. utrique autem pinguitudo e medio exit praeterquam in vitulo marino. animalia in renibus pinguissima, oves quidem letaliter circum eos concreto pingui. aliquando in iis inveniuntur lapilli. - renes habent omnia quadripedum quae animal generant, ova parientium testudo sola, quae et alia omnia viscera, sed ut homo bubulis similes velut e multis renibus compositos.

pectus, hoc est ossa, praecordiis et vitalibus natura circumdedit, at ventri, quem necesse erat increscere, ademit: nulli animalium circa ventrem ossa. pectus homini tantum latum, reliquis carinatum, volucris magis et inter eas aquaticis maxime. costae homini octonae, subus denae, cornigeris xiii, serpentibus xxx.

infra alvum est a priore parte vesica, quae nulli ova gignentium praeter testudinem, nulli nisi sanguineum pulmonem habenti, nulli pedibus carentium. inter eam et alvum arteriae ad pubem tendentes, quae ilia appellantur. in vesica lupi lapillus, qui syrites vocatur, sed in hominum quibusdam diro cruciatu subinde nascentes calculi et saetarum capillamenta. vesica membrana constat, quae vulnerata cicatrice non solidescit nec qua cerebrum aut cor involvitur; plura enim membranarum genera.

feminis eadem omnia praeterque vesicae iunctus utriculus, unde dictus uterus. quod alio nomine locos appellant, hoc in reliquis animalibus volvam. haec viperae et intra se parientibus duplex, ova generantium adnexa praecordiis, et in muliere geminos sinus ab utraque parte laterum habet, funebris quotiens versa spiritum inclusit. boves gravidas negant praeterquam dextero volvae sinu ferre, etiam cum geminos ferant. volva eiecto partu melior quam edito: eiecticia vocatur illa, haec porcaria. primiparae suis optima, contra effetis. a partu, praeterquam eodem die suis occisae, livida ac macra. nec novellarum suum praeter primiparas probatur potiusque veterum, dum ne effetarum, nec biduo ante partum aut post partum aut quo eiecerint die. proxima ab eiecticia est occisae uno die post partum. huius et sumen optimum, si modo fetus non hauserit; eiecticiae deterrimum. antiqui abdomen vocabant prius quam calleret, incientes occidere non adsueti.

cornigera una parte dentata et quae in pedibus talos habent sebo pinguescunt, bisulca scissive in digitos pedibus et non cornigera adipe. concretus hic et, cum refrixit, fragilis semperque in fine carnis; contra pingue inter carnem cutemque suco liquidum. quaedam non pinguescunt, ut lepus, perdix. steriliora cuncta pingua et in maribus et in feminis; senescunt quoque celerius praepingua. omnibus animalibus est quoddam in oculis pingue. adips cunctis sine sensu, quia nec arterias habet nec venas. plerisque animalium et pinguitudo sine sensu; quam ob causam sues spirantes a muribus tradunt adrosos, quin et l. aproni consularis viri filio detractos adipem levatumque corpus immobili onere.

medulla ex eodem videtur esse, iuventae rubens, in senecta albescens. non nisi cavis haec ossibus nec cruribus iumentorum aut canum; quare fracta non feruminantur, quod defluente evenit medulla. est autem pinguis iis quibus adipis, sebosa cornigeris, nervosa et in spina tantum dorsi ossa non habentibus, ut piscium generi, ursis nulla, leoni in feminum et brachiorum ossibus paucis exigua admodum; cetera sunt tanta duritia, ut ignis elidatur velut e silice. et iis dura quae non pinguescunt, asinorum ad tibias canora. delphinis ossa, non spinae, animal enim pariunt; serpentibus spinae. aquatilium mollibus nulla, sed corpus circulis carnis vinctum, ut saepiae atque lolligini. et insectis negatur aequae esse ulla. cartilaginea aquatilium habent medullam in spina, vituli marini cartilaginem, non ossa. item omnium auriculae ac nares, quae modo eminent, flexili mollitia, naturae providentia ne frangerentur. cartilago rupta non solidescit nec praecisa ossa recrescunt praeterquam veterinis ab ungula ad suffraginem ... homo in longitudinem usque ad ter septenos annos, tum deinde ad plenitudinem. maxime autem pubescens nodum quendam solvere, et praecipue aegritudine, sentitur.

nervi, orsi a corde bubuloque etiam circumvoluti, similem naturam et causam habent, in omnibus lubricis applicati ossibus nodosque corporum, qui vocantur articuli, aliubi interventu, aliubi ambitu, aliubi transitu ligantes, hic teretes, illic lati, ut quaeque poscit figuratio. nec hi solidantur incisi, mirumque, vulneratis summus dolor, praesectionis nullus. sine nervis sunt quaedam animalia, ut pisces, arteriis enim constant; sed neque his molles piscium generis. ubi sunt nervi, interiores conducunt membra, superiores revocant.

inter hos latent arteriae, id est spiritus semitae; his innatant venae, id est sanguinis rivi. artieriarum pulsus in cacumine maxime membrorum evidens, index fere morborum, in modulos certos legesque metricas per aetates - stabilis aut citatus aut tardus - discriptus ab herophilo medicinae vate miranda arte; nimiam propter suptilitatem desertus, observatione tamen crebri aut languidi ictus gubernacula vitae temperat. arteriae carent sensu, nam et sanguine. nec omnes vitalem continent spiritum, praecisisque torpescit tantum pars ea corporis. aves nec venas nec arterias habent, item serpentes, testudines, lacertae, minimumque sanguinis.

venae in praetenues postremo fimbrias supter totam cutem dispersae adeo in angustam suptilitatem tenuantur, ut penetrare sanguis non possit aliudve quam excitus umor ab illo, qui cacuminibus innumeris sudor appellatur. venarum in umbilico nodus ac coitus.

sanguis quibus multus et pinguis, iracundi. maribus quam feminis nigrior et iuventae quam senio, et inferiore parte pinguior. magna et in eo vitalitatis portio. emissus spiritum secum trahit, tactum tamen non sentit. animalium fortiora quibus crassior sanguis, sapientiora quibus tenuior, timidiora quibus minimus aut nullus. taurorum celerrime coit atque durescit - ideo pestifer potu - , proxime aprorum, at cervorum caprearumque et bubalorum omnino non spissatur. pinguiissimus asinis, homini tenuissimus. iis, quibus plus quaterni

pedes, nullus. obesis minus copiosus, quoniam absumitur pingui. profluvium eius uni fit in maribus homini, aliis nare alterutra vel utraque, quibusdam per inferna, multis per ora stato tempore, ut nuper macrino visco praetorio viro et omnibus annis volusio saturnino urbis praefecto, qui nonagensimum etiam excessit annum. solum hoc in corpore temporarium sentit incrementum, si quidem hostiae abundantiores fundunt, si prius bibere.

quae animalium latere certis temporibus diximus, non habent tunc sanguinem praeter exiguas admodum circa corda guttas, miro opere naturae, sicut in homine vim eius ad minima momenta mutari, non somno tantum minore materia suffusi, verum ad singulos animi habitus, pudore, ira, metu, palloris pluribus modis, item ruboris: alius enim irae et alius verecundiae. nam in metu refugere et nusquam esse certum est multisque non profluere transfossis, quod homini tantum evenit. nam quae mutare diximus colorem, alienum accipiunt quodam re percussu; homo solus in se mutat. morbi omnes morsque sanguinem absumunt.

sunt qui suptilitatem animi constare non tenuitate sanguinis putent, sed cute operimentisque corporum magis aut minus bruta esse, ut ostreas et testudines; boum terga, saetas suum obstare tenuitati immeantis spiritus, nec purum liquidumque tramitti; sic et in homine, cum crassior callosiorve excludat cutis: ceu vero non crocodilis et duritia tergoris tribuatur et sollertia. hippopotami corio crassitudo talis, ut inde torrentur hastae, et tamen quaedam ingenio medica diligentia. elephantorum quoque tergora inpenetrabiles caetras habent, cum tamen omnium quadripedum suptilitas animi praecipua perhibetur illis. ergo cutis ipsa sensu caret, maxime in capite. ubicumque per se ac sine carne est, vulnerata non coit, ut in bucca cilioque.

quae animal pariunt, pilos habent; quae ova, pinnae aut squamas aut corticem, ut testudines, aut cutem puram, ut serpentes. pinnarum caules omnium cavi. praecisae non crescunt, evulsae renascuntur. membranis volant fragilibus insecta, umentibus hirundines in mari, siccis inter tecta. vesperilionum alae quoque articulos habent.

pili e cute exeunt crassa hirti, feminis tenuiores; equis in iuba largi, in armis leoni, dasypodi et in buccis intus et sub pedibus, quae utraque trogus et in lepore tradidit, hoc exemplo libidinosiores hominum quoque hirtos colligens. villosissimum animalium lepus. pubescit homo solus, quod nisi contigit, sterilis in gignendo est, seu mas seu femina. pili in homine partim simul, partim postea gignuntur. hi castratis non nascuntur, congeniti autem non desinunt, sicut nec feminis magno opere; inventae tamen quaedam defluvio capitis invalidae, ut et lanugine oris, cum menstrui cursus stetere. quibusdam post genituri sponte non gignuntur. quadripedibus pilum cadere atque subnasci annuum est. viris crescunt maxime in capillo, mox in barba. recisi non, ut herbae ac cetera, ab incisura augentur, sed ab radice exeunt. crescunt et in quibusdam morbis, maxime phthisi, et in senecta, defunctis quoque corporibus. libidinosi congeniti maturius defluunt, agnati celerius crescunt. quadripedibus senectute crassescunt lanaeque rarescunt.

quadripedum dorsa pilosa, ventres glabri. - boum coriis glutinum excoquitur, taurorumque praecipuum. -

mammās homo solus e maribus habet, cetera animalia mammarum notas tantum. sed ne feminae quidem in pectore nisi quae possunt partus suos attollere. ova gignentium nulli; nec lact nisi animal parienti. volucrum vespertiloni tantum: fabulosum enim arbitror de strigibus, ubera eas infantium labris inmulgere. esse in maledictis iam antiquis strigem convenit, sed quae sit avium, constare non arbitror. asinis a fetu dolent, ideo sexto mense arcent partus, cum equae anno prope toto praebeant. quibus solida ungula nec supra geminos fetus, haec omnia binas habent mammās, nec aliubi quam in feminibus. eodem loci bisulca et cornigera, boves quaternas, oves et caprae binas. quae numeroso fecunda partu et quibus digiti in pedibus, haec plures habent et toto ventre duplici ordine, ut sues, generosae duodenas, volgares binis minus; similiter canes. alia ventre medio quaternas, ut pantherae, alia binas, ut leaenae. elephans tantum sub armis duas nec in pectore, sed citra in alis occultas. nulli in feminibus digitos habentium. primis genitis in quoque partu sues primas praebent - eae sunt faucibus proximae - , et suam quisque novit in fetu quo genitus est ordine, eaque alitur nec alia. detracto illa alumno suo sterilescit ilico ac resilit, uno vero ex omni turba relicto sola munifex, quae genito fuerat attributa, dependet. ursae mammās quaternas gerunt, delphini binas in ima alvo papillas tantum nec evidentes et paulum in oblicum porrectas. neque aliud animal in cursu lambitur. et ballaenae autem vitulique marini mammis nutriunt fetus.

mulieri ante septimum mensem profusum lact inutile, ab eo mense, quo vitales partus, salubre. plerisque autem totis mammis atque etiam alarum sinu fluit. cameli lact habent, donec iterum gravescant. suavissimum id existimatur ad unam mensuram tribus aquae additis. bos ante partum non habet, et primo semper a partu colostrae fiunt, ni admisceatur aqua, in pumicis modum coeunte duritia. asinae praegnates continuo lactescunt. pullos earum, ubi pingue pabulum, biduo a partu maternum lact gustasse letale est. genus mali vocatur colostratio. caseus non fit ex utrimque dentatis, quoniam eorum lact non coit. tenuissimum camelis, mox equis, crassissimum asinae, ut quo coaguli vice utantur. conferre aliquid et candori in mulierum cute existimatur. poppaea certe, domiti neronis coniunx, quingentas per omnia secum fetas trahens, balnearum etiam solio totum corpus illo lacte macerabat, extendi quoque cutem credens. omne autem igne spissatur, umore fervescit. bubulum caseo fertilius quam caprinum, ex eadem mensura paene altero tanto. quae plures quaternis mammās habent, caseo inutilia, et meliora quae binas.

coagulum hinnulei, leporis, haedi laudatum, praecipuum tamen dasypodis, quod et profluvio alvi medetur, unius utrimque dentatorum. mirum barbaras gentes, quae lacte vivant, ignorare aut spernere tot saeculis casei dotem, densantes id alioqui in acorem iucundum et pingue butyrum. spuma id est, lacte concretior lentiorque quam quod serum vocatur. non omittendum in eo olei vim esse et barbaros omnes infantesque nostros ita ungui.

laus caseo romae, ubi omnium gentium bona comminus iudicantur, e provinciis nemausensi praecipua, lesurae gabalicoque pagis, sed brevis ac musteo tantum commendatio. duobus alpes generibus pabula sua adprobant: delmaticae docleatem mittunt, ceutronicae vatusicum. numerosior appennino: cebanum hic e liguria mittit ovium maxime lacte, sassinatem ex vmbria mixtoque etruriae atque liguriae confinio luniensem magnitudine conspicuum, quippe et ad singula milia pondo premitur, proximum autem urbi vestinum eumque e caedicio campo laudatissimum. et caprarum gregibus sua laus est, in recenti maxime augente gratiam fumo, qualis in ipsa urbe conficitur cunctis praeferendus; nam galliarum sapor medicamenti vim optinet. trans maria vero bithynus fere in gloria est. inesse pabulis salem, etiam ubi non detur, ita maxime intellegitur, omni in salem caseo senescente, quales redire in musteum saporem aceto et thymo maceratos certum est. tradunt zoroastren in desertis caseo vixisse annis xx ita temperato, ut vetustatem non sentiret.

terrestrium solus homo bipes. uni iuguli, umeri, ceteris armi; uni ulnae. quibus animalium manus sunt, intus tantum carnosae, extra nervis et cute constant.

digiti quibusdam in manibus seni. m. corani ex patricia gente filias duas ob id sedigitas accipimus appellatas et volcacium sedigitum, inlustrem in poetica. hominis digiti ternos articulos habent, pollex binos; et digitis adversus universis flectitur, per se vero in oblicum porrigitur, crassior ceteris. huic minimus mensura par, ac duo reliqui sibi, inter quos medius longissime protenditur. quibus ex rapina victus quadripedum, quini digiti in prioribus pedibus, in reliquis quaterni. leones, lupi, canes, panthera in posterioribus quoque quinos ungues habent uno iuxta cruris articulum dependente; reliqua, quae sunt minora, et digitos quinos.

bracchia non omnibus paria secum. studioso threci in c. caesaris ludo notum est dexteram fuisse proceriorem.

animalium quaedam ut manibus utuntur priorum ministerio pedum sedentque ad os illis admoventia cibos, ut sciuri. nam simiarum genera perfectam hominis imitationem continent facie, naribus, auribus, palpebris, quas solae quadripedum et in inferiore habent gena, iam mammas in pectore et brachia et crura in contrarium similiter flexa, in manibus ungues, digitos longioremque medium. pedibus paulum differunt; sunt enim ut manus praelongae, sed vestigium palmae simile faciunt. pollex quoque iis et articuli ut homini, ac praeter genitale - et hoc in maribus tantum - viscera etiam interiora omnia ad exemplar.

ungues clausulae nervorum summae existimantur. omnibus hi quibus et digiti. sed simiae imbricati, hominibus lati - et defuncto crescunt - , rapacibus unci, ceteris recti, ut canibus, praeter eum qui a crure plerisque dependet. omnia digitos habent quae pedes, excepto elephanto; huic enim informes, numero quidem v, sed indivisi ac leviter discreti ungulisque, non unguibus, similes, et pedes maiores priores, in posterioribus articuli breves. idem poplites intus flectit hominis modo, cetera animalia in diversum posterioribus

pedibus quam prioribus. nam quae animal generant, genua ante se flectunt et suffraginum artus in aversum.

homini genua et cubita contraria, item ursis et simiarum generi, ob id minime perniciousa. ova parientibus quadrupedum, crocodilo, lacertis, priora genua post curvantur, posteriora in priorem partem. sunt autem crura his obliqua, humani pollicis modo. sic et multipedibus praeterquam novissima salientibus. aves, ut quadrupedes, alas in priora curvant, suffraginem in posteriora.

hominis genibus quaedam et religio inest observatione gentium. haec supplices attingunt, ad haec manus tendunt, haec ut aras adorant, fortassis quia inest iis vitalitas. namque in ipsa genus utriusque commissura, dextra laevaue, a priore parte gemina quaedam buccarum inanitas inest, qua perfossa ceu iugulo spiritus fluit. inest et aliis partibus quaedam religio, sicut in dextera: osculis aversa adpetitur, in fide porrigitur. antiquis graeciae in supplicando mentum attingere mos erat. est in aure ima memoriae locus, quem tangentes antestamur; est post aurem aequae dexteram nemeseos, quae dea latinum nomen ne in capitolio quidem invenit, quo referimus tactum ore proximum a minimo digitum, veniam sermonis a diis ibi recondentes.

varices in cruribus viro tantum, mulieri raro. c. marium, qui vii consul fuit, stanti sibi extrahi passum unum hominum oppius auctor est.

omnia animalia a dextris partibus incedunt, sinistris incubant. reliqua ut libitum est gradiuntur, leo tantum et camelus pedatim, hoc est, ut sinister pes non transeat dextrum, sed subsequatur. pedes homini maximi, feminis tenuiores in omni genere. surae homini tantum et crura carnosae. reperitur apud auctores quendam in aegypto non habuisse suras. vola homini tantum exceptis quibusdam. namque et hinc cognomina inventa planci, plauti, pansae, Scauri, sicut a cruribus vari, vatiae, vatini, quae vitia et in quadrupedibus. solidas habent ungulas quae non sunt cornigerae; igitur pro iis telum ungulae ictus est illis. nec talos habent eadem, at quae bisulca sunt, habent. iidem digitos habentibus non sunt, neque in prioribus omnino pedibus ulli. camelo tali similes bubulis, sed minores paulo; est enim bisulcum discrimine exiguo; pes in vestigio carnosus ut ursi, qua de causa in longiore itinere sine calceatu fatiscunt.

vngulae veterino tantum generi renascuntur. sues in illyrico quibusdam locis solidas habent ungulas. cornigera fere bisulca; solida ungula et bicornis nullum, unicornis asinus tantum indicus; unicornis et bisulcum oryx. talos asinus indicus unus solidipedum habet, nam sues ex utroque genere existimantur, ideo foedi earum. hominem qui existimarunt habere, facile convicti. lynx tantum digitos habentium simile quiddam talo habet; leo etiamnum tortuosius. talus autem rectus est in articulo pedis, ventre eminens concavo, in vertebra ligatus.

avium aliae digitatae, aliae palmipedes, aliae inter utrumque, divisae digitis adiecta latitudine. sed omnibus quaterni digiti, tres in priore parte, unus a calce. hic deest quibusdam longa crura habentibus. iynx sola utrimque binos

habet; eadem linguam serpentium similem in magnam longitudinem porrigit; collum circumagat in aversam se; ungues ei grandes ceu graculis. avium quibusdam gravioribus in cruribus additi radii, nulli uncus habentium ungues. longipedes porrectis ad caudam cruribus volant; quibus breves, contractis ad medium. qui negant volucrem ullam sine pedibus esse, confirmant et apodas habere, docent et drepanin, quae ex his rarissime apparet. - visae iam et serpentes anserinis pedibus. -

insectorum pedes primi longiores duros habentibus oculos, ut subinde pedibus eos tergeant, ceu notamus in muscis. quae ex iis novissimos habent longos, saliant, ut locustae. omnibus autem his seni pedes. araneis quibusdam praelongi accedunt bini. internodia singulis terna. octonos et marinis esse diximus, polypis, saepiis, lolligini, cancris, qui brachia in contrarium movent, pedes in orbem aut in oblicum; iidem solis animalium rotundi. cetera binos pedes duces habent, cancri tantum quaternos. quae hunc numerum pedum excessere terrestria, ut plerique vermes, non infra duodenos habent, aliqua vero et centenos. numerus pedum impar nulli est.

solidipedum crura statim iusta nascuntur mensura, postea exporrigentia se verius quam crescentia. itaque in infantia scabunt aures posterioribus pedibus, quod addita aetate non queunt, quia longitudo superficiem corporum solam ampliat. hac de causa inter initia pasci nisi summissis genibus non possunt nec usque dum cervix ad iusta incrementa perveniat. pumilionum genus in omnibus animalibus est, atque etiam inter volucres.

genitalia maribus quibus essent retrorsa diximus. ossea sunt lupis, vulpibus, mustelis, viverris, unde etiam calculo humano remedia praecipua. urso quoque, simul atque expiraverit, cornescere aiunt. camelino arcus intendere orientis populis fidissimum. nec non aliqua gentium quoque in hoc discrimina et sacrorum etiam, citra perniciem amputantibus matris deum gallis. contra mulierum paucis prodigiosa adsimulatio, sicut hermaphroditis utriusque sexus, quod etiam quadripedum generi accidisse neronis principatu primum arbitror. ostentabat certe hermaphroditas subiunctas carpento suo equas, in treverico galliae agro repertas: ceu plane visenda res esset principem terrarum insidere portentis.

testes pecori armentoque ad crura decidui, subus adnexi. delphino praelongi ultima conduntur alvo; et elephanto occulti. ova parientium lumbis intus adhaerent, qualia ocissima in venere. piscibus serpentibusque nulli, sed eorum vice binae ad genitalia a renibus venae. buteonibus terni. homini tantum iniuria aut sponte naturae franguntur, idque tertium ab hermaphroditis et spadonibus semiviri genus habent. - mares in omni genere fortiores sunt praeterquam pantheris et ursis.

caudae praeter hominem ac simias omnibus fere et animal et ova gignentibus, pro desiderio corporum nudae hirtis, ut apris, parvae villosis, ut ursis, praelongae saetosis, ut equis. amputatae lacertis et serpentibus renascuntur. piscium meatus gubernaculi modo regunt atque etiam in dexteram ac laevam motae ut remigio quodam inpellunt. lacertis inveniuntur

et geminae. boum caudis longissimus caulis atque in ima parte hirtus; idem asinis longior quam equis, sed saetosus veterinis. leoni in prima parte ut bubus et sorici, pantheris non item; vulpibus et lupis villosus ut ovibus, quibus procerior. sues intorquent, canum degeneres sub alvum reflectunt.

vocem non habere nisi quae pulmonem et arterias habeant, hoc est nisi quae spirent, aristoteles putat. idcirco et insectis sonum esse, non vocem, intus inmeante spiritu et incluso sonante; alia murmur edere, ut apes, alia contractum stridorem, ut cicadas, receptum enim duobus sub pectore cavis spiritum, mobili occursante membrana intus, attritu eius sonare. muscas, apes, cetera similia cum volatu et incipere audiri et desinere, sonum enim attritu et interiore aura, non anima, reddi; locustas pinnarum et feminum attritu sonare. credatur sane item aquatilium pectines stridere, cum volant, mollia et crusta intacta nec vocem nec sonum ullum habere: sed ceteri pisces, quamvis pulmone et arteria careant, non in totum sine ullo sunt sono - stridorem eum dentibus fieri cavillantur - , et is, qui caper vocatur in acheloo amne, grunnitum habet et alii, de quibus diximus. ova parientibus sibilus, serpentibus longus, testudini abruptus. ranis sui generis, ut dictum est, nisi si et in his ferenda dubitatio est, quia vox in ore concipitur, non in pectore. multum tamen in his refert et locorum natura: mutae in macedonia traduntur, muti et apri. avium loquaciores quae minores, et circa coitus maxime: aliis in pugna vox, ut coturnicibus, aliis ante pugnam, ut perdicibus, aliis cum vicere, ut gallinaceis. isdem sua maribus, aliis eadem et feminis, ut luscinarum generi. quaedam toto anno canunt, quaedam certis temporibus, ut in singulis dictum est. elephans citra nares ore ipso sternumento similem elidit sonum, per nares autem turbarum raucitati. bubus tantum feminis vox gravior, in alio omni genere exilior quam maribus, in homine etiam castratis. infantis in nascendo nulla auditur ante quam totus emergat utero. primus sermo anniculo; set semenstris locutus est croesi filius et in crepundiis prodigio, quo totum id concidit regnum. qui celerius fari coepere, tardius ingredi incipiunt. vox roboratur a xiiii annis; eadem in senecta exilior, neque in alio animalium saepius mutatur.

mira praeterea sunt de voce digna dictu: theatrorum in orchestris scobe aut harena superiacta devoratur, item rudi parietum circumiectu, doliis etiam inanibus. currit eadem recto vel conchato parietum spatio, quamvis levi sono dicta verba ad alterum caput perferens, si nulla inaequalitas impediat. vox in homine magnam voltus habet partem. adgnosimus ea prius quam cernamus non aliter quam oculis, totidemque sunt hae, quot in rerum natura mortales, et sua cuique sicut facies. hinc illa gentium totque linguarum toto orbe diversitas, hinc tot cantus et moduli flexionesque, sed ante omnia explanatio animi, quae nos distinxit a feris et inter ipsos quoque homines discrimen alterum, aequae quam a beluis, fecit.

membra animalibus adgnata inutilia sunt, sicut sextus homini semper digitus. placuit in aegypto nutrire portentum, binis et in aversa capitis parte oculis hominem, sed iis non cernentem.

miror equidem aristotelem non modo credidisse praescita vitae esse aliqua in corporibus ipsis, verum etiam prodidisse. quae quamquam vana existimo nec sine cunctatione proferenda, ne in se quisque ea auguria anxie quaerat, attingam tamen, quia tantus vir in doctrinis non spreuit. igitur vitae brevis signa ponit raros dentes, praelongos digitos, plumbeum colorem pluresque in manu incisuras nec perpetuas. contra longae esse vitae incurvos umeris et in manu unam aut duas incisuras longas habentes et plures quam xxxii dentes, auribus amplis. nec universa haec, ut arbitror, sed singula observat, frivola, ut reor, et volgo tamen narrata. addidit morum quoque spectus simili modo apud nos trogus, et ipse auctor e severissimis, quos verbis eius subiciam: “frons quibus est magna, segnem animum subesse significat; quibus parva, mobilem; quibus rotunda, iracundum, velut hoc vestigio tumoris apparente. supercilia quibus porriguntur in rectum, molles significant; quibus iuxta nasum flexa sunt, austeros; quibus iuxta tempora inflexa, derisores; quibus in totum demissa, malivolos et invidos. oculi quibus utrimque sunt longi, malificos moribus esse indicant; qui carnosos a naribus angulos habent, malitiae notam praebent; candida pars extenta notam inpudentiae habet; qui identidem operiri solent, inconstantiae. oricularum magnitudo loquacitatis et stultitiae nota est.” hactenus trogus.

animae leonis virus grave, ursi pestilens. contacta halitu eius nulla fera attingit, ociusque putrescunt adflata. e reliquis homini tantum infici natura voluit pluribus modis, et ciborum ac dentium vitiis, sed maxime senio. dolorem sentire non poterat, tactu sensuque omni carebat sine qua nihil sentitur; eadem commeabat recens assidue, exitura supremo et sola ex homine superfutura, denique haec trahebatur e caelo: huius quoque tamen reperta poena est, ut neque id ipsum, quo vivitur, in vita iuvaret. parthorum populis haec praecipue et a iuventa propter indiscretos cibos, namque et vino faetent ora nimio; sed sibi proceres medentur grano assyrii mali, cuius et suavitas praecipua, in esculenta addito.

elephantorum anima serpentes extrahit, cervorum urit. diximus hominum genera qui venena serpentium suctu corporibus eximerent. quin et subus serpentes in pabulo sunt, et aliis venenum est. quae insecta appellavimus, omnia olei aspersu necantur, vultures unguenti - qui fugat alios appetunt odorem - , scarabaei rosa. quasdam serpentes scorpio occidit. scythae sagittas tingunt viperina sanie et humano sanguine; inremediabile id scelus: mortem ilico adfert levi tactu.

quae animalium pascerentur veneno diximus. quaedam, innocua alioqui, venenatis pasta noxia fiunt et ipsa. apros in pamphyliam et ciliciae montuosis salamandra ab iis devorata qui edere, moriuntur: neque enim est intellectus ullus in odore vel sapore; et aqua vinumque interemit salamandra ibi inmorta vel si omnino biberit unde potetur, item rana quam rubetam vocant. tantum insidiarum est vitae! vespae serpente avidae vescuntur, quo alimento mortiferos ictus faciunt. adeoque magna differentia est victus, ut in tractu pisce viventium theophrastus prodat boves quoque pisce vesci, sed non nisi vivente.

homini cibus utilissimus simplex, acervatio saporum pestifera et condimento perniciosior. difficulter autem perficiuntur omnia in cibus acria, aspera, inconsueta, varia, nimia et avide hausta, et aestate quam hieme difficilius et in senecta quam in iuventa. vomitiones homini ad haec in remedium excogitatae frigidiora corpora faciunt, inimicae oculis maxime ac dentibus.

somno concoquere corpulentiae quam firmitati utilius; ideo athletas ambulatione malunt cibos perficere. pervigilio quidem praecipue vincuntur cibi. augescunt corpora dulcibus atque pinguibus et potu, minuuntur siccis et aridis frigidisque ac siti. quaedam animalia et pecudes quoque in africa quarto die bibunt. homini non utique septimo letalis inedia; durasse et ultra undecimum plerosque certum est. morbus esuriendi semper inexplebili aviditate uni animalium homini.

quaedam rursus exiguo gustu famem ac sitim sedant conservantque vires, ut butyrum, hippace, glycyrrhiza. perniciosissimum autem et in omni quidem vita quod nimium, praecipue tamen corpori, minuique quod gravet quolibet modo utilius.

verum ad reliqua naturae transeamus.

LIBER XII

animalium omnium quae nosci potuere naturae generatim membratimque ita se habent. restat ut neque ipsa anima carentia - quandoquidem nihil sine ea vivit - , terra edita et inde eruta, dicantur ac nullum sileatur rerum naturae opus. diu fuere occulta eius beneficia, summumque munus homini datum arbores silvaeque intellegebantur. hinc primum alimenta, harum fronde mollior specus, libro vestis. etiam nunc gentes sic degunt. quo magis ac magis admirari subit his a principiis caedi montes in marmora, vestes ad seras peti, unionem in rubri maris profunda, zmaragdum in ima tellure quaeri. ad hoc excogitata sunt aurium vulnera, nimirum quoniam parum erat collo, crinibus, manibus gestari, nisi infoderentur etiam corpori. quam ob rem sequi par est ordinem vitae et arbores ante alia dicere ac moribus primordia ingerere nostris.

haec fuere numinum templa, priscoque ritu simplicia rura etiam nunc deo praecellentem arborem dicant. nec magis auro fulgentia atque ebore simulacra quam lucos et in iis silentia ipsa adoramus. arborum genera numinibus suis dicata perpetuo servantur, ut iovi aesculus, apollini laurus, minervae olea, veneri myrtus, herculi populus. quin et silvanos faunosque et dearum genera silvis ac sua numina tamquam e caelo attributa credimus. arbores postea blandioribus fruge sucis hominem mitigavere. ex his recreans membra olei liquor viresque potus vini, tot denique sapores anni sponte venientes et mensae, depugnetur licet earum causa cum feris et pasti naufragorum corporibus pisces expetantur, etiam nunc tamen secundae. mille praeterea sunt usus earum, sine quis vita degi non possit. arbore sulcamus maria terrasque admovemus, arbore exaedificamus tecta. arborea et simulacra numinum fuere nondum pretio excogitato beluarum cadaveri atque ut, a diis nato iure luxuriae, eodem ebore numinum ora spectarentur et mensarum pedes. produnt alpibus coercitas ut tum inexsuperabili munimento gallias hanc primum habuisse causam superfundendi se italiae, quod helico ex helvetiis civis earum fabilem ob artem romae commoratus ficum siccam et uvam oleique ac vini promissa remeans secum tulisset. quapropter haec vel bello quaesisse venia sit.

sed quis non iure miretur arborem umbrae gratia tantum ex alieno petitam orbe platanus haec est, in mare ionium diomedis insula tenus eiusdem tumuli gratia primum invecta, inde in siciliam transgressa atque inter primas donata italiae et iam ad morinos usque pervecta ac tributarium etiam detinens solum, ut gentes vectigal et pro umbra pendant. dionysius prior siciliae tyrannus regium in urbem transtulit eas domus suae miraculum, ubi postea factum gymnasium; nec potuisse in amplitudinem augescere aut alias fuisse in italia ac nominatim hispania apud auctores invenitur.

hoc actum circa captae urbis aetatem, tantumque postea honoris increvit, ut mero infuso enutriantur. conpertum id maxime prodesse radicibus,

docuimusque etiam arbores vina potare.

celebratae sunt primum in ambulatione academiae athenis cubitorum xxxiii radice ramos antecedente. nunc est clara in lycia fontis gelidi socia amoenitate, itineri adposita, domicilii modo cava octoginta atque unius pedum specu, nemorosa vertice et se vastis protegens ramis arborum instar, agros longis obtinens umbris ac, ne quid desit speluncae imagini, saxea intus crepidinis corona muscosos complexa pumices, tam digna miraculo, ut licinius mucianus ter consul et nuper provinciae eius legatus prodendum etiam posteris putaverit, epulatum intra eam se cum duodevicensimo comite, large ipsa toros praebente frondis, ab omni adflatu securum, optantem imbrium per folia crepitus, laetiores quam marmorum nitore, picturae varietate, laquearium auro cubuisse in eadem. aliud exemplum gai principis in veliterno rure mirati unius tabulata laxaeque ramorum trabibus scamna patula et in ea epulati, cum ipse pars esset umbrae, quindecim convivarum ac ministerii capaci triclinio, quam cenam appellavit ille nidum. est gortynae in insula creta iuxta fontem platanus una insignis utriusque linguae monimentis, numquam folia dimittens, statimque ei graeciae fabulositas superfuit iovem sub ea cum europa concubuisse, ceu vero non alia eiusdem generis esset in cypro. sed ex ea primum in ipsa creta, ut est natura hominum novitatis avida, platani satae regenerare vitium, quandoquidem commendatio arboris eius non alia maior est quam soles aestate arcere, hieme admittere. inde in italiam quoque ad surburbana sua claudio principe marcelli aesernini libertus, sed qui se potentiae causa caesaris libertis adoptasset, spado thessalicus praedives, ut merito dici possit is quoque dionysius, transtulit id genus. durantque et in italia portenta terrarum praeter illa scilicet quae ipsa excogitavit italia.

namque et chamaeplatani vocantur coactae brevitatis, quoniam arborum etiam abortus invenimus. hoc quoque ergo in genere pumilionum infelicitas dicta erit. fit autem et serendi genere et recidendi. primus c. matius ex equestri ordine, Divi Augusti amicus, invenit nemora tonsilia intra hos lxxx annos.

peregrinae et cerasi persicaeque et omnes quarum graeca nomina aut aliena, sed quae ex iis incolarum numero esse coepere, dicuntur inter frugiferas. in praesentia externas persequemur a salutari maxime orsi.

malus assyria, quam alii medicam vocant, venenis medetur. folium eius est unedonis intercurrentibus spinis. pomum ipsum alias non manditur, odore praecellit foliorum quoque, qui transit in vestes una conditus arcetque animalium noxia. arbor ipsa omnibus horis pomifera est, aliis cadentibus, aliis maturescentibus, aliis vero subnascentibus. temptavere gentes transferre ad sese propter remedii praestantiam fictilibus in vasis, dato per cavernas radicibus spiramento, qualiter omnia transitura longius seri aptissime transferrique meminisse conveniet, ut semel quaeque dicantur. sed nisi apud medos et in perside nasci noluit. haec est cuius grana parthorum proceres incoquere diximus esculentis commendandi halitus gratia. nec alia arbor laudatur in medis.

lanigeras serum in mentione gentis eius narravimus, item indiae arborum

magnitudinem. unam e peculiaribus indiae vergilius celebravit hebenum, nusquam alibi nasci professus. herodotus eam aethiopiae intellegi maluit in tributi vicem regibus persidis e materia eius centenas phalangas tertio quoque anno pensitasse aethiopas cum auro et ebore prodendo. non omittendum id quoque, vicanos dentes elephantorum grandes, quoniam ita significavit, aethiopas ea de causa pendere solitos. tanta ebori auctoritas erat urbis nostrae cccx anno; tunc enim auctor ille historiarum condidit thuriis in italia, quo magis mirum est quod eidem credimus, qui padum amnem vidisset neminem ad id tempus asiae graeciaeque visum. cognita aethiopiae forma - ut diximus, nuper allata neroni principi - raram arborem meroen usque a syene fine imperii per [dcccclxxxvi] p. nullamque nisi palmarum generis esse docuit. ideo fortassis in tributi auctoritate tertia res fuerit hebenus.

romae eam magnus pompeius triumpho mithridatico ostendit. accendi fabianus negat, uritur tamen odore iucundo. duo genera eius: rarum id quod melius, arboreum, purae et enodis materiae nigri splendoris ac vel sine arte protinus iucundi, alterum fruticosum cytisi modo et tota india dispersum.

est ibi et spina similis, sed deprehensa vel lucernis igni protinus transiliente.

nunc eas exponemus, quas mirata est alexandri magni victoria orbe eo patefacto.

figus ibi eximia pomo, se ipsa semper serens. vastis diffunditur ramis, quorum imi in terram adeo curvantur, ut annuo spatio infigantur novamque sibi progeniem faciant circa parentem in orbem quodam opere topiario. intra saepem eam aestivant pastores, opacam pariter et munitam vallo arboris, decora specie subter intuenti proculve fornicato ambitu. superiores eiusdem rami in excelsum emicant silvosa multitudine, vasto matris corpore, ut lx passus pleraeque orbe colligant, umbra vero bina stadia operiant. foliorum latitudo peltae effigiem amazonicae habet; ea causa fructum integens crescere prohibet. rarus ... que nec fabae magnitudinem excedens, sed per folia solibus coctus praedulcis sapore et dignus miraculo arboris. gignitur circa acesinen maxime amnem.

maior alia pomo et suavitate praecellentior, quo sapientes indorum vivunt. folium alas avium imitatur, longitudine trium cubitorum, latitudine duum. fructum cortice emittit admirabilem suci dulcedine, ut uno quaternos satiet. arbori nomen palae, pomo arierae. plurima est in sydracis, expeditionum alexandri termino. est et alia similis huic, dulcior pomo, sed interaneorum valetudini infesta. edixerat alexander ne quis agminis sui id pomum attingeret.

genera arborum macedones narravere maiore ex parte sine nominibus. est et terebintho similis cetera, pomo amygdalis, minore tantum magnitudine, praecipuae suavitatis, in bactris utique. hanc aliqui terebinthon esse proprii generis potius quam similem ei putaverunt. sed unde vestes lineas faciunt, foliis moro similis, calyce pomi cynorrhodo. serunt eam in campis, neque est gratior vinearum prospectus.

oliva indiae sterilis praeterquam oleastri fructus. passim vero quae piper

gignunt iunipiris nostris similes, quamquam in fronte caucasi solibus opposita gigni tantum eas aliqui tradidere. semina a iunipiro distant parvulis siliquis, quales in phasiolis videmus. hae prius quam dehiscant decerptae tostaeque sole faciunt quod vocatur piper longum, paulatim vero dehiscentes maturitate ostendunt candidum piper, quod deinde tostum solibus colore rugisque mutatur. verum et his sua iniuria est, atque caeli intemperie carbunculant fiuntque semina cassa et inania, quod vocant bregma, sic indorum lingua significante mortuum. hoc ex omni genere asperrimum est levissimumque et pallidum, gratius nigrum, lenius utroque candidum. non est huius arboris radix, ut aliqui existimavere, quod vocant zingiberi, alii vero zimpiberi, quamquam sapore simili. id enim in arabia atque trogodytica in villis nascitur, parva herba, radice candida. celeriter ea cariem sentit, quamvis in tanta amaritudine. pretium eius in libras #1108 vi. piper longum facillime adulteratur alexandrino sinapi. emitur in libras #1108 xv, album #1108 vii, nigrum #1108 iii. usum eius adeo placuisse mirum est; in aliis quippe suavitas cepit, in aliis species invitavit: huic nec pomi nec bacae commendatio est aliqua. sola placere amaritudine, et hanc in indos peti! quis ille primus experiri cibus voluit aut cui in appetenda aviditate esurire non fuit satis utrumque silvestre gentibus suis est et tamen pondere emitur ut aurum vel argentum.

piperis arborem iam et italia habet, maiorem myrto nec absimilem. amaritudo grano eadem quae piperi musteo credatur esse: deest tosta illa maturitas ideoque et rugarum colorisque similitudo. adulteratur iunipiri bacis mire vim trahentibus; in pondere quidem multis modis.

est etiamnum in india piperis grans simile quod vocatur caryophyllon, grandius fragiliusque. tradunt in indica loto id gigni. advehitur odoris gratia. fert et spina piperis similitudinem praecipua amaritudine, foliis parvis densisque cypri modo, ramis trium cubitorum, cortice pallido, radice lata lignosaeque, buxei coloris. hac in aqua cum semine excocta in aereo vase medicamentum fit, quod vocatur lycion. ea spina et in pelio monte nascitur adulteratque medicamentum, item asphodeli radix aut fel bubulum aut apsinthium vel rhus vel amurca. aptissimum medicinae quod est spumosum. indi in utribus camelorum aut rhinocerotum id mittunt. spinam ipsam in graecia quidam pyxanthum chironium vocant.

et macir ex india advehitur, cortex rubens radice magnae, nomine arboris suae. qualis sit ea incompertum habeo. corticis melle decocti usus in medicina ad dysintericos praecipuus habetur.

saccaron et arabia fert, sed laudatius india. est autem mel in harundinibus collectum, cummum modo candidum, dentibus fragile, amplissimum nucis abellanae magnitudine, ad medicinae tantum usum.

contermina indis gens ariana appellatur, cui spina lacrima pretiosa murræ simili, difficili accessu propter aculeos adnexos. ibi et frutex pestilens, ... raphani, folio lauri, odore equos invitans, qui paene equitatu orbavit alexandrum primo introitu. quod et in gedrosis accidit item laureo folio. et ibi

spina tradita est, cuius liquor adpersus oculis caecitatem inferret omnibus animalibus, nec non et herba praecipui odoris, referta minutis serpentibus, quarum ictu protinus moriendum esset. onesicritus tradit in hyrcaniae convallibus fico similes esse arbores quae vocentur occhi, ex quibus defluat mel horis matutinis duabus.

vicina est bactriana, in qua bdellium laudatissimum. arbor nigra, magnitudine oleae, folio roboris, fructu caprifici. ipsi natura quae cummi. alii brochon appellant, alii malacham, alii maldacon, nigrum vero et in offas convolutum hadrobolon. esse autem debet tralucidae simile cerae, odoratum et, cum frietur, pingue, gustu amarum citra acorem. in sacris vino perfusum odoratius. nascitur et in arabia indiaque et media ac babylone. aliqui peraticum vocant ex media advectum. fragilius hoc et crustosius amariusque, at indicum umidius et cumminosum. adulteratur amygdala nuce, cetera eius genera cortice et scordasti - ita vocatur arbor aemulo cummi - , sed deprehenduntur, semel quod dixisse et in ceteros odores satis sit, odore, colore, pondere, gustu, igne. bactrio nitor siccus multique candidi ungues, praeterea suum pondus, quo gravius esse aut levius non debeat. pretium sincero in libras #1108 iii.

gentes supra dictas persis attingit. rubro mari, quod ibi persicum vocavimus, longe in terram aestus agente, mira arborum natura. namque erosae sale, investitis derelictisque similes, sicco litore radicibus nudis polyporum modo amplexae steriles harenas spectantur. eadem mari adveniente fluctibus pulsatae resistunt immobiles; quin et pleno aestu operiuntur totae, adparetque rerum argumentis asperitate aquarum illas ali. magnitudo miranda est, species similis unedoni, pomum amygdalis extra, intus contortis nucleis.

tylos insula in eodem sinu est, repleta silvis qua spectat orientem quaque et ipsa aestu maris perfunditur. magnitudo singulis arboribus fici, flos suavitate inenarrabili, pomum lupino simile, propter asperitatem intactum omnibus animalibus. eiusdem insulae excelsiore suggestu lanigerae arbores, alio modo quam serum: his folia infecunda, quae ni minora essent, vitium poterant videri. ferunt mali cotonei amplitudine cucurbitas, quae maturitate ruptae ostendunt lanuginis pilas, ex quibus vestes pretioso linteo faciunt. arborem vocant gossypinum, fertiliore etiam tylo minore, quae distat [x] p. iuba circa fruticem lanugines esse tradit linteaue ea indicis praestantiora, arabiae autem arborem, ex qua vestes faciant, cynas vocari, folio palmae simili. sic indos suae arbores vestiunt. in tyulis autem et alia arbor floret albae violae specie, sed magnitudine quadruplici, sine odore, quod miremur in eo tractu. est et alia similis, foliosior tamen roseique floris, quem noctu conprimens aperire incipit solis exortu, meridie expandit; incolae dormire eum dicunt. fert eadem insula et palmas oleasque ac vites et cum reliquo pomorum genere ficos. nulli arborum folia ibi decidunt, rigaturque gelidis fontibus et imbres accipit.

vicina iis arabia flagitat quandam generum distinctionem, quoniam fructus constant radice, frutice, cortice, suco, lacrima, ligno, surculo, flore, folio,

pomo. radix et folium indis in maximo pretio.

radix costi gustu fervens, odore eximia, frutice alias inutili. primo statim introitu amnis indi in patale insula duo eius genera: nigrum et, quod melius, candicans. pretium in libras #1108 v s.

de folio nardi plura dici par est ut principali in unguentis. frutex est gravi et crassa radice, sed brevi ac nigra fragilique, quamvis pingui, situm redolente, ut cypiros, aspero sapore, folio parvo densoque. cacumina in aristas se spargunt; ideo gemina dote nardi spicas ac folia celebrant. alterum eius genus apud gangen nascens damnatur in totum ozaenitidos nomine, virus redolens. adulteratur et pseudonardo herba, quae ubique nascitur crassiore atque latiore folio et colore languido in candidum vergente, item sua radice permixta ponderis causa et cummi spumaque argenti aut stibi ac cypiro cypirive cortice. sincerum quidem levitate deprehenditur et colore rufo odorisque suavitate et gustu maxime siccante os, sapore iucundo. pretium spicae in libras #1108 c. folii divisere annonam amplitudine. hadrosphaerum vocatur maioribus pilulis #1108 xxxx. quod minore folio est, mesosphaerum appellatur; emitur #1108 lx. laudatissimum microsphaerum e minimis foliis; pretium eius #1108 lxxv. odoris gratia omnibus, maior recentibus. nardo colos, si inveteravit, nigriori melior. in nostro orbe proxime laudatur syriacum, mox gallicum, tertio loco creticum, quod aliqui agrion vocant, alii phun, folio olusatri, caule cubitali, geniculato, in purpuram albicante, radice obliqua villosaque et imitante avium pedes. baccaris vocatur nardum rusticum, de quo dicemus inter flores. sunt autem omnia ea herbae praeter indicum. ex iis gallicum et cum radice vellitur abluiturque vino. siccatur in umbra, alligatur fasciculis in charta, non multum ab indico differens, syriaco tamen levius. pretium #1108 iii. in his probatio una, ne sint fragilia et arida potius quam sicca folia. cum gallico nardo semper nascitur herba quae hirculus vocatur a gravitate odoris et similitudine, qua maxime adulteratur. distat quod sine cauliculo est et quod minoribus foliis quodque radice neque amarae neque odoratae.

nardi vim habet et asarum, quod et ipsum aliqui silvestre nardum appellant. est autem hederæ foliis, rotundioribus tantum mollioribusque, flore purpureo, radice gallici nardi, semine acinosum, saporis calidi ac vinosi, in montibus umbrosis bis anno florens. optimum in ponto, proximum in phrygia, tertium in illyrico. foditur, cum folia amittere incipit, et in sole siccatur, celeriter situm trahens ac senescens. inventa nuper et in thracia herba est cuius folia nihil ab indico nardo distant.

amomi uva in usu est ex indica vite labrusca, ut alii existimavere, frutice tortuoso, palmi altitudine, carpiturque cum radice, manipulatim leniter componitur, protinus fragile. laudatur quam maxime punici mali foliis simile nec rugosis, colore rufo. secunda bonitas pallido; herbaceum peius, pessimumque candidum, quod et vetustate evenit. pretium uvæ in libras #1108 lx, friato vero amomo #1108 xliix. nascitur et in armeniae parte quae vocatur otene et in media et in ponto. adulteratur foliis punici et cummi liquido, ut cohaereat convolvatque se in uvæ modum. est et quae vocatur

amomis, minus venosa atque durior ac minus odorata, quo apparet aut aliud esse aut colligi in maturum.

simile his et nomine et frutice cardamomum, semine oblongo. metitur eodem modo in arabia. quattuor eius genera: viridissimum ac pingue, acutis angulis contumax frianti - hoc maxime laudatur - , proximum e rufo candicans, tertium brevius atque nigrius, peius tamen varium et facile tritu odorisque parvi, qui vero costo vicinus esse debet. hoc et apud medos nascitur. pretium optimi in libras #1108 iii.

cinnamomo proxima gentilitas erat, ni prius arabiae divitias indicari conveniret causasque quae cognomen illi felicitis ac beatae dedere.

principalia ergo in illa tus atque murra, haec et cum trogodytis communis, tura praeter arabiam nullis ac ne arabiae quidem universae. in medio eius fere sunt atramitae, pagus sabaeorum capite regni sabota in monte excelso, a quo octo mansionibus distat regio eorum turifera sariba appellata; hoc significare graeci mysterium dicunt. spectat ortus solis aestivi, undique rupibus invia et a dextera mari scopulis inaccessio. id solum e rubro lacteum traditur. silvarum longitudo est schoeni xx, latitudo dimidium eius. schoenus patet eratosthenis ratione stadia xl, hoc est p. [v], aliqui xxxii stadia singulis schoenis dedere. attolluntur colles alti, decurruntque et in plana arbores sponte natae. terram argillosam esse convenit, raris fontibus ac nitrosis. attingunt et minaei, pagus alius, per quos evehitur uno tramite angusto. hi primi commercium turis fecere maximeque exercent, a quibus et minaeum dictum est. nec praeterea arabum alii turis arborem vident, ac ne horum quidem omnes, feruntque [iii] non amplius esse familiarum quae ius per successiones id sibi vindicent; sacros vocari ob id nec ullo congressu feminarum funerumque, cum incidant eas arbores aut metant, pollui atque ita religionem mercis augeri. quidam promiscuum tus iis populis esse tradunt in silvis, alii per vices annorum dividi.

nec arboris ipsius quae sit facies constat. res in arabia gessimus et romana arma in magnam partem eius penetrare, gaius etiam caesar Augusti filius inde gloriam petiit, nec tamen ab ullo, quod equidem sciam, latino arborum earum tradita est facies. graecorum exempla variant: alii folio piri, minore dumtaxat et herbidi coloris, prodidere, alii lentisco similem subrutilo folio, quidam terebinthum esse, et hoc visum antigono regi allato frutice. iuba rex iis voluminibus, quae scripsit ad c. caesarem Augusti filium ardentem fama arabiae, tradit contorti esse caudicis, ramis aceris maxime pontici, sucum amygdalae modo emittere, talesque in carmania apparere et in aegypto satas studio ptolemaeorum regnantium. cortice lauri esse constat; quidam et folium simile dixere: talis certe fuit arbor sardibus, nam et asiae reges serendi curam habuerunt. qui mea aetate legati ex arabia venerant, omnia incertiora fecerunt, quod iure miremur, virgis etiam turis ad nos commeantibus, quibus credi potest matrem quoque teretem enodi fruticare trunco.

meti semel anno solebat minore occasione vendendi; iam quaestus alteram vindemiam adfert. prior atque naturalis vindemia circa canis ortum flagrantissimo aestu, incidentibus qua maxime videatur esse praegnans

tenuissimusque tendi cortex. laxatur hic plaga, non adimitur; inde prosilit spuma pinguis. haec concreta densatur, ubi loci natura poscat, tegete palmea excipiente, aliubi area circumpavita. purius illo modo, sed hoc ponderosius. quod in arbore haesit, ferro depectitur, ideo corticosum. silva divisa certis portionibus mutua innocentia tuta est: nemo saucias arbores custodit, nemo furatur alteri. at hercules alexandriae, ubi tura interpolantur, nulla satis custodit diligentia officinas. subligaria signantur opifici; persona additur capiti densusve reticulus; nudi emittuntur: tanto minus fidei apud nos poena quam apud illos silvae habent! autumno legitur ex aestivo partu; hoc purissimum, candidum. secunda vindemia est vere, ad eam hieme corticibus incisis. rufum hoc exit nec comparandum priori. illud carfiathum, hoc dathiathum vocant. creditur et novellae arboris candidius esse, sed veteris odoratius. quidam et in insulis melius putant gigni, iuba in insulis negat nasci. quod ex eo rotunditate guttae pependit, masculum vocamus, cum alias non fere mas vocetur ubi non sit femina; religioni tributum, ne sexus alter usurparetur. masculum aliqui putant a specie testium dictum. praecipua autem gratia mammoso, cum haerente lacrima priore consecuta alia miscuit se. singula haec manum implere solita invenio, cum minore deripiendi aviditate lentius nasci liceret. graeci stagonian et atomum tali modo appellant, minorem autem orobian. micas concussu elisas mannam vocamus. etiamnum tamen inveniuntur guttae quae tertiam partem mnae, hoc est xxviii denariorum pondus, aequent. alexandro magno in pueritia sine parsimonia tura ingerenti aris paedagogus leonides dixerat, ut illo modo, cum devicisset turiferas gentes, supplicaret. at ille arabiae potitus ture onustam navem misit et exhortatus est, ut large deos adoraret. tus collectum sabotam camelis convehitur, porta ad id una patente. degredi via capital reges fecere. ibi decumas deo quem vocant sabin mensura, non pondere, sacerdotes capiunt, nec ante mercari licet: inde impensae publicae tolerantur; nam et benigne certo dierum numero deus hospites pascit. evehi non potest nisi per gebbanitas, itaque et horum regi penditur vectigal. caput eorum thomna abest a gaza, nostri litoris in iudaea oppido, [30xxiii]30 [xxxvii] d p., quod dividitur in mansiones camelorum lxv. sunt et quae sacerdotibus dantur portiones scribisque regum certae. sed praeter hos et custodes satellitesque et ostiarii et ministri populantur. iam quacumque iter est aliubi pro aqua, aliubi pro pabulo aut pro mansionibus variisque portoriis pendunt, ut sumptus in singulas camelos #1108 dclxxxviii ad nostrum litus colligat, iterumque imperii nostri publicanis penditur. itaque optimi turis libra #1108 vi pretium habet, secundi #1108 v, tertii #1108 iii. adulteratur apud nos resinae candidae gemma perquam simili, sed deprehenditur quibus dictum est modis. probatur candore, amplitudine, fragilitate, carbone, ut statim ardeat, item ne dentem recipiat potiusque in micas frietur.

murram in isdem silvis permixta arbore nasci tradidere aliqui, plures separatim, quippe multis locis arabiae gignitur, ut apparebit in generibus. convehitur et ex insulis laudata, petuntque eam etiam ad trogodytas sabaei transitu maris. sativa quoque provenit, multum silvestri praelata. gaudet rastris

atque ablaqueationibus, melior radice refrigerata.

arbori altitudo ad quinque cubita, nec sine spina, caudice duro et intorto, crassiore quam turis, et ab radice etiam quam reliqua sui parte. corticem levem similemque unedoni scabrum alii spinosumque dixere, folium olivae, verum crispus et aculeatus, iuba olusatris. aliqui similem iunipero, scabriorem tantum spinisque horridam, folio rotundiore, sed sapore iuniperi. nec non fuere qui e turis arbore utrumque nasci mentirentur.

inciduntur bis et ipsae isdemque temporibus, sed a radice usque ad ramos qui valent. sudant autem sponte prius quam inciduntur stacte dicta, cui nulla praefertur. ab hac sativa et in silvestri quoque melior aestiva. non dant ex murra portiones deo, quoniam et apud alios nascitur; regi tamen gebbanitarum quartas partes eius pendunt. cetero passim a vulgo coemptam in folles conferciunt, nostrique unguentarii digerunt haud difficulter odoris atque pinguedinis argumentis.

genera complura: trogodytica silvestrium prima, sequens minaea, in qua et atramitica est et gebbanitica et ausaritis gebbanitarum regno, tertia dianitis, quarta collaticia, quinta sambracena a civitate regni sabaeorum mari proxima, sexta quam dusaritim vocant. est et candida uno tantum loco, quae in mesalum oppidum confertur. probatur trogodytica pinguedine et quod aspectu aridior est sordidaque ac barbara, sed acrior ceteris. sambracena praedicta ante alias hilaris, sed viribus tenuis. in plenum autem probatio est minutis glaebris nec rotundis, in concretu albicantis suci et tabescentis utque fracta candidos unguis habeat, gustu leniter amara. secunda bonitas intus variae; pessima quae intus nigra, peior, si etiam foris. pretia ex occasione ementium varia: stactae a #1108 iii ad #1108 l, sativae summum #1108 xi, erythraeae xvi - hanc volunt arabicam intellegi - , trogodyticae nucleo xvi s, ei vero quam odorariam vocant xii. adulteratur lentisci glaebris et cummi, item cucumeris suco amaritudinis causa, sicut ponderis spuma argenti. reliqua vitia deprehenduntur sapore. cummi dente lentescens. fallacissime autem adulteratur indica murra, quae ibi de quadam spina colligitur. hoc solum peius india adfert, facili distinctione: tanto deterior est.

ergo transit in mastichen, quae et ex alia spina fit in india itemque in arabia; lainam vocant. sed mastiche quoque gemina est, quoniam et in asia graeciaque reperitur herba a radice folia emittens et carduum similem malo, seminis plenum ac lacrimae, quae erumpit incisa parte summa, vix ut dinosci possit a mastiche vera. nec non et tertia in ponto est, bitumini similior, laudatissima autem chia candida, cuius pretium in libras #1108 x, nigrae vero #1108 ii. chia e lentisco traditur gigni cummii modo. adulteratur ut tura resina.

arabia etiamnum et ladano gloriatur. forte casuque hoc et iniuria odorum fieri plures tradidere, caprasque, maleficum alias frondibus animal, odoratorum vero fruticum adpetentius, tamquam intellegant pretia, carpere germinum caules praedulci liquore turgentes destillantemque ab iis casus mixtura sucum inprobo barbarum villo abstergere. hunc glomerari pulvere,

incoqui sole, et ideo in ladano caprarum pilos esse. sed hoc non alibi fieri quam in nabataeis, qui sunt ex arabia contermini syriae. recentiores ex auctoribus storbon hoc vocant traduntque silvas arabum pastu caprarum infringi atque ita sucum villis inhaerescere, verum autem ladanum cypri insulae esse, ut obiter quaeque genera odorum dicantur, quamvis non terrarum ordine. similiter hoc et ibi fieri tradunt et esse oesypum hircorum barbis genibusque villosis inhaerens, sed hederæ flore deroso, pastibus matutinis, cum est rorulenta cypros. dein nebula sole discussa pulverem madentibus villis adhaerescere atque ita ladanum depecti. sunt qui herbam in cypro, ex qua id fiat, ledam appellant; etenim illi ledanum vocant. huius pinguis insidere; itaque et tractis funiculis herbam eam convolvi atque ita offas fieri. ergo in utraque gente bina genera, terrenum et facticium. id quod terrenum est friabile, facticium lentum. nec non fruticem esse dicunt in carmania et super aegyptum per ptolemaeos tralatis plantis aut, ut alii, degenerante in id turis arbore, colligique ut cummim inciso cortice et caprinis pellibus excipi. pretia sunt laudatissimo in libras asses xxxx. adulteratur myrti baxis et aliis animalium sordibus. sinceri odor esse debet ferus et quodam modo solitudinem redolens, ipsum visu aridum tactu statim mollescere, accensum fulgere odore iucundo; gravi myrtatum deprehenditur crepitatque igni. praeterea sincero calculi potius e rupibus inhaerent quam pulvis.

in arabia et olea dotatur lacrima, qua medicamentum conficitur graecis enhaemon dictum, singulari effectum contrahendis vulnere cicatricibus. in maritimis hae fluctibus aestuque operiuntur, nec bacae nocetur, cum constet in foliis salem relinqui.

haec sunt peculiaria arabiae, et pauca praeterea communia alibi dicenda, quoniam in iis vincitur. peregrinos ipsa mire odores et ad externos petit: tanta mortalibus suarum rerum satias est alienarumque aviditas. petunt igitur in elymaeos arborem bratum, cupresso fusae similem, exalbidis ramis, iucundi odoris accensam et cum miraculo historiis claudi caesaris praedicatam. folia eius inspergere potionibus parthos tradit; odorem esse proximum cedro fumumque eius contra ligna alia remedio. nascitur ultra pasitigrim finibus oppidi sostratae in monte scanchro. petunt et in carmanos arborem stobrum ad suffitus, perfusam vino palmeo accendentes. huius odor redit a camaris ad solum, iucundus, sed adgravans capita, citra dolorem tamen; hoc somnum aegris quaerunt. his commerciis carra oppidum aperuere, quod est ibi nundinarium. inde gabbam omnes petere solebant dierum viginti itinere et palaestinen syriam. postea characem peti coeptum ac regna parthorum ex ea causa, auctor est iuba. mihi ad persas etiam prius ista portasse quam in syriam aut aegyptum videntur herodoto teste, qui tradit singula milia talentum annua turis pensitasse arabas regibus persarum. ex syria revehunt styracem, acri odore eius in focis abigentes suorum fastidium. cetero non alia sunt ligni genera in usu quam odorata, cibosque sabaei coquunt turis ligno, alii murræ, oppidorum vicorumque non alio quam ex aris fumo atque nidore. ad hunc ergo sanandum styracem in follibus petunt hircinis suffiuntque tecta: adeo

nulla est voluptas quae non adsiduitate fastidium pariat. eundem et ad serpentes fugandas urunt in odoriferis silvis frequentissimas.

non sunt eorum cinnamomum aut casia, et tamen felix appellatur arabia, falsi et ingrati cognominis, quae hoc acceptum superis ferat, cum plus ex eo inferis debeat. beatam illam fecit hominum etiam in morte luxuria quae dis intellexerant genita inurentium defunctis. periti rerum adseverant non ferre tantum annuo fetu, quantum nero princeps novissimo poppaeae suae die concremaverit. aestimentur post ea toto orbe singulis annis tot funera acervatimque congesta honori cadaverum quae dis per singulas micas dantur. nec minus propitii erant mola salsa supplicantibus, immo vero, ut palam est, placatiores. verum arabiae etiamnum felicius mare est; ex illo namque margaritas mittit. minimaque computatione miliens centena milia sestertium annis omnibus india et seres et paeninsula illa imperio nostro adimunt: tanti nobis deliciae et feminae constant. quota enim portio ex illis ad deos, quaeso, iam vel ad inferos pertinet

cinnamomum et casias fabulose narravit antiquitas princepsque herodotus avium nidis et privatim phoenicis, in quo situ liber pater educatus esset, ex inviis rupibus arboribusque decuti carnis quam ipsae inferrent pondere aut plumbatis sagittis, item casiam circa paludes, propugnante unguibus diro vespertilionum genere aligerisque serpentibus, his commentis augentes rerum pretia. comitata vero fabula est ad meridiani solis repercussus inenarrabilem quendam universitatis halitum e tota paeninsula existere tot generum aurae spirante concentu, magnique alexandri classibus arabiam primum odoribus nuntiatam in altum. omnia falsa, si quidem cinnamomum idemque cinnamum nascitur in aethiopia trogodytis conubio permixta. hi mercatores id a conterminis vehunt per maria vasta ratibus, quas neque gubernacula regant neque remi trahant vel impellant vela, non ratio ulla adiuvet: omnium instar ibi sunt homo tantum et audacia. praeterea hibernum mare exigunt circa brumam, euris tum maxime flantibus. hi recto cursu per sinus impellunt, atque a promunturii ambitu argestae deferunt in portum gebbanitarum qui vocatur ocilia. quam ob rem illi maxime id petunt, produntque vix quinto anno reverti negotiatores et multos interire. contra revehunt vitrea et ae+na, vestes, fibulas cum armillis ac monilibus. ergo negotiatio illa feminarum maxime fide constat.

ipse frutex duum cubitorum altitudine amplissimus palmique minimus, quattuor digitorum crassitudinis, statim a terra vi digitis surculosus, arido similis, cum viret, non odoratus, folio origani, siccitate gaudens, sterilior imbre, caeduae naturae. gignitur in planis quidem, sed densissimis in vepribus rubisque, difficilis collectu. metitur non nisi permiserit deus. iovem hunc intellegunt aliqui, assabinum illi vocant. xliiii boum caprarumque et arietum extis impetratur venia caedendi, non tamen ut ante ortum solis aut post occasum liceat. sarmenta hasta dividit sacerdos deoque partem ponit, reliquum mercator in massas condit. est et alia fama cum sole dividi ternasque partes fieri, dein sorte gemina discerni quodque soli cesserit relinqui ac sponte

conflagrare. praecipua bonitas virgultorum tenuissimis partibus ad longitudinem palmi, secunda proximis brevior mensura, atque ita ordine. vilissimum quod radicibus proximum, quoniam ibi minimum corticis, in quo summa gratia, eaque de causa praeferuntur cacumina, ubi plurimus torpet. ipsum vero lignum in fastidio propter organi acrimoniam, xylocinnamomum vocatur. pretium ei in libras #1108 x. quidam cinnami duo genera tradidere, candidius nigriusque, et quondam praeferebatur candidum, nunc contra nigrum laudatur atque etiam varium praeferunt candido. certissima tamen aestimatio, ne sit scabrum atque ut inter sese tritum tarde frietur; damnatur in primis molle aut cui labet cortex. ius eius a gebbanitarum rege solo proficiscitur; is edicto mercatu vendit. pretia quondam fuere in libras denarium milia. auctum id parte dimidia est incensis, ut ferunt, silvis ira barbarorum. id acciderit ob iniquitatem praepotentium an forte, non satis constat. austros ibi tam ardentes flare, ut aestatibus silvas accendant, invenimus apud auctores. coronas ex cinnamo interrasili auro inclusas primus omnium in templis capitolii atque pacis dicavit imperator Vespasianus Augustus. radicem eius magni ponderis vidimus in palatii templo, quod fecerat Divo Augusto coniunx augusta, aureae paterae inpositam, ex qua guttae editae annis omnibus in grana durabantur, donec id delubrum incendio consumptum est.

frutex et casia est iuxtaque cinnami campos nascitur, sed in montibus crassiore sarmento, tenui cute verius quam cortice, quem contra atque in cinnamo diximus labare et exinaniri pretium est. amplitudo frutici trium cubitorum, colos triplex: cum primum emicat, candidus pedali mensura, dein rufescit addito semipede, ultra nigricans. haec pars maxime laudatur ac deinde proxima, damnatur vero candida. consecant surculos longitudine binum digitorum, mox praesuunt recentibus coriis quadripedum ob id interemptarum, ut putrescentibus vermiculi lignum erodant et excavent corticem, tutum amaritudine. probatur recens maxime et quae sit odoris longissimi gustuque quam minime fervens potiusque lento tepore leniter mordens, colore purpureae, quaeque plurima minimum ponderis faciat, brevi tunicarum fistula atque non fragili. ladam vocant talem barbaro nomine. alia est balsamodes, ab odore simili appellata, sed amara ideoque utilior medicis, sicut nigra unguentis. pretia nulli diversiora, optimae in libras #1108 l, ceteris #1108 v.

his adiecere mangones quam daphnidis vocant, cognominatam isocinnamon, pretiumque ei faciunt #1108 ccc. adulteratur styrace et propter similitudinem corticum laurus tenuissimis surculis. quin et in nostro orbe seritur, extremoque in margine imperii, qua rhenus adluit, vidi in alvariis apium satam. color abest ille torridus sole et ob id simul idem odor.

ex confinio casiae cinnamique et cancamum ac tarum invehitur, sed per nabataeos trogydas, qui consedere ex nabataeis.

eo comportatur et serichatum et gabalium, quae intra se consumunt arabes, nostro orbi tantum nominibus cognita, sed cum cinnamo casiaque nascentia. pervenit tamen aliquando serichatum et in unguenta additur ab aliquis.

permutatur in libras #1108 vi.

myrobalanum trogodytis et thebaidi et arabiae, quae iudaeam ab aegypto disternit, commune est, nascens id unguento, ut ipso nomine apparet, quo item indicatur et glandem esse. arbor est heliotropio, quam dicemus inter herbas, simili folio, fructus magnitudine abellanae nucis. ex his in arabia nascens syriaca appellatur et est candida, contra in thebaide nigra. praefertur illa bonitate olei quod exprimitur, sed copia thebaica. inter haec trogodytica vilissima est. sunt qui aethiopicam his praeferant, glandem nigram nec pinguem, nucleoque gracili, sed liquore qui exprimitur odoratiore, nascentem in campestribus. aegyptiam pinguiorem esse et crassiore cortice rubentem et, quamvis in palustribus nascatur, brevioris sicciorisque; e diverso arabicam viridem ac tenuiorem et, quoniam sit montuosa, spissioris; longe autem optimam petraeam ex quo diximus oppido, nigro cortice, nucleo candido. unguentarii autem tantum cortices premunt, medici et nucleos, tundentes adfusa paulatim calida aqua.

myrobalano in unguentis similem proximumque usum habet palma in aegypto quae vocatur adipsos, viridis, odore mali cotonei, nullo intus ligno. colligitur autumnus paulo ante quam incipiat maturescere. quod si relinquatur, phoenicobalanus vocatur et nigrescit vescentesque inebriat. myrobalano pretium in libras #1108 ii. institores et faecem unguenti hoc nomine appellant.

calamus quoque odoratus in arabia nascens communis indis atque syriae est, in qua vincit omnes. a nostro mari cl stadiis inter libanum montem aliumque ignobilem (non, ut quidam existimavere, antilibanum) in convalle modica iuxta lacum, cuius palustria aestate siccantur, tricenis ab eo stadiis calamus et iuncus odorati gignuntur. sane enim dicamus et de iunco, quamvis alio herbis dicato volumine, quoniam tamen hic unguentorum materia tractatur. nihil ergo a ceteris sui generis differunt aspectu, sed calamus praestanti odore statim e longinquo invitat, mollior tactu, meliorque qui minus fragilis et qui assulose potius quam qui raphani modo frangitur. inest fistulae araneum, quod vocant florem, praestantiore cui numerosius. reliqua probatio ut niger sit - damnantur albi - , melior, quo brevior crassiorque, et lentus in frangendo. calamo pretium in libras singulas #1108 i, iunco #1108 v. traduntque iuncum odoratum et in campania inveniri.

discessimus a terris oceanum spectantibus ad convexas in nostra maria. ergo aethiopiae subiecta africa hammoniaca lacrima stillat in harenis suis; inde nomen etiam hammonis oraculo, iuxta quod gignitur arbore quam metopon appellant, resinae modo aut cummum. genera eius duo: thrauston masculi turis similitudine, quod maxime probatur, alterum pingue et resinosum, quod phyrasma appellant. adulteratur harenis velut nascendo adprehensis; igitur quam minimis glaebis probatur et quam purissimis. pretium optimo in libras asses xxxx.

sparganos infra eos situs in cyrenaica provincia maxime probatur; alii bryon vocant. secundum locum optinet cyprius, tertium phoenicius. fertur et in aegypto nasci, quin et in gallia; nec dubitaverim: sunt enim hoc nomine cani

arborum villi, quales in quercu maxime videmus, sed odore praestantes. laus prima candidissimis atque latissimis, secunda rutilis, nulla nigris. et in insulis petrisque nati improbantur omnesque quibus palmarum atque non suus odor sit.

cypros in aegypto est arbor, ziziphi foliis, semine coriandri, candido, odorato. coquitur hoc in oleo premiturque postea, quod cypros vocatur. pretium ei in libras #1108 v. optimum e canopica in ripis nili nata, secundum ascalone iudaeae, tertium in cypro insula. odoris suavitas quaedam. hanc esse dicunt arborem quae in italia ligustrum vocetur. in eodem tractu aspalathos nascitur, spina candida magnitudine arboris modicae, flore rosae. radix unguentis expetitur. tradunt in quocumque frutice curvetur arcus caelestis, eandem quae sit aspalathi suavitatem odoris exsistere; sed si in aspalatho, inenarrabilem quandam. quam quidam erysisceptrum vocant, alii sceptrum. probatio eius in colore rufo vel igneo tactuque spisso et odore castorei. permutatur in libras #1108 v. in aegypto nascitur et maron, peius quam lydium, maioribus foliis ac variis; illa brevia ac minuta et odorata.

sed omnibus odoribus praefertur balsamum, uni terrarum iudaeae concessum, quondam in duobus tantum hortis, utroque regio, altero iugerum viginti non amplius, altero pauciorum. ostendere arborum hanc urbi imperatores vespasiani, clarumque dictu, a pompeio magno in triumpho arbores quoque duximus. servit nunc haec ac tributa pendit cum sua gente, in totum alia natura quam nostri externique prodiderant. quippe viti similior est quam myrto. malleolis seri didicit nuper, vincta ut vitis, et inplet colles vinearum modo. quae sine adminiculis se ipsa sustinet, tondetur similiter fruticans ac rastris nitescit properatque nasci, intra tertium annum fructifera. folium proximum tuburi, perpetua coma. saeviere in eam iudaei sicut in vitam quoque suam; contra defendere romani, et dimicatum pro frutice est; seritque nunc eum fiscus, nec umquam fuit numerosior. proceritas intra bina cubita subsistit. arbori tria genera: tenue et capillacea coma quod vocatur eutheriston; alterum scabro aspectu, incurvum, fruticosum, odoratius; hoc trachy appellant, tertium eumeces, quia est reliquis procerius, levi cortice. huic secunda bonitas, novissima eutheristo. semen eius vino proximum gustu, colore rufum, nec sine pingui. peius in grano quod levius atque viridius. ramus crassior quam myrto. inciditur vitro, lapide osseisve cultellis; ferro laedi vitalia odit, emoritur protinus, eodem amputari supervacua patiens. incidentis manus libratur artificii temperamento, ne quid ultra corticem violet. sucus e plaga manat quem opobalsamum vocant, suavitatis eximiae. sed tenui gutta ploratu: lanis parva colligitur in cornua, ex iis novo fictili conditur, crassiori similis oleo et in musto candida; rufescit deinde simulque durescit e tralucido. alexandro magno res ibi gerente toto die aestivo unam concham impleri iustum erat, omni vero fecunditate e maiore horto congios senos, e minore singulos, cum et duplo rependebatur argento, nunc etiam singularum arborum largior vena. ter omnibus percutitur aestatibus, postea deputatur. et sarmenta quoque in merce sunt. [dccc] hs amputatio ipsa surculusque venire

intra quintum devictae iudaeae annum; xylobalsamum vocatur et coquitur in unguentis. pro suco ipso substituere officinae. corticis etiam ad medicamenta pretium est. praecipua autem gratia lacrimae, secunda semini, tertia cortici, minima ligno. ex hoc buxosum optimum, quod et odoratissimum, e semine autem maximum et ponderosissimum, mordens gustu fervensque in ore. adulteratur petraeo hyperico, quod coarguitur magnitudine, inanitate, longitudine, odoris ignavia, sapore piperis. lacrimae probatio ut sit e pingui tenuis ac modice rufa et in fricando odorata. secundus candidi coloris, peior viridis crassusque, pessimus niger, quippe ut oleum senescit. ex omni incisura maxime probatur quod ante semen fluxit. et alias adulteratur seminis suco, vixque maleficio deprehenditur gustu amariore; esse enim debet lenis, non subacidus, odore tantum austerus. vitatur et oleo rosae, cypri, lentisci, balani, terebinthi, myrti, resina, galbano, cera cypria, prout quaeque res fuit, nequissime autem cummi: quoniam arescit, in manu inversa et in aqua sidit, quae probatio eius gemina est. debet et sincerum arescere, sed hoc cummi addita fragili crusta evenit. et gustu deprehenditur, carbone vero quod cera resinaque adulteratum est, nigriore flamma. nam melle mutatum statim in manu contrahit muscas. praeterea sinceri densatur in tepida aqua gutta sidens ad ima vasa, adulterata olei modo innatat et, si metopio vitata est, circulo candido cingitur. summa est probatio ut lac coagulet, in veste maculas non faciat. nec manifestior alibi fraus, quippe milibus denarium sextarii, empti vendente fisco trecenis denariis, veneunt: in tantum expedit augere liquorem. xylobalsamo pretium in libras #1108 vi.

proxima iudaeae syria supra phoenicen styracem gignit circa gabala et marathunta et casium seleucia montem. arbor est eodem nomine, cotoneo malo similis, lacrimae ex austero iucundi odoris; intus similitudo harundinis, suco praegnans. in hanc circa canis ortus advolant pinnati vermiculi erodentes, ob id scobe sordescit. styrax laudatur post supra dicta ex pisidia side, cypro, cilicia, creta, minime ex amano syriae medicis, sed unguentariis magis. colos in quacumque natione praefertur rufus et pinguiter lentus, deterior furfurosus et cano situ obductus. adulteratur cedri resina vel cummi, alias melle aut amygdalis amaris. omnia ea deprehenduntur gustu. pretium optimo #1108 xvii. exit et in pamphylia, sed aridior minusque succosus. dat et galbanum syria in eodem amano monte e ferula, quae eiusdem nominis, resinae modo; stagonitim appellant. quod maxime laudant, cartilagosum, purum ad similitudinem hammoniacy minimeque lignosum. sic quoque adulteratur faba aut sacopenio. sincerum, si uratur, fugat nidore serpentes. permutatur in libras #1108 v. medicinae hoc tantum, panacen et unguentis eadem gignit, nascentem et in psophide arcadiae circaque erymanthi fontem et in africa et in macedonia, ferula sui generis quinque cubitorum, foliis primo quaternis, mox senis in terra iacentibus, ampla magnitudine rotundis, in cacumine vero oleagineis, semine muscariis dependente ut ferulae. excipitur sucus inciso caule messibus, radice autumnis. laudatur candor eius coacti; sequens pallido statera, niger colos inprobatur. pretium optimo in libras #1108 ii. ab hac ferula

differt quae vocatur spondylion foliis tantum, quia sunt minora et platani divisura. non nisi in opacis gignitur. semen eodem nomine silis speciem habet, medicinae tantum utile. dat et malobathrum syria, arborem folio convoluto, colore aridi folii, ex quo premitur oleum ad unguenta, fertilioris eiusdem aegypti. laudatius tamen ex india venit. in paludibus ibi gigni tradunt lentis modo, odoratius croco, nigricans scabrumque, quodam salis gustu. minus probatur candidum. celerrime situm in vetustate sentit. sapor eius nardo similis esse debet sub lingua. odor vero in vino subfervefacti antecedit alios. in pretio quidem prodigio simile est, a denariis singulis ad #1108 ccc pervenire libras, folium autem ipsum in libras #1108 lx.

oleum et omphacium est. fit duobus generibus et totidem modis, ex olea et vite, olea adhuc alba expressa, deterius ex druppa. ita vocatur prius quam cibo matura sit, iam tamen colorem mutans; differentia quod hoc viride est, illud candidum. e vite psithia fit aut aminnea. cum sunt acini ciceris magnitudine, ante canis ortum, in prima lanugine demetitur uva eiusque melligo. reliquum corpus sole coquitur - nocturni rores caventur in fictili conditae - ; melligo colligitur subinde et cyprio aere servatur. optima quae rufa acriorque et aridior. pretium omphacio in libras #1108 vi. fit et alio modo, cum in mortariis uva immatura teritur siccataque in sole postea digeritur in pastillos.

eodem et bryon pertinet, uva populi albae. optima circa cnidum aut cariam in sitientibus aut siccis asperisque, secunda in lyciae cedro. eodem et oenanthe pertinet; est autem vitis labruscae uva; colligitur, cum floret, id est cum optime olet, siccatur in umbra substrato linteo atque ita in cados conditur. praecipua ex parapotamia, secunda ab antiochia atque laudicea syriae, tertia ex montibus medicis; haec utilior medicinae. quidam omnibus his praeferunt eam quae in cypro insula nascitur. nam quae in africa fit, ad medicos tantum pertinet vocaturque massaris. omnis autem ex alba labrusca praestantior quam e nigra.

est praeterea arbor ad eadem unguenta pertinens, quam alii elaten vocant - quod nos abietem - alii palmam, alii spatham. laudatur hammoniaca maxime, mox aegyptia, dein syriaca, dumtaxat in locis sitientibus odorata, pingui lacrima, quae in unguenta additur ad domandum oleum.

in syria gignitur et cinnamum quod comacum appellant. id est sucus nuci expressus, multum a suco illo veri cinnami differens, vicina tamen gratia. pretium in libras asses xxxx.

LIBER XIII

hactenus in odoribus habent pretia silvae, erantque per se mira singula, iuivitque luxuria omnia ea miscere et e cunctis unum odorem facere: ita reperta sunt unguenta. quis primus invenerit non traditur. iliacis temporibus non erant, nec ture supplicabatur: cedri tantum et citri, suorum fruticum, et in sacris fumo convolutum nidorem verius quam odorem noverant, iam rosae suco reperto; nominatur enim hic quoque in olei laude. unguentum persarum gentis esse debet. illi madent eo et accersita commendatione inluvie natum virus extinguunt. primum, quod equidem inveniam, castris darii regis expugnatis in reliquo eius apparatu alexander cepit scrinium unguentorum. postea voluptas eius a nostris quoque inter lautissima atque etiam honestissima vitae bona admissa est, honosque et ad defunctos pertinere coepit. quapropter plura de eo dicemus. quae ex his non erunt fruticum, ad praesens nominibus tantum indicabuntur, natura vero eorum suis reddetur locis.

unguentis cognomina dedere aliis patriae, aliis suci, aliis arbores, aliis causae, primumque id scire convenit, mutatam auctoritatem et saepius transisse gloriam. laudatissimum fuit antiquitus in delo insula, postea mendesium. nec mixtura et compositione tantum hoc accidit, sed iidem suci varie alibi atque alibi praevalere aut degeneravere. irinum corinthus diu maxime placuit, postea cyzici, simili modo rhodinum phaseli, quam gloriam abstulere neapolis, capua, praeneste. crocinum in solis ciliciae diu maxime laudatum est, mox rhodi, oenanthinum in cypro, post adramytteio, amaracinum in coo, postea eodem loco praelatum est melinum, cyprinum in cypro, deinde in aegypto, ubi mendesium et metopium subito gratius factum est. mox haec abstulit phoenice et cyprini laudem aegypto reliquit. panathenaicum suum athenae perseveranter optinere. fuerat et pardalium in tarso, cuius etiam compositio et mixtura oblitterata est. narcissinum quoque ex flore narcissi desiit componi. ratio faciendi duplex, succus et corpus: ille olei generibus fere constat, hoc odorum; haec stymmata vocant, illa hedyismata. tertius inter haec est colos multis neglectus; huius causa adduntur cinnabaris et anchusa. sal adpersus olei naturam coercescit. quibus anchusa adiecta est, sal non additur. resina aut cummis adiciuntur ad continendum odorem in corpore; celerrime is evanescit atque defluit, si non sunt haec addita. unguentorum expeditissimum fuit primumque, ut verisimile est, e bryo et balanino oleo, de quibus supra diximus et increvit deinde mendesium balanino, resina, murra, magisque etiam metopium. oleum hoc est amygdalis amaris expressum in aegypto, cui addidere omphacium, cardamomum, iuncum, calamum, mel, vinum, murrum, semen balsami, galbanum, resinam terebinthinam. e vilissimis quidem hodieque est - ob id creditum et id e vetustissimis esse - quod constat oleo myrteo, calamo, cupresso, cypro, lentisco, mali granati cortice. sed divulgata maxime unguenta crediderim rosa, quae plurima ubique gignitur. itaque simplicissima rhodini mixtura diu fuit additis omphacio, flore rosae,

crocino, cinnabari, calamo, melle, iunco, salis flore aut anchusa, vino. similis ratio et in crocino additis cinnabari, anchusa, vino. similis et in sampsuchino admixtis omphacio, calamo. optimum hoc in cypro, mytilenis, ubi plurima sampsuchus. miscentur et viliora genera olei e myrto, lauru, quibus additur sampsuchum, lilium, faenum graecum, murra, casia, nardum, iuncus, cinnamomum. e malis quoque cotoneis et strutheis fit oleum, ut dicemus, melinum, quod in unguenta transit admixtis omphacio, cyprino, sesamino, balsamo, iunco, casia, habrotono. susinum tenuissimum omnium est; constat ex liliis, balanino, calamo, melle, cinnamo, croco, murra; et dein cyprinum ex cypro et omphacio et cardamomo, calamo, aspalatho, habrotono; aliqui et cyperum addunt et murrā et panacem. hoc optimum sidone, mox aegypto. si non addatur sesaminum oleum, durat et quadriennio; excitatur cinnamomo. telinum fit ex oleo recenti, cypiro, calamo, meliloto, faeno graeco, melle, maro, amaraco. hoc multo erat celeberrimum menandri poetae comici aetate; postea successit propter gloriam appellatum megalium, ex oleo balanino, calamo, iunco, xylobalsamo, casia, resina. huius proprietas ut ventiletur in coquendo, donec desinat olere; rursus refrigeratum odorem suum capit. singuli quoque suci nobilia unguenta faciunt: in primis malobathrum, postea iris illyrica et cyzicena amaracus, herbarum utraque. vel pauca his et alia alii miscent; qui plurima, alterutri mel, salis florem, omphacium, agni folia, panacem. externa omnia et prodigiosa cinnamomino pretia: adicitur cinnamo balaninum oleum, xylobalsamum, calamus, iunci, balsami semina, murra, mel odoratum. unguentorum hoc crassissimum. pretia ei a #1108 xxxv ad #1108 ccc. nardinum sive foliatum constat omphacio aut balanino, iunco, costo, nardo, amomo, murra, balsamo. in hoc genere conveniet meminisse herbarum, quae nardum indicum imitarentur, species viii a nobis esse dictas: tanta materia adulterandi est. omnia autem acutiora fiunt costo, amomo, quae maxime nares feriunt, crassiora murra suavioraque, medicinae autem utiliora croco, acerrima per se amomo; hoc et capitis dolores facit. quidam satis habent adspargere quae sunt pretiosissima ceteris decoctis, incendio parcentes, sed non est eadem vis nisi una decoctis. murra et per se unguentum facit sine oleo, stacte dumtaxat, alioqui nimiam amaritudinem adfert. cyprino viride fit, susino unguinosum, mendesio nigrum, rhodino candidum, murra pallidum. haec sunt antiquae inventionis genera et postea officinarum furta.

nunc dicetur cumulus ipse deliciarum et summa auctoritas rei. ergo regale unguentum, appellatum quoniam parthorum regibus ita temperatur, constat myrobalano, costo, amomo, cinnamo comaco, cardamomo, nardi spica, maro, murra, casia, styrace, ladano, opobalsamo, calamo iuncoque syriis, oenanthe, malobathro, serichato, cypro, aspalatho, panace, croco, cypiro, amaraco, loto, melle, vino. nihilque eius rei causa in italia victrice omnium, in europa vero tota praeter irim illyricam et nardum gallicum gignitur. nam vinum et rosa et myrti folia oleumque communia fere omnium terrarum intellegantur.

siccis odoribus constant quae diapasmata vocantur. nam faecem unguenti magma appellant. inter omnes potentissimus odor quisquis novissime additur.

unguenta optime servantur in alabastris, odores in oleo, quod diuturnitati eorum tanto utilius quanto pinguius, ut ex amygdalis. et ipsa unguenta vetustate meliora. sol inimicus iis, quam ob rem in umbra conduntur plumbeis vasis. experimentum eorum inversa manu capitur, ne carnosae partis calor vitiet.

haec est materia luxus e cunctis maxime supervacui. margaritae enim gemmaeque ad heredem tamen transeunt, vestes prorogant tempus: unguenta ilico expirant ac suis moriuntur horis. summa commendatio eorum ut transeuntem feminam odor invitet etiam aliud agentis. exceduntque quadringenos denarios librae: tanti emitur voluptas aliena; etenim odorem qui gerit, ipse non sentit. si tamen et haec aliqua differentia signanda sunt, in m. ciceronis monumentis invenitur unguenta gratiora quae terram quam quae crocum sapiant, quando etiam corruptissimo in genere magis tamen iuvat quaedam ipsius vitii severitas. sed quosdam crassitudo maxime delectat, spissum appellantes, linique iam, non solum perfundi, gaudent. vidimus etiam vestigia pedum tingui, quod monstrasse m. othonem neroni principi ferebant, quaeso ut qualiter sentiretur iuvaretque ab ea parte corporis nec non aliquem e privatis audivimus iussisse spargi parietes balnearum unguento atque gaium principem solia temperari ac, ne principale videatur hoc bonum, et postea quendam e servis neronis. maxime tamen mirum est hanc gratiam penetrasse et in castra; aquilae certe ac signa, pulverulenta illa et cuspidibus horrida, unguuntur festis diebus, utinamque dicere possemus quis primus instituisset! ita est nimirum: hac mercede corruptae orbem terrarum devicere aquilae. ista patrocinia quaerimus vitiis, ut per hoc ius sub casside unguenta sumantur.

quando id primum ad romanos penetraverit, non facile dixerim. certum est antiocho rege asiaque devictis, urbis anno dlxv, P. Licinium Crassum l. iulium caesarem censores edixisse ne quis venderet unguenta exotica; sic enim appellavere. at hercules iam quidam etiam in potus addunt, tantique est amaritudo, ut odore prodigo fruantur ex utraque parte corporis. l. plotium, l. planci bis consulis censorisque fratrem, proscriptum a triumviris in salurnitana latebra unguenti odore proditum constat, quo dedecore tota absoluta proscriptio est; quis enim non merito iudicet perisse tales

cetero terrarum omnium aegyptus accommodatissima unguentis, ab ea campania est copia rosae. iudaea vero incluta est vel magis palmis, quarum natura nunc dicitur. sunt quidem et in europa vulgoque italia, sed steriles. ferunt in maritimis hispaniae fructum, verum inmitem; dulcem in africa, sed statim evanescentem. contra in oriente ex iis vina gentiumque aliquis panis, plurimis vero etiam quadrupedum cibus; quam ob rem iure dicentur externae. nulla est in italia sponte genita nec in alia parte terrarum nisi in calida, frugifera vero nusquam nisi in fervida. gignitur levi sabulosaque terra, maiore in parte et nitrosa. gaudet riguis totoque anno bibere, cum amet sitientia. fimo quidam etiam laedi putant, assyriorum pars aliqua, si non rivis misceat. genera earum plura, et prima frutice non excedentia sterilem hunc - aliubi et ipsum fertilem - brevisque rami orbe foliosum. tectorii vicem hic parietibus plerisque

in locis praestat contra aspergines. est et procerioribus silva arbore ex ipsa, foliorum aculeo fruticante circa totas pectinatim. quas silvestres intellegi necesse est, incerta tamen libidine etiam mitioribus se miscent. reliquae, teretes atque procerae, densis gradatisque corticum pollicibus aut orbibus faciles ad scandendum orientis se populis praebent, vitilem sibi arborique indutis circulum mira pernecitate cum homine subeuntem. coma omnis in cacumine et pomum est, non inter folia hoc, ut in ceteris, sed suis inter ramos palmitibus racemosum, utraque natura uvae atque pomi. folia, cultrato mucrone lateribus in sese bifida, tabellas primum demonstravere geminas, nunc ad funes vitiliumque nexus et capitum levia umbracula finduntur. arboribus, immo potius omnibus quae terra gignat herbisque etiam, utrumque esse sexum diligentissimi naturae tradunt, quod in plenum satis sit dixisse hoc in loco, nullis tamen arboribus manifestius. mas palmite floret, femina citra florem germinat tantum spicae modo. utrisque autem prima nascitur pomi caro, postea lignum intus, hoc est semen eius. argumentum quod parvae sine hoc reperiuntur in eodem palmite. est autem oblongum, non ut olivis orbiculatum, praeterea caesum a dorso pulvinata fissura et in alvo media plerisque umbilicatum. inde primum spargitur radix. seritur autem pronum et bina iuxta composita semina superque totidem; quoniam infirma e singulis planta est, quaternae coalescunt. multis candidisque lignum hoc a carnibus discernitur tunicis, aliis corpori adhaerentibus, laxaeque distans tantum cacuminis filo adhaeret. caro maturescit anno. quibusdam tamen in locis, ut in cypro, quamquam ad maturitatem non perveniat, grato sapore dulcis est. folium ibi latius, fructus quam reliquis rotundior nec ut devoretur corpus, verum ut expuatur suco modo expresso. et in arabia languide dulces traduntur esse palmae, quamquam iuba apud scenitas arabas praefert omnibus saporibus quam vocant dablan. cetero sine maribus non gignere feminas sponte edito nemore confirmant circaque singulos plures nutare in eum pronas blandioribus comis. illum erectis hispidum adflatu visuque ipso et pulvere etiam reliquas maritare; huius arbore excisa viduvio sterilesceere feminas. adeoque est veneris intellectus, ut coitus etiam excogitatus sit ab homine, e maribus flore ac lanugine, interim vero tantum pulvere, insperso feminis.

seruntur autem palmae et trunco duum cubitorum longitudine, a cerebro ipso arboris fissuris diviso atque defosso. et ab radice avulsae vitalis est satus et ramorum tenerrimis. in assyria ipsa quoque arbor strata in solo umido tota radicatur, sed in frutices, non in arborem. ergo plantaria instituunt anniculasque transferunt et iterum bimas. gaudent enim mutatione sedis, verna alibi, in assyria autem circa canis ortus. nec ferro attingunt ibi novellas, sed religant comas, ut in altitudinem exeant. robustas deputant crassitudinis gratia, semipedales ramorum truncos relinquentes, qui decisi alibi necant matrem. diximus salsum ab iis solum diligi. ergo, ubi non est tale, salem aspergunt, non radicibus, sed longius paulo. quaedam in syria et aegypto in binos se dividunt truncos, in creta et in ternos, quaedamque et quinos. ferunt statim in trimatu, in cypro vero, syria, aegypto quadrimae, aliae quinquennes, altitudine

hominis, nullo intus pomi ligno quamdiu sunt novellae, ob id spadonum accepto nomine.

genera earum multa. sterilibus ad materias operumque lautiora utitur assyria et tota persis. sunt et caeduae palmarum quoque silvae, rursus germinantes ab radice succisae. dulcis medulla earum in cacumine, quod cerebrum appellant, exemptaque vivunt, quod non aliae. vocantur autem chamaeropes, folio latiore ac molli ad vitilia utilissimae, copiosae in creta, sed magis in sicilia. e palmis prunae vivaces ignisque lentus. fructiferarum aliis brevius lignum in pomo, aliis longius, his mollius, illis durius, quibusdam osseum, limarum dente contra fascinantes religione politum. aliud pluribus vestitum paucioribusve tunicis, aliud crassioribus tenuioribusve. ita fiunt undequingenta genera, si quis omnium persequi velit nomina, etiam barbara, vinorumque ex iis differentias. clarissimae omnium, quas regias appellavere ob honorem, quoniam regibus tantum persidis servarentur, babylone natae uno in horto bagou; ita vocant spadones, qui apud eos etiam regnare. hortus ille numquam nisi dominantis in aula fuit. at in meridiano orbe praecipuam optinent nobilitatem syagri proximamque margarides. hae breves, candidae, rotundae, acinis quam quam balanis similiores, quare et nomen a margaritis accepere. una earum arbor in chora esse traditur, una et syagrorum, mirumque de ea accepimus, cum phoenice ave, quae putatur ex huius palmae argumento nomen accepisse, intermori ac renasci ex se ipsa, eratque, cum proderem, fertilis. pomum ipsum grande, durum, horridum et a ceteris generibus distans sapore quodam ferinae in apris evidentissimo, quae causa nominis. quarta auctoritas sandalidum a similitudine appellatarum. iam in aethiopiae fine quinque harum, qui plurimas, arbores tradunt, non raritate magis quam suavitate mirabiles. ab his caryotae maxime celebrantur, et cibo quidem, sed et suco uberrimae, ex quibus praecipua vina orienti, inimica capiti, unde pomo nomen. sed ut copia ibi atque fertilitas, ita nobilitas in iudaea, nec in tota, sed hiericunte maxime, quamquam laudata et archelaide et phaselide atque liviade, gentis eiusdem convallibus. dos iis praecipua suco pingui lactentibus quodamque vini sapore in melle praedulci. sicciore ex hoc genere nicolai, sed amplitudinis praecipuae: quaterni cubitorum longitudinem efficiunt. minus speciosae, sed sapore caryotarum sorores et ob hoc adelphides dictae proximam suavitatem habent, non tamen eandem. tertium ex his genus patetae: nimio liquore abundant, rumpitque se pomi ipsius, etiam in sua matre, ebrietas, calcatis similis. suum genus e sicciore turba dactylis, praelonga gracilitate curvatis interim; nam quos ex his honori deorum damus, chydaeos appellavit iudaea gens contumelia numinum insignis. in totum arentes thebaidi atque arabiae macroque corpore exiles, et adsiduo vapore torrente crustam verius quam cutem obducunt. in ipsa quidem aethiopia friatur haec - tanta est siccitas - et farinae modo spissatur in panem. gignitur autem in frutice ramis cubitalibus, folio latiore, pomo rotundo, sed maiore quam mali amplitudine; coecas vocant. triennio maturescunt, semperque frutici pomum est subnascente alio. thebaidis fructus extemplo in cados conditur cum sui ardoris

anima. ni ita fiat, celeriter expirat marcescitque non retostus furnis. e reliquo genere plebeiae videntur syriae et quas tragemata appellant. nam in alia parte phoenices ciliciaeque populari etiam nomine a nobis appellantur balani. eorum quoque plura genera. differunt figura rotunditatis aut proceritatis, differunt et colore, nigriores ac rubentes. nec pauciores fico traduntur colores, maxime tamen placent candidi. distant et magnitudine, prout multi cubitum effecere, quidam sunt non ampliores faba. servantur ii demum qui nascuntur in salsis atque sabulosis, ut in iudaea atque cyrenaica africa, non item in aegypto, cypro, syria, seleucia assyria, quam ob rem sues et reliqua animalia ex iis saginantur. vitiiati aut vetusti eius pomi signum est decidisse candidam verrucam, qua racemo adhaeserint. alexandri milites palmis viridibus strangulati sunt; in gedrosis id factum est pomi genere, alibi copia evenit: est enim tanta suavitas musteis, ut finis mandendi non nisi periculo fiat.

syria praeter hanc peculiare habet arbores: in nucum genere pistacia nota - prodesse adversus serpentium morsus traduntur et potu et cibo - , in ficorum autem caricas et minores eiusdem generis, quas cottana vocant, item pruna in damasco monte nata et myxas, utramque iam familiarem italiae. e myxis in aegypto et vina fiunt.

iunipiris similem habet phoenice cedrum minorem. duo eius genera, lycia et phoenicia, differunt folio; nam quae durum, acutum, spinosum habet, oxycedros vocatur, ramosa et nodis infesta altera, odore praestans. fructum ferunt myrti magnitudine, dulcem sapore. et maioris cedri duo genera. quae floret, fructum non fert, fructifera non floret, et in ea antecedentem fructum occupat novus; semen eius cupresso simile. quidam cedrelaten vocant. ex hac resina laudatissima. materiae vero ipsi aeternitas, itaque et simulacra deorum ex ea factitaverunt. cedrinus est romae in delubro apollo sosianus seleucia advectus. cedro similis in arcadia est arbor, in phrygia frutex vocatur cedris.

syria et terebinthum habet. ex iis mascula est sine fructu; feminarum duo genera. alteri fructus rubet lentis magnitudine, alteri pallidus cum vite maturescit, non grandior faba, odore iucundus, tactu resinosus. circa iden troadis et in macedonia brevis arbor haec atque fruticosa, in damasco syriae magna. materies ei admodum lenta ac fidelis ad vetustatem, nigri splendoris; flos racemosus olivae modo, sed rubens, folia densa. fert et folliculos emittentes quaedam animalia ceu culices lentoremque resinosum, qui et ex cortice erumpit. et rhus syriae mascula sterili fert femina, folio ulmi paulo longiore et piloso, foliorum semper inter se contrariis pediculis, gracili brevique ramo. pelles candidae conficiuntur iis. semen lenti simile cum uva rubescit, quod vocatur rhus, medicamentis necessarium.
